In short, the lack of written law is only a formal deficiency and altogether the rules of warfare must be sought in (a) the written international rules of warfare embodied in international agreements; (b) the unwritten international law, as defined in the Hague conventions and Article 38 of the Statute of the Permanent Court of International Justice; and (c) municipal legislation—for it seems obvious from passages in the international conventions that the signatory powers undertook to translate the stipulations of the respective agreements into the language of municipal law, by their penal codes, military codes, or special legislation; and this applies not only to the contractual obligations of the signatories which form the subject of the international conventions, but also to all those rules of international laws of war which result from the 'usages established between civilised nations, from the laws of humanity, and the requirements of the public conscience,' for they are the 'silent' rules of warfare. A war crime therefore does not necessarily differ from any other crime, though a typical list of 'war crimes' was drawn up by the 'Commission on Responsibility,' which was charged with the task of investigating the matter of atrocities committed by the Central Powers during the First World War (see *American Journal of International Law*, vol. xiv., 1920). Obviously some W. C. could only be committed through the opportunity offered by war conditions; but, substantially, this does not differentiate a crime of violence committed during war and one committed in peacetime. One authority lists various elements as the essentials for qualifying 'war crimes': 'They are acts of violence (both positive and negative violence); they are committed under specially favourable circumstances created by war; committed by a special group of persons in connection with the war (e.g. army commanders, police in occupied countries, commandants of prisoner-of-war camps);

committed during war; and are not covered by the exceptions provided by the international laws of warfare' (M. Lachs). Certainly the element of violence was emphasised by the Inter-Allied Conference at St. James's Palace (Jan. 1942), whose delegates signed a declaration in which they affirmed that acts of violence perpetrated by the Gers. and their allies and associates against the civilian pops. were at variance with accepted ideas concerning acts of war and political offences as these are understood by civilised nations, and placed among their prin. aims the punishment of those guilty and responsible for these crimes, and they expressed their determination to see that the guilty, whatever their nationality, were sought for and handed over to justice, and that the sentences pronounced were carried out. In short, it is clear that the concept of 'war crime' is free from uncertainty or ambiguity.

The defect in the past in these prohibitive provisions of international law has been that there was no court with power to try and to punish the transgressor. 'It is,' wrote Lord Simon, on the Nuremberg trial, 'the creation of the court, not the enunciation of the law, that is the novelty; and few people will feel their sense of justice outraged because when Germany collapsed the Allies decided to create such a court rather than to let those who were guilty of such deeds violate the law with impunity.' The outcome of this decision was a charter constituting the tribunal which tried and condemned the Nazi leading criminals at Nuremberg (see *NUREMBERG TRIAL*). In that trial Lord Justice Lawrence disposed of the *ex post facto* pleas of the defendants, particularly as such pleas affected wars of aggression regarded as crimes. For the defendants it was urged that a fundamental principle of all law—international and domestic or municipal—is that there can be no punishment of crime without a pre-existing law. *Nullum crimen sine lege, nulla poena sine lege*. It was submitted that *ex post facto* punishment is abhorrent to the law of all civilised nations, that no sovereign power had made aggressive war a crime at the time the alleged criminal acts were committed, that no statute had defined aggressive war, that no penalty had been fixed for its commission, and no court had been created to try and punish the offenders. Lord Justice Lawrence, in delivering the judgment of the court, said that the maxim *nullum crimen sine lege* is not a limitation of sovereignty, but is in general a principle of justice. 'To assert,' he said, 'that it is unjust to punish those who in defiance of treaties and assurances have attacked neighbouring states without warning is obviously untrue, for in such circumstances the attacker must know that he is doing wrong, and so far from it being unjust to punish him, it would be unjust if his wrong were allowed to go unpunished. Occupying the positions they did in the government of Germany, the defendants, or at least some of them, must have known of the treaties signed by Germany outlawing

recourse to war for the settlement of international disputes; they must have known that they were acting in defiance of all international law when in complete deliberation they carried out their designs of invasion and aggression. On this view of the case alone, it would appear that the maxim has no application to the present facts.' The judge pointed out that that view was strongly reinforced by the pact of Paris or Kellogg-Briand Pact of Aug. 27, 1928, which was binding on sixty-three nations, including Germany, Italy, and Japan. 'War for the solution of international controversies undertaken as an instrument of national policy certainly includes a war of aggression, and such a war is therefore outlawed by the pact.' It was also submitted on behalf of most of these defendants that in doing what they did they were acting under the orders of Hitler, and therefore could not be held responsible for the acts committed by them in carrying out these orders. 'The fact that the defendant acted pursuant to order of his government or of a superior shall not free him from responsibility, but may be considered in mitigation of punishment' (Article 8 of the International Military Tribunal). 'The provisions of this article,' said Lord Justice Lawrence, 'are in conformity with the law of all nations. That a soldier was ordered to kill or torture in violation of the international law of war has never been recognised as a defence to such acts of brutality, though, as the charter here provides, the order may be urged in mitigation of the punishment. The true test, which is found in varying degrees in the criminal law of most nations, is not the existence of the order, but whether moral choice was in fact possible.' According to statistics of the United Nations W. C. Commission, an international body estab. in Oct. 1943 at a meeting of the representatives of seventeen nations in London, some 24,365 persons had been tried in Europe (up to about the end of Dec. 1946) for W. C. in Brit., U.S., Fr., Gk., Norwegian, Czechoslovak, and Polish courts (the figures for Czechoslovakia and Poland include also trials of persons accused of collaboration and treachery). Out of this total 1432 received the death penalty, 16,413 were sentenced to varying terms of imprisonment, and 6520 were acquitted. In the Far E. 1468 persons had been tried before U.S., United Kingdom, and Australian courts, with 457 death sentences, 735 sentences of imprisonment, and 276 acquittals. These figures, however, constantly increased as the machinery came into full working order in all the countries concerned. No figures were available from the Soviet Union or the Soviet zone of occupation in Germany. See also UNITED NATIONS WAR CRIMES COMMISSION.

Criminal Appeal, Court of, was estab. in England by the Criminal Appeal Act, 1907. The judges eligible to sit in the court are the lord chief justice and the judges of the King's Bench Div. (appointed for the purpose by the lord chief

justice with the consent of the lord chancellor for such period as he thinks desirable in each case). The number of judges at any sitting is three. By the above-mentioned Act the right of appeal is given to a person (a) against conviction on ground of appeal involving a question of law; (b) with the leave of the court or upon the certificate of the judge who tried the prisoner that it is a fit case for appeal, against conviction on any ground of appeal involving a question of fact alone, or a question of mixed law and fact, or any other ground which appears to the court to be a sufficient ground of appeal; (c) with the leave of the court against the sentence unless the sentence be one fixed by law. The court in any such appeal shall allow the appeal if they think that the verdict of the jury should be set aside on the ground that it is unreasonable or cannot be supported on the evidence, or that the judgment of the court before whom the appellant was convicted should be set aside on the ground of a wrong decision on any question of law, or that, on any ground, there was a miscarriage of justice. The court may, however, dismiss the appeal, notwithstanding that they are of opinion that the point raised in the appeal might be decided in favour of the appellant, if they consider that no substantial miscarriage of justice has actually occurred. On an appeal against sentence the court shall, if they think that a different sentence should have been passed, quash the sentence passed at the trial and pass such other sentence (more or less severe) warranted in law by the verdict, and thus implies a power to increase the term of imprisonment given in the court below. The court shall, if they allow an appeal against conviction, quash the conviction and direct a judgment and verdict of acquittal to be entered. The principle upon which the court act is that of attaining the end of substantial justice. They will not quash a sentence upon a mere technicality, but require proof that there is a doubt whether, had the proceedings been conducted differently, the jury would have found another verdict. In this connection it is to be noted that the court has decided that the prisoner is entitled to have his defence, however weak or improbable, included by the judge in his summing-up and the omission of this duty by the judge is sufficient to upset the verdict on appeal. The appellant is entitled to be present on the hearing of an appeal against conviction, but not an application for leave to appeal.

C.I.D. (Criminal Investigation Department) is the detective branch of the Metropolitan Police. The C.I.D. was created in 1878 under Howard Vincent, who was appointed director of criminal investigation. Under his successor, James Monro, the C.I.D. was brought under the nominal control of the commissioner of police, and Monro became assistant commissioner. To cope with the Fenian outrages, 1883-85, Monro created a special branch of the C.I.D., first called the Special Irish Branch. The special branch

is still continued, and is concerned with the protection of state personages and with any crimes directed against the state. The special branch, however, is not under any form of political control. In addition to this branch the C.I.D. consists of a staff of detectives at New Scotland Yard, and at each of the twenty-three divs. of the Metropolitan Police Dist. The activities of the detective staff at Scotland Yard are divided between the Central Office and the Criminal Record Office, which includes the finger print bureau. The estab. strength of the C.I.D. is about

C.I.D.

The new building of the Metropolitan Police at New Scotland Yard, from the Victoria Embankment, London.

920 men. Plain-clothes detectives are selected from those showing special aptitude after serving in the uniform branch for twelve months. The C.I.D. is noted for its excellent team work, and it is now subdivided into branches which specialise in various aspects of crime. The C.I.D., of which the Flying Squad is a part, operates only within the metropolitan area, but the chief constable of a prov. dist. may solicit the aid of the C.I.D. through the medium of the home secretary. The number of inquiries undertaken for the prov. and continental police averages 6000 annually. The work of the C.I.D. is confined to indictable offences of a more serious character. Much valuable work is also done by the C.I.D. in preventing crime.

Criminal Law. The professed object of C. L. is the prevention of crimes by the deterrent effect of punishment. The

term crime does not lend itself to exact definition, but may be described as 'an act forbidden by law under pain and punishment.' The advantage of this description by reference to the sanction (*i.e.* evil incurred by reason of disobedience to command) is that crimes can be differentiated from civil injuries or torts, the two terms not being mutually exclusive. Neither the moral quality of a particular act nor the enormity of its consequence is a certain criterion for referring it to the category of crimes. Theoretically these may be valuable tests in that the fundamental object of the C. L. is the vindication of a wrong done to the community, whereas damages are given by way of compensation for a wrong tending rather to the prejudice of a private right. Again, as civilisation advances, the tendency, in marked contrast to ruder states of society when even theft was regarded as a civil injury, is to increase the number of acts the moral obliquity of which renders them punishable as crimes. Most crimes necessarily include a tort, *e.g.* libel, assault, and rape, and give a right to sue for damages; but many crimes, such as treason and perjury, give no such right; and again, such wrongs as trespass to lands, seduction, and slander are merely civil injuries and not crimes. In general, nothing is a crime unless plainly forbidden by law; but a common law court may in its discretion pronounce to be a crime any act which is productive of great public mischief or grave moral scandal. In the Eng. law the traditional classification of crimes is into treason, felonies, and misdemeanours. They are also classified according as they are punishable: (1) On indictment or information, or (2) on summary conviction before a justice or justices of the peace without the intervention of a jury. A broad classification is frequently made between crimes and offences, the latter embracing non-indictable wrongs punishable either summarily or by the infliction of a penalty, the former being restricted to acts punishable on indictment; but otherwise the two terms are interchangeable. All treasons, felonies, misdemeanours, imprisonments (*q.v.*) of treason or felony, and attempts to commit any of these crimes, are indictable. In general, it may be said that felonies comprise the more serious, and misdemeanours the less serious, crimes. The distinction, however, is merely historical, a felony (literally the price of a fief) in feudal times signifying any offence which was visited with forfeiture by the accused of his fief or land to the lord of the fee. Later the term was applied also to acts which resulted in forfeiture of goods. In Blackstone's time capital punishment (*q.v.*) usually followed on a conviction for felony, except in cases of petty larceny or wounding. An act is also a felony where so described by the statute creating the offence, but most felonies are so at common law. Felonies and misdemeanours differ mainly in respect of their consequences: a suspected felon may be arrested without a warrant under certain conditions, but not so a misdemeanant;

misdeameours are triable upon indictment, inquisition or information, but felonies are not triable on information; in the case of felonies the person aggrieved should vindicate the public wrong by prosecuting the felon before beginning any civil action that may be open to him, but in misdeameours there is no such obligation on him; and a person charged with misdeameour may be released on bail (*q.v.*), but not so a person accused of felony. The distinction between felony and misdeameour is unknown in the C. L. of Scotland. It is a rule of the Eng. C. L. that no one is a criminal unless he has a guilty mind (*nemo est reus nisi mens sit rea*). Motive is immaterial. Criminal intention, a guilty mind, and malice are all synonymous in C. L., and indicate, not ill-will against a particular person, but that a wrongful act has been done intentionally and without just cause or excuse. Malice is an essential element except where an act is expressly declared to be criminal without proof of guilty intention. These exceptions comprise mainly public nuisances, cases of adulteration of tobacco, adulteration of food and drugs, offences against the Merchandise Marks Acts, and offences relating to the sale of intoxicating liquors. Such acts can hardly be called criminal in the truest sense, but they are criminally punishable on grounds of public policy.

An attempt to commit a crime is punishable if the act done is a sufficient indication of the intention to commit the full offence. No person may be excused for a criminal act unless he can be presumed not to have realised the consequences of what he was doing. Infants under seven years of age are presumed to be absolutely incapable of crime. Children between seven and fourteen years of age are only punishable for a crime where there is evidence of guilty knowledge or mischievous discretion. Hales's *Pleas of the Crown* records the fact that a boy of ten was hanged for murder (Spigurnel's case). Insanity, like infancy, is deemed incompatible with criminal responsibility, but the presumption of sanity is only rebuttable by proof that the accused at the time of committing the act was labouring under such a defect of reason, from disease of the mind, as not to know the nature and quality of the act he was doing, or if he did know it, that he did not know he was doing what was wrong (*see CRIMINOLOGY*). Where the insanity is partial, *i.e.* where the delusions extend to one or more matters only, the test of responsibility depends on whether, assuming the facts to be as the accused in his delusion supposed them, the act was nevertheless contrary to the law, and also whether the accused knew the act was contrary to the law. Drunkenness is no excuse for crime, although it may be taken into account in considering the motive or intent with which the accused committed the act; and chronic drunkenness, resulting in a degree of madness temporary or permanent, may render the accused criminally irresponsible. But though insanity, whether caused by

drunkenness or otherwise, is a good defence, the test of criminal responsibility in the case of drunkenness is not the same as for insanity, and where the defence sets up only drunkenness and not insanity, the judge will not direct the jury on the question whether, even if the prisoner knew what he was about, he knew that he was acting unlawfully. The House of Lords confirmed these principles in a general review of the case-law on the subject in the case of *R. v. Beard* in 1920 and also laid it down that evidence of drunkenness which makes the prisoner incapable of forming the specific intent essential as an ingredient in the crime with which he is charged should be considered together with the other facts proved so as to determine whether he had such intent. Ignorance of the C. L. is no excuse for a crime. A bona fide mistake of fact will excuse if the original intention was lawful. In many cases of felony, if a wife commits the crime in the presence of her husband, the law presumes that she acts under his coercion. The presumption is rebuttable on proof that she was the leading spirit in the transaction. The law is uncertain in the case of a married woman's misdeameours, but the general tendency now is to apply the same rule as in felonies. Persons committing acts otherwise criminal, under the physical compulsion of another, or as a consequence of terror greater than that inspired by the law, are, in general, irresponsible for such acts. An accessory before the fact is one who, though absent at the time of the felony committed, yet procures, consents, commands, or abets another to commit a felony. There can be no accessories in treason or misdeameour, all persons participating being prin. offenders. An accessory after the fact is one who, knowing a felony has been committed by another, receives, relieves, comforts, or assists the felon (*see BREACH*). Crimes are generally classified as follows: (1) Offences of a public nature, including (a) crimes against the sovereign and the gov., *e.g.* treason, sedition, and coinage offences; (b) against religion, *e.g.* blasphemy (*q.v.*); (c) against public justice, *e.g.* perjury, champerty (*q.v.*), maintenance (*q.v.*), breach of prison (*see BREACH*), and compounding (*q.v.*) offences; (d) against the public peace, *e.g.* riots, libels, challenge to fight; (e) against public trade, morals, health, and good order, *e.g.* smuggling, bigamy, indecency, adulteration, and keeping gaming houses; (2) offences against the persons or property of individuals, including, as to the person, murder and manslaughter, rape and offences under the Criminal Law Amendment Act, 1885, concealment of birth, and assaults of various kinds; and, as to property, arson, burglary, embezzlement, forgery, housebreaking, larceny, obtaining by false pretences and receiving stolen goods. The Prevention of Crime Act, 1908, provided that a person who was convicted of being an 'habitual criminal' might be sentenced to a term of not more than six years' preventive detention in addition to the sentence for the crime

wherewith he was then charged. It is difficult to say how far this Act, during its forty years' duration, was effective in the prevention of crime, but the opinion gradually prevailed that what was wanted was not so much detention as corrective training. Hence the Act was repealed by the analogous provisions on 'persistent offenders' of the Criminal Justice Act, 1948. These provide that where a person not under twenty-one is convicted on indictment of an offence punishable with two or more years' imprisonment, and has been twice previously convicted since he attained seventeen years of age of offences similarly punishable, the court may, with a view to his reformation and the prevention of crime, in lieu of any other sentence, pass a sentence of corrective training for not less than two nor more than four years. This term of training is to be followed by a period of supervision if the offender is released before the expiration of his sentence. If the persistent offender is not less than thirty and has been convicted on indictment on at least three previous occasions since seventeen years of age, and was on at least two of those occasions sentenced to Borstal training, imprisonment, or corrective training, the court may sentence him to a term of preventive detention of not less than five nor more than fourteen years. Besides capital punishment (*q.v.*), which may be awarded only in cases of high treason, murder, piracy with violence, and setting fire to his majesty's ships, dockyards, etc., punishment in England may consist of penal servitude for not less than three years, imprisonment with or without hard labour for not more than two years, and fines. No court may pass a sentence of whipping, but under the prison rules made under the Criminal Justice Act, 1948, a male prisoner may be awarded by a visiting committee eighteen strokes (twelve if he is under twenty-one) of a cat-o'-nine-tails or birch rod for mutiny, incitement to mutiny, or gross personal violence to a prison officer. Children under seventeen may be sent to an approved school (see CHILDREN ACTS). Since the passing of the Criminal Appeal Act, 1907, a person convicted of an offence may appeal against either his conviction or his sentence, or both, whether in a question of fact or law, or both (see CROWN CASES RESERVED, COURT FOR; CRIMINAL APPEAL, COURTOFF). The Crown, through the home secretary, may exercise the prerogative of pardon, or reprieve a person convicted of murder by commuting the death sentence for a term of imprisonment. Courts of criminal jurisdiction in England include the central criminal court (*q.v.*), assize courts, co. or quarter sessions (see COUNTY SESSIONS), and petty sessional courts. The king's bench div. has jurisdiction in all crimes, but rarely exercises it. Parliament is a high court for certain trials, the proceedings being either by impeachment or, in the case of trial of a peer, by indictment before the House of Lords. The Scots C. L. in its essentials closely approximates to the Eng., such differences as exist

being mainly in the terminology which is borrowed directly from the civil law (*q.v.*), although often applied with a different shade of meaning, e.g. criminal intent or malice is known as *dole* (Lat. *dolus*, fraud, deceit); and small petty offences were generally called *delicts*. By the Scots law no private party except the person injured or his next of kin can accuse criminally; and to enable him to do so he is required to apply to the Lord Advocate to obtain his concurrence to the prosecution with a right of appeal to the High Court of Justiciary in case of the Lord Advocate's refusal.

The present century has seen changes in the law which have much altered the nature of criminal trials. The most significant Acts in this respect have been the Criminal Evidence Act, 1898, which enabled any person being tried on a criminal charge to give evidence upon his own behalf (besides allowing the accused's wife or husband to give evidence); the Criminal Appeal Act, 1907, which allowed appeals not only on points of law but on the facts (*cf.* BERK, ADOLF); and the Indictments Act, 1915, which revolutionised the form of indictments, simplified the procedure in many respects, and rendered unnecessary or even obsolete a mass of technical learning which had rendered the C. L. the most complex and difficult of all the branches of our law. The attitude of our courts towards the criminal has changed in correspondence with the change in the appearance, methods, and numbers of the criminal. Thus a modern criminal rarely has a long list of previous convictions recorded against him. Often too he has a substantial business, which to all outward appearance is honestly conducted. Modern judges are not necessarily disposed to assume that a man is honest because he has never actually been charged or convicted of dishonesty; nor do they assume that a man is incapable of committing a sexual crime because the police know nothing against him. Again, the armed burglar is obsolete, and has been replaced by the slim, athletic cat-burglar, who can climb a drainpipe with consummate ease and remove a pane of glass without noise. It is in regard to his weak associates that the attitude of the courts has changed completely—i.e. the type of weak youth to whom the cat-burglar or other criminal poses as a hero who can outwit the police and live a life of luxury without working. Mr. Justice Humphreys believes there is general acceptance for the proposition that a first offender, especially if young, should only be imprisoned if his crime is of the kind which demands punishment by way of deterrent to others. From a pamphlet entitled *Prisons and Borstals*, issued by the Home Office in 1945, it is evident that the authorities wished if possible to improve the prison system and to secure the right means of reforming youthful law-breakers, and these objectives found expression in the new Criminal Justice Act, 1948 (see below). As regards the

Criminal Appeal Act, the main objects in the minds of those responsible for the passing of the Act were (i) to give every person convicted on indictment the right to have any point of law arising during the trial considered by the court of appeal; (ii) to enable that court to revise sentences, the inequality and severity of which had become notorious. Two recent lord chief justices have frequently averred that appeals upon so-called points of law are in an increasing number of cases frivolous and an abuse of the process of the court, and indeed successful appeals against conviction number no more than about 4 per cent of the applications sent in. But the court has undoubtedly been useful in the direction of standardising sentences and 'the fact that there was a court to which a convicted person might appeal against a sentence has undoubtedly tended to make some trial judges, burning with indignation at the misdeeds of some miscreant, pause before translating into terms of imprisonment or penal servitude all the anger they may feel' (*Criminal Days*, by Mr. Justice Humphreys, 1946).

The Gov.'s Criminal Justice Bill, pub. in Nov. 1938, proposed drastic reform in the Brit. penal system, a further humanising of prison life, and a number of new methods of dealing with juvenile and adolescent offenders without recourse to imprisonment. Under this Bill corporal punishment would have been abolished, except for mutiny and gross assault in prison. The clause abolishing corporal punishment for all offences except assaults on prison warders was carried in March 1939, in the Standing Committee of the House of Commons which had the Bill under consideration. But in Nov. 1939 the Bill was abandoned, subject to the possibility of its being reconsidered if more opportune circumstances arose.

A new Bill was introduced by Mr. Attlee's Labour Gov. in 1947 and received the royal assent in the following year. This, the Criminal Justice Act, 1948, makes some important changes in the administration of justice, to come into operation on such dates as may be appointed by Order in Council, and large sections of the Act came into operation on Dec. 27 (1948). Sections 1 and 2 abolish penal servitude, hard labour prison div., and sentence of whipping, but they are not yet operative. On the second reading of the Bill in Nov. (1947) the gov. intimated that they could not regard the time as opportune to include in it provision for the suspension or abolition of the death penalty. A number of members were in favour of abolition, but statistics showing an appreciable increase in Cs. involving violence in the years between 1938 and 1946, and also an increase in trials for burglary, house-breaking, and shop-breaking, determined the gov.'s attitude on the question. Hitherto it had been unusual for criminals engaged in these Cs. to carry lethal weapons, particularly fire-arms, but since the Second World War there has been evidence of a regrettable change in this respect. Among the things to be considered was whether old offen-

ders, who might expect a heavy sentence for such Cs., would be tempted to arm themselves if they ran no risk of losing their lives on conviction of a murder perpetrated during the commission of, or issuing from, a criminal enterprise. The Act also amends the law relating to the probation of offenders and provides new methods of dealing with persons liable to imprisonment; amends the law relating to the proceedings of criminal courts, including the law relating to evidence—the Act making some advance in providing for greater use of written evidence as distinct from spoken evidence; abolishes privilege of peerage in criminal proceedings; and regulates the management of prisons and other institutions and the treatment of offenders and other persons committed to custody. Where a court before which a person is convicted of an offence (not being an offence the sentence for which is fixed by law) is of opinion that, having regard to the nature of the offence and the character of the offender, it is expedient to do so, the court may, instead of sentencing him, make a probation order, that is, an order requiring him to be under the supervision of a probation officer for not less than one year nor more than three years. This part of the Act contemplates a substantial extension of the probation hostel or home and, generally, provides for inclusion in the probation order of requirements relating to the residence of the offender, the guiding consideration being his home surroundings. Where the court is satisfied that the mental condition of an offender is such as requires and as may be susceptible to treatment but is not such as to justify his being certified as a person of unsound mind under the Lunacy Act, 1890, or as a defective under the Mental Deficiency Act, 1913, the court may include in the probation order a requirement that the offender shall submit to treatment either as a voluntary patient in a hospital, nursing home, or other approved place, or as a resident patient in an institution approved by the minister of health, or as a non-resident patient at such an institution, or treatment under the direction of a duly qualified medical practitioner as may be specified in the order. But a probationer who is required to submit to treatment for his mental condition will not be treated as having failed to comply with that requirement on the ground only that he has refused to undergo any surgical, electrical, or other treatment if, in the opinion of the court, his refusal was reasonable having regard to all the circumstances. Non-compliance with the requirements of a probation order involves the offender being dealt with by a court in any manner in which it could have dealt with him if it had just convicted him of that offence; or, in the case of young offenders, being required to attend an 'attendance centre' for a specified number of hours. The Act, while not limiting the power of the courts in dealing, within the maximum penalties laid down for various types of offences, severely with an offender when severity is required, maintains a range of treatment

available to the courts in dealing with offenders. This is especially exemplified in the new provisions respecting young offenders. Sentence of death may not be pronounced on or recorded against a person convicted of an offence if it appears to the court that at the time when the offence was committed he was under the age of eighteen years; but, in lieu of such sentence, the court shall sentence him to be detained during the king's pleasure. A court of summary jurisdiction may not impose imprisonment on a person under seventeen years of age, and a court of assize or quarter sessions may not impose imprisonment on a person under fifteen years of age; and no court may impose imprisonment on a person under twenty-one years of age unless the court is of opinion that no other method of dealing with him is appropriate. The alternatives to imprisonment are probation orders, detention in a detention centre, and training at a Borstal institution, but a court may not order a person to be detained in a detention centre if he has previously been sentenced to imprisonment or Borstal training, or if he is not less than seventeen years of age, and has previously been ordered to be so detained since reaching that age. A court of summary jurisdiction inflicting imprisonment on a person between seventeen and twenty-one must state and enter in the court register the reason it has formed the opinion that no other method of dealing with the offender is appropriate. The Act contemplates that a young offender discharged from prison shall be under adequate supervision to help him in rehabilitation and to reinforce and inspire his own efforts to avoid temptation to a life of crime. The Act therefore provides that offenders under twenty-one, sentenced to twelve months' imprisonment or more, shall, in approved cases, be licensed at the time when ordinarily due to discharge as remission for good conduct. The licence contains conditions requiring supervision, and the offender for the remainder of the period is liable to recall. Some important changes are made in Borstal training. The age limit is fixed at twenty-one and the Act also widens the qualification for Borstal training by empowering the court to order it, if satisfied of its expediency having regard to character, previous conduct, and circumstances of the offence. This enables assizes and quarter sessions to impose Borstal training in the light of all information on the offenders and offences. The actual period of detention in a Borstal institution may not exceed three years nor be less than twelve months. The Act abolishes the right of peremptory challenge of jurors which, however, was an obsolete right practically never exercised. But an accused person retains the right to challenge a juror 'on cause shown,' which affords considerable protection.

See J. F. Stephen, *Digest of Criminal Law*, 1877, 1926, and *History of the Criminal Law of England*, 1883; S. F. Harris, *The Principles and Practice of the Criminal Law*, 1899, 1936; C. S. Kenny,

Outlines of Criminal Law, 1902, 1936; P. Howard, *Criminal Justice in England*, 1931; A. M. Wilshire, *Elements of Criminal Law and Procedure*, 1933; and H. Mannheim, *The Dilemma of Penal Reform*, 1939.

United States.—The principles underlying the C. L. of the U.S.A. are those of the Eng. common law. Most of the maxims familiar to the student of Eng. C. L. obtain in the Amer. system, e.g. the maxim, *neminem ignorantia eorum que quis scire tenetur excusat*, i.e. every person is bound and is presumed to know the law at his peril. The C. L., whether common or statute, is imperative with reference to the conduct of individuals; so that where a statute forbids or commands anything to be done, any act of omission or commission contrary to the prohibition or command is an offence at common law and indictable in the U.S.A. as in England. An offence which may be the subject of criminal procedure is defined in the classic Amer. authorities as an act committed or omitted in violation of a public law either forbidding or commanding it (114 U.S. 677). As respects the sources of Amer. C. L., it is an accepted principle that when a statute punishes a crime by its legal designation, without enumerating the acts which constitute it, then it is necessary to resort to the common law for a definition of the crime with its distinctions and qualifications; hence if an act is made criminal, but no mode of prosecution is directed or no punishment provided, the common law comes into operation, prescribing the mode by prosecution or by indictment. This is the common law of England, but might now be properly called the common law of the U.S.A. (Baldwin's *Century Edition of Bouvier's Law Dictionary*, 1926). Many if not all the cardinal principles of the Eng. and Amer. systems of C. L. are identical, e.g. that every one is presumed to be innocent till the contrary is shown; that the question of guilt is to be determined without reference to a prisoner's general character; that the prisoner cannot be required to criminate himself; but this principle is subject to the position that where the prisoner testifies in his own behalf he may be cross-examined like any other witness, just as in Eng. criminal procedure under the Criminal Evidence Act, 1898. Though the states owe their law to the one common source, the common law of England, it cannot be said that one *corpus juris* of C. L. prevails in the U.S.A. as a whole; for in the administration of the C. L. each state has its exclusive jurisdiction as a sovereign independent community; each with its own judges and its own separate procedure, subject always to the overriding restrictions imposed by the Amer. Constitution. As in England, the dividing line between felonies and misdemeanours prevails, but by the operation of statute law it occasionally happens that a crime may be a felony in one state and a misdemeanour in another; but generally the more serious crimes are felonies. In state codes or systems of C. L. crimes are further divided into the usual categories of crimes against

the person and against property, other main categories being crimes against the public peace (e.g. riots), against trade (e.g. offences against the customs laws), against decency, against the law of nations (e.g. piracy). In murder, unlike the simplicity of the Eng. common law definition, there are various 'degrees' of culpable homicide (see *under MURDER*); while as regards treason, the sole kinds recognised in the U.S.A. are levying war against the State or adhering to its enemies. As to the ingredients of any particular crime, the general principles are the same in the U.S.A. and for the different states as in other matured legal systems; and the same observation applies to the analysis of criminal responsibility, e.g. the rule in *McNaughten's case* on insanity as a defence (see *McNAUGHTEN'S CASE*), and again as to the validity or otherwise of drunkenness as a defence. In one vital particular criminal procedure in the U.S.A. is in advance of Eng. procedure in that in a prosecution for a crime in which there is no question of vindicating the public wrong proceedings are initiated by a state official, variously styled the State attorney or dist. attorney, who takes the place of the private prosecutor in England. The summary jurisdiction in the U.S.A. follows much the same course as in England, and similarly all the stages of procedure from grand to petty jury. Again as in England, there are juvenile courts for the trial or correction of young children or young persons. As regards appeal the accused can, in all the states, petition the trial court for a new trial, which, however, will be granted only if the court thinks the conviction cannot stand in law. Generally, too, the accused may appeal to a court of higher instance both on a question of law and on a question of fact; but there is this cardinal difference from the practice that prevails in the Eng. court of criminal appeal, that the Amer. court cannot hear new evidence nor vary the sentence, but is restricted to either quashing the conviction or remitting the case for re-trial. See R. Pound, *Criminal Justice in America*, 1930; S. S. and Glueck, *Crime and Justice*, 1930.

Criminology is that part of sociology which relates to the morbid psychology of criminals. It is now generally termed criminal anthropology. It investigates the physical and psychical peculiarities observable in criminals, and the practical results of this more searching inquiry into the genesis of crime are to be seen in the changed methods of prison discipline, the careful treatment of juvenile criminals, and the preventive detention of habitual criminals (see *CRIMINAL LAW*). The science of C. is comparatively new, and the impetus given to its study is due to the work of Lombroso. It is true that long before Lombroso produced his celebrated and highly controversial *L'uomo delinquente* some form of classification of criminals had been attempted, various definitions of moral insanity propounded, and a greater measure of sympathetic consideration given to the life of a criminal

than when most crimes were punishable by death and imprisonment. But there was a want of precision in thought and much misleading generalisation. Attention was directed solely to theories of punishment. Without inquiry into the pathology of crime it seems merely to have been assumed that the criminal in some manner ill defined was to be 'improved' at all costs; with that philanthropic object in view treatment began, as it were, at the wrong end; societies influenced by the work of Howard sentimentalising over the hard lot of the prisoner and expending every effort in making prison life as comfortable as circumstances would permit. Something in the nature of a moral astringent was required if social reform in this direction was to be more than a name; and such a healthy corrective was more than forthcoming in the teaching of Lombroso. Having for a considerable time closely examined all classes of criminals, Lombroso in 1876 pub. his remarkable work setting forth the theory of the existence of an unmistakable criminal type: a type of congenital criminal whose instinctive propensity to criminal habits was easily discernible by various peculiarities of physiognomy and physical conformation. Broadly speaking, criminologists of the Lombroso school infer the following physical characteristics *inter alia* among criminals generally, although not all are displayed by the same individual. Thieves have small and murderers large heads. The shape of the head is remarkable for abnormality or irregularity. Defective conditions often occur in the cerebral region. The lower part of the face has a heavy appearance, the weight of the lower jaw being much above the average, and the forehead is receding. The ears are large, prominent, and outstanding, with other abnormalities. Wrinkles are strongly marked, and occur frequently in the young. Left-handedness is common, and not infrequently criminals are ambidextrous. The respiratory apparatus is deficient; pigeon-breasts, imperfectly developed chests, and stooping shoulders are common. Swindlers were noted to possess much greater sensibility than either murderers or thieves. There is also obtuseness in the sense of taste, especially among women. Sexual precocity in all forms is excessive. Alcoholism in either of the parents was found to be frequently associated with criminality in the offspring. The psychical peculiarities observed by criminologists include some very remarkable emotional characteristics. Their morbid vanity was very marked, a fact which accounts for an otherwise inexplicable omission to take proper precautions against leaving clues. Capital trials have an irresistible attraction for many criminals. Intemperate and gambling habits are frequent—indeed, form a stimulus to wake them from an habitual lethargy; but criminals are also capable of short periods of great activity. Lombroso noted that some were remarkable for spontaneous outbursts of excitability.

These views have by no means found

universal favour. One objection is that the above peculiarities may often be observed in perfectly honest and kindly people. There is some ground, too, for supposing that Lombroso was generalising from a few particular instances. In England there was a small group colloquially termed the 'mad doctors' who supported the criminal anthropologist school; but for the most part the safer doctrine of responsibility for crime is embraced. It may be doubted, however, whether Lombroso's theory of irresponsibility implies insanity in the generally accepted senses of that word. On the contrary, most criminologists, in classifying criminals and enumerating their physical and psychological characteristics or abnormalities, draw a clear distinction between the insane criminal and those not insane. Lombroso himself, however, was strongly opposed to any undue leniency of treatment. Logically, however, if Lombroso's theory of instinctive criminality be true, no theory of punishment can be justified that aims at retribution or vindication, for a man can hardly be held responsible for acts he cannot help committing. The older school of mental pathologists generally classed the congenitally criminal among the morally insane. Dr. Pritchard defined moral insanity as consisting in a morbid perversion of the natural feelings, affections, inclinations, temper, habits, and moral dispositions, without any notable lesion of the intellect, or knowing and reasoning faculties, and particularly without any maniacal hallucinations; and observed that no such disorder had been recognised in the Eng. courts of judicature, or even admitted in general by Eng. medical writers. Medicine and law have ever been at variance over theories of responsibility, and nowhere does this variance become wider than in the different views of the moral effect of delusions. Medicine, it may be said, generally adopts the view that a single delusion implies a disease of the brain in its entirety; the law abstains from any such pathological inquiry and imputes criminal responsibility wherever it can prove, not an abstract conception of right from wrong, but the capacity of knowing right from wrong with reference to the circumstances of any particular case (see CRIMINAL LAW). The term moral insanity is not always used in the same sense by the authorities. Dr. Hack Tuke calls it emotional insanity, and refers to an exalted form of it which tends to pass into delusional insanity, and other forms which assume a destructive character, such as homicidal mania. But he observes that it is popularly employed by medical men in the limited sense of perversion of the moral nature by disease or defect without intellectual disturbance and without any necessary association with irresistible impulses; the 'ego being perverted through an abnormal condition of the cerebral organisation, constitutional or acquired.' In this limited sense the morally insane stand in the unfortunate position that the weight of medical opinion imputes disease in

some shape or form, while the law, looking solely to the assumed unimpaired state of the intellectual faculties, imputes responsibility. There is, however, a considerable amount of latent ambiguity in the adopted classifications of criminals. Lombroso's *delinquente nato*, or congenital criminal, on any classification of criminals, forms but a small proportion of the aggregate of criminals or criminal types, although it seems doubtful whether he did not include under one comprehensive type—instinctive criminal—all who displayed in varying degrees some or most of the physical and psychological characteristics above enumerated. Havelock Ellis points out that the instinctive criminals do, however, constitute the most serious part of the prison pop., in that they reveal criminality in its most emphatic shape, and present those signs of abnormality, degeneracy, or disease, physical and psychological, which are to be found in a less well-marked form in other types or classes of criminals. These other types or classes are somewhat loosely and unscientifically classified into (a) criminals by passion, (b) occasional criminals, (c) habitual or professional criminals, (d) insane criminals. This so-called clinical classification is faulty, in that it co-ordinates types evolved from subjective considerations with classes that appear to be types of criminals by reason only of the objective consideration that they happen to commit a criminal act. Moreover, although in fact most of these classes display in more or less strongly marked form the physical and psychological peculiarities already enumerated, it has to be conceded that the person who commits what in Fr. law is called a *crime passionnel*, is not usually characterised by any abnormality or degeneracy. Again, no better reason for the inclusion of the 'occasional' criminal can be offered than that he betrays an inability to resist any opportunity of crime that presents itself. The habitual or professional criminals are by Prof. Enrico Ferri divided into two classes, the weaker and degenerate who commit crime helplessly, and the more strictly professional criminal who deliberately follows a career of crime and shirks no difficulties afforded by hazardous enterprises. These, it is conceded, do not usually show any marked physical or psychological abnormality. The obvious commentary on the attempt to relate, more or less closely, all or most classes of criminals to types of specified abnormal peculiarities is that the criminologists, having found an undoubted type in the morally insane exhibiting in a well-marked degree peculiarities of character and anatomy, attempt to fasten such peculiarities in greater or less degree upon all who happen to commit a crime. The last class—the insane—comprises those whose intellectual faculties are unquestionably impaired. Insanity in the technical sense according to Esquirol, and most subsequent writers, comprises mania where hallucination extends to all manner of objects, monomania where it is confined to one or a small number of objects, dementia where the subject is

rendered incapable of reasoning in consequence of some functional cerebral disorder not congenital, and idiotism connoting a congenital malformation in the brain. Even the law must exculpate those falling within the above classes who commit crime except, in the case of the monomaniac, where a particular knowledge of right and wrong is believed to be capable of proof. The exclusion of by far the greater number of the prison pop. from any conclusive suspicion of abnormality—especially the habitual or professional criminal—suggests the natural inference that there is no truly instinctive criminal type at all. In fact, the value of cranial measurements, etc., depends on the recognition that these abnormalities are the result rather than the cause of moral delinquency. The chief glory of Lombroso and his school, however, is their insistence that C. must concern itself with the individual. Their study of the biological and social cause of criminality lifted C. out of the traditions of the classical school which treated crime as something to be analysed only from the point of view of the penologist, and C. became instead a positive social science.

By an extension and not a refutation of Lombroso's work, Garofalo, Lombroso's great successor, and other criminologists of the modern positive school examine not only the physiology, but especially the mind and the psychic impulses of the criminal. They are concerned above all with the underlying motive of criminality, and they discover it in the mental and emotional condition of the criminal. It is shown that there is no sharp distinction between sanity and insanity, and as a result of the researches of Freud (*q.v.*) and his followers the hypothesis of the unconscious mind is well estab. The causation of a criminal act can be traced back through the unconscious by the psycho-analytic method which Freud initiated. The morally insane criminal becomes therefore more answerable for his acts and yet at the same time less responsible, as his real motives often lie outside his consciousness. But psychological C. dismisses any theory of punishment and is not concerned with retribution. The aim of psycho-analysis is therapeutic, and for this reason one branch of C. extends beyond the identification and capture of the criminal to the treatment of him in detention. The criminal is regarded as having a defective sense of citizenship, and it becomes the business of prison authorities aided by a psychiatrist to cure this defect. This theory of punishment is extended to include even murderers. The conviction seems to grow ever stronger that poverty or other adverse environment has far more to do with habitual crime than innate propensity, and to that end punishment is directed ever further along the lines of correction or reformation, and even further removed from the traditions of a *lex talionis*, or any other form of punishment, the dominant element of which is retribution.

Page, *Crime and the Community*, 1938; and M. A. Elliott and F. E. Merrill, *Social Disorganisation*, 1941.

Crimmitschau, see KRIMMITSCHAU.

CRINOLINE

Early nineteenth century.

Crimp, one who decoys men into the naval or military (but especially naval) service. Apparently, the usual method employed is to ply a man with drink and then induce him to sign articles of service. Section 111 of the Merchant Shipping Act, 1894, provides that only a person who holds a licence from the Board of Trade, or who is the owner or master or mate of a ship, or is the servant and in the constant employment of the owner of a ship, or is a superintendent, may engage a seaman to be entered on board any ship in the United Kingdom. There is a further provision that no one may receive any seaman to be so entered if he knows that the seaman has been engaged in contravention of the Act. The penalty is a fine not exceeding £5 for each offence.

Crinan Canal, Argyllshire, Scotland. It connects C. Loch with Jura Sound at Ardrishaig. It is about 9 m. long and 24 ft. broad, and its construction was completed in 1801.

Crinoidea, see ENCRINITES.

Crinoidea (Gk. *κρίνον*, lily; *ἴδωρ*, form), beautiful class of pelmatozoan echinoderms containing about 400 living species and many fossil forms; the extinct crinoids are usually spoken of as stone-lilies, and the existing species as sea-lilies. In general structure they resemble other echinoderms, such as the star-

fishes, but they have many features peculiar to themselves. Some of the best-known species are *Anledon* (or *Comatula*) *rosacea*, the feather-star, *Rhizocrinus lofolensis*, which occurs at great depths of the Atlantic, and *Pentacrinus aserius*, which is found in the Pacific.

Crinoline (Lat. *crinis*, hair; *linum*, flax, linen), name given to a stiff horsehair fabric formerly used to distend women's skirts. A wired structure worn beneath the gown to widen the garment at the hem was also called a C. The name is also often applied alike to the Elizabethan farthingale (*q.v.*), the later hooped petticoat used in the eighteenth century, and to the nineteenth-century bustle with a petticoat four or more yards wide at the hem. The hoop was first made of wood, then of whalebone or steel. About the year 1866 people began to see the absurdity of the fashion and its popularity declined rapidly from that time. In millinery, a material made of cotton gauze dressed with glue and used for manufacturing hats, is known as C.

Crinum, genus of Amaryllidaceae, contains nearly one hundred handsome plants, many of which form the greatest ornaments of our gardens. They are naturally tropical and subtropical, but they will grow well in England. *C. asiaticum*, the poison bulb, is a native of the E. Indies; its bulbs are powerfully emetic and are used in Hindustan to produce vomiting when poison has been taken. *C. amabile* is another beautiful native of the E. Indies.

Cripple Creek, co. tn. of Teller co., Colorado, U.S.A. It lies on the Midland Terminal railway and also on the Florence and Cripple Creek railway. This tn., which stands at an elevation of 9800 ft., is the centre of a large gold-mining dist. which has developed very much of late years and includes other tns. which are situated near to C. C., among them the tn. of Victor. Pop. 1400.

Cripples. Where crippling has not been caused by accident or as an effect of war, it usually has its origin in poliomyelitis or infantile paralysis. In tuberculosis, or in some congenital disease. Welfare centres and clinics deal to a certain extent with the infant cripples, but it is not until they have attained school age that crippled children receive due care.

In 1890 Mrs. Humphry Ward made provision for C. in her settlement in Tavistock Place, London, being a pioneer in this matter. Good work was later performed by Mrs. Grace Kimmins, wife of a late chief inspector of the L.C.C. Education Dept. As founder of the Heritage Schools of Arts and Crafts for Crippled Boys and Girls (1904) at Chalvey, Sussex, she trained thousands of children from three to sixteen years of age to become self-reliant citizens, in many cases able to earn their own livelihood by such work as cabinet-making, tailoring, shoe-making, or embroidery. In 1908 the Lord Mayor Treloar Cripples' Hospital and College was founded by Sir Wm. Treloar at Alton and Hayling Is., to afford curative treatment for children up to

twelve years of age suffering from tuberculous diseases of bones or joints, and technical education for boys from fourteen to eighteen years of age. The C. home and industrial school at Winchmore Hill trains girls over eight years of age in dressmaking, while the Fine Needlework Association for Invalid Women and Girls, in Kensington, London, employs embroidresses and needleworkers above the age of fifteen years. The Stratford-on-Avon weaving school provides a means of whole or partial support for crippled girls. London, Bristol, Oswestry, and Pinner have all large orthopaedic hospitals, and the Invalid Children's Aid Association (1888), 117 Piccadilly, W., has branches throughout London to help the suffering children. In 1920 a bureau of information, the Central Council for the Care of C., was estab. at 117 Piccadilly. The L.C.C. provides fifteen scholarships yearly to crippled children between the ages of fourteen and seventeen years. In Great Britain, the Invalid Children's Aid Association and the Central Council for the Care of C. have had considerable influence on progress in local welfare. Educational and propaganda work is done by both societies to inspire practical efforts in solving problems relating to persons handicapped by physical defects. The aim of these societies is to secure co-operation for the estab. all over the kingdom of a central open-air hospital, supported by a chain of clinics. Since 1928 a number of new orthopaedic hospital schools have been estab. by the Central Council, which is now a federation of all orthopaedic interests, lay and medical, public and voluntary. See G. Girdleston, *The Care and Cure of Crippled Children*, 1925; Central Council for Care of C., *Handbook on the Welfare of Cripples*, 1937; and J. Colson, *The Rehabilitation of the Injured*, 1944.

Cripps, Sir Stafford (b. 1889), Eng. politician and lawyer, fourth son of Sir Alfred C., first Baron Parmoor—whom he followed into the ranks of Labour politicians: educated at Winchester and Univ. College, London. Studied first for the ministry but turned to the law. Called to the Bar, 1913, K.C., 1927, Fellow of Univ. College, 1930. Ed. legal works on compensation (as had his father before him) and on eccles. law. Treasurer of World Alliance for Promoting International Friendship through the Churches. Solicitor-general in the second Labour Gov., 1930-31. Elected Labour M.P. at E. Bristol by-election, 1931. Withdrew into opposition on the formation of the first National Gov. and from the Labour party's executive when the party supported economic sanctions against Italy. Recalled to the party's executive, he advocated a united front with the Communists, but this was rejected by the party conference of 1937. Later he began a campaign for a popular front composed of Labourites, Liberals, Communists, and Independent Conservatives, and was driven out of the Labour party, 1939; but on giving up the campaign he was readmitted. In May, 1940, it was

announced that he would lead a Brit. trade mission to Moscow in an attempt to find a basis of agreement between the Brit. and Soviet Govs. on economic questions, but the Soviet Gov. refused the offer. In June 1940 he was appointed Brit. ambas. to Moscow, staying in Moscow until 1942. In the same year he became lord privy seal and leader of the House of Commons. From 1942 to 1945 he was minister of aircraft production; and in the Labour Gov. which took office in that year was successively president of the Board of Trade, minister for economic affairs, and chancellor of the Exchequer. Pubs.: *Why this Socialism?* (1934); *The Struggle for Peace* (1936); *Democracy Up-to-Date* (1938); editor of *Cripps on Compensation* and of *Cripps on Church and Clergy*.

Crissa, see CRISSA.

Crises (commercial or financial). Broadly speaking a commercial crisis is due to an over-extension of national credit (*q.v.*). John Stuart Mill, in his analysis of the phenomena of a C., strikes the true note in the predisposing cause when he speaks of the inclination of the mercantile public to increase their demand for commodities by making use of all or much of their credit as a purchasing power in the hope of making a profit. Various theories have been propounded to account for the apparent periodicity of C., but in this connection this periodicity is only attained by co-ordinating both greater and lesser C., and by ignoring the fact that the greater scientific precision and prudence of modern commercial dealings tend to increase the intervals between commercial C. and to lessen their gravity. It seems unnecessary to look further for the psychological explanation of recurrent C. than in the facts of human nature itself. The desire to increase one's wealth by enormous profits on a comparatively small capital outlay is one which owes its origin and strength to the rise and development of joint stock companies. The public almost loses sight of the tremendous historical lesson of the S. Sea Bubble. A boom in a particular commodity will, if cleverly organised, attract public subscriptions to an almost unlimited extent, regardless of the facts of political economy. The strain on credit due to the over issue of paper money consequent on accommodation given by banking houses to such speculative companies soon leads to a reaction and a demand for the liquidation of liabilities in cash. Panic, however, in the sense of a run on banks is not fortunately a necessary corollary to a crisis. Public confidence in its credit may be restored by various means, such as the authorised issue by the Bank of England of notes for a lower amount or the suspension of the Bank Charter Act; and such steady influences have often operated to avert disaster. Apart from predisposing causes, a commercial crisis, according to Mill, appears to exhibit these phenomena: a great number of merchants and traders more or less simultaneously apprehend that they will have some difficulty in meeting their engagements,

owing to the recoil of prices after they have been raised by an intense spirit of speculation embracing many commodities.

The exciting cause of this spirit of speculation is to be found in some accident, such as the opening of a new foreign market, the promise of a new field of supply, to meet indications of a short supply of great articles of commerce. Prices rise and the holders of stock or shares realise, or appear to be able to realise, huge gains. Speculation, aggravated by the mushroom growth of rival concerns, goes far beyond what might have justified the original expectation of a rise of prices, and then extends itself to other articles. The prices of these latter rise like the other articles, involving a great extension of credit. People at once give as well as take credit more freely than in normal times. A reaction sets in and prices fall, not merely to a normal level, but far below, with the result that where before credit was practically illimitable, even firms of estab. repute are unable to obtain their customary credit. In extreme cases unreasonable panic may ensue, money being borrowed at exorbitant rates of interest, and sales of goods made for absurdly low cash payments. Mill points out that it is not universally true that the contraction of credit characteristic of a crisis must have been preceded by an irrational extension of it. The crisis of 1847, for example, was not caused in the manner above described, but by a combination of circumstances tending to reduce the available supply of capital in the loan market. Those circumstances were the high price of cotton and an unprecedented importation of food necessitating considerable foreign payments, the continual demands on circulating capital (*q.v.*) by railway calls, and the loan transactions of railway companies, for conversion into fixed capital. In the annals of our commercial hist. the crisis arising out of the failure of the S. Sea Company stands out as the greatest financial disaster of all. But the draining of the country's capital to carry on the war against the armies of the ambitious Louis XIV. crippled the national resources, and brought many of the richest families to absolute penury. This crisis was the more notable for the reason that it occasioned the rise of the Bank of England through the good offices of Paterson, who instituted its progenitor, the Bank of Issue, for the purpose of issuing notes covered (*see COVER*) by an equal amount of gov. securities. The whole banking system, indeed, springs from this source. Other 'bubble' companies there have been subsequently, but none to approach the S. Sea Company in magnitude of disastrous consequences. The crisis of 1826, which followed on over-speculation, was due primarily to the rapid increase of the number of banks, no vil. of any pretensions being without one. The accommodation in the way of discounts to small traders led to absolutely unrestricted issues of paper money in the country banks. The currency as a consequence became redundant, and the Bank of Eng-

land was unable to meet the heavy drain on its bullion when the country banks began to endeavour to resume cash payments. The result was a run on all the banks as soon as it was realised that they could obtain no accommodation in London.

There was a crisis in 1836, following on the collapse of abortive speculative schemes, with results nearly as disastrous as in 1825. The next crisis appears to have followed on the great railway mania in 1845. It is recorded that at this period the railways completed, in course of construction, or projected, represented 1263 companies, with a total capital invested of £113,612,018, and total liabilities £590,447,490. The damage to the public credit by this fever of speculation in railway schemes was further aggravated in 1847 by the failure of the potato crop in Ireland, which involved an estimated loss of some £13,000,000 sterling. The explosion of the ensuing speculation in Indian corn brought about a fall in price and the ruin of some eighteen colossal business houses of London and the provs., with liabilities exceeding £1,500,000. The next great crisis was in 1857, a serious feature being that up to this time C. seem generally to have followed one another at intervals of ten years. The crisis of 1857 was remarkable for the fall of the famous house of Overend, Gurney & Co., in consequence of suspicion breathed against its members in connection with certain shady transactions relative to the 'coal warrant swindles.' Their liabilities were over £11,000,000. Since this collapse the commercial world has been startled at intervals by sundry disasters, private failures, and the collapse of limited liability companies, e.g. the failure of the Royal Bank of Liverpool in 1867, and the City of Glasgow Bank in 1878.

A notable financial crisis in the U.S.A. occurred in 1907 and was followed by a Bill enabling banks to issue currency on security of other than gov. bonds. The failure of the Birkbeck Bank was redeemed by the fact that the society was able at once to pay 10s. in the £ and hold out hope of future payments. For some years before the outbreak of the First World War, academic discussions had taken place with regard to the adequacy of the gold reserve, and there were many who predicted that in the event of a sudden rush on the banks, gold reserves in the Bank of England would be insufficient to meet requirements. These prophets little realised the stern test to which the whole system of Brit. finance would be put by the events which followed so quickly upon the declaration of war by Great Britain on Aug. 4, 1914. The London Stock Exchange closed its doors on July 31; to have remained open longer would have been to invite disaster, as London would have been flooded with securities and the stock of Eng. gold would have been considerably diminished. The Bank of England became practically the only source from which money could be borrowed, and it was forced to raise its discount rate from 4 per cent to 8 per cent

on July 31, and to 10 per cent on Aug. 1. The bank holiday was extended by royal proclamation from Aug. 4 to Aug. 6. The Bank of England was indemnified by a letter from the gov. against liability for the issue of notes in excess of the limits imposed by the Act of 1844. This cover was, however, only necessary for a few days. The gov. decided to issue £1 and 10s. currency notes and an Act known as the Currency and Bank Notes Act was passed on Aug. 6, and currency notes were actually in use the next day (see under CURRENCY). By this timely measure the gold reserve was husbanded and the need for currency which had been felt during the extended bank holiday had been supplied. (On emergency measures taken in the United Kingdom to avoid a financial crisis see *Financial and Monetary Policy in Second World War* in article BANKS AND BANKING.) See Kirkaldy, *British Finance, 1914-21*; J.S. Mill, *Principles of Political Economy*; Burnley, *Romance of Modern Industry*; W. S. Churchill, *The Crises, 1931*; H. A. L. Fisher, *The Facts behind the Crises, 1931*; Lord Melchett, *Why the Crises?*, 1931; E. Cannan, *Economic Scarcities, 1933*; I. Fisher, *Booms and Depressions, 1933*; and G. Sloccombe, *Crises in Europe, 1934*.

Crispi, Francesco (1819-1901), It. statesman, one of the great founders of It. unity, was b. at Ribera in Sicily. He was an advocate at Naples when the Palermo revolt broke out in 1848. Taking a leading part in this, he had to escape to Piedmont, where he earned a scanty living as a journalist. Expelled in 1853 as a republican conspirator he fled to France, was again expelled, and joined Mazzini in London. In 1859 he returned to Sicily in disguise to foment rebellion against the Neapolitan Gov., and in 1860 assisted Garibaldi in the expedition which swept the Bourbons out of S. Italy. He was appointed to important posts, first in Sicily and afterwards in Naples, but when Victor Emmanuel's army arrived and the Two Sicilies were annexed, Garibaldi and C. found their occupations gone. The latter entered the Parliament at Turin, and distinguished himself as an ardent republican; but in 1864, recognising that only the monarchy could unify Italy, he became a supporter of Victor Emmanuel. In 1867, on the occasion of Garibaldi's rash attack on the papal states, C., foreseeing that the movement would certainly fail and injure the national cause, tried to check his former leader, but without success; the catastrophe came, and led to the retention of a Fr. garrison at Civita Vecchia. During the Franco-Ger. war, however, this was withdrawn and C. with other patriots practically forced the It. Gov. to occupy Rome. When the Liberals came into power (1876), C. became president of the Chamber, and in 1877 went on an important political mission to London, Paris, and Berlin, holding negotiations which prepared the way for the formal estab. of the new kingdom in 1878, when on the death of Victor Emmanuel of Savoy his son was crowned as Humbert I. of Italy. When

Pope Pius IX. *d.* in 1879 the Sacred College proposed holding their electoral conclave abroad, but C. persuaded them to remain in Rome, promising absolute freedom and protection, adding, however, that if they went the Vatican would be occupied by the state. They decided to remain, and a dangerous problem for the new kingdom was thus solved. Soon after this C.'s opponents brought against him a charge of bigamy, which, though not legally substantiated, as his first marriage was declared invalid, yet so affected his reputation that he was out of office for some years; but returning as premier in 1887, he took up a strong foreign policy, warmly promoting the views of the Triple Alliance, and treating France with decided coldness. His party was overthrown in 1891, but in 1894 he was again premier, and an anarchist attempt on his life told greatly in his favour; but in 1895 the terrible disaster of Adowa, where an It. army was annihilated by the Abyssinians, ruined his gov., and he never resumed office. An attack upon him for alleged misuse of public money failed; he resigned his seat for Palermo, but was re-elected by an immense majority. His eyesight, however, gave way, and he afterwards took little part in public affairs. He *d.* at Naples. See G. Salvemini, *La Politica Estera di Francesco Crispi*, 1919; and B. Croce, *Storia d'Italia, 1871-1915*, 1928.

Crispin, Saint and Martyr, lived during the third century. He, with his brother Crispianus, is said to have left Rome for Gaul, and to have carried on the trade of a shoemaker while there, thus becoming the patron saint of shoemakers. In 287 the two brothers were put to death, and their martyrdom is commemorated on Oct. 25.

Crissa, or Crisa, tn. of anct. Greece in Phocis, was situated S.W. of Delphi near Mt. Parnassus, remains of its old walls still being in existence. Some people have identified it with Cirrha, but the general opinion is that Cirrha was the port, although the two were intimately connected in anct. hist. Owing to large tolls having been levied on pilgrims visiting the oracle, war was declared by the Amphictyons at the beginning of the sixth century, and both tns. were taken.

Cristineaux, see CREES.

Cristofori, Cristofali, or Christofani, Bartolommeo (1655-1731), *b.* at Padua. He was a maker of harpsichords, and after carrying on his business in Padua for some time, was eventually asked by Ferdinando de' Medici to go to Florence, where he remained until his death. He was also the first one to employ 'hammers' in the mechanism of the piano.

Critchett, Richard Claude, see CARTON, R. C.

Criterion Theatre, London, was opened in 1874, and was originally joined to Messrs. Spiers & Pond's Hotel, being built underground. In 1875 Wyndham obtained a share in the management of the theatre. In 1884 it was re-opened under the management of Wyndham after having been reconstructed, *Brighton* and

The Candidate both proving successes. In 1886 Wyndham appeared with Miss Mary Moore in *David Garrick*, one of his greatest successes. After this old plays were revived, among them *Wild Oats*, *The School for Scandal*, *She Stoops to Conquer*, and *London Assurance*. Other plays: *Young Woodley*, by J. W. van Druten (1929), and plays by Terence Rattigan.

Critias, pupil of Socrates, but was not a follower of his doctrines, at any rate after he had passed from the sphere of Socrates' personal influence. In Athens he led the oligarchical party, and in 404 B.C. he was the chief one of the body known as the Thirty Tyrants, practising in that capacity many excesses and cruelties. In the same year, 404 B.C., he fell in the battle of Munychia, fighting against Thrasybulus. He was also a writer of poetry, and is said to have written a work on politics.

Critical Temperature, that temp. below which it is possible to liquefy a gas by applying pressure. The conditions which are necessary for the liquefaction of gases were discovered by Dr. Andrews in 1879. He discovered that below 31° C. carbon dioxide could be liquefied, but that above it no amount of pressure could produce this effect. Every substance has a definite C. T., associated with which is a definite pressure. For a long while oxygen, nitrogen, hydrogen, carbon monoxide, and marsh gas were known as the permanent gases, because their C. Ts. are so low that it is only within comparatively recent years that it has been possible to cool them below their C. Ts., and so to liquefy them, *e.g.* air must be cooled below -140° C. at a pressure of thirty-nine atmospheres, and hydrogen below -241° C. under fifteen atmospheres before they can be liquefied. All gases have now been liquefied, the most difficult to liquefy being helium.

Criticism, Biblical. A certain study of the sacred text has always existed, but the growth of biblical studies in the nineteenth century has led to a classification into two separate depts., which have been named (1) Lower or textual C. and (2) Higher C. It follows of necessity, from the variations found in the early scriptural texts, that the first people who made an effort to prepare an ed. of the O. and N. Ts. practised this art in some degree. The early Fathers may thus be termed textual critics, to a certain extent. In the last century however, such great strides have been made in this subject, that the term is generally reserved to the work of this period. The autographs of the scriptures are no longer extant, and in the various copies that remain there are many differences of text. These differences have arisen in various ways, some from the errors of copyists, some from the interpolation of glosses or marginal comments into the text. It is the work of the textual critic to collate all the texts at his disposal and all parallel documents which may throw light on the subject. From these he attempts to find out the original autograph readings. The field for the

N.T. C. is rendered the larger by the fact that a great number of MSS. have come down to us. The most useful text of the N.T. is E. Nestle's *Novum Testamentum Græce et Latine* (1906). The groundwork for this ed. had been laid by Westcott and Hort's excellent *New Testament in the Original Greek* (1881) and the text of Tischendorf.

(2) Higher C., on the other hand, deals not with establishing the text but, taking these studies as its point of departure, examines minutely internal evidence in order to reach conclusions on the date, authorship, and nature of the book, also external evidence in order to place the book in its historical setting. The higher critic must discuss the books of the Bible literally, historically, and theologically. A work of primary importance is the dating of the various writings, and the settlement of their authorship. This C. was first applied to the O.T. by Jean Astruc, a Fr. physician, whose work, entitled *Conjectures sur les mémoires originaux dont il paroît que Moïse s'est servi pour composer le livre de la Genèse*, was published in 1753 with some doubt by the devout Catholics, lest it should become an instrument in the hands of the freethinkers. In this work he points out the distinction between the two sources (Jahvistic and Elohist) of the book of Genesis, and his position has been supported and extended by modern critics. The next important name in O.T. C. is that of Eichhorn, who applied Astruc's system of examination to the rest of the Pentateuch. The introduction of these methods of historical study into the realms of sacred thought was viewed with horror by the ultra-orthodox, and vigorous attempts were made to stop it. Both sides tended to exaggerated claims. But after a century of controversy a middle position is establishing itself. Outside the Rom. Catholic Church the Mosiac authorship of the Pentateuch is generally abandoned, and Isaiah is believed to be the work of two or more independent writers. In N.T. C. the extreme radical views of certain Ger. and Dutch scholars have now been generally rejected, and although there is no sign of any return to the traditional idea of the verbal infallibility of the N.T. writers, the general historical accuracy of the synoptic gospels (i.e. Matthew, Mark, and Luke) is reaffirmed by the majority of competent critics. The historical character of the fourth gospel is still in dispute. The authenticity of the Pauline Epistles is accepted, with reservations in the case of Ephesians and the Pastoral Epistles.

Partly owing to the large amount of new material that has come to hand in the last half-century, our knowledge of the N.T. has become more accurate and scientific, and we have passed to a new stage of the task of C. In the nineteenth century (and down to 1914), whereas N.T. scholarship had concerned itself largely with critical analysis of documents, and through such analyses sought to solve problems of authorship, date,

principles of composition, sources, derivations, and the like, these questions no longer stand at the centre of interest. The tendency now is to assume these general results as estab. and to examine further questions in the light of what the different schools of thought consider proved. The new C. is less analytical than synthetic, though the use of this word in this context does not imply putting together what was originally separate. Rather it means an attempt to reveal a unity already present, though disguised by varying forms of thought and expression, and by the idiosyncrasy of the individual writer. The true use of the higher C. has been finely summed up by Strachan in his article 'Criticism' (O.T.) in the *Encyclopedia of Religion and Ethics*. 'Since all light and truth are of God,' he says, 'biblical science can bring the churches and nations nothing but good. It is inevitable that the art of criticism should sometimes be practised by men of little faith, or of no faith, and that in their case the critical spirit should be captious rather than sympathetic, the critical weapon destructive rather than constructive. The fault is not in the instrument but in the user.'

The higher C. developed later in England than on the Continent, and on the whole has followed moderate lines, as may be seen from the above quotation: an outstanding work was Prof. Driver's *Introduction to the Literature of the Old Testament*. Among the moderate critics may be cited the works of J. B. Lightfoot, W. H. Sanday, and B. F. Westcott. Cheyne and Black, of the *Encyclopædia Biblica*, are more radical. See Anderson, *The Bible and Modern Criticism*, 1893; Höpfi, *Die Höhere Bibelkritik* (2nd ed.), 1905; Vigouroux, *Les Livres Saints et la Critique Rationaliste*, 1886; A. Peake, *Commentary on the Bible*, 1925; and C. Gore, *A New Commentary on Holy Scripture*, 1928. See also T. K. Cheyne, *Founders of Old Testament Criticism*, 1893; J. Wellhausen, *Prolegomena zur Geschichte Israels*, 1899; G. A. Smith, *Modern Criticism and the Preaching of the Old Testament*, 1901; A. Robinson *The Study of the Gospels*, 1902; and B. H. Streeter, *The Four Gospels*, 1924. For separate books of the Bible see the vols. of the *International Critical Commentary*, Westminster Commentaries, and Clarendon Bible, especially works by Rawlinson, MacNeill, Barnard, and Balmforth.

Criticism, Literary (Gk. κριτική, judge, umpire; κρίνειν, to distinguish, decide, interpret), involves the study and interpretation of literary art, and itself forms a branch of literature. Matthew Arnold spoke of it in its widest significance as 'a disinterested endeavour to learn and propagate the best that is known and thought in the world.' In a more limited sense it is the unprejudiced analysis of the merits and defects of some particular literary work, or the attempt to estimate the relative position of an individual writer in literature. L. C. may be considered from two sides—theory and practice. The theory of it falls within the study of

æsthetics, that is, it comprises the study of the nature of beauty, and of the nature and function of art. The critic, in examining the underlying principles of art, not infrequently tends to confuse æsthetic with ethical considerations. As these principles are interpreted differently in different times, so we obtain changes in taste. Thus, the theory of L. C. may be said to be the philosophy of taste, while the practice of it is the hist. of taste. Matthew Arnold asserted that it was impossible to criticise without re-creating. An artist attempts to give his conception of the ideal truth which nature imperfectly expresses. He does not merely imitate what he sees or transcribe what he hears, but he chooses those things which fit in with his general conception of truth. While the artist selects, arranges, and creates, it is the function of the critic to explain the principle of selection, and, by his interpretation, to re-create for his age the great creative works of all time.

From its very nature L. C. must be of late birth in the literary hist. of a nation. Previous to Aristotle, Plato had discussed, in the second book of his *Republic*, the nature of the distinction between lyric, epic, and dramatic poetry; he, and also Isocrates, had examined and discussed the rules of rhetoric; and Aristophanes had delivered a pungent C. of the plays of Euripides in the *Frogs*. But Aristotle is generally recognised to be the founder of L. C. Every true critic must turn to the *Poetics* for the fundamental principles of his art, though, of course, many of Aristotle's words cannot be accepted to-day or must receive a modern interpretation. For his experience was limited in that he knew no literature save that of his own country. However, Aristotle examined the literature which he knew with wonderful perspicacity. He discusses general theories, deduced chiefly from Gk. drama, and also deals with certain technical matters, such as the uses of various metrical forms as a medium for poetic thought. After Aristotle, the critics of any note are those who belonged to the Neoplatonist school, whose chief work was to analyse the nature of beauty. Among them must be reckoned Proclus, Crates, Aristarchus, Zenodotus, and Plotinus (trans. into Lat. 1492).

Rom. literature did not produce many great critics apart from Cicero and Horace. The former was chiefly interested in the rules of rhetoric. The canons of poetic art, set forth by Horace in some of his epistles and satires, as well as in his *Ars Poetica*, had a great influence on the correct school of the eighteenth century. In these works he discourages any departure from the rules laid down by the Gks., but gives no very illuminating or independent C. of art. Other Rom. critics who may be briefly noticed here are Servius Maurus Honoratus, who wrote an elaborate commentary on Virgil; and his contemporary, Macrobius (about A.D. 400), who wrote a dissertation in seven books, entitled *Saturnalia Convivia*, on hist., and mythology. A late Gk. writer, whose one extant work must be men-

tioned on account of its far-reaching influence, is Cassius Longinus. In *Heptachyos, On the Sublime* (written about A.D. 260; printed 1554), Longinus lays great stress on a hitherto not much discussed aspect of beauty, namely, the harmony of words and the dignity of style.

Until the works of Dante and Boccaccio were pub. in Italy, there was no critical work produced in the Middle Ages apart from one or two rhythmical treatises, such as the *Ars rhythmica* of John of Garlandia. During the Renaissance there was a large output of humanist C., the chief works of this kind, produced in Italy, being Marco Girolamo Vida's *De Arte Poetica* (1527); Joseph Justus Scaliger's *Poetica* (1561); Castelvetro's *Poetica* (1570); Patrizzi's *Poetica* (1586); and Tasso's *Discorsi* (1587).

It was about this time that critical literature began to be written in England. It is true that Chaucer had paid homage to his masters, Dante, Petrarch, and Boccaccio, and, in his reference to the 'false gallop' of chivalrous verse, as well as in his delightful rhyme of *Sir Thopas*, had shown clearly what he thought of the romantic ballad, but it is not till the age of Elizabeth that C. was written as such. Elizabethan C. did not attempt to analyse or interpret the works of individual writers, but dealt with the remoter subjects of classification of writers or their works according to the literary form employed, and with technical considerations of metre. Thus literary controversies raged round the question of observing quantitative rules in writing Eng. verse, and the far more important question of the function and legitimacy of art. 'From the Elizabethans to Milton, from Milton to Johnson, English criticism was dominated by constant reference to classical models.' It was the richness and freedom of the ancients, that had chiefly appealed to men like Marlowe and Spenser, but many had allowed their imagination to run riot.

A reaction against the uncurbed freedom of the Elizabethan writers began with Ben Jonson, who urged the necessity of restraint and discipline in art, and insisted that the learned 'do use an election and a mean.' His Cs. may be found in the introduction to his plays, and in *Timber, or Discourses upon Men*, etc. In his *Conversations* with Drummond of Hawthornden he made some acrid comments on his contemporaries, but he was capable of the most generous praise, as in his *Ode to Shakespeare*. The new school, of which Dryden was the head, accepted certain laws or principles of art, formulated by Aristotle, Horace, or such Fr. critics as Cornille and Boileau, and closely adhered to them on the assumption that they were fixed and invariable. They found fault with the Elizabethans for their lawlessness, and only admired correctness, proportion, and harmony. The members of the new school possessed, however, many of the qualities which constitute a good critic. The Elizabethans were, in general, so busy creating that they did not stop to analyse their own words or the words of their fellows.

It was essentially a creative age. The writers of the so-called classical school lacked inspiration, but possessed keen, alert minds, an observant eye, and a judicious spirit. Their weakness as critics lay in their desire to standardise literature, to classify everything according to rule. Dryden was called by Dr. Johnson 'the father of Eng. criticism.' He was certainly the greatest critic of his age; it is a matter of opinion whether he has ever been surpassed in that particular sphere. Dryden inaugurated two new methods of L. C., the comparative and the historic. The Elizabethans in a haphazard way had employed the comparative method. That is to say, they were fond of classifying authors according to the form or subject-matter of their works. Dryden preferred to compare the merits of sev. works rather than those of their respective authors. His method is entirely different from that of any previous critic. He does not dogmatise, but in an incomparably easy and pleasant manner takes the reader into his confidence, discourses with him, and finally persuades him into his own way of thinking. The finest of Dryden's critical writings is the *Essay of Dramatic Poesy* (1667). His other essays are prefixed to his *Annus Mirabilis* (1667); to his *Fables, Ancient and Modern* (1700); and to his various plays. In them he examines the relative merits of classical Fr. and Eng. drama and discusses certain questions of metre. Though lacking in supreme artistic sensibility, he possessed a catholic taste and fine literary discrimination. He was quick in picking out the salient features of the men under discussion, and couched his Cs. in a vigorous and incisive form. In his enthusiastic but discriminating eulogy of Shakespeare, Dryden conciliated a prejudiced audience, and estab. the position of that poet for all time.

The editing and annotating of Shakespeare form an important part of the work of the eighteenth century. Nicholas Rowe (1673-1718) was one of the earliest of these editors. His ed. appeared in 8 vols. (1709-14). Pope's *Shakespeare* was pub. in 6 vols. in 1725. In the following year Lewis Theobald (1688-1744), 'the Porson of Shakespearean criticism,' pub. *Shakespeare Restored*, which was followed in 1727 by *Proposals for Publishing Emendations and Remarks on Shakespeare*, and in 1733 by a 7-vol. ed. of the dramatist. Dr. Johnson's ed., which included the labours of former critics, was completed in 1765. In the latter half of the century appeared the work of three painstaking and scholarly editors, Capell (10 vols.), 1768; Steevens (10 vols., in revision of Johnson), 1773; Malone (10 vols.), 1790. In 1821 appeared the famous ed., commonly called *Boswell's Malone*, in which Reed and James Boswell collaborated. Throughout the eighteenth century L. C., undoubtedly through the example set by Dryden, was very much occupied with the work of individual writers. Milton continued to hold the high throne on which Dryden had set him. Addison (1672-1719) wrote eighteen papers on the great poems of Milton,

passing by, according to the taste of his times, the *Juvenilia* as almost beneath C. Dr. Johnson's famous *Lives of the Poets* was pub. in 1778-81. Johnson, like his contemporaries, had great regard for what the *Rambler* called 'the indispensable laws of Aristotelian criticism.' He had little, if any, artistic sensibility, and no great love of what is purely imaginative beauty. He was, too, hampered as a critic by his strong literary and personal prejudices, and by his tendency towards didactic moralising. Nevertheless, his judgments are generally sound and discriminating, and his work is full of wise reflections on life.

The appearance and subsequent development of the weekly magazine or review gave rise to a new kind of L. C.: the short critical essay. The great prose writers of this period—Addison, Steel, Swift, Johnson, Goldsmith, and the rest—all contributed to the papers of the day, the chief of which were the *Tatler*, 1709-1711; the *Spectator*, 1711-12; the *Rambler*, 1750-52; the *Idler*, 1758-60; the *Public Ledger*, 1759-98; the *Bee*, 1791-94; the *Monthly Review*, etc. In Addison's essays on *Wit and Humour* we may find the first tentative writer on æsthetics, on the philosophy and science of art. Pope's *Treatise on the Bathos* was pub. in 1727. Mark Akenside's *Pleasures of the Imagination* in 1744, its final form appearing in 1772; Edmund Burke's *Philosophical Inquiry into the Origin of our Ideas on the Sublime and Beautiful* in 1756, and from 1769 to 1791 Sir Joshua Reynolds (1723-92) delivered his famous discourses on art at the Academy.

The change in L. C. which occurred at the dawn of the nineteenth century preceded a change in literary taste. The transition from the old order to the new was gradual, and signs of revolt from the rules and methods of the Augustans are apparent in the work of such poets as Goldsmith, Gray, Collins, Crabbe, and Cowper. The Romantic movement was marked by naturalism, or a breaking away from the sophistication of society with a consequent return to nature, and by medievalism or Gothicism, stimulated by what Gray called 'the rude, the savage, the tremendous.' Both aspects of the new school of literary art are present in the *Lyrical Ballads*, pub. in 1798. The preface of the 1800 ed. contained Wordsworth's justification of his poetic diction. Dryden had argued that, as poetry is an idealised representation of life, the language of poetry must be removed from the language of real life. Wordsworth astounded his contemporaries by asserting that 'there neither is nor can be any essential difference between the language of prose and verse.' Not only did he release poetry from the trammels of artificial diction, but he widened men's conception of it by showing that art is the supreme achievement of human consciousness.

The change in taste from the rational to the mystic coincided with a change in idea of the function of L. C. The C. of absolute standards gave place to that of imaginative appreciation. Coleridge, in his course

of lectures on the Eng. poets (1808 and 1811-12), and in his *Biographia Literaria* (1817), regards the function of C. to be reverent interpretation. In this respect he himself revolutionised Shakespearian C. in England, and estab. the position of Wordsworth as a poet. Coleridge was much influenced by his studies of the Ger. classics. The C. of the Romantics had a new aim with higher principles. By their study of the literature and hist. of ant. and modern nations, their field of comparison was enlarged, and they obtained a wider tolerance. L. C. meant to the new school a C. of life, whose function it is to throw light on the dark places of human thought and history, upon the growth and subtle transformation of spiritual belief. Carlyle spoke of 'the poetry of criticism; for it is in some sort also a creative art; aiming, at least, to reproduce under a different shape the existing product of the poet; painting to the intellect what already lay painted to the heart and the imagination.'

It is impossible in a short article to dwell in any detail on the characteristics of individual writers. The chief critics, not already mentioned, of the early part of the nineteenth century, and their more important work may be briefly noted: Lamb, *Spectimens of English Dramatic Poets* (1808); 'Essays of Elia' in the *London Magazine* (1820), and *Last Essays* (1833); Peacock, *Four Ages of Poetry*, which provoked Shelley's *Defence of Poetry* (1820); De Quincey, *Confessions of an English Opium Eater* (1821) and *German Prose Classics* (1826-27); Hazlitt, *Characters of Shakespeare's Plays* (1817), *Lectures on the English Poets* (1818), *Lectures on the English Comic Writers* (1819), *Lectures on the Dramatic Literature of the Reign of Elizabeth* (1821), and *The Spirit of the Age* (1825); Landor, *Imaginary Conversations* (1824-28 and 1829); Macaulay, 'Essays' in the *Edinburgh Review* (1825); Leigh Hunt, *Lord Byron and some of his Contemporaries* (1828); and Carlyle, 'Essays' in the *Edinburgh Review* and other magazines (1827-33). From the above list the general features of the work may be observed. All the early nineteenth-century critics were interested in the function of poetry in the nature of poetic imagination, and in the relation between art and science. For many years a controversy continued round the work of Wordsworth, and it was not till the closing years of his life that his position as a poet was publicly recognised. His poetry and the nature of his spiritual insight were continually discussed by his younger contemporaries. The work of these writers is also distinguished by its revaluation and enthusiastic admiration for seventeenth-century Eng. writers, and, to a certain extent, by its interest in European literature.

The magazines and reviews estab. at the beginning of the nineteenth century are of great importance in the hist. of Eng. C. The chief of these influential organs were *The Quarterly Review* (1800), *The Edinburgh Review* (1802), *The Blackwood Maga-*

zine (1816), and *The London Magazine* (1817). In them we find for the first time L. C. affected by the political bias of the writer. The outstanding figures of late nineteenth-century L. C. were Matthew Arnold, Ruskin, and Pater. Arnold's works of C. include *Essays in Criticism* (1865 and 1888), *On the Study of Celtic Literature* (1867), *Literature and Dogma* (1873), and *Mixed Essays* (1879). The philosophic C. of the second decade of the twentieth century derives from him, but was separated from him in point of time by the impressionist C. of Swinburne, Pater, and Symonds, followed by the scholarly C. of Gosse, Saintsbury, Walter Raleigh, Sir Arthur Quiller-Couch, and Israel Gollancz. From these derives a careful literary research pursued diligently in England and America.

The character of modern L. C. changed from the trenchant tone of the nineteenth century, e.g. Macaulay and *The Edinburgh Review*, to one of comparative mildness. Individualistic and impressionistic trends prevailed. There was little or no awareness of schools and a conspicuous indifference to general æsthetic considerations. However, although contemporary England has not yet been able to produce a really great critic many brilliant contributions have been made. The most active in the field of theoretical æsthetics was Lascelles Abercrombie (1881-1938), the author of *An Essay towards a Theory of Art* (1922) and *Romanticism* (1926). To the closely allied field of æsthetic technique Abercrombie contributed *The Principles of English Prosody* (1923). Here also belong Robert Bridges's studies of classical and Eng. prosody, Percy Lubbock's study of fiction in *The Craft of Fiction* (1921), E. M. Forster's *Aspects of the Novel* (1927), and George Moore's comments in *Conversations in Ebury Street* (1924). One of the most important developments of L. C. is in the psychological interpretation of critical values. Here the contemporary leader is I. A. Richards (b. 1893), who in his *Principles of Literary Criticism* (1925) and *Practical Criticism* (1930) is primarily concerned with the study of the processes of comprehension and evaluation. Further work in this field has been done by Herbert Read (b. 1893), and F. R. Leavis (b. 1895) in his *New Bearings in English Poetry* (1932). The leader in æsthetic C. of the classical school and one of the most distinguished of contemporary critics is T. S. Eliot (b. 1888). He makes a general plea for tradition and classicism as canons of C. and literature and has done valuable work in reinterpreting such great figures of the past as Dante, Donne, and Shakespeare. His counterpart in America is the critic Irving Babbitt. At the opposite extreme are the impressionistic critics of whom Arthur Symonds (1865-1945) was the chief exponent. His critical creed was formulated under the personal influence of Walter Pater. Among what might be called the sociological critics G. K. Chesterton (1874-1938) was the most versatile and lively, though he sometimes sacrificed soundness of judgment to the

temptation of turning an epigram. His attitude to life was definitely conservative and in this Wyndham Lewis (b. 1886) is somewhat akin to him, in contrast to the critical radicalism of Bernard Shaw (b. 1856) and the eclectic liberalism of Havelock Ellis (1859-1939). On the borders of biography and C. brilliant work has been done by Harold Nicolson on Tennyson and Byron and by J. Middleton Murry on Keats, Shakespeare, and D. H. Lawrence. The most readable and scholarly hist. of Eng. literature has been produced by two Frenchmen, Émile Legouis and Louis Cazamian. Leading Eng. contemporary book reviewers include Desmond McCarthy, Charles Morgan, Robert Lynd, Harold Nicolson, Raymond Mortimer, V. Sackville West, and V. Pritchett. Van Wyck Brooks is a leading Amer. critic.

In France the earliest work of L. C. was the *Défense et illustration de la langue française*, which was pub. in 1549 by Joachim du Bellay. This work, together with Ronsard's own writings on the art of poetry and the *Art poétique* of Vanquelin de la Fresnoye (1574, printed 1605) contain the literary theories of the *Pléiade*, whose general object was to bring the Fr. language both in its application and vocabulary on a level with the classical tongues, mainly by borrowing from them. Though the *Pléiade* achieved much that it desired, its members no doubt went too far in their luxuriant importations and innovations and provoked to some extent the reaction which began about 1600. The new movement for the neo-classic or anti-romantic which swept Europe was inaugurated by François de Malherbe (1555-1628). In the words of Boileau, 'Rinfin Malherbe vint,' and the strict Fr. classical school had begun. Malherbe's influence as a critic was great and far-reaching, but by no means wholly beneficial. From his time dates that deplorable falling off of the more poetic qualities of Fr. poetry which continued well into the nineteenth century. Malherbe was supported in his revolution by Regnier, far superior to him as a poet, who often had the sense to oppose and ridicule Malherbe's innovations, Vaugelas, Balzac ('the Malherbe of prose'), and finally by Corneille in his famous prefatory discourses. René Rapin systematised the neo-classical ideal in sev. works, most of which appeared between 1668 and 1674. Le Rapin and the Jesuits Le Bossu and Bouhours illustrate in their writings most forcibly the crippling rigidity of formal classicism. At the close of the seventeenth century Nicolas Boileau-Despréaux (1636-1711) stands out as the leading literary critic in France. In his famous *L'Art poétique* (1674) he analyses the various kinds of verse composition and summarises the principles peculiar to each, as well as laying down rules for poetic diction. His *L'Art poétique* occupies in Fr. literature a place parallel to that of Horace's *Ars poetica* in that of Lat. During the greater part of the eighteenth century neo-classicism ruled supreme in European literature, with Voltaire, Buffon (who

coined the phrase 'the style is the man'), Marмонтel, La Harpe, and Suard as its most distinguished exponents in France.

In Germany the doctrines of Scaliger and Ronsard were reproduced by Martin Opitz (1597-1639). His *Buch von der deutschen Poeterey* (1624) became the theoretical textbook of the Ger. Renaissance and regulated Ger. literature for the next hundred years. The innumerable literary societies, such as the Fruchtbringende Gesellschaft, which at that time were being formed all over the country in imitation of the Accademia della Crusca in Florence, helped to further Opitz's reform and did a real service to the Ger. language by purifying it from foreign ingredients. Later in the seventeenth century the 'second Silesian school' arose in opposition to the first school of Opitz. Its leading exponents were D. C. von Lohenstein (1635-83) and Christian Hofmann von Hofmannswaldau (1617-79), who cultivated a bombastic and euphuistic style similar to that of the It. Marini and the Sp. writer Góngora. The next critic of consequence arose with J. C. Gottsched (1700-66) in Leipzig, who between 1724 and 1740 estab. literary reforms on the lines of Fr. seventeenth-century classicism. His chief work was his *Versuch einer kritischen Dichtkunst für die Deutschen* (1730) and incorporates the principles of Boileau. Gottsched was convinced that Ger. literature could advance only if subordinated to the laws of Fr. classicism and he trans. many Fr. plays which were to serve as models to Ger. dramatists. In 1740 he came into conflict with the two Swiss writers and critics J. J. Bodmer and J. J. Breitinger who, under the influence of Addison and contemporary It. critics, demanded that the poetic imagination should not be hampered by rules. Gottsched was adamant, and in the ensuing controversy between Leipzig and Zurich he was inevitably defeated. But it was Gottfried Ephraim Lessing (1729-81) who dealt the death-blow to Gottsched's Fr. pseudo-classicism and led the way back to the truly classic art of ant. Greece. His two prin. critical works are the famous *Literaturbriefe* and his *Hamburgische Dramaturgie*. He was an enthusiastic protagonist of Shakespeare and looked to England and not to France for the regeneration of the Ger. theatre. His own dramas were examples pointing the way. J. G. Herder (1744-1803) carried on where Lessing had left off. He aimed at crystallising national feeling in poetry and ridicules the ambition of Ger. writers to be classic, as Lessing had ridiculed their desire to be Fr. (see his *Fragmente über die neuere deutsche Literatur*, 1767).

Modern, or romantic C., came in with the final downfall of the neo-classical tradition in Europe at the very close of the eighteenth century. As Lessing paved the way for it in Germany, so had Diderot in France. The two brothers August Wilhelm (1767-1845) and Friedrich Schlegel (1772-1829) provided the theoretical basis of Romanticism. In contrast to the older school they insisted

that the first duty of the critic was to understand and appreciate—genius could not be judged by preconceived code of principles. It is impossible here to go into the further development of L. C. in the nineteenth century in any detail and reference should be made to the account of the literature of the country concerned. In France, Sainte-Beuve remains of supreme importance and his work has survived many changes of opinion. He was followed by T. Gautier, St. Marc, Girardin, P. de St. Victor, and many others, down to Taine and the school of individualistic critics. Tolstoy's *What is Art?*, a most revolutionary work, appeared in the last quarter of the nineteenth century. In Germany, while much has been written on L. C., no name comparable to that of Lessing has become outstanding either for originality or great insight among modern critics. As in other countries, writers of eminence in other fields have contributed to L. C. in their own field, and mention may be made of R. M. Rilke's letters where poetry is discussed, and of the noted novelist Thomas Mann who has contributed a vol. of L. C. on various subjects.

Critolaus, Gk. philosopher, b. at Phaselis in Lycia. He became the chief of the Peripatetic school after Aristotle, whose pupil he had been. He was chosen to accompany Carneades and Diogenes to Rome. The mission was successful, and the 500 talents which the Athenians had asked back from the Romans were sent with those ambas.

Crittenden, John Jordan (1787-1863), Amer. politician, b. in Versailles, Kentucky. He was a senator, 1835-41. In 1841 he became attorney-general in the Cabinet of President W. H. Harrison. From 1848 to 1850 he served as governor of his state. In 1850 he served in the Cabinet of President Fillmore as attorney-general, and from 1855 to 1861 again in the Senate. In the Civil war his influence was marked in keeping Kentucky from seceding from the Union. In 1861 he was elected to the National House of Representatives, where he stoutly upheld the gov. in its war-making policies, but bitterly opposed dividing Virginia into two states and the enrolment of Negro slaves as soldiers. He d. at Frankfort, Kentucky.

Criovelli, Carlo, Venetian painter, who lived in the fifteenth century, and seems to have been the pupil of Antonio Murano.

The chief among his works are 'Madonna and Child Enthroned,' 'Madonna in Ecstasy,' 'Saints Catherine and Mary Magdalene,' 'The Twelve Apostles,' 'Coronation of the Virgin,' and 'The Annunciation.'

Croaghpatrick, mt. of Ireland in the co. of Mayo, situated on the S. shore of Clew Bay and to the S.W. of Westport. It is about 2500 ft. high.

Croatia-Slavonia, formerly a crownland within the Austro-Hungarian Empire, later a prov. of Yugoslavia, and now two separate republics of the federation

Yugoslav Embassy

WEAVING AT HRASTOVICE, CROATIA

The woman wears the traditional dress of her village.

of Yugoslavia. Croatia, the larger portion of C.-S., lies in the W., extending from the Adriatic to the R. Drave. The R. Danube also separates C.-S. from Hungary, the R. Save from Bosnia on the S. Area is 16,920 sq. m. The surface is largely mountainous and hilly. There are wooded offshoots of the Julian and Styrian Alps (2000-4000 ft.). The S. of Croatia includes part of the cretaceous Alpine highlands, known as the Karst dist., with deep-cut valleys and subterranean water-courses. There are also the Zagreb highlands, the Great and Little Kapella, and the Velebit Planina (about 5700 ft.). There are also alluvial and diluvial plains, fertile valleys, and many forests in the hills of oak, beech, elm, and pine. The lower parts of Slavonia are unhealthy, through marshes and swamps, while Croatia's coast-land is exposed to the Adriatic currents and the ravages of the

Itora, which sweeps down like a hurricane from the Karst. Otherwise the climate is moderate, and the land generally fertile. Crops of wheat, pulse, maize, flax, hemp, potatoes, and tobacco thrive. Much fruit is grown in the S.—apples, nuts, grapes, etc. The plum-brandy, 'Silvovitz', is famous, and some wines are produced. Beautiful cotton and silk fabrics are manufactured, and there are silk, glass, and sugar mills. Among the exports are grain, fruit, timber, and flour. Horses, sheep, swine, and other live-stock are reared. The chief minerals are coal and lignite (Ivansčica, Bilo, Požega, Vrdnik Mts.), iron ore, zinc, lead, and copper, but they are not important. The people are largely engaged in agriculture. The inhab. are mainly Croats or Serbs (89 per cent.), about 5 per cent. are Gers., and there are also a few Hungarians, Magyars, and Jews. Nearly three-quarters of the pop. are Rom. Catholics, the rest are mostly members of the Gk. Orthodox Church. The *zadrugas*, or family communities, are a characteristic feature of their social life. These consist of ten to twenty persons under the rule of a *domacin* or *glavnik*. Manufs. and education are improving, but still some 44 per cent. of the pop. are illiterate. The cap., Zagreb (now cap. of Croatia), has a univ. Other large tns. are Varazdin (Varazd), Karlovac Gorulj, Eszék, Brod, Mitrovica, and Zimany. The port of Fiume (Rieka), originally in C.-S., was given an independent existence under the treaty of Rapallo concluded with Italy in 1920. Eventually (1924) the port was partitioned, Fiume itself being allotted to Italy and Port Baross and the Delta to Yugoslavia; but by the 1947 peace treaty with Italy, Fiume was ceded to Yugoslavia. Other important trading ports in C.-S. are Zeugg and Porto Rê. The total pop. of C.-S. is about 3,000,000.

History.—The Croats (Chrobates and Chorvates) are Slavs, their language differing little from that of the Serbians or Serbs. C.-S. was originally included in the Rom. prov. Pannonia. In the seventh century A.D. it was colonised by Croats from the Carpathians. In the ninth century they adopted Latin Christianity. About 900 a kingdom, including Bosnia and Dalmatia, was established, and proclaimed independent of the Byzantine emperors. This kingdom lasted for nearly two centuries. From the close of the eleventh century to the middle of the fifteenth its hist. was closely linked with that of Hungary. From then till the end of the seventeenth century it was under Turkish occupation. From 1777 to 1868 there were constant separations from Hungary, notably under the famous *ban*, Jellachich, 1848. At the reorganisation of the Austro-Hungarian monarchy (1867–68) a compromise was agreed upon. In 1818, after the collapse of the Habsburg monarchy, C.-S. joined the newly formed kingdom of the Serbs, Croats, and Slovenes. For administrative purposes Yugoslavia by the terms of the 1921 Constitution was divided into *oblasti* or prefectures. There were four *oblasti*

in C.-S., each sending deputies to the National Assembly in proportion to the pop., one deputy to every 40,000 inhab. With the abolition of the constitution the former provs. of Yugoslavia, together with the names Croatia, Slavonia, etc., were also abolished, and the country was divided into nine *banats*, each under a *ban* or governor nominated by the king. The *banats* were named after the rivs. (e.g. Sava, cap. Zagreb), but the boundaries of what was formerly C.-S. were not very much altered. Politically C.-S. became the stronghold of the National Agrarian party, and under their leader, Stefan Raditch, the Croats opposed the centralist government. This opposition came to a head in 1928 when attempts were made to make C.-S. autonomous. Raditch was assassinated by a member of the Serbian Radical party, and soon after (Jan. 6, 1929) Alexander (q.v.), king of Yugoslavia, abolished the National Assembly and united the country under a royal dictatorship. The National Assembly was replaced by a Supreme Legislative Council, consisting of eleven Serbs, four Croats, and two Slovenes.

The attempt of the old Serbian politicians to impose their domination on Croats was one of the factors which made democracy impossible in Yugoslavia between the world wars. Partition of Yugoslavia followed the Ger. occupation in 1941, and on April 10 the 'independence' of Croatia was proclaimed; on May 13 a treaty was signed between Germany and the puppet Fascist state of Croatia determining the boundaries between them. All the Axis countries recognised the independence of Croatia, but the Yugoslav Gov. protested against the Axis partition and the dismemberment of Croatia. After the 1941 partition Croatian Fascists, led by Ante Pavetic, massacred tens of thousands of Serbs in Bosnia, but subsequently when Tito's partisan army was formed Croat and Serb peasants joined each other in Marshal Tito's forces, and in 1943 Croats and Serbs were fighting side by side against Gers., Chetniks, and Ustaše or Serb and Croat Quislings. Following the defeat of Germany and Italy Yugoslavia was proclaimed a people's republic under the name of the Federal People's Republic of Yugoslavia, consisting of six constituent republics, of which the three most important are Serbia, Croatia, and Slavonia, all being of the Soviet type. See further under YUGOSLAVIA. See R. W. Seton-Watson, *Absolutism in Croatia*, 1912; C. Battorich, *The Martyrdom of Croatia*, 1920; J. Buchan (ed.), *Yugoslavia*, 1923; and G. Ellison, *Yugoslavia, Country and People*, 1933.

Croce, Benedetto (b. 1866). It. philosopher and critic, b. at Pescasseroli, Aquila. Began education at Catholic boarding-school in A. ples. In 1883, by the earthquake of Casamicciola in the is. of Ischia, C. lost his parents and only sister, and was buried for hours under ruins and severely injured. Afterwards he lived at Rome with his uncle Silvo Spaventa, a Conservative leader. Returning to

Naples in 1886, he became known as a local antiquarian. His philosophical disquisitions arose out of his historical studies and began in 1893. He also devoted attention to the economic doctrines of Marx. In 1902 commenced pub. of his works on the philosophy of the spirit (*Filosofia dello Spirito*)—derived from Neapolitan thinkers: Giambattista Vico (c. 1688–1744), who held there was a 'common nature' in mankind ruling men's actions despite individual aims; Bertrando Spaventa; and Francesco de Sanctis (1817–83). The Absolute is found to be a beginningless and endless Activity; Aristotelian concepts virtually disappear; intuition becomes all-important, because reality is exhausted by the four pure concepts—Beauty, Truth, Usefulness, and Goodness. Obviously, then, not only man but every conscious being is a creator. Matter is mere lumber, whose origin and laws (if it can be said to have any) are unimportant, and whose mechanism is a contemptible appearance—instead of being the terrible obstacle it has heretofore been to those concerned about the freedom of the will. The difficulty of inducing belief that man is a creator in the biblical sense—'let there be light,' 'let there be sea,' 'let there be fishes'—is overcome by denying separate reality to light and sea and fishes. C. was made a senator in 1910, and minister of education from June 1920 till July 1922. Unlike Giovanni Gentile, his former colleague in many scholarly enterprises, who took office under the Fascists and helped to provide them with an ideological basis, C. not only refused to co-operate with them but was active with his pen against their anti-liberal forces. His repute and standing were so high that even Mussolini did not take drastic measures against him. It is quite a remarkable fact that C.'s book *History as the Story of Liberty*, which contained one of the profoundest expositions of the ideals for which the United Nations were fighting in the Second World War, should have been pub. in Fascist Italy in 1938. His philosophy of the spirit, or rather his concept of truth as hist., substitutes for the 'melancholy picture of a blind humanity groping in darkness the heroic picture of mankind rising from light to light.' His other works are most voluminous. *Filosofia dello Spirito* consists of three parts: *Estetica come scienza dell'espressione e linguistica generale* (1902), *Logica come scienza del Concetto puro* (1904), and *Teoria e Storia della Storiografia* (1912). He wrote also *Storia d'Italia da 1871 al 1915* (1928) and *Storia d'Europa nel secolo decimono* (1932). He pub. his *Autobiography* in 1918 (new ed. 1926, Eng. trans. 1927). See H. W. Carr, *The Philosophy of Benedetto Croce: the Problem of Art and History*, 1917; and A. M. Fraenkel, *Die Philosophie Benedetto Croces und das Problem der Naturerkenntnis*, 1929.

Crochet (Fr. *crochet*, or *croc*, meaning hook), kind of knitting which consists of loops made with a hooked needle drawing one through the other to form an open

or solid fabric, the hook being held in the right hand and the thread and resultant work in the left. For over 100 years C. has remained a favourite adornment for table linen, tray cloths, and mats. It is also used on church vestments and altar cloths. Fine lace collars adorned the dresses of our grandmothers. C. edgings decorated their underlinen and fine lingerie, and C. chair back covers (anti-macassars) were also much in evidence. Shetland shawls, slippers, bags, and purses can be made in a C. stitch. Luncheon mats, for use on the table instead of tablecloths, are practical, decorative, and serviceable, and can be carried out in soft-coloured threads, particularly écar, to tone in with modern furnishings. Other materials used are cotton, mercerised cotton, pure or synthetic silk, fine gold thread (especially for filigree work), etc. A hook should be selected which is suitable in size to the thread used: large bone hooks for heavy wools and cottons, and fine steel hooks for thin cotton, mercerised, or flax lace thread.

Two chief kinds of C. are Ger. and Victorian. *German* consists of sev. different kinds of stitches, including the common chain stitch, single stitch, treble stitch, double stitch, etc.

Victorian or Tunisian C. is sometimes known as C. knitting because all the stitches of a row are held on one long straight hook, a row of chain is worked to form the base and each stitch is then looped on the hooked needle to the end. The thread is then twisted round the hook and passed through one loop, then twisted round again and drawn through two loops, and all the stitches are worked off in this way to the end. This kind of C. results in a soft pliable piece of work, suitable for pram or cot blankets, covers, scarves, slippers, etc.

Hairpin C. is worked on a large steel hairpin, or two-pronged fork, with a hooked needle. Insertions, fringes, and dollies can be made in this way.

Bosnian C. is a special kind of work which can be carried out in various colours; it resembles braid, is strong and yet elastic. It is therefore useful for waistbands, etc. It is comprised of single stitches, the arrangement of colours forming the pattern.

Designs of exquisite patterns are nowadays available to the C. worker on the chart principle, which enables the elaborate pattern to be more easily followed than tedious directions. C. can be done in odd moments; it may be worked in one whole piece, or in small separate pieces of varying shapes which are later joined together by stitches, as in *quipure* lace, etc. Fine lace collars may consist of separate stars, squares, lozenges, etc., joined to form a collar with varying length treble stitches and finished with a picot edging. There are fine classic examples of this, the result of much painstaking work of a passing generation.

Crocidolite, mineral occurring in fibrous or asbestos-like filaments, belonging to the amphibole group. Chemically it is an iron sodium silicate. It varies in

colour, sometimes being of a golden yellow, and at others of a dull red or blue-green tint. The ornamental stone has a beautiful silky lustre. When of a blue colour it is called hawk's-eye, and when of rich golden-brown, tiger-eye. C. occurs in seams, associated with iron ores in Griqualand W. and Cape Colony. It is also found in some other places, but only in small quantities.

Crocket, in architecture, an ornament placed on the inclined sides of pinnacles, capitals, pediments, canopies, gables, spires, etc., of various buildings of the Early Eng. period; usually in the form of a winding stem, with buds or curled leaves projecting here and there, ending in a finial; sometimes in the form of animals. Cf. continued from the twelfth century throughout Gothic architecture.

Crockett, David (1786-1836), one of the classical types of Amer. woodsmen, hunters, pioneers, and fighters, *b.* Green Co., Tennessee. Largely self-taught. In 1813 he served under Gen. Andrew Jackson in the war with the Creek Indians. He entered politics and from 1821 to 1824 served in the state legislature. He served in the National House of Representatives from 1827 to 1831. He was a notable figure in Congress on account of his racy stories, smacking of the soil. After his last defeat for Congress, he moved into the then ter. of Texas, was soon in the thick of the fighting with the Mexicans and lost his life as one of the defenders of the Alamo at San Antonio, March 6, 1836. In the days before the Civil war 'Davy' Crockett was a hero to every Amer. boy.

Crockett, Samuel Rutherford (1860-1914), novelist, *b.* in Galloway, at Duchrae, where he was brought up on a farm. In 1886 joined the Free Church of Scotland, becoming a minister at Penicuik. He gave up the ministry, however, to pursue a literary career. His sketches in the *Christian Leader* appeared in book form as *The Stickit Minister and some Common Men* (1893). His best-known novels are *The Raiders* (1894) and *The Lilac Sun-Bonnet* (1894). Other novels and sketches include *The Grey Man* (1896); *The Men of the Moss Hags* (1895); *The Red Axe* (1898); *Maid Margaret of Galloway* (1905); *The Loves of Miss Anne Raiderland: All about Grey Galloway, its Stories, Traditions, Characters* (1904); *The Seven Wise Men* (1909); *The Smugglers* (1911); and *Sandy's Love Affair* (1913). See M. M. Harper, *Crockett and Grey Galloway*, 1907. He d. at Avignon.

Crocodilia (Gk. *κροκόδειλος*, properly an Ionic word, — (1) a kind of lizard, (2) the crocodile or alligator of the Nile), order of reptile characterised by a huge, lizard-like body, and recalling in many ways the giant Saurians with which the earth was peopled during a previous period of its existence. The whole of the existing members of the order are included in a single family, which may be subdivided into sev. generic groups; of these the most specialised are the caimans and alligators (*q.v.*). Common peculiarities of the Crocodylidae are a long and powerful

tall; a vertical longitudinal crest on the upper surface of the body, consisting of a series of horny lobes, double in the basal half of the tail and single beyond; and a protective armour, consisting of rows of quadrangular, horny shields of varying sizes, which overlap at the edges. The teeth, which are conical and may be of very large size, are confined to the margin of the jaws, where they are implanted in distinct sockets, and while in use are continually being replaced by fresh ones growing from beneath. A remarkable feature of the existing form of crocodile is the extremely backward position of the aperture of the internal nostrils, this being due to the development of special plates by the bones of the palate, which

CROCODILE

grow beneath the nasal passage so as to form a floor to it, and thus completely cut it off from the cavity of the mouth. As the summit of the windpipe is continued upwards into this posterior aperture of the nostrils, crocodiles are able to breathe while their mouths are wide open and filled with water. The stomach is globular, with a pair of tendinous centres like those of birds; the digestion is so rapid and powerful that every bone of the creature's prey is dissolved whilst still in the wide and long gullet. As regards reproduction, crocodiles lay from twenty to sixty eggs, of the approximate size of those of a goose, and covered with a hard, white shell. These are deposited in some hollow in the sand of the bank, where, after being covered to a greater or less depth, they are left for twelve to thirteen weeks to hatch. Whether the parent always assists in the incubation is not certain. The true crocodiles comprise rather less than a dozen species ranging over Africa, S. Am., N. Australia, and tropical America. The Indian crocodile, known to natives as the mugger and erroneously to Anglo-Indians as the alligator, ranges over India, Ceylon, Burma, and the Malay peninsula and Is. It is a freshwater variety inhabiting only rivers, lakes, and marshes, and in its characteristics

most nearly approaches the caiman and the alligator.

Crocoisite, see **CHROME YELLOW**.

Crocus, the chief genus of the Iridaceae, consists of many hardy species. They are to be found chiefly in the middle and S. parts of Europe and the only true Brit. species is *C. nudiflorus*, which flowers in the autumn. *C. sativus* is the saffron C., a native of Asia Minor, cultivated in S. Europe; the dried stigmas yield saffron, formerly of repute as a perfume, and as a nervine, stomachic and narcotic drug, now used chiefly as a colouring ingredient. The tn. of Saffron Walden has taken its name from its cultivation of the plant. *C. vernus* is the purple or white crocus of our gardens in spring; *C. biflorus*, the Scotch C., is a native of S. Italy.

Crœsus (c. 540 B.C.), the last king of Lydia, of the Mermnad dynasty, son of Alyattes. He conquered the Ionian, Æolian, and other neighbouring tribes, till his empire finally extended from the S., N., and W. coasts of Asia Minor to the R. Halys on the E. and the Taurus Mts. in the S. His enormous wealth was proverbial, and the phrase 'a perfect Crœsus' still survives. For the legend of his interview with Solon see Herodotus, i. 29. After the overthrow of the Median empire (549), the kings of Lydia and Babylonia leagued together against Cyrus of Persia. The Delphic oracle gave C. the ambiguous answer that if he marched against the Persians 'a great empire would be overthrown.' This proved to be his own. He was utterly defeated near Sardis and taken prisoner, 546. Accounts of his death vary greatly: Cyrus probably spared his life. The dedication in (ik. on fragmentary columns from the temple of Artemis (Brit. Museum) are by C.

Croft, or Crofts, **William** (1678-1727), Eng. musical composer, organist of St. Anne's, Soho, 1700-2; of the Chapel Royal, 1707; of Westminster Abbey, 1708. His *Musica Sacra* (thirty anthems and a burial service) appeared in 1724. St. Anne's and St. Matthew's psalm-tunes are also attributed to him, and a single chant in B. minor for the Anglican service. In early life he composed overtures and airs for various plays.

Crofter. A C. is defined by the Crofter's Holdings (Scotland) Act, 1886, to be any person who is tenant from year to year of a holding of arable or pasture land, who resides on his holding, and whose ann. rent does not exceed £30. To constitute a C.'s holding, the holding must be in a crofting par., i.e. one in which Cs. have for eighty years preceding the passing of the Act of 1886 had holdings of arable land, with a common right of pasturage. The etymology of C. is unknown, but the word *croft* (i.e. the agric. holding itself) is derived from old Eng. *croft*, meaning an enclosed field. These holdings exist for the most part in the Highlands and is. of Scotland, and consist, or did consist, for the most part of extremely scanty properties, the largest in Skye, for example, being but 7 ac. The holding in common pasture involves the periodical conversion of the holdings into

grass land. From the barrenness of the Highlands of Scotland, the condition of these joint tenants of divided farms was for long an unenviable one. Many of them, however, eked out a scanty livelihood by combining with their tillage fishing or some other vocation. Cs. for the most part seem always to have been good farmers, whence their few well-cultivated ac. generally produced a better yield per ac. than the land of the large farmer. The Act of 1886 and other amending Acts were passed as the result of much agitation to remedy the grievances of Cs., more especially in regard to security of tenure. For some time prior to the Act of 1886 there had been numerous evictions of the Cs. from their holdings, and the ensuing agitation, culminating in sev. royal commissions and many statutes, owed its strength to the belief held by the Cs. themselves that their tenancies were practically perpetual. Whether they were ever in law in a better position than an analogous class called *cottars*, who are simply squatters in dwelling-houses situate in a crofting par., seems doubtful. But the Act of 1886 gives the C. a perpetual tenure, and the landlord cannot evict him unless his rent falls into arrear for one year; or he attempts to assign his tenancy; or becomes bankrupt, or is in default in other ways specified in the Act. The Cs. Commission, however, can remove a C. on such terms as to compensation as they think fit.

Crofts, Ernest (1847-1911), Eng. artist, b. at Leeds and educated at Rugby School. He studied painting first in London under Alfred Clay and afterwards at Düsseldorf under Emil Hünten, a noted military artist. Among his pictures are 'The Retreat,' 'On the Morning of the Battle of Waterloo,' 'Cromwell at Marston Moor,' 'Marlborough after the Battle of Ramillies,' 'At the Farm of Mont Saint Jean, Waterloo,' 'Charles I. on his way to the Scaffold,' and 'Napoleon and the Old Guard at Waterloo.'

Croisic, or Le Croisic, seaport in Loire-Inférieure, France. It is a watering-place and has fisheries; salt is produced here. Pop. 2400.

Croix, tn. of France near to Roubaix in the dept. of Nord, with chemical and textile industries. Pop. 17,400.

Croix de Guerre, personal decoration for award to soldiers, sailors, or airmen of the Fr. and Belgian forces mentioned in dispatches during the two World Wars. It was instituted in both countries in 1915. 'Mentions' were usually made for individual acts of gallantry, devotion to duty, or similar feats. The decoration is, of course, different in both countries.

Croker, John Wilson (1780-1857), politician and man of letters, was educated at Trinity College, Dublin, and went to the Irish Bar, where he rapidly made headway. In 1807 he was returned to Parliament as member for Downpatrick. Perceval in 1809 appointed him secretary to the Admiralty, in which position he did excellent work, in which indeed he was so interested that he declined higher office. He retired from the Admiralty in 1830.

He was an admirable debater, and more than once overthrew Macaulay, once referring to a speech made by the historian as 'vague generalities handled with that brilliant imagination which tickles the ear and pleases the fancy without satisfying the reason.' There is no doubt that these discomfitures had much to do with Macaulay's unjust and venomous review of his adversary's admirable ed. of Boswell's *Johnson* (1831); and C.'s essay on Macaulay's *History* is, by contrast, impartial and kindly. He trans. some valuable memoirs on the Fr. Revolution (1823), ed. the *Suffolk Papers* (1823), and the *Letters of Mary Lepel* (1821-22), and collected material for an ed. of Pope's works (subsequently used by Whitwell, Elwin, and Courthope). From his pen is said to have come the famous essay on Keats's *Endymion*. An autocratic person, he made many enemies, and was contemptuously and quite unfairly depicted as Rigby in *Coningsby*, and, with as little justification, as Wenham in *Vanity Fair*. Others of his chief works are *Stories for Children from the History of England* (1817); *Memoir of the Reign of George the Second* (1818, 1884); *Essays on the Early Period of the French Revolution* (1857). He also pub. sev. vols. of verse. See W. A. Maginn (ed. W. Bates), *A Gallery of Illustrious Characters*, 1873; and L. J. Jennings, *Memoirs and Correspondence of the Right Hon. John Wilson Croker*, 1884.

Croker, Richard (1841-1922), Amer. political boss, b. at Clonakilty, in co. Cork, Ireland. His parents emigrated when he was two years old, and he settled in New York, where he received a common-school education. In 1868 he was elected alderman. He afterwards filled various municipal offices, ending as city chamberlain in 1890; meanwhile he had acquired great influence in Tammany Hall, and in that connection had fought Tweed in 1870. Soon after the death of Tweed's successor, John Kelly, in 1886, C. became Tammany Boss. After his resignation in 1902, he retired to Ireland. He trained horses; and one of them, Orby, won the Derby in 1907.

Croker, Thomas Crofton (1798-1854), Irish writer, b. at Cork. At a very early age he spent his time in collecting legends of the Irish people. His chief works are *Researches in the South of Ireland* (1824); *Fairy Legends and Traditions of the South of Ireland* (1825-28); and *Legends of the Lakes* (1829).

Crole, or Croleus, Robert, see CROWLEY.

Croly, George (1780-1860), Brit. poet and preacher of great eloquence, b. at Dublin, and educated at Trinity College, Dublin. Entered the Church of England and was eventually appointed rector of St. Stephen's, Walbrook. Was a constant writer on all sorts of subjects, whether comedy, tragedy, satire, or poetry. Also contributed many articles on biography, romance, and theology to the current magazines. His best work was *Salathiel: a Story of the Past, the Present, and the Future* (1828).

Cromagnon Race, primeval European race which entered Europe in the upper

palaeolithic and trans-neolithic ages. The name was given by Paul Broca to a number of skeletons discovered in 1868 in the C. grotto at Les Eyzies, in the Dordogne. Other typical bones come from Wales and Mentone. Tall and long-headed, the C. R. is regarded as one of the mother-races of the Nordic and Mediterranean races, and traces of this type are still found there to-day.

Cromarty: 1. Former co. of Scotland, including the promontory Ardmeanach, or Black Isle, at the head of Moray Firth, and numerous detached portions of land within Ross co., now forming part of the co. Ross and C. (*q.v.*). 2. Parl. and municipal bor., seaport, vil., and par. of Scotland. The tn. is 5 m. from Invergordon, 9 m. from Nairn, 20 m. from Inverness. Bp. of Hugh Miller, the geologist, to whom a statue was erected in 1859. The sheriff court is held here every alternate Friday afternoon. Manufs. rope, sacking, and sail-cloth, and has a herring fishery. Pop. (par.) 1600. 3. C. Firth, one of the finest bays in Britain, is a land-locked inlet of the North Sea, on the N.E. coast of Scotland, N.W. of Moray Firth. It is 18 m. long, 3 to 5 m. broad, 5 to 35 fathoms deep. It is entered by a narrow strait between the N. and S. Sutors. The Three Kings Reef is about $\frac{1}{2}$ m. from land. There is a lighthouse at the entrance. Miller discovered fossil fishes (Pterichthys, Osteolepis, and others) in the Red Sandstone near.

Cromdale, par. in Elgin, on the Spey, 3 m. distant from Grantown. Historically interesting on account of defeat inflicted on Jacobites by King William's troops in 1690. Pop. 3000.

Crome, John (1769-1821), usually known as Old Crome. Founder of the Norwich School of Artists. He was b. at Norwich of humble origin. The son of a weaver, he first became an errand boy; then he was apprenticed to a house painter, Mr. T. Harvey of Catton, observing his genius in his sketches from nature, which he painted in his leisure moments, procured him a post as drawing master, and from then onwards C. was able to give up a great part of his time to the subject he loved. His drawing of trees, meadows, sky, and clouds was very faithful to nature. He also made a particular study of Dutch pictures, and earned for himself the title 'English Hobbema.' In 1805 the Norwich Society of Artists assumed definite shape, and in 1808 he was elected president. His work received scant remuneration during his life. It was only after his death that the full value of his work became recognised. His best known productions are 'Mousehold Heath' (National Gallery, London), 'Carrow Abbey,' 'View of Chapel Fields, Norwich,' 'Clump of Trees, Hautbois Common,' 'Fish-market at Boulogne,' 'Bridges on the Ostend River.' He also made a series of etchings of his own favourite Norfolk scenery. See D. Turner, *Etchings by John Crome*, 1838; L. Binyon, *John Crome and John Sell Cotman*, 1906; and C. H. C. Baker, *John Crome*, 1921.

Crome, John Bernay (1794-1842), landscape painter, son of John C.; his style is very similar to that of his father, and his pictures have consequently been sold as being the productions of the older and more experienced painter.

Cromer, Sir Evelyn Baring, first Earl of (1841-1917), son of Henry Baring, M.P., and of Cecilia Anne, daughter of Vice-Adm. Windham of Felbridge Hall, Norfolk. Entered Royal Artillery in 1858; alderman to Sir Henry Stokes in Ionian Is. in 1861; and appointed private secretary to the viceroy of India during the years 1872 and 1876. He gained great fame for his administration of Egyptian affairs. It is due to his unremitting efforts that Egypt holds her present position among the nations. Appointed commissioner of the Egyptian public dept., and later controller-general in Egypt, he changed the gov. from a state of threatened bankruptcy into a flourishing condition; but not until the cause of the trouble, in the person of Khedive Ismail, had been removed. Amongst other appointments he acted as agent and consul-general in Egypt during the years 1883-1907. He had received K.C.S.I. for his Indian services; and was made Baron C. in 1892, viscount in 1898, and earl in 1901. It was due to his administration that the Sudan was restored to the rule of Egypt and the Brit. Empire, when the battle of Omdurman (1898) settled the question. Among his pubs. are two vols. on *Modern Egypt* (1908); and two vols. of *Political and Literary Essays*, between 1908 and 1916.

Cromer, par. and seaside resort of England, situated on the N.E. coast of Norfolk, 20 m. N. of Norwich. It is beautifully sheltered on the land side by hills, and has become famous as a watering-place on account of the fine bathing which can be obtained, and the splendid beach. The extensive golf-links add to its popularity. Its new pier was damaged in the Second World War. The sea has greatly encroached on the coast; the cliffs are protected by sea-walls. Fishing is the chief industry. The coast is extremely dangerous. There is a lighthouse visible for 23 m. Pop. 4100.

Cromlech (*crom*, bending, crooked; *lech*, stone), in archaeology, structures of a prehistoric age, often a circle of upright stone, as at Stonehenge. The name was formerly used also by Brit. archaeologists for equally old structures consisting of a large, flattish, unhewn stone resting horizontally on three or more fixed vertically in the ground. These appear to be chambered, sepulchral mounds, found in the Brit. Isles, N.W. France, Spain, N. Africa, Syria, and Japan. They mark the Neolithic age in Europe, and are now usually called dolmens, or in Guernsey and elsewhere Druid altars. The sepulchral chambers or cists beneath the mounds often contained a skeleton, with arms, stone implements, and various relics. Some attribute them to the Celts. The single stone may have been 'stones of bowing or worship' (see Armstrong's *Gaelic Dictionary*, 1825). Structures of

note of this kind are numerous in England, in Devonshire and Cornwall; there is also Kit's Coty House near Aylesford in Kent, and two structures at Plas Newydd in Anglesey. In Scotland there are the Auld Wives' Lifts near Craigmaddie House, Stirlingshire, those at Stennils in Orkney, the Standing Stones of Callernish in the Isle of Lewis, and the partially ruined Witch's Stone at Bonnington Mains near Edinburgh. See CIRCLES OF STONES, DOLMEN, MENHIR. See A. H. Keane, *Ethnology*, 1896; Leslie, *Early Races of Scotland*, II., 1866; and Borlase, *The Dolmens of Ireland*, 1897.

Crompton, Samuel (1753-1827), greatest improver of cotton manuf. through his invention of the spinning mule, for which, however, he received little recognition. B. at Bolton, Lancashire, he lived a hard-working life as farmer and weaver. It took him five years' ceaseless toil to invent the machine which was to produce the finest yarn ever woven. His spinning mule became the most popular one on the market, and was used in preference to the machines constructed by either Arkwright or Hargreave.

Crompton, cotton mill and colliery dist. in Lancashire, 2½ m. distant from Oldham. Urban pop. 15,000.

Cromwell, Henry (1628-74), son of Oliver the protector, under whom he served towards the end of the Civil war. He entered the army at twenty, and lived mainly in Ireland, accompanying Oliver there (1649) as colonel. In 1653 he was one of the Irish representatives in the Little (Nominated) Parliament. Major-general of Irish forces, 1655; lord deputy, 1657, becoming popular by his moderate policy. Recalled to England (1659) after his brother Richard's fall from power, he retired into private life. His great-grandson (d. 1821) was the last descendant of C.'s family.

Cromwell, Oliver (1599-1658), Lord Protector of England, b. at Huntingdon, was descended from a nephew of Thomas C., minister of Henry VIII. Educated at Huntingdon Grammar School and Sidney Sussex College, Cambridge, he studied law at Lincoln's Inn for a short period before marrying the daughter of Sir John Bourchier, and settled down in his native tn. It has been said that he was fond of gaming and other low pleasures in his youth, but there seems to be no real foundation for these statements, and indeed he is spoken of by others as a young man of deeply religious convictions. He sat for Huntingdon in the memorable Third Parliament of Charles I. (1628) and distinguished himself for his zeal against the bishops. After the dissolution of this Parliament he retired into the country to a grazing farm at St. Ives, where he became par. overseer and a zealous member of the religious community. In 1636 his maternal uncle, Sir Thomas Stuart, d. leaving him property in the Isle of Ely worth £500 a year, and thither, disgusted with the gov., he went with his family and, it is said, even thought of migrating to New England, actually taking a passage for himself and family

and only remaining in England because the ship by which he was to have sailed was detained by proclamation. By such chances does the fate of kings hang in the balance! In 1639 he was returned to Parliament for Cambridge, having become a popular leader and styled 'Lord of the Fens' for having kept a part of that country in Cambridgeshire from being expropriated from the people by various rapacious landowners. He sat for Cambridge in the Short and Long Parliaments, 1639-40. Sir Philip Warwick mentions him with disfavour in Nov. 1640, recording with disgust that 'he was very much hearkened to.' On the outbreak of the Civil war he contributed freely to the parl. army-chest, helped to form the E. Association, which secured E. Anglia for his party, and joined the army as a captain. Impressed by the superiority of the cavalier horse at Edgehill, he conceived the idea of encountering loyalist enthusiasm with Puritan zeal and strict discipline. Raising a troop of 'godly men' in his own co., mostly yeomen, and training them himself, they proved so efficient that the whole army was gradually remodelled on the same line. At Marston Moor he and his 'Ironsides' turned defeat into victory, and at Naseby won the decisive battle of the campaign. For these victories he received the thanks of Parliament and a pension of £2500 a year. He was now not only the greatest soldier in England, but head of the Independents, who in 1647 seized the king's person at Holmby House, and thenceforward controlled the destinies of the country. After many attempts to make terms with Charles, all thwarted by his obstinacy and duplicity, there ensued the closing tragedy at Whitehall, the justice and expediency of which are still debated. To C. and his party it seemed inevitable, but the shock to public sentiment did much to efface the impression caused by previous years of tyranny. The Irish campaign, with the massacres of Drogheda and Wexford, left a further blot on C.'s fame, though he put forward in justification the Irish cruelties of 1641, and the advisability of avoiding further bloodshed by striking terror into the enemy. The victories of Dunbar (1650) and Worcester (1651) enhanced his military reputation, and in 1653, impatient of parl. mismanagement and intrigue, he forcibly dissolved the House and set up what was practically a military despotism, thus doing what Charles had lost his crown and life in attempting. He summoned another Parliament, but this, though composed of members selected by the Army Council, proved unmanageable, and resigned its powers Dec. 1653. Four days later, under a written constitution, drawn up by a mixed council of officers and civilians, C. was installed as lord protector, with a council of state and a Parliament to be elected within nine months. The sovereign power was now within his reach, and on Feb. 19, 1654, he was formally invested with the dignity of protector of the Commonwealth of England, Scotland, and Ireland, in the Court of Chancery. As protector he

pursued a vigorous policy, making the Eng. flag respected wherever it was seen. As a ruler he was in many respects in advance of his time, introducing valuable reforms and projecting others which were defeated by the prejudices of his supporters. The principle of religious toleration was affirmed, but not allowed to apply in the case of Romanists and Anglicans, though even towards these C. seems to have been less harsh than his officials. Jews and Quakers were treated with leniency, and even attacks on religion, though dealt with severely, were not so brutally punished as of old. A strict Puritan regime for the improvement

OLIVER CROMWELL

Engraving after the painting by Robert Walker.

of morals was enforced, but its harshness bred hypocrites rather than true piety, and the reaction under Charles II. was a natural result. Education was encouraged, C. taking special interest in the univs. Though stern in repressing vice—e.g. he issued regulations to control racing—he was by no means so narrow as many of the Puritans; he enjoyed hunting and athletic sports, and was fond of music and pictures. He had enemies on all sides—Royalists, Presbyterians, Levellers, Anabaptists, Fifth-Monarchy men, all conspired against his rule, and many plots were formed for his assassination, but he did not alter his course.

His latest years were not happy; the attempt to create a House of Lords signally failed, the heavy taxes and the strict rule of his major-generals produced widespread discontent, and the constant dread of assassination affected him deeply. The death of his favourite daughter, Elizabeth Claypole, in 1658 broke him down, and his moodiness and proneness to suspicions were enhanced by the pub. of a pamphlet by Col. Titus, entitled *Killing no Murder* and designed to justify the assassination of a 'tyrant.' Despite

the attentions of his physician, he became ill of a fever and *d.* on Sept. 3, the anniversary of his victories at Dunbar and Worcester. His body was interred in Henry VII.'s Chapel, whence, at the Restoration, it was taken and exposed on the Tyburn gallows. C. was one of the greatest statesmen and soldiers England ever produced. His foreign policy had two great aims, the honour and welfare of England and the maintenance of Protestantism. To extend our trade and colonies he fought with Holland and Spain; Blake's wonderful achievements and the conquest of Jamaica form part of this story. He estab. a council for trade and granted a charter to the E. Indian Company, and his action at the time of the Vaudois persecution will never be forgotten. He raised England to a higher place among the nations than she held for many years before or after, and to him we may attribute the official foundation of our maritime greatness. Eng. sailors before had 'fought for their own hand'; C. made the navy a national institution. C. had six children: Richard, Henry, Bridget, Elizabeth, Mary, and Frances. Richard succeeded him in the Protectorate, but with the turn of the tide against him, he resigned and went abroad (see CROMWELL, RICHARD). Henry went to Ireland as lord lieutenant; Bridget married, first Gen. Ireton, and afterwards Gen. Fleetwood; Elizabeth married John Claypole of Northamptonshire; Mary married Lord Fauconberg, and is supposed to have assisted in the restoration of Charles II.; and Frances married, first a grandson of Earl Warwick, and afterwards Sir John Russell of Cambridgeshire. Of Elizabeth, the wife of C., it is said that she was a strong-minded woman and a constant spur to her husband in all his ambitions. An imposing statue, of the idealistic type, executed by Hamo Thornycroft, R.A., stands in Westminster in front of the walls of the Houses of Parliament—its fitting environment. See T. Carlyle (ed.), *Letters and Speeches of Oliver Cromwell*, 1845; S. R. Gardiner, *History of the Great Civil War*, 1886, and *Constitutional Documents of the Puritan Revolution*, 1906; Sir C. H. Firth, *Cromwell's Army*, 1912; W. C. Abbott, *Conflicts with Oblivion*, 1924, 1935, (ed.) *Bibliography of Oliver Cromwell*, 1929, and (the standard collection) *Writings and Speeches of Oliver Cromwell*, 1937; also the lives by Lord Morley, 1900; G. R. Stirling Taylor, 1928; J. Buchan, 1934; F. H. Hayward, 1934; M. Ashley, 1937; D. E. Muir, 1945.

Cromwell, Richard (1626-1712), son of Oliver the protector; his successor from 1658 till May 1660. He had served in the army and in various Parliaments under his father, but was not so strong or capable a man. The Long Parliament and heads of the army agreed to dismiss him from office, this decree being accepted without a struggle. See O. Cromwell (a lineal descendant of the protector Oliver Cromwell), *Memoirs of the Protector . . . and of his Sons*, 1820; Sir R. Tangye, *The Two Protectors*, 1899.

Cromwell, Thomas, Earl of Essex (c.

1485-1540), ambitious Eng. statesman and courtier of Henry VIII.'s reign. He served in the Fr. Army in Italy, becoming a good linguist while abroad; returned to England in 1513 and became a lawyer. He was a student of it. politics and admired Machiavelli. From 1514 he entered Wolsey's service, serving him faithfully as secretary, and speaking in his defence in the House of Commons, 1529 (see Shakespeare's *Henry VIII.*, act ii.). He became Privy Councillor, 1531, and Henry's chief minister after Wolsey's fall, being one of the king's chief agents in bringing about the Eng. Reformation and in establishing Tudor absolutism. He advocated Henry's divorce from Catherine of Aragon by exercise of royal supremacy. In 1533 he was chancellor of the exchequer; in 1535 vicar-general to enforce the carrying out of the Act of Supremacy (1534). To him were largely due 'the suppression of the monasteries' and confiscation of their property as a means of securing revenue, which earned him the title *malleus monachorum* (hammer of the monks). Lord privy seal, 1536; lord chamberlain, 1539; earl of Essex, 1540. His influence with the king at one time was very great, and he caused the downfall of men in the highest places, such as More, Fisher, Pole, and Courtenay. He crushed the Catholic revolt in the N. (Pilgrimage of Grace). C. was deservedly dreaded by and unpopular with both nobles and clergy. His fate was sealed partly by his agency in bringing about Henry's marriage with Anne of Cleves. Accused of treason, he was deserted by the king and executed. See M. Drayton, *Historie of the Life and Death of Lord Cromwell*, 1609; W. F. Hook, *Lives of the Archbishops of Canterbury*, vi., 1868; J. A. Froude, *History of England*, chapters vi. to xvii., 1882; R. B. Merriman, *Life and Letters of Thomas Cromwell*, 1902; van Dyke, *Renaissance Portraits*, 1905; and J. Lingard, *History of England*, iv. 8.

Cronin, Archibald Joseph (b. 1896), Scottish writer and doctor. Practised in London and Wales, as a medical inspector in the mines, providing him with a background for some of his novels, especially *The Citadel*. His chief works are *Hatter's Castle* (1931); *The Stars Look Down* (1935); *The Citadel* (1937); *The Keys of the Kingdom* (1942); *The Green Years* (1944); and *Shannon's Way* (1948).

Cronje, Piet Arnoldus (1835-1911), Boer general of Huguenot extraction. Was at one time member of the executive council of the Transvaal Republic and chief native commissioner. He led his men against the Brit. at Doornkop and Majuba Hill; was also responsible for forcing the garrison of Potchefstroom to capitulate, purposely suppressing the news of the armistice (1881). In 1895 he made the Jameson raid of no effect. On the announcement of the Transvaal war, he joined in the hostilities against the Brit., but was defeated in his attack on Kimberley. Gained a victory over Lord Methuen at the Modder R., and later at Magersfontein. Was forced to retreat before Gen. French in the siege of Kim-

berley. In spite of the efforts of the two Boer generals, De Wet and Botha, to come to his aid, he was forced to surrender with a force of 4000 men and six guns at Majuba. He was sent to St. Helena, but was allowed to return at the end of the Transvaal campaign. Was a large land-owner.

Cronstadt, in Russia, see **KRONSTADT**.

Cronus (called **Saturnus** by the Romans), identical with the Rom. god Saturn; C. according to the generally accepted version was the son of Uranus, one of the Titans, and of Ge, the earth. He married Rhea, by whom he had many children, among whom were Hera (Juno), Hades (Pluto), Poseidon (Neptune), and Zeus (Jupiter). He dispossessed his father of the throne of heaven, and was ousted from it in like manner by his own son Zeus.

Crook, George (1828-90), Amer. general; b. in Ohio. Made himself famous both in the Civil war and in his resistance to the attacks of the Indians in Idaho during the years 1866-72, and again eleven years later in Arizona.

Crook and Billy Row, par. in the co. of Durham, England near Bishop Auckland. Pop. 12,700.

Crooked Islands, two is. of the W. Indies, belonging to the Brit. group, Bahamas. They consist of Acklin, or Great Crooked Is., and Little Crooked Is. To the westward of Great Crooked Is. is Castle Is., upon which is a lighthouse, whose light is visible at a distance of about 18 m. Another lighthouse is situated on Bird's Rock, W. of Little Crooked Is. The Spaniards took possession of them, but they were restored to England in 1783. The pop. of 1300, mostly Negro, is engaged in cotton and banana production.

Crookes, Sir William (1832-1919), physicist and chemist; b. in London, eldest son of Joseph C., a tailor. He was first a student at the Royal College of Chem. under Hofmann; then made superintendent of the meteorological dept. of the Radcliffe Observatory, and gave lectures on chem. at the Science College. F.R.S. 1863; and vice-president of the Chemical Society, 1870. Obtained a prize of 3000 francs and a gold medal from the Fr. Académie des Sciences. An authority on all sanitary questions. Made many original discoveries in chem. and physics; viz. of the metal thallium (1861), and of the rare earth monium or victorinum. An expert in electricity; invented the radiometer and C.'s tubes. In addition to various technical works he wrote a standard treatise on *Select Methods in Chemical Analysis* (1871) and a small book on *Diamonds* (1909), a subject to which he had devoted some study during visits to S. Africa. Knighted in 1897, president of Brit. Association in 1898, O.M., 1910. Amongst the many contributions made by C. is his theory that all the elements have evolved from one primordial stuff, 'protyle.' His *Researches on the Phenomena of Spiritualism* (1874) contained matter that he never retracted, though it formed subject of regret with many colleagues who placed less trust in the good faith of

all humanity. See F. D'Albe, *Life of Sir William Crookes*, 1923.

Crookhaven, fishing vil. in the co. of Cork, Eire, 30 m. distant from Skibbereen. Pop. 150.

Crooks, Will (1852-1921), Eng. politician. One of the earliest of the Labour leaders, he became mayor of Poplar in 1903. Entered the House of Commons in the same year, and in 1916 was made a Privy Councillor.

Crookston, chief city in the co. of Polk, Minnesota, U.S.A.; situated on the Red Lake R., and some 150 m. distant from Winnipeg. Pop. 7100.

Crop, term used in speaking of certain dilatations of the alimentary canal of some animals. It is situated in an anterior position to the true stomach, and serves as a reservoir for food. In birds it is often called the *craw*, and is noticeable especially in predaceous and granivorous species; in the C. of the pigeon are two small accessory sacs. Insects also have these dilatations immediately preceding the proventriculus. In some, e.g. bees, the food can be disgorged from the C. for the benefit of the young.

Cropredy and Cropredy Bridge, par. in Oxfordshire, England, 4 m. distant from Banbury. C. Bridge is memorable for the victory gained by Charles I. over Waller, 1644. Pop. 400.

Crops. This general term for the agric. produce of the soil, the return of the farmer's labour, has been classified in many ways. Thus we speak of white C., that is of those plants such as wheat or barley and other grain which turn white as they ripen; of green C., those which are harvested green, such as clover, grasses, including also roots, potatoes, etc.; so too we have black C., especially used of beans and peas. A more convenient and more useful classification is now usually adopted, that of *cereal*, *leguminous*, and *root C.* The cereals include wheat, barley, oats, rye, maize; the leguminous clover, beans, peas, vetch, sainfoin, lucerne; the roots turnips, swedes, and mangels, and often also cabbage, kail, carrots, and potatoes. Further, there are special C. of importance to the world production of the soil, such as rice and its congeners, and the industrial cotton crop. Farmers in very early times knew that the planting of the same crop in the same ground, year in year out, exhausted the soil; thus it is that in primitive times we find the 'extensive' system prevailing in which, after a piece of land was exhausted, the farmer moved on and exhausted another. Sometimes we find primitive peoples moving as a community as the soil was exhausted—nomad agric. communities like the early Teutonic peoples mentioned by Tacitus and Caesar. Virgil's *Georgics* exhibits a knowledge of rotation of C., for he bids the farmer either lay his ground fallow every alternate year, or let the rotation of spelt or pulse, vetch, or lupine prevent the exhaustion of the soil; and he combines copious manuring with rotation. The more full development of crop rotation took place in England when the old

common-field system of farming by small tenants still prevented any but the large landowner from making use of the scientific rotation of which Lord Townshend was the pioneer. By the beginning of the nineteenth century rotation was nearly everywhere in force, and numerous systems, differing according to the nature of the soil, climate, altitude, and general situation, etc., were to be found. In countries such as Italy a very wide selection of following C. is made use of, and there a six or even eight years' system is found. In modern Brit. farming roots or leguminous C. alternate with the cereals. It must be remembered that cereals are exhaustive, for not only do

fact by farmers in times long past (see Pliny, *Natural History*, viii.); its reason was not known till the experiments of Hellriegel and Willfarth in Germany in 1888. Experiment had shown that a piece of land laid down for a long time in pasture and then sown for fifteen years with lupines contained thrice as much nitrogen as it contained before, which could only have come from the air. The test was made with leguminous plants in sterilised soil side by side with oats and barley. They were both obliged to be fed with nitrogenous manures. With a mixture of non-sterilised soil, the leguminous plants developed nodules at the roots and flourished without manure;

High Commissioner for Canada

CROPS AT INDIAN HEAD, NEAR CALGARY

they not accumulate the nitrogenous and mineral constituents of the soil, but they are not used on the farm, and all they have taken from the soil is sold off, while roots and clover, as feeding stuffs for stock, return these constituents as manures. The famous 'Norfolk' four-course system, roots, barley, clover, wheat, is typical of the rotation system. The root crop is also useful for allowing cleaning of the ground by hoeing between the rows. As to the exhaustion of the constituents of the soil, cereals take up more phosphoric acid than other C. except clover; and this therefore is lost to the soil, while it is retained by the roots consumed by the stock; potash is less taken up by cereals than by other C. and little therefore is wasted. These are the main losses of minerals by the growth of C., and must be replaced by mineral manures. The root C. take up far more nitrogen than the cereals, but not nearly so much as the leguminous C., which are the great consumers of nitrogenous material. It is this fact that makes a crop like red clover such a splendid preliminary for a cereal crop. This has been known as a practical

fact by farmers in times long past (see Pliny, *Natural History*, viii.); its reason was not known till the experiments of Hellriegel and Willfarth in Germany in 1888. Experiment had shown that a piece of land laid down for a long time in pasture and then sown for fifteen years with lupines contained thrice as much nitrogen as it contained before, which could only have come from the air. The test was made with leguminous plants in sterilised soil side by side with oats and barley. They were both obliged to be fed with nitrogenous manures. With a mixture of non-sterilised soil, the leguminous plants developed nodules at the roots and flourished without manure;

these nodules are found in all leguminous plants growing in natural, non-sterilised soils, and are caused by micro-organisms, *Bacteria radicicola*, which absorb nitrogen from the air through the nodule, break down, and in turn are absorbed by the plant. Cultivations of these bacteria are made and sprayed on the plants, and have an important effect in increasing agric. C. See also AGRICULTURE, CROPS; ROTATION OF CROPS. See L. Bailey (ed.), *Cyclopædia of Farm Crops*, 1922; H. G. Sanders, *An Outline of British Crop Husbandry*, 1939; W. Fream, *Elements of Agriculture*, 1941; and H. I. Moore, *Crops and Cropping*, 1946.

Croquet. Antiquarians have traced the descent of this game from Pell Mell or Pall Mall, Fr. *paille-malle*, which was fashionable at the end of the seventeenth century in London, and was played with hoops, a ball, and mallet, the object being to run a ball through the hoops and strike a peg in the fewest strokes. The game, much as it is played to-day, seems to have been first played in Ireland in 1852, and it became popular before 1860. As then played, there were ten hoops with a double

hoop or cage in the centre. In 1868 the All England C. Club was formed, and championship games were played at Wimbledon. For some years C. was played everywhere where a lawn was available, but it was a family or garden party game. Lawn tennis practically killed it, and a revival in a new form did not take place for some twenty years. In 1897 was formed the C. Association, the ruling body, with the centre of the game at Roehampton. The new C. is very scientific, and the utmost skill and care are exercised in the laying of lawns, in the selection of mallets, and the making of the balls.

The ground is a level grass lawn 35 yds. long by 28 yds. wide; 7 yds. from the centre of each base or shorter line are two pegs; there are six hoops of iron rods, $\frac{1}{2}$ to $\frac{3}{4}$ in. in diameter, 12 in. from the ground when fixed, $3\frac{1}{2}$ in. wide (for championship play, 1910, but 4-in. hoops are used). The hoops are placed thus (the unit of measurement from line 1, etc.): Nos. 1, 2, 3, and 4 are placed at the angles level with the pegs and 7 yds. distant from them and from the base and side lines; Nos. 5 and 6 are placed in the centre between the pegs, 7 yds. from each peg and from each other. The order of playing hoops is 1, 2, 3, 4, 5, 6, hit turning peg, then 2, 1, 4, 3, 6, 5, and winning peg. No. 5 is the 'rover' hoop. There are four balls, $3\frac{1}{2}$ in. diameter, and 15 oz. to 16 oz. in weight. Composition balls are now used for match play, but the older boxwood type are still common. Two, playing two balls each, or four, playing one ball each, are the number of players, blue and black against red and yellow, the order of play being blue, red, black, yellow. Each player has a metal clip, coloured as his ball, which must be placed on the hoop or peg next to be passed through or struck. The mallets must have wooden heads with straight faces exactly alike, the head usually weighing about $3\frac{1}{2}$ lb. The points of the game are scored by each ball passing the hoops and striking the pegs in order, and the winning player (or two players in partnership) is he who makes all possible points with both balls. The ground is marked with a white chalk band round base and side lines and a spot 3 ft. from the lines is placed at each angle. The start of each player is made from any point between the centre of the base line and the left corner and 3 ft. from the base line, which is behind the winning or last peg. Two terms used in the game need to be explained: roquet is to strike another ball with one's own; croquet is, after making a roquet, to take up the striking ball, place it against the ball struck wherever it may have rolled, and then play so that both the balls in contact are moved. If a player fails to make a point, i.e. to pass through a hoop or strike a peg (or both, in, of course, the proper order as stated above), or if he fails to roquet another ball, he loses his turn, and the next player in turn plays. If he succeeds in making a point, he has another stroke; if he roquets, he then takes roquet, plays the stroke or has another stroke after the

balls have been struck or croqueted. In the old game, the player could place his foot on his own ball, but this has disappeared in the new game. Also opponents' balls could be driven out of play; now no ball must be croqueted across the boundary line; if it is the player does not play his second stroke and loses his turn. The ball out of bounds is replaced 3 ft. from the line where it crossed.

With a true lawn and a knowledge of tactics the game can be as skilful in combination and in power of leaving balls for the next stroke or strokes as billiards. Special attention must be given to the various strokes made in making roquets. If the player wishes to take his second stroke at some distance he rushes the object ball, that is, strikes it so hard that it travels a considerable distance. A skilful player can, with his ball, cut the object ball so that it goes off at an angle; he may by striking his ball at the top make a follow through as in billiards. Wiring an opponent, i.e. leaving his ball so close to a hoop or peg that he has no free stroke at an object ball, is another test of skilled play. If, however, an opponent is wired so that no object ball is possibly available, he may lift his ball and go back to the starting point or baulk. The best way of holding the mallet and standing has been much discussed. A swing or pendulum stroke is from every point of view the best, and it may be made either by standing facing across the ball and swinging the mallet between the legs, or by standing with both feet in a line parallel with the ball and swinging the mallet with the right hand lower down and the left at the top; but the methods of grip are as various as those of golf. There is an elaborate system of handicapping for tournaments. In the U.S.A. the older form of C. has survived, but a special form, known as roque, extremely scientific, answers more to the scientific modern Eng. C. It is played not on grass, but on an artificially prepared ground which is 60 ft. by 30 ft., with four corners cut off 6 ft. in length, thus making a hexagonal court. There are ten hoops and two pegs which stand 12 in. and 18 in. out of the ground respectively. The most marked difference in the game is the rubber-faced board surrounding the ground against which a player may strike his ball and cause it to rebound into play, as off a billiard cushion; this stroke is called a carom. See the C. Association's *Laws of Croquet*, and periodical *Croquet Gazette*. There are many good books on the hist. and scientific methods of play by T. Mayne Reid (1863), J. D. Heath (1874, 1904), and H. C. Needham (1900). See also C. D. Locock, *Modern Croquet Tactics* (1920).

Crore (Hindu karor), Anglo-Indian word for 10,000,000 or 100 lakhs (usually) of rupees. It is also spelt kraur, courour, cauror, etc., and represented by Rs. 10,000,000 (or in official papers Rs. 1,000,000, one million tens-of-rupees). The value of a C. of rupees, now that the rupee is worth 1s. 6d., is about £750,000.

Crosby (married name, Van Alstyne), **Frances Jane** (1820-1915), Amer. hymn-writer; *b.* at Southeast, Putnam co., New York; daughter of John Crosby. Blinded in infancy; in 1835 entered New York Institution for the Blind; there graduated (1844) and taught (1847-58). Married, 1858, Alex. Van Alstyne, blind music teacher (*d.* 1902). Wrote hymns whose world-wide popularity is largely due to fortunate settings. 'Safe in the arms of Jesus' is best known; 'O hear my cry'—with its refrain 'Come, Great Deliverer'—is peculiarly haunting.

Crosby, Howard (1826-91), Amer. preacher, *b.* in New York; graduated at the univ. of New York city; was prof. of Gk. there in 1851, and at Rutgers College, New Brunswick, New Jersey, 1859. He was chancellor of the univ. of the city of New York, 1870-81, and in 1873 moderator of the Presbyterian church. He took a prominent part in politics and social reform. His son, **Ernest Howard Crosby** (1856-1907), a social reformer, was *b.* in New York city and graduated at its univ., 1878. He was president of the Social Reform Club of New York city and the New York Anti-Imperialist League. He pub. many works in the manner of Walt Whitman.

Crosby, two seaside pars., Great C. and Little C., of Southport, a rising seaside resort in the co. of Lancaster, England. Pop. 13,000.

Crosier, or **Crozler**, originally 'bearer of the crose', but in the fifteenth and sixteenth centuries both 'crose' and 'crose' began to be confounded as 'crose' (see *Murray's English Dictionary*). The C. was originally the bearer of the episcopal crook (*crociarius*); finally the crook itself was called C. It is now the pastoral, crook-headed staff, one of the insignia of the bishop, carried before both bishops and archbishops. Probably derived from the *lituus* of Rom. augurs. See O. Taylor, *Archæologia*, 52, 'On the Use of the Terms Crosier, Pastoral Staff, and Cross.'

Cross, Mary Ann, or Marian, see **ELIOT, GEORGE**.

Cross, Sir **Richard Assheton**, first Viscount (1823-1914), Eng. politician, *b.* near Preston, and in 1868 defeated Gladstone in S.W. Lanarkshire by 313 votes. Although of comparatively untried ability he was appointed by Disraeli in 1874 to the post of home secretary with a seat in the Cabinet. He was responsible for the following enactments; The Artisans Dwellings Act, 1875; the Factory and Workshops Act, 1878; the Criminal Law Amendment Bill, and the Housing of the Working Classes Bill, 1885.

Cross, *riv.* which rises in the Cameroons in W. Africa. This riv. is navigable for three-quarters of its course and enters the bight of Biafra.

Cross (Lat. *crux*), intersection of two pieces of wood at right angles. In ant. times the C. was a very common means of punishment. As such it seems to have been Phœnician in its origin, though it was used by Indians, Persians, Medes, Gks., and Romans. The original form of crucifixion was by fastening or impaling the

victim on a stake, the *crux simplex*. But the various forms of the *crux compuncta* are better known. The *crux commissa*, known also as the Tau (from the Gk. capital T) and C. of St. Anthony (the name by which the Lat. C. was distinguished in the Middle Ages), consists of the upright with the C.-piece at the top. In the *crux immissa*, or Lat. C., part of the upright extends above the C.-piece. This is the form best known in the W., and the Gk. C., where the four arms are of equal length, may be considered a variant of it. The *Celtic C.* is then Lat. C. with a circle round the head. The *crux descussata*, saltire, or St. Andrew's C., so called because tradition relates that St. Andrew suffered martyrdom on a C. of this shape, is formed of two beams crossing each other obliquely. From these four varieties countless smaller types of C. have been evolved by Christian symbolism. Though so far we have only spoken of the C. as an instrument of death and disgrace, yet even before the time of Christ it was also in use as a religious emblem. By the ant. Egyptians the *crux ansata* was regarded as the symbol of life, and in Gaul it was a symbol of the sun. The Sp. conquerors of S. America were greatly astonished to find the symbol of the C. venerated in that country, where it was the sign of the god of rains. In the reign of Constantine, the sign of the C. in the form known as the *labarum* or XP, became the official standard of the empire. In 325 tradition tells us that St. Helena, the mother of Constantine, made a journey to Jerusalem to seek the true C. Her investigations resulted in the discovery of three Cs., and by the advice of Macarius, patriarch of Jerusalem, a sick woman was laid on them in turn, that the C. of Christ might be discovered. When laid on the third she regained her health, and the miracle was considered conclusive. Relics of the C. spread throughout the world, and the feast of the Invention or Finding of the C. is celebrated in the W. Church on May 3. The feast of the Exaltation of the C., celebrated E. and W. on Sept. 14, commemorates its recovery by Heraclius (A.D. 628) after capture by the Persians. The high veneration which was paid to relics of the C. during the early ages led to the great iconoclastic controversy. The iconoclasts wished to do away with such veneration, but the Church decreed that *latreia* (adoration) might indeed be paid to the wood of the C., though the worship is referred back to the person of the Crucified. In the medieval Eng. Church and the Rom. Catholic Church the worship of the C. takes place on Good Friday. During Passion-tide all the Cs. in the church have been veiled in violet, and on Good Friday the veils of the altar C. are removed at the singing of the anthem, 'Behold the wood of the cross on which hung the Saviour of the world.' It is then solemnly laid on the altar steps and kissed with great reverence by the sacred ministers. Another smaller C. is similarly venerated by the people. The early and deep hold which the veneration

of the C. took on the Eng. mind is shown by Cynewulf's wonderful poem, *The Dream of the Rood*. The sign of the C. was made in the early Church with the thumb on forehead or mouth. In the E. Church it is made with the first two fingers and the thumb, from forehead to breast, then to the right shoulder and then to the left. The general W. use is from left to right with open hand, though Lutherans use only the thumb. The placing of a C. or crucifix over the altars of churches is common to Rom. Catholics, Anglicans, and Lutherans alike; but many extreme Protestants refuse the use of the sacred sign as a mere superstition of human invention. *Processional Cs.* are those used to head eccles. processions, while *pectoral Cs.* are worn on the breast by bishops. In the case of metropolitans, an *archiepiscopal C.* takes the place of the bishop's crosier.

C. railway station in London being a modern copy. *Town or market Cs.* were generally erected in the market-places of tns. and vils. as pulpits whence sermons and addresses might be given. There are some excellent examples of these structures in England, in which country they were best developed. That of Cheddar in Somersetshire consists of an open vaulted structure with plenty of space where shelter may be taken from the rain. In the centre rises the base of the C. which surmounts the whole. The famous Paul's C. was erected by Henry III. in 1259. The many important sermons preached from it have made it an integral part of Brit. hist., but its exact form is unknown. It was demolished in 1643 as an offence to the Puritans. The present C., surmounted by a picture of St. Paul, was erected in 1911 as a memorial, and is also provided with a

CROSS-BOW AND QUARREL

The various kinds of Cs. in upright architecture must now be considered, for in the great art of Christian architecture, and throughout the whole range of medieval decorative art, the C. sign has been a most powerful influence, and Cs. exhibiting an infinite variety of form and proportion surmounted the loftiest architectural members of cathedrals and churches. The *sanctuary Cs.*, usually covered with exquisite sculptural design, marked the verge of a sanctuary. These and the *boundary or monumental Cs.* consist of an upright pillar or obelisk set in a heavy socket level with the ground. Sometimes they marked boundaries, but it is generally believed that most of them were erected to mark the grave of some king, bishop, or important hero. The oldest of these Cs. are connected with Scandinavian buildings and, from the fact of their bearing inscriptions in runes, are known as *runic Cs.* The Ruthwell C. is a good example of this kind. It is said that the is. of Iona once contained 300 monumental Cs., but only one, that of St. Martin, is now standing. The famous *Eleanor or Norman Cs.* are well known. They were erected in 1290 by Edward I. on his way to Westminster with the body of his wife Eleanor. At each place where the body rested for a night a memorial C. was erected. Ten or more, of which those at Geddington, Northampton, and Waltham are restored originals, were erected between 1291 and 1294. That at Charing was destroyed in the seventeenth century, the present C. in the courtyard of Charing

pulpit for giving addresses. The Scottish tn. Cs. early lost their religious character, and were used for the announcement of royal and civic proclamations. See G. de Mortillet, *Signe de la croix avant le Christianisme*, 1866; J. Stuart, *Sculptured Stones of Scotland*, 1867; E. Bunson, *Das Symbol des Kreuzes bei allen Nationen*, 1878; G. F. Browne, *The Ancient Cross Shafts at Newcastle and Ruthwell*, 1916; W. G. Collingwood, *Northumbrian Crosses of pre-Norman Age*, 1927; and R. Guénon, *Symbolisme de la croix*, 1931.

Crossbill, bird of the genus *Loria*, native of Europe, Asia, and N. America, chiefly in pine forests. The C. gains its name from its curious bill, in which the upper mandible crosses over the lower one at the point. This enables them easily to tear and break the scales of the pine cones on which they chiefly feed. The common red C. (*L. curvirostra*) is the best known, and occurs sometimes in Scotland. The plumage of the female is orange-green or grey-green. It only occurs in Britain as a migrant.

Cross-bow, or Arbalist, weapon used chiefly during the twelfth and thirteenth centuries, after which it gave place in England to the less cumbersome long-bow. It consisted of a bow, made of wood, iron, or steel, attached to a wooden stock, similar in shape to the butt of a musket. The bowstring was pulled back by a lever which in the smaller instruments was worked by hand or foot, and held in position by a notch. The bolt or 'quarrel,'

consisting of a short stout winged shaft with metal point, was laid in a groove at the top, and the string was released by a trigger. The larger Cs. may almost be considered as engines of war, so cumbersome were they. See Sir R. Payne-Gallwey, *The Crossbow*, 1903.

Cross-Country Running had its origin in school steeplechases held at Rugby, Shrewsbury, and Eton. In 1867 a C.-C. race was inaugurated by the Thames Rowing Club. Various clubs for C.-C. R. then came into being, and in 1876 the first national championship was held at Epping Forest. All the competitors lost their way. In 1929 the national championship was won by the Birchfield Harriers for the sixteenth time since 1877. An international championship was formed in 1902, and England were the first winners, Alfred Shrubbs being the Eng. champion. The C.-C. race was omitted from the Olympic games for 1928 as an unsuitable event for a summer programme. W. M. Cottrell (England) and Nurmi (Finland) are among the best C.-C. runners of recent years.

Crossen, see **KROSSEN**.

Cross-Examination, see **EVIDENCE**.

Crosshead. The C. in an engine is the block which, fixed at the end of the piston-rod, works between parallel guides, and so takes up the sideward thrust due to the obliquity of the connecting-rod, thus enabling the piston-rod to work in a straight line. It is generally made of cast iron, but is also of wrought iron or cast steel, and the slide bars between which it works are of wrought iron or steel with bearing surfaces of brass.

Crossley, Ada (1874-1929), famous Australian contralto; b. March 3, 1874, at Tarraville, Gippsland, Victoria; daughter of Edwards Wallis Crossley; mother related to poet Cowper. Educated at Port Albert, Gippsland; taught music by Alberto Zelman and Fanny Simonsen. In London, after four months under Sir Charles Santley, sang first at Queen's Hall, May 18, 1895. Married, 1905, Francis F. Muecke.

Crossley, Sir Francis (1817-72), b. at Halifax, Yorkshire, and became a celebrated Eng. manufacturer in the carpet trade. He accumulated an enormous fortune, which he dispensed very liberally on the Congregational Church and on various charities in connection with his own native city. His business success was obtained by the introduction of steam instead of manual labour and to the system of patenting new inventions. He was created a baronet 1863.

Crossmollina, tn. and par. in the maritime co. of Mayo, Ire., and situated in the barony of Tirawley. Pop. 4500.

Cross, Southern, see **SOUTHERN CROSS**.

Crossword Puzzles, offshoot or variant of the acrostic. The crossword puzzle consists of a diagram made up of numbered and blocked-in spaces, the numbered spaces ultimately to contain letters and the blocked-in spaces to show the beginning or termination of a word. When the letters are all filled in they help to form words arranged horizontally and

vertically. Clues to the words are given with the diagram, and may be either straightforward or deliberately ambiguous. The most usual diagram consists of a square of fifteen spaces each way, the blanks forming a symmetrical pattern, but oblongs and pictorial shapes are often used, and in some cases a thickened line takes the place of the blocked-in space. Crosswords of a childish sort were not unknown to the nursery magazines of the last century, but the vogue did not start until the early 1920's, when a New York publisher took hold of what at that time was a little noticed feature of a Sunday newspaper and brought out the first crossword puzzle book. Its success was remarkable. Crosswords began to appear in newspapers and magazines, and the Amer. public was captured. In England it then met with a general and enthusiastic welcome, and soon became almost as familiar in a paper as the title-page. The crossword puzzle has lasted a remarkably long time in England, practically all newspapers and many magazines supplying crosswords for their readers; the daily *Times* succumbed to them in 1930, after holding out for seven years. The majority of crosswords have simple solutions, but those in *The Times*, *Sunday Times*, *Observer*, *New Statesman and Nation*, *Spectator*, etc., give scope for research. Various periodicals have organised crossword competitions, usually with alternative solutions for many words, only chance directing the right choice of solutions. The *jeu de mots croisés* attained a certain popularity in France, and the *Morning Post* pub. sev. C. P. in Fr. for Eng. readers. *The Times* has issued sev. in Lat. C. P. have also been used with success for commercial advertising purposes.

Crotalus, genus of ophidian reptiles or pit-vipers, a sub-family of Viperidae. There are about eleven species, characterised by the presence of a rattle and the covering of small scales on the top of the head. All are to be found in America, and are known as rattle-snakes. *C. horridus*, a native of the U.S.A., is the common rattle-snake (q.v.). Two other familiar species are *C. terrificus* and *C. durissus*.

Crotch, William (1775-1847), musical composer, b. at Norwich. At the age of four he played the organ in London. In 1786 at the age of eleven he became assistant organist to Randall at Trinity and Kings Colleges, Cambridge. Three years later he wrote an oratorio *The Captivity of Judah*. After some time as a theology student at Oxford, he finally in 1790 turned again to music, and was appointed organist in Christ Church Cathedral. He took his Mus.D. in 1799, and in 1822 became first principal of the Royal Academy of Music in London. He wrote for the organ, piano, and voice, and was the author of a work *Elements of Musical Composition and Thorough Bass*.

Croton, large tropical genus of Euphorbiaceae, contains many species with important medical properties. *C. cascarilla* is a native of Santa Domingo

and Florida, and yields the cascarrilla bark. *C. Tiglium*, an inhab. of the Moluccas and Ceylon, is one of the most active and drastic of purgatives, woods, leaves, and fruit all containing the property. The seeds were formerly called grains of Tilly or Molucca grains, and the oil expressed from them is the powerful C. oil. The oil consists of a mixture of fatty acids and their glycerides, notably acetic, butyric, valeric, and methyl crotonic acids; the purging quality of the oil seems due to crotonic acid. A single drop administered internally acts as a drastic purgative; its action is too powerful for ordinary use, but it is employed with good effect in the case of unconscious or insane patients. *C. lacciferum* furnishes a very fine lac and a brilliant varnish. *C. sanguifluum* yields a deep red resinous substance resembling dragon's blood (*q.v.*); *C. balsamiferum* is aromatic and the liquor called eau de Mantes is distilled from it.

Croton, riv. of New York, U.S.A., and a trib. of the R. Hudson, into which it flows when about 35 m. distant from the city of New York. It helps to supply that city with water.

Crotona, or **Croton**, Gk. colony founded from Achaea (710 B.C.) in Calabria, Italy. It is the modern Cotrone on E. coast in the prov. of and 30 m. from the city of Catanzaro. By 510 B.C. it was strong enough to destroy its neighbour, Sybaris. It was famous in antiquity for the school of Pythagoras, a school of medicine, and as the bp. of Milo, the athlete. Later it lost its independence, and became part of the Rom. Empire. The present Cotrone has walls, a citadel, a cathedral, and a castle, and is about 6 m. from Cape Colonne. Liquorice root is grown. Pop. (com.) 11,600. See Smith's *Dictionary of Greek and Roman Geography*.

Crotophaga, sub-family of the family Cuculidae (cuckoos), peculiar to the New World, including sev. species. The chief member is the Ani, Black Parrot, or Savannah-bird, which extends from the S. States of N. America throughout most of S. America. Its plumage is glossy black, and its strange shape has also gained it the name of the Black Witch.

Crouch, riv. of Essex, England, flowing into the North Sea at Foulness. Burnham-on-C. is a favourite yachting centre. Length, 24 m.

Croup, spasmodic affection of the larynx in children, usually accompanied by the formation of a false membrane. The application of the term is now very uncertain, as many conditions formerly called C. have been identified with other diseases. The safest plan is to suspect diphtheria wherever the exudation of a false membrane is apparent. It is possible that bacilli, other than the diphtheria bacilli, may give rise to membranous growths, but all such cases must be regarded as doubtful, and recourse should be had to diphtheria antitoxin. A croupous condition may be due to catarrh of the larynx, when the treatment should aim at reducing the inflammation and removing any obstructive matter

causing difficulty in breathing. *Laryngismus stridulus* is a spasmodic affection of the larynx, threatening asphyxiation. The attacks are sudden in their onset and cease just as suddenly. The throat should be examined for adenoids, as they probably constitute the cause.

Crow, bird of the genus *Corvus*, of the family Corvidae. The family is distributed over almost the whole of the globe, though there are very few species in the E. part of Australia or in S. America. They include Cs., magpies, jays, and choughs, and may be subdivided into a large number of species. The colour of the true C. is black, generally a glossy black, often tinged with white at the edges of the feathers. But more distant members of the family are brownish: the jackdaw has grey at the back of the neck, and the hooded C. (*C. splendens*) is grey on the back and under parts. The choughs also vary from the common black in their red feet and red or yellow bills. The Corvidae have strong and generally straight bills with no notch in the upper mandible. The wings are long and pointed, except in the jays and magpies, where they are shorter. The tail is long and graduated, usually with twelve rectrices, of which the two middle ones are longer than the others. The C. is regarded by many naturalists as the highest family of birds. The intelligence of all of them is great in the extreme, and innumerable stories are told of their craft and cunning. Many of them vary their own disagreeable notes by imitating those of other birds. Among these the Amer. blue jays are the most noted. They may also be taught to imitate the human voice. Cs. are omnivorous, eating animal, fish, and vegetable foods indifferently. They show themselves very adaptable to circumstances, and devour almost anything edible.

Crowberry, or *Empetrum nigrum*, species and genus of Empetraceae which grows chiefly in the N. temperate zone and in the Andine Mts. The plant is an evergreen shrub with small crowded leaves, and the fruit is a black edible berry of a juicy nature, sometimes used in making wines. The fruit owes its name to its reputation for attracting crows, and in rookeries it is often used for decorative purposes.

Crowd, musical instrument. *see* CRUTH.
Crowe, Sir Eyre Alexander (1864-1925), civil servant in the Brit. Foreign Office, was b. at Leipzig; third son of Sir Joseph Archer C., consul-general there. His mother was a Ger., Fräulein Asta von Barby, of Gotha. Educated at Düsseldorf, Berlin, London, and Paris. Entered Foreign Office in 1885. In 1907 Brit. delegate at second Hague Conference. In 1911 awarded the K.C.M.G. for success in arbitrating, at The Hague, over recapture of an Indian agitator on Fr. soil. Assistant under-secretary for foreign affairs, 1912. Before the First World War he made a memorandum on foreign relations, which was useful when the war broke out. Attended Paris Peace Conference as minister plenipotentiary, and

from 1920 to 1925 was made permanent under-secretary.

Crowfoot, see **RANUNCULUS**.

Crow Indians, also called **Sioux**, or **Dacotahs**, tribe of N. Amer. Indians inhabiting the Dacotah ter.; more civilised than the other tribes.

Crowland, or **Croyland**, par. and tn. of England, situated in Lincolnshire on the R. Welland, 8½ m. N. of Peterborough. There are the ruins of an anct. abbey, which was built by Ethelbald in 716, and which has had a remarkable hist. The Danes destroyed it in 870, and in 948 it was rebuilt, after which it was twice burned and twice rebuilt. There is also an anct. bridge, built in the fourteenth century, upon which is a statue supposed to represent Alfred, or possibly Ethelbald. Ingulphus was abbot of C. from 1076 until 1109. Pop. 2700.

stamped on the back of the coin, and seated on his horse bearing the royal shield of arms. Queen Elizabeth appeared crowned in the later coins. The C. of Charles II.'s reign was covered with four shields typifying England, Scotland, Ireland, and France. At the present time the C. is worth five shillings in England. The C. of Denmark, Norway, and Sweden is very small in value and represents the sum of a little over one shilling.

Crown (Lat. *corona*), known from very anct. times as a headdress for kings, priests, or warriors. Cs. were used by the Egyptian kings, often very elaborate in style, but extremely simple at the time of the Ptolemies. In classical times the C. was usually a circular ornament of metal, in the form of a chaplet of leaves or flowers, worn on solemn and festive occasions. Among the Gks. it was an

CROWN OF CHARLES II.

Crowle, par. and tn. of Lincolnshire, England, situated in the Isle of Axholme, and extending into the W. Riding of Yorkshire. It is 5 m. E.S.E. of Thorne by rail. Pop. 3010.

Crowley, **Crole**, or **Croleus**, Robert (c. 1518-83), archdeacon of Hereford in 1559, and four years later prebendary of St. Paul's. Equally celebrated in the printing trade. He gave to us the first metrical version of the psalter in print and also brought out an admirable typographical ed. of the *Vision of Piers Plowman* in 1550.

Crowley, cap. of Acadia par., Louisiana, U.S.A. Centre of a rice-growing country. Pop. 9500.

Crown, name of various coins which represent different values in different countries. The origin of the word C. is to be found in the Fr. word *couronne*, the name of a gold coin issued by Philip of Valois in the early fourteenth century. Towards the close of the same century another Fr. king, Charles VI., issued a coin called the *écu de la couronne*. The C. did not appear in England until the reign of Henry VIII., and then it was a coin consisting of a mixture of gold and silver, the value of which represented five shillings. It was in the reign of Edward VI. that the image of the king appeared

emblem of office (as in the case of the archons), or frequently a reward for victors in the Hellenic games (Olympic, Isthmian, etc.). As a reward for exceptional services to the state it was a much-prized honour among the Romans. Among the various kinds were the 'corona obsidionalis' of grass or wild flowers, given to the general who rescued a besieged army; 'corona civica' of oak-leaves and acorns, given to the soldier who saved a fellow citizen's life in battle; 'corona navalis', a gold circlet ornamented with beaks of ships for the winner of a naval victory; 'corona muralis', similarly adorned with battlements, for the first who scaled the walls of a besieged city; 'corona vallaris', with palisades, for the first to break into the enemy's camp; 'corona triumphalis', awarded to the general who was granted a triumph. Among the emblematical Cs. were the 'corona sacerdotalis', worn by those engaged in sacrifice; 'corona funebris' or 'sepulchralis' for the dead; 'corona convivialis' of banqueters; 'corona nuptialis' or bridal C. In Germany, Norway, and medieval England the bridal wreath or C. was often of metal. As used in modern times for an emblem of sovereignty the C. was borrowed from the diadem (fillet of silk or wool) of oriental

origin. Alexander the Great adopted this from the Persian kings. Rom. emperors are represented with the diadem, laurel C., or radiating C. (symbolising the deification of the emperors). The diadem of Constantine the Great was replaced in the sixth century under Justinian by the 'stemma,' an elaborated golden fillet. Still more elaborate Cs. succeeded this in turn, until the present arched C. became the usual form. At the Norman Conquest a circle of pearls set in gold was the C. of Eng. kings. In the twelfth and thirteenth centuries this was heightened by strawberry leaves or trefoils. That of Henry IV. had strawberry leaves and fleurs-de-lis alternately, with sixteen small groups of pearls. Edward IV.'s was arched over with jewelled bands of gold closing under a mound ensigned by a cross patee, crosses patee replacing the strawberry leaves, and roses or fleurs-de-lis the pearl clusters. The imperial C. used from Charles II.'s reign to that of William IV. has four crosses patee and four fleurs-de-lis alternately, while two complete pearl-studded arches rising from the crosses have 1½ mound and cross at their intersection; George VI. wears this same C., known as 'St. Edward's.' The Queen's C. is the imperial C. made for Queen Victoria, 1838. It contains many ant. jewels, notably the lovely spinel ruby of the Black Prince, the sapphire from Edward the Confessor's ring, and the Stuart sapphire. (See Wickham Legg, *English Coronation Records*, 1901.) The pope's C. is a high unclasp mitre, with three circlets, decorated with ribbons, and surmounted by the ball and cross. The C. of the former Austrian emperors was cleft in the centre, but resembles the mitre in appearance. This style was adopted by Maximilian II. in 1570. A single arch surmounted by mound and cross rose from the left. The C. of Scotland, discovered in 1818 with other regalia in Edinburgh Castle, probably dates (with the exception of its arches) from the days of Robert Bruce. The iron C. of Lombardy, restored to the king of Italy, 1866, was a gold circle with a thin fillet of iron inside, said to have been hammered from a nail of the true cross, alleged to date from the time of Pope Gregory the Great (A.D. 590-604). The C. of the Ger. Empire had eight shields, the larger bearing the cross, the smaller the imperial eagle. There were four arches surmounted by mound and cross. Cs. are often seen in heraldic bearings or coats-of-arms. (See M. Holmes, *Crowns of England*, 1937; and M. Bowen, *Crowns and Sceptres*, 1937.)

In constitutional law and practice 'the C.' is a comprehensive symbolical expression denoting the members of the legal sovereignty in whom is vested the supreme executive power. The executive government of the Brit. Empire is carried on in the name of the C., and all its public acts are theoretically done by right of the royal prerogative. But all public acts of the C. are also done on the advice of the ministers of the C., with the result that the formerly personal prerogatives

of the king have become the privileges of the executive, which by the conventions of our unwritten constitution are in their turn a reflection of the privileges of the people. The C. as a term connoting the king and his ministers expresses the responsibility of the latter for every public act of the former, and the expressions 'descent of the C.' or 'succession of the C.' therefore mean the devolution of the paramount executive power from one monarch or titular head to his successor. The result of the constitutional limitations on the king's theoretical sovereignty is that the prerogative of the C., which Blackstone defines as 'a special pre-eminence which the king hath over and above all other persons, and out of the ordinary course of the common law in right of his royal dignity,' has become gradually narrowed in its content. The term prerogative, as indicating the ant. customary powers of the C. springing from the early character of the kingship as a tribal chieftaincy, and later the feudal overlordship, is in these days better regarded, in Prof. Dicey's words, as 'nothing else than the residue of discretionary or arbitrary authority which at any given time is legally left in the hands of the Crown.' It is a term which has caused much perplexity to the constitutional lawyer, but the various rights, privileges, and attributes composing the prerogative are clear. The common law prerogatives of the C. or the privileges of the executive comprise various legal attributes of sovereignty, privileges resulting from those attributes together with certain powers which may be said either to be inherent in any sovereign entity, or which are merely the survivals of more ant. times. The attribute of perfection of judgment expressed in the maxim that 'the king can do no wrong' puts the C. above the law, but results in the practice that ministers are liable for all royal acts, and that no administrative act can be done by the C. without the counter-signature of some responsible minister. The maxim is subject, however, to the curious interpretation that when the king makes an illegal grant or wrongfully confers a franchise, he has merely been 'deceived in his grant,' with the consequence that the grant can be upset as contrary to public justice. The C. has no dispensing power where public interests of vested rights are involved—a prohibition crystallised in the Bill of Rights, 1684—nor can the C. violate the common law. With such limitations as these it becomes clear that the maxim has lost its original force, and serves rather to demonstrate the transfer of legal liability to ministers rather than the moral perfection of the king's judgment. But the personal immunity of the sovereign from liability finds expression in the fact that no subject can sue the king in his own courts, but must proceed by way of petition or right presented through the home secretary, and referred by the latter to the attorney-general. An equally important attribute of the sovereign is his traditional perpetuity expressed in

the maxim that the king never dies. The C., indeed, is a corporation (q.v.) sole with perpetual succession. The common law terminated all appointments held 'during pleasure' on the demise of the C., but the statute of 1 Ed. VII., c. 5, by providing that such offices shall not be affected by a demise, brought the practice into accord with the maxim. Other prerogatives concerning the royal authority *per se* are that lapse of time cannot bar the right of the C. to sue or prosecute; the subordination of the right of the subject when it conflicts with that of the king; the immunity of the king from any statutory obligation unless bound by express language or by necessary implication; and the privileges flowing from the theory that the king is never a minor.

But there are numerous limitations on these prerogatives also, e.g. the right of the C. to claim real property as against the adverse possession of the subject is barred after fifty years; succession duty cannot be claimed by the C. after twelve years from the date of the death giving rise to the succession, or where the Inland Revenue authorities have 'slept on the C. rights'; and indictments for treason, other than cases of attempted assassination of the king, cannot be preferred after three years from the committal of the crime. Again, royal minorities are always provided for by statute, and it is generally conceded that the king is bound, whether named expressly or by necessary implication or not, by, *inter alia*, statutes for the preservation of public rights, statutes for the public good, or for the suppression of public wrongs. Other prerogative powers include the right to receive and send ambas. from and to foreign countries; the power to make treaties, leagues, and alliances with foreign nations; the power of issuing letters of marque and reprisal where not abrogated by treaty; the power of declaring war and making peace; and the power of granting safe conducts to alien enemies. But there is considerable doubt whether the C. can cede land to a foreign state during time of peace, or interfere with the position of the subject without Parliament's sanction, and the House of Commons can stop supplies for the payment of a war declared by the C. The prerogative of the C. to assent to and dissent from Bills sent up for the royal assent is now reduced to a shadowy veto which has never been exercised since the reign of Anne. As the fountain of justice the king can create common law courts for the empire beyond the seas and pardon offenders (*see also* CRIMINAL LAW), as *parens patriæ* he has the nominal custody of all infants and lunatics, as the arbiter of commerce can erect markets and coin money, and as the fountain of honour confer titles of nobility. The royal prerogative touching revenue matters confers on the C. the ownership of waifs, strays, treasure trove, wrecks, and the personal estate of intestates dying without next of kin, and enables the C. to levy customs, excise, stamp and death duties, and income tax. As the orthodox head of the Established Church,

the C. appoints, on the recommendation of the Prime Minister, archbishops, bishops, and other dignitaries of the Church, and entertains appeals from eccles. courts through the judicial committee of the Privy Council. (For the Councils of the Crown, *see* CABINET.) *See* L. G. W. Legge, *English Coronation Records*, 1901; and G. J. Youngusband and C. Davenport, *The Crown Jewels of England*, 1919.

Crown, in architecture, term applied either to C. tower or to the top portion of a cornice, or again to the spire formed by two converging buttresses as in St. Nicholas' Abbey, Newcastle.

Crown Agents for Colonies. These are home government officials whose functions relate to the commercial interests of the crown colonies (q.v.). Their duties are of a semi-administrative character, and appertain to such matters as the regulation of ports and docks, and shipping contracts. There are at present (1949) two C. A., assisted by a secretary and a large staff comprising consulting engineers, naval architects, analysts, assayers, and accountants. Among the colonies for which they act as agents are Bahamas, Barbados, Brit. Guiana, Brit. Honduras, Ceylon, Gambia, Gibraltar, Gold Coast, Hong Kong, Jamaica, Malay States, Malta, Newfoundland, N. Nigeria, Sierra Leone, Somaliland, Straits Settlement, Trinidad, Wei-hai-wei, and the Windward Is. They act as agents also for the W. Africa Frontier Force, the King's African Rifles, the Uganda Railway, the gov. of Zanzibar, and the Tanjong Pagar Dock Board. C. A. are to be distinguished from the agents-general of the self-governing colonies, whose duties are also of a commercial nature, in that these latter are truly colonial representatives. The offices of the C. A. are at Whitehall Gardens, S.W.1.

Crown Cases Reserved, Court for. Before the institution in 1907 of the court of criminal appeal the C. for C. C. R., consisting of the judges of the high court, or five of them at least, of whom the lord chief justice had to be one, was the tribunal to which was reserved any question of law that might have arisen in a criminal trial, whether at the central criminal court (q.v.), the assizes, or quarter sessions. Unlike the court of criminal appeal, which replaced the C. for C. C. R., the latter court could not hear appeals on questions of fact, or mixed law and fact.

Crown Colony, colony under the C. C. form of gov. The phrase C. C. Gov. is used with various meanings. In the broadest, and perhaps the most correct, sense it is applied to all the colonies in which the Crown retains the real control of the executive (e.g. to all the W. Indian colonies prior to recent changes). By both official and common usage, however, it is often narrowed so as to exclude colonies with elected assemblies though without a responsible executive. Sometimes it is applied in a still narrower sense only to those colonies which have no elected, as opposed to nominated, members at all in their legislatures.

Some writers divide the genus C. C. into two species, pure, where the whole legislature is nominated, and semi-representative, where part of it is chosen by election. In any case the official majority is the characteristic institution of C. C. Gov., and the effect of this official majority is that the legislative council is really an advisory body. The term C. C. was not in general use until the 1840's. It was the antithesis to the old colonial system of representative gov., and in its earliest use the term meant those conquered or ceded colonies in which the Crown retained, consciously, full authority by way of circumventing the principle laid down in *Mansfield's* historic judgment in *Campbell v. Hall* (1774). That judgment was to the effect that by the grant of representative institutions to any particular colony the Crown, unless its powers were expressly reserved, forever precluded itself from the exercise of further legislative power over that colony, and from the power of amending its local legislation; so that henceforward these powers could be exercised only by the colonial legislature or by Act of the Imperial Parliament. It was to provide for the gov. of Senegambia and of Quebec that the C. C. in its modern sense came into operation, the old representative system being impracticable or unsuitable by reason of the fact that in the one was an African pop. incapable of assimilating itself to that system, and in the other an alien Fr. pop. Lord Lugard stated that the C. C. form of gov., adopted in all Brit. dependencies in Africa, was evolved for the control of small is., or of small trading depots on the mainland coasts. Its chief features, he said, are a highly centralised secretariat, controlling all depts.; the colonial secretary, and not the governor, is often the real executive officer, and he acts for the governor when the latter is absent from the seat of gov. or from the colony. Lord Lugard considered that the legislative council was necessarily largely absorbed in the interests of the commercial community, and inevitably out of touch with the machinery of distant native administrations, and little competent to deal with legislation affecting them. The system, in his opinion, was at that time ill adapted for the gov. of large countries (see his *Representative Forms of Government and Indirect Rule in British Africa*, 1929). Another instructive early instance of a C. C. is that of Trinidad which, when taken by Abercromby, was largely inhabited by Sp. people, who could hardly be expected to reconcile themselves to the abrogation of Sp. law or institutions. Later, however, the term C. C. became used for other colonies, whether conquered or settled colonies. In the latter category, if the colony was settled by Brit. immigrants, these were generally supposed to take Eng. law and institutions with them (see *COLONIAL LAW*). Later, however, the term C. C. came to include a class of settled colony, under the authority of the Crown, in its pre-representative stage, e.g. New S. Wales in its early settlement period. It also came to embrace settled

colonies in the tropics in which representative gov. was impossible, e.g. Sierra Leone; and the W. Indian colonies upon their abandonment of the old representative system, e.g. Jamaica by its own initiative in 1866 after the Negro insurrections and the general upheaval following emancipation; the conquered tropical African colonies of the late nineteenth century, and the class of colonial protectorates (q.v.). By this time the criterion of the C. C., which originally sprang from the classic distinction between conquered and settled colonies, now came to be founded on the distinction between self-governing colonies and non-self-governing colonies. In most cases the Crown not only retains the right of veto on local legislation, but the power to legislate directly by order in council. See M. Wight, *The Legislative Council*, 1946.

It is an article of faith in Brit. colonial policy to-day that every endeavour should be made to accelerate progress towards self-government in the colonies. Considerable progress is being made in the essential work of social and economic reconstruction and, although political development is governed by social and economic progress, this latter progress is apt to obscure the work of liberalising colonial political institutions that is going on all the time. New constitutions have been introduced in a number of colonies, and some major constitutional reforms have been inaugurated. Indeed, there are very few colonies where there have not been constitutional changes of one kind or another, notably during the year following the close of the Second World War. Among the most notable constitutional changes are those in Ceylon, Jamaica, and Nigeria (see under those heads), all of which illustrate the policy of promoting the growth of responsible self-government and the estab. of political institutions based on popular control. So far-reaching are the changes in some cases that the term C. C. as applied to the particular dependencies is a misnomer; e.g. the reforms in Ceylon adopted from the recommendations of the Soulbury Commission mean nothing less than the introduction of a parl. system with Cabinet responsibility based on the Brit. model, and a general approximation to dominion status. The changes made in Brit. Malaya—the constituent states of which are really protectorates under treaty arrangements—are also designed, through the new Malayan union, to lay the foundations for ultimate self-government. The field for political advancement is, necessarily, greatest in Africa, for in that continent is concentrated the largest area of our colonial empire and the largest number of our colonial peoples. In the Gold Coast an unofficial majority is now elected to the legislative council, and in Nigeria a new constitution has been approved which secures a measure of genuine political unity, whilst allowing for the diversity of the peoples and the varying forms of traditional government. In E. and Central Africa there has been

an increase in the direct representation of Africans on the legislative councils of Kenya, Uganda, Tanganyika, and Zanzibar. In Nyasaland an African council has been set up for the whole protectorate, with delegates drawn from the prov. councils; and a similar central council has been created in N. Rhodesia. When these councils have been securely estab. it is intended that members from them should be selected to sit on the legislative councils—so that throughout Africa constitutional developments are proceeding alongside the great extension of responsibility and interest by Africans in local government and in native administrative services. It would seem that in the W. Indies political advancement is likely to be made through some form of federation, especially as the majority of the is. are in favour of the principle. See also COLONY and COLONIAL TRUSTESHIP. See H. E. Egerton, *A Short History of British Colonial Policy, 1606-1909* (9th ed.), revised by A. P. Newton, 1932, and *British Colonial Policy in the XXth Century*, 1922; H. H. Wrong, *Government of the West Indies*, 1923; Sir A. Bertram, *The Colonial Service*, 1930; E. Jonks, *The Government of the British Empire*, 1937; *The British Empire: a report on its structure and problems*, issued by the Royal Institute of International Affairs, 1937; Margery Perham, *Native Administration in Nigeria*, 1937; R. Emerson, *Malaysia: a study in direct and indirect rule*, 1937; H. L. Hall, *The Colonial Office: a History*, 1937; Sir C. J. Jeffries, *The Colonial Empire and its Civil Service*, 1938; Lord Hailey, *An African Survey*, 1938; Sir D. Cameron, *My Tanganyika Service and some Nigeria*, 1938; E. Barker, *Ideas and Ideals of the British Empire*, 1941; and E. Walker, *Colonies*, 1944. See also under the individual colonies.

Crown Debts, those debts which are due to the Crown, e.g. fines, penalties, and which are contradistinguished from debts due to the subject principally by reason of the priority they enjoy in the administration of the estate of a deceased person who has *d. insolvent*. The old common law allowed the Crown (*q.v.*) to recover C. D. summarily by a writ of *extent* against the debtor's land and goods, and to follow that property into the hands of whomsoever it went. Apparently the Crown still has this power, but it cannot take copyholds in execution. The Crown's lien on the debtor's property as against a *bona fide* purchaser for value of the debtor's property only extends to specialty debts (i.e. created by deed), and debts of record (judgment debts, recognizances, and others, see DEBT); it does not extend to a simple contract debt. Rates and taxes, so far as they can be said to be C. D., are preferential debts in the administration of the estate of a bankrupt, but otherwise C. D. have no priority over other debts when an estate is administered in bankruptcy. In the administration of the estate of a deceased person, debts due to the Crown by record or under a bond or covenant are paid first,

where the estate is solvent, but simple contract debts due to the Crown merely enjoy priority over all other kinds of simple contract debts. Where the estate is insolvent C. D. enjoy a like priority where the estate is administered by the legal personal representative or by the chancery div.; but where it is administered by the court of bankruptcy, C. D. are, it seems, payable *pari passu* with other debts due under judgments, specialties, and simple contract. In winding-up proceedings of a company, C. D. are allowed. C. D. stand in the same position as in the bankruptcy of an individual.

Crown Lands, lands enjoyed in right of the Crown, the profits from which form part of the ordinary revenue of the Crown, or revenue which the Crown has had from time immemorial. Since 1760, when George III. surrendered these revenues for a fixed sum or civil list, they have been collected on the public account. At the time of the surrender the gross revenues amounted to about £89,000, and the net return to about £11,000. In the year ended March 31, 1938, the total receipts were £2,030,888, of which amount £151,103 was from the mines. At the present day C. L. comprise no great extent of property, most of them having been granted away to private subjects. Other C. L. are lands formed by alluvial deposit, lands left bare by the sea, and royal mines. The Crown title to foreshore or land between high and low water-mark, and lands covered by inlets of the sea or navigable rivers, is limited by the public rights of navigation and fishing, and rights incidental thereto. C. L. are exempt from taxation in the absence of express or implied words to the contrary in the Acts imposing the different burdens. The offices of the commissioners of C. L. are at 55 Whitehall.

Crown Office, dept. of the central office of the supreme court of judicature. Its official head is the clerk of the Crown in the king's bench (*q.v.*), now generally entitled the king's coroner and attorney and master of the C. O. The work of this office relates to the administrative business on the Crown side of the king's bench div., and also of the divisional courts of that div. It has no concern with proceedings on the revenue side of the court, nor in regard to parl. and municipal elections petition, or bankruptcy matters. The duties of the king's coroner, which are very numerous, are *inter alia* to issue informations in the nature of *quo warranto* for misdemeanours in agreement to the order of the court; to attend at the sittings of the divisional courts, so as to inform the judges on questions of practice and procedure, and take minutes of the proceedings; to administer the oath of allegiance to judges or magistrates on their appointment; and to keep in safe custody the records of the C. O. pending removal to the record office (see CUSTODIA ROTULORUM). The judicial business of the Crown side of the king's bench is transacted either in court or before the judges or the master of the C. O. in chambers.

The ministerial business as conducted in the C. O. includes a great number of matters, including, especially, the issuing of writs of *habeas corpus*, prohibitive attachment, *mandamus certiorari*, and writs of subpoena.

Crown Point, tn. in Essex co., in New York, U.S.A., and 36 m. distant from Burlington. It is situated on Lake Champlain, so called after the Fr. coloniser, Champlain, and the remains of a Brit. fort captured by the Amers. in 1775. Iron and ore deposits in the neighbourhood. Pop. 1660.

Crown Solicitor, see SOLICITOR TO THE TREASURY.

Crowne, John (c. 1640-1703), Eng. dramatist, b. in Nova Scotia. He began a literary career in England with his romance *Pandion and Amphigenia* (1665), one of the few Eng. heroic romances after the manner of Scudéry. Though of no very striking talent as a dramatist, he found favour at Charles II.'s court, and his plays were successful, some being acted in the eighteenth century. Dryden considered C. his rival. Among his plays are *The Country Wit* (1675); *The Destruction of Jerusalem* by Titus Vespasian (two parts, produced in 1677); *Trojanus* (1681); *City Politiques* (performed in 1683); *Sir Courtly Nice: or, It Cannot Be* (1685); *The Married Beau: or, The Curious Impertinent* (1694); *Caligula* (1698). His dramatic works were pub. with a memoir, by J. Maidment and W. H. Logan (1873-1877), and a bibliography by G. P. Winship (1922). See T. Cibber, *Lives of the Poets*, 1753; A. F. White, *John Crowne, His Life and Dramatic Works*, 1922.

Crowquill, Alfred, see FORRESTER, A. H. Crow Steps, see CORRIE STEPS.

Crowther, Samuel Adjai (1809-91), missionary bishop of Africa, b. in Yoruba and sold as a slave in 1821. Was rescued with his comrades in 1822, and sent to Sierra Leone. The Church Missionary Society took an interest in him; he became a convert to Christianity and came over to England to the Church Missionary College at Islington. He was ordained by Bishop Blomfield, and on returning to his own country he trans. the Bible and Prayer Book into Yoruba and other dialects. Was created bishop of the Niger ters. in 1864, and d. in 1891 after a life of strenuous labour and great piety.

Croydon (Doomsday Crotindene; formerly Craydene, chalk hill), parli. municipal, and co. bor. of Surrey, England, 10 m. from London, in the diocese of Canterbury. The par. of C. is 36 m. in circumference. C. sends two members to Parliament. It owes its growth and popularity to general trade, attractive residential quarters, and proximity to London. The par. church dates back originally to about A.D. 962, was rebuilt probably by Archbishop Courtenay (d. 1396), and again after the fire of 1867 (see below). The archiepiscopal palace, now used by the Kilburn sisters as a girls' school, was the residence of the primates until 1757 (see below). The Whitgift Hospital was founded in Elizabeth's reign.

Archbishop Whitgift's endowment also endows the grammar and middle schools. Others were endowed by Archbishop Tension, 1714. Adult education is provided at the C. Polytechnic and the C. School of Art. The prin. assembly hall is the civic hall, formerly the hall of the N. End Brotherhood. It has accommodation for 1050 people. Before its acquisition it was badly damaged in air raids, an oil bomb having brought down half the roof. It was restored as far as war conditions allowed. There is a fine tn. hall, a theatre, public libraries, and barracks. There are breweries, a number of light engineering and other factories, and a clock and bell foundry. The world's largest carillon of seventy-two bells for the Riverside Church, New York, was cast at this latter factory. The airport covers 400 ac. and cost £267,000. Extensions of the C. General Hospital costing £80,000 were opened in 1927. The Warringham Park Mental Hospital has accommodation for 960 patients, and gives all forms of modern treatment. The C. crematorium was opened in 1937, with a chapel built in Gothic style with vaulted roof. In 1896 the central library was opened in Katharine Street which, as part of the architectural pile of the tn. hall, possesses premises as imposing as those of any public library in the S. of England. The library was one of the earliest to adopt the 'open access' system (see LIBRARIES). The branch library in Brigstock Road, Thornton Heath, was opened in 1914. In 1926 provision was made for numerous other branch libraries, but the Second World War arrested completion of the scheme. The large electricity undertaking suffered considerable damage in 1940, when a 500-kilo bomb hit the power station, and in 1944 a flying bomb exploded in the engine room; but by 1947 practically the whole of the damage had been made good. The new electricity offices and showrooms at Walsley Road were occupied in 1941. There are numerous parks and recreation grounds and open spaces covering a total area of 1380 ac. Addington Hills is a natural park of 130 ac., consisting of a plateau of 460 ft. altitude with heather and fir-trees. Other parks are New Addington (94 ac.), Beaulieu Heights (21½ ac.), Ashburton Park (12 ac.), Selsdon Wood (200 ac.), Grange Wood (on Norwood Hills), a 30-ac. park on a commanding site; and Norwood Grove (32½ ac.), noted for its trees, flowers, and birds.

From the evidence of relics which are preserved in the tn. hall C. seems to have been the very centre of the S.E. Saxon settlement. The Noviomagus of the Romans was the Wallington of a later day, in the hundred of which C. was legally included. Legend has it that the original par. church was founded by the Christian soldiers of Julius Plautius, but this is not verifiable; when the thirteenth-century church was built portions of an early Saxon church were discovered. An early document by which Archbishop Aethelred exchanges C. land with Duke Aelfred is the first extant reference to the age-old

connection of the archbishops of Canterbury with C. The Domesday Survey shows that (c. 1085) the manor of C. (later known as the archbishops' palace and to-day as the old palace) was in the lordship of Archbishop Lanfranc, and that there were a church and some 200 inhab. From the time of Lanfranc the archbishops occupied this manor as their summer residence. The archbishops gave C. its first fair (1273) and first market (1276), their purpose being, it is said, to supply the needs of the pilgrims passing through C. to the shrine of St. Thomas at Canterbury. Among famous guests at the manor were James I. of Scotland, the prisoner-guest of Archbishop Arundel,

Liverpool in the early nineteenth century. In 1809 this house became the military seminary of the E. India Company, where, among others, Lord Napier of Magdala, Lawrence of Lucknow, and Lord Roberts of Kandahar received their training. At the beginning of the nineteenth century the pop. of C. was 6000. With the opening of the London to C. railway for traffic the pop. was increased to 16,000. This enhanced the difficulties of local government, and C. was the first tn. to adopt the Public Health Act, and to constitute a local board of health. Among the chairmen of the board were Cuthbert Johnson, who, in his spare time, compiled an extensive MS. hist. of C.

CROYDON AIRPORT

in 1412; Catherine of Aragon, who after her divorce sought refuge there; Mary Tudor; and Elizabeth Tudor, who made sev. visits to C., the first in 1573 as the guest of Archbishop Parker. Whitgift, the most intimate name in the record of the archbishops at the palace, founded the hospital of the Holy Trinity, known as the Whitgift Hospital, in 1596, for the use of the aged poor of Lambeth and C. The archbishops withdrew from the palace in 1757; in 1808 they bought Addington Palace, which became their outside London residence until 1896. Grindal, Whitgift, and many other archbishops are buried in the par. church or at St. Mary, Addington. The eccles. par. of C. still remains in the diocese of Canterbury, and the bishop of C. is one of the suffragans of the archbishop who is bishop of the diocese. One of C.'s most famous citizens was Lord Howard of Effingham, who lived and d. at Haling House, the site of which is now occupied by Whitgift School. Addiscombe House, later called Addiscombe Place, built by the son-in-law of John Evelyn, was the home of Lord

(to be seen in the C. reference library), and Wm. Drummond. Among its most noted officers was Baldwin Latham, the engineer who not only built the water tower at Park Hill, but designed water-works at Vienna and elsewhere in Europe. C. was a pioneer in air transport, with the building of the aerodrome at Waddon. Blériot landed there after his channel flights; Lindbergh landed there from Paris after his solo crossing of the Atlantic. Until the Second World War C. was the airport of London, and not, as to-day, one of the airports of the metropolis reserved for charter aircraft. The first bombs that fell in the London area in 1940 fell upon C., some months before the continuous attack on C. and London began. In the flying-bomb period it was the most bombed tn. in England, and suffered great devastation, from which it has not yet fully recovered. The death-roll was, however, low owing to evacuation and good shelter accommodation.

It is on official record that Queen Mary II. in council actually approved a charter as a bor. to C. (May 21, 1691), but that,

owing to the default of the secretary of state (probably the second earl of Nottingham) or for some now undiscoverable reason, the charter was never received or made operative. C. had to wait 200 years before, in the year 1883, the charter of incorporation was granted by Queen Victoria. In 1889 C. was granted the powers and duties of a co. bor., with control of its own highways, education, and public health services. The tn. now has its own bor. courts and quarter sessions. The pop. in 1931 was 233,155, and in 1947 (estimated) 244,000.

Croydon, formerly a suburb of Sydney, New S. Wales, now included in Ashfield (pop. 45,000) and Burwood (pop. 20,000).

Crozat Islands, group of volcanic is. situated in the S. Indian Ocean at almost equal distances from each other between the Cape of Good Hope and Kerguelen Is. The names of the prin. is. are Possession, East, and Penguin. Sixteen is. are uninhabited. The C. I. are a Fr. dependency of Réunion, and have an area of 200 sq. m.

Crozier, Francis Rawdon Moira (c. 1795–1848), naval officer, b. in Ireland. He made three voyages with Capt. Parry to the Arctic Circle in 1821–27, went to the Antarctic Ocean with Capt. Ross in the *Terror* in 1839–43, and sailed as second officer in Franklin's last expedition in 1845 to discover the N.W. Passage, dying in the Polar regions. The party was not heard of till Capt. McClintock found a record (signed, April 1848, by Capt. C.) on King William's Is. in 1859, stating that the explorers were about to start for Great Fish R. under C.'s command. See Sir F. L. McClintock, *Fate of Sir J. Franklin*, 1859.

Crozier, John Beattie (1849–1921), Brit. historian and philosophical writer, b. of Scottish parents in Ontario. Among his works are *The Religion of the Future* (1880) and *Civilisation and Progress* (1885, trans. into Jap., 1903). A civil-list pension was granted him in 1894, and doubled later to enable him to carry out his studies. Other pubs. are *Lord Randolph Churchill: a Study of English Democracy* (1887); *History of Intellectual Development on the Lines of Modern Evolution* (1897–1901); *My Inner Life* (1898); *The Wheel of Wealth* (1906); *Sociology applied to Practical Politics* (1911); and *Last Words on Great Issues* (1917).

Crozier, see **CROSIER**.

Crozon, seaport of France, in Finistère, on Douarnenez Bay, 10 m. from Brest, with sardine fisheries. Pop. 7700.

Cruclian Carp, or *Carassius vulgaris*, fresh-water fish of Europe and Asia, closely allied to the goldfish. It is a member of the Cyprinidae, or carp family, and differs from the carp chiefly in having no barbel. It sometimes bears the name of Prussian carp.

Cruciferae, very extensive natural order of Dicotyledons, containing between one and two thousand herbs or shrubs dispersed over the milder parts of the world. A large proportion consists of inconspicuous and useless weeds, but many are cultivated either for their beauty or for their useful properties. Honey is secreted

in nectaries at the base of the outer stamens, and self-fertilisation is of regular occurrence. The order comprehends such useful plants as the mustard, cress, turnip, cabbage, radish, scurvy-grass, and horse-radish. Of the genera *Brassica*, *Cheiranthus*, and *Nasturtium* are among the most important.

Crucifix (Lat. *cruci fixus*, fastened to the cross), literally 'the Crucified One,' a cross with the effigy of Christ fastened to it. The C. began to replace the plain cross in churches in the reign of Constantine (d. A.D. 337). The Gk. Church did not acknowledge them, and they were not commonly used in the E. till the close of the eighth century. They were general in the Lat. Church in the Carolingian period. They form a prominent feature in Rom. Catholic churches. The earliest representations presented Christ as alive and clothed, with open eyes, the figure being pierced by four nails. The symbolic sacrificial lamb often figured on the cross, with a medallion bust of Christ, as in the Vatican cross. Later Christ appears as dead, naked except for a loincloth, fastened by three nails. In Catholic churches the prin. C. stands in the centre of the high altar. They are generally of gold or silver, but are sometimes made of wood or stone, and smaller ones of ivory. Many great artists and sculptors have carved Cs. Sometimes a pictorial and not a plastic representation appeared on the cross.

Cruden, Alexander (1701–70), Eng. scholar, author of a famous Bible concordance. He was educated at Marischal College, Aberdeen, and then for a time confined for symptoms of insanity, finally coming to London (c. 1722) as tutor and bookseller. He became bookseller to the queen, 1735. His *Complete Concordance to the Holy Scriptures of the Old and New Testament* (including a concordance to the Apocrypha) appeared in 1737. Later he acted as a corrector for the press, and called himself 'Alexander the Corrector' of national morals. His *Scripture Dictionary* was pub. in 1770.

Cruden, par. and coast tn. of Aberdeenshire, Scotland, 8 m. from Peterhead. A battle between Malcolm II. of Scotland and Canute (later king of England) is supposed to have been fought here. Pop. 3000.

Cruelty to Animals, see **ANIMALS**, **CRUELTY TO**.

Cruelty to Children, **NATIONAL SOCIETY for the Prevention of**, see **NATIONAL**.

Cruikshank, George (1792–1878), caricaturist and artist, was the son of Isaac C. (c. 1756–c. 1811) and the younger brother of Robert C. (1739–1856), both of whom also achieved success as caricaturists. George C. had no training in art, though he once made an abortive attempt to enter the academy schools, but he was a born artist and began to sketch as a child. Some of his drawings at the age of seven have been exhibited. In 1811 he began to contribute to the scurrilous periodical *The Scourge*, and within a few years he was on the staff of other papers, and had begun to illustrate books.

He issued many cartoons after the style of Gillray, and the subject of a considerable number issued in 1814 and 1815 was, naturally enough, Napoleon. In the latter year he became associated with Wm. Hone, the author and bookseller, and his illustrations to Hone's lampoons on George IV. and the managers of the queen's trial, such as 'The Queen's Matrimonial Ladder,' 'Non mi ricordo,' and 'The Man in the Moon' attracted much attention. These squibs against George IV. were reissued as *Facetiae and Miscellanies* (1827). In 1818 he issued the first of his pictorial sermons, the famous 'Bank Restriction Note,' through which he claimed with

his output enormous. He contributed largely to the *Comic Almanac* (1835-53), the forerunner of *Punch*. Among the popular books of the period illustrated by C. are Grimm's *German Popular Stories*, 1823-26 (containing possibly his best work), and *Fairy Tales* (1827); Scott's *Waverley Novels*; *Memoirs of Grimaldi* (1838), *Don Quixote* (1833); *Points of Humour* (2 vols.) (1823-24); *Bentley's Miscellany* (containing his illustrations of Ainsworth's *Jack Sheppard*). *The Table Book* and *The Omnibus* were magazines of his own. His last known work, a frontispiece to Mrs. Blewitt's *The Rose and the Lily*, was done when he was eighty-

CRUIKSHANK'S CONCEPTION OF ST. VALENTINE'S DAY
Comic Almanac.

some reason to have caused the death penalty for forgery to be abolished. Subsequently he issued a series of eight plates, 'The Bottle' (1847), and an oil-painting, 'The Worship of Bacchus' (1862), in which he preached temperance and showed the downward path of the drunkard. Of these, perhaps, he was more proud than of any others of his work. Other temperance prints were 'The Gin Bottle,' 'The Gin Trap,' 'The Gin Juggernaut,' 'The Drunkard's Children,' and 'Sunday in London.' His other oil-paintings include 'Titania and Bottom,' 'Cinderella' (1854, now in S. Kensington Museum, London), 'The Fairy Ring,' 'Grimaldi Shaving,' and 'Disturbing the Congregation.' In later years he devoted himself largely to the illustration of books, and in this direction he was particularly successful with Dickens (*Oliver Twist* and *Sketches by Boz*), Ainsworth (*The Tower of London*, and six other books), Thackeray (*The Legend of the Rhine*), Fielding, Smollett, and Sterne. His industry was prodigious and

three. Three years later he d., and was buried at Kensal Green, but shortly after his remains were removed and interred at St. Paul's. In caricature (*q.v.*) he carried on the work of Rowlandson and Gillray, but without their ferocity and coarseness; in humorous drawing he stood alone, and as an illustrator he has not been excelled. He was at his best, in this last branch of art, in depicting the grotesque and terrible. See W. B. Jerrold, *The Life of George Cruikshank*, 1883; W. M. Thackeray, *An Essay on the Genius of George Cruikshank*, 1884; A. M. Cohn, *George Cruikshank: a Catalogue Raisonné*, 1924; and R. McLean, *George Cruikshank*, 1948.

Cruiser (Dutch *kruisen*, to cross), war vessel primarily built for speed. It existed as early as the sixteenth century and was used for scouting, convoying, and carrying dispatches. At first it was a pinnacle of small dimensions, but the operations against the pirates in the seventeenth century caused a bigger class of vessel to be built, provided with oars

as well as sails and carrying heavier armament. By the middle of the eighteenth century it had developed into the frigate of 700 tons carrying twenty-eight or thirty-two guns, and was improved during the naval wars with France until it reached some 1500 tons. The introduction of iron shipbuilding greatly affected the C., as it enabled speed to be developed parallel with strength of armament. The development was, however, slow. At first there was the corvette (*q.v.* for the modern vessel), with small steaming capacity but high sailing qualities. This was followed by unprotected Cs. in which the steaming capacity was greatly improved. Upon these came the protected C. to which class belonged the *Edgar*, launched in 1893, having a displacement of 7350 tons and a

Renown (32,000 tons with 15-in. guns) were also battle Cs. In the First World War there was always need for a swift vessel carrying heavy armament, such craft being highly suitable for attacking warships of substantial magnitude, while at the same time being able to make wide enveloping movements for the purpose of operating in the rear of a hostile fleet or threatening its retreat. These were essential functions of the battle C., and an excellent opportunity for the exercise of the battle C.'s powers was afforded in the battle of the Falkland Is. (*q.v.*), where two Brit. battle Cs. destroyed Adm. von Spee's Ger. squadron. At the battle of Jutland, however, Brit. and Ger. battle Cs. fought each other, and their powers of speed were not used in any exceptional manner. The terms of the

C.O.I., Crown copyright

H.M.S. 'SCYLLA,' CRUISER OF THE 'DIDO' CLASS, 5450 tons

speed of 19 knots. This was followed in 1895 by the *Powerful* type (displacement 14,200 tons, speed 22 knots). Later on came the class of armoured Cs. of the *Cressy* type, launched in 1901, which was followed by the *Monmouth* type in 1903; the *Devonshire* type in 1905; and the *Minotaur* in 1908. The *Minotaur* had a displacement of 14,600 tons, a speed of 23 knots, and carried four guns of 9·2 in., and ten of 7·5 in. The armoured C. was greatly favoured at the beginning of the present century to the prejudice of the battleship, but a reversal of opinion subsequently took place, and later naval opinion favoured the building of bigger battleships of the Dreadnought and super-Dreadnought types. This movement also led to the introduction of a new class known as the battle C., whose armament is only slightly inferior to that of the strongest battleships. To this class belonged ships of the type of the *Invincible*, launched in 1909 (displacement 17,250 tons, speed 27 knots), and the *Queen Mary* (displacement 27,600 tons, speed 28 knots), with eight guns of 13·5 in. calibre. The *Hood* (42,100 tons with 15-in. guns), which was sunk in the Second World War (see 'HOOD,' THE), and

Washington Treaty (*q.v.* of 1921, however, practically sealed the doom of this type of vessel. The Washington Treaty had for a time a very important influence on the design of all types of war vessels, and in the case of Cs. a limit of 10,000 tons displacement, with guns up to a maximum of 8 in., was fixed. Now generally the term C. (as distinct from Amer. battle Cs. or 'large cruisers') refers (since the Washington limitations) to a light C. of not more than 10,000 tons displacement. Cs. are built for speed, their function being to convoy merchant vessels and transports, and to pursue enemy armed ships and merchant ships, and for police duty on Commonwealth trade routes. The R.N. generally names them after Brit. cos., towns, dominions, and colonies. Three Brit. Cs. of the *Leander* class, completed in 1934, were intended to become the standard type for large vessels, but subsequent international events made it necessary to increase the displacement. In 1938 the R.N. had thirteen 'Washington' and forty-four other modern Cs. The Gov's defence plans, as expressed in the White Paper of March 3, 1936, provided for increasing the total number of Cs. to seventy, of which sixty would be

under age and ten over age. In the naval programme for 1939 it was proposed, *inter alia*, to build four large 6-in. Cs. At present the Brit. Navy has (1948) forty-three Cs. Those of the *Tiger* and *Swiftsure* classes (completed 1944-46) are of 8000 tons displacement, have nine 6-in. guns and ten 4-in. anti-aircraft guns, and a speed of 31 knots. Other leading classes are the *Fiji* class, (1940-45) all named after colonies; they are of 8000 tons, have twelve 6-in. guns and eight 4-in. anti-aircraft guns; the *Dido* class (1939-1941), 5450 tons, ten 5.25-in. guns and eight 4-in. anti-aircraft guns; the *Black Prince* class (also 1940-45), same armament as the *Dido* class. All the last three classes have a speed of 33 knots. Then there is the *Southampton* class, named after the big cities. They were completed in 1938-39 and vary from 9100 to 10,000 tons and have twelve 6-in. guns and eight 4-in. anti-aircraft guns (*Belfast* has twelve); *London* class, named after Eng. cos., were completed in 1929, have a displacement of 9850 tons or slightly less, carry eight 8-in. guns and a similar number of 4-in. guns. The *Kent* class, also named after cos., are a year older, are mostly of 10,000 tons and have much the same armament as the *London* class. Among other classes are the *Carlisle*, two of which class, *Capetown* and *Colombo*, completed 1922 and 1919, are listed to-day as anti-aircraft ships. They are 4200-ton ships and carry eight 4-in. and two 3-in. guns and five 6-in. and two 3-in. guns respectively. The Royal Australian Navy has three Cs., the Royal New Zealand Navy and the Royal Canadian Navy two each.

The U.S.A. has (1947, built or building) three battle Cs. ('large Cs.'). *Alaska*, *Guam*, and *Hawaii*, each of 27,000 tons, with nine 12-in. guns and twelve 5-in. guns (1941-48); twenty-five heavy Cs. between 9324 and 17,000 tons; and forty-one light Cs. between 6000 and 14,700 tons, thirty being of 10,000 tons. The Fr. Navy has nine Cs. ranging between 5886 and 10,000 tons and that of the U.S.S.R. eleven in service. See G. Holman, *The King's Cruisers*, 1948, and *Jane's Fighting Ships*.

Crusades, or Wars of the Cross (Fr. *croisade*). The objects of these religious wars carried on by European nations against Mohammedanism for sev. centuries were originally (1) to ensure the safety of pilgrims visiting the Holy Sepulchre, and (2) to set up Christian rule in Palestine. Later on we find the attack directed against Egypt and even Constantinople, and in the fourteenth century the conquests of the Ottoman Turks turned crusading into a defensive movement. It is usual to speak of the C. as six or seven in number, but actually the movement was continuous for over two centuries, hardly a decade passing without one or more expeditions. Only the most successful or the most disastrous of these, however, have taken prominent place in hist. In the eleventh century affairs stood thus: The mild rule of the early Saracens had for centuries allowed a

Christian protectorate, first estab. under Charlemagne, to exist in Jerusalem, and many monarchs, including our own Alfred, sent offerings to the holy places. But this was ended in 1010 by the fanatical caliph, Hakim, who destroyed the sanctuary. The protectorate passed in 1021 to the Gk. Church, and in 1071 the Saracens were themselves overcome by a rougher tribe, the Seljukian Turks. Christian pilgrimage became difficult and dangerous, and in 1095 the appeals of Pope Urban II., seconded by the preaching of Peter the Hermit, led to the undertaking of an enterprise which in various forms had already been proposed by more than one pontiff. The turbulent warriors of Europe received a new impulse. Instead of being restrained by the Church with peaceful admonitions, as in the institution of the Truce of God, their warlike ardour was encouraged, organised, and dedicated to what was proclaimed to be the highest and holiest service. The *Deus vult* of Clermont found its echo in the hearts alike of princes and commoners. In 1095 sev. undisciplined hosts, including those of Walter the Penniless and Peter the Hermit, set out for the E. but perished on the way. In 1096-97 a great army under Godfrey de Bouillon, Bohemund of Otranto, and other leaders, concentrating on Constantinople, fought its way through Asia Minor, taking Antioch in 1098, and Jerusalem in 1099. A Christian kingdom was estab., with Godfrey as its first head, his brother Baldwin as prince of Edessa (Upper Mesopotamia), and Bohemund ruling at Antioch. Godfrey d. in 1100 and was succeeded by Baldwin; Bohemund was captured by the enemy, and a great Fr. expedition sent for the relief of Antioch was almost entirely destroyed. During the next half-century, in spite of reinforcements, including fleets from Genoa, Norway, and Venice, the Christians in Syria were hard-pressed. To assist in the defence of Jerusalem were formed the orders of Hospitalers of St. John, and Knights Templars, afterwards so widely renowned. In 1144 Edessa was lost, and the second crusade, under Louis VII. of France and Conrad III. of Germany, ended disastrously, and its failure for a time discouraged European effort, while the Moslem pressure increased on all sides.

In 1184-85 the monarchy of the city of Jerusalem was offered to the kings of France and England in turn, to induce them to come to the rescue, but nothing was done in either country, beyond the levying of a special yearly tax (which is said to have been the precursor of our modern system of taxation). Two years later the great Saladin, sultan of Egypt, who had long been maturing his plans, having captured Damascus in 1174 and Aleppo in 1183, now swept down through Galilee with an immense force, defeated the Christians at Tiberias and Hattin, and took Jerusalem, Oct. 1187. The news was received in Europe with consternation and rage. Fresh C. were set on foot, of which the most important was that led

by Philip of France, Frederick of Germany, and Richard I. of England. The Germans went through Asia Minor, losing their emperor on the way by drowning; the French and English journeyed by sea to Acre, which had already been besieged nearly two years by Guy de Lusignan. Richard distinguished himself in the capture of the city, but quarrelled with his allies, who left him to carry on the war alone. After a year of brilliant but useless exploits, he made a truce with Saladin, and returned to Europe. Another crusade, starting from Venice in 1202, became involved in Venetian and Byzantine intrigues, and instead of reaching Jerusalem assisted the deposed Isaac Angelus to regain the Greek throne; a few months later Constantinople was stormed by the Crusaders, and a Latin empire established under Baldwin of Flanders, 1204. In 1212 occurred the strangest and most pathetic events in the history of the holy wars. A 'children's crusade,' was started by a French boy named Etienne, near Vendôme, who, announcing that he had a divine mission, was joined as he went southward by 30,000 other children. They embarked at Marseilles; two of their vessels foundered near Sardinia, the rest reached Alexandria, where the children were seized and sold as slaves, few of them ever regaining their liberty. At about the same time another boy named Nicholas, in Germany, led a similar expedition into Italy, but this did not end so miserably. Some died by the way, but many returned home, and others found service in Italy and elsewhere. The fact of parents allowing their children to take part in such enterprises shows, perhaps, more plainly than anything else, the ignorant credulity and fanaticism of those days. A crusade under Andrew of Hungary and others (1217-21) against the Moslem power in Egypt was a failure, but that of Frederick II., undertaken in 1228 while he was under the ban of the pope, was successful. By diplomacy, not fighting, he regained Jerusalem and the Holy Land of Palestine, which remained in Christian hands until 1244, when it was finally lost. The seventh crusade, led by Louis IX. of France (St. Louis), in 1248, was like that of 1217 directed against Egypt, and proved even more disastrous. Louis, with the greater part of his army, was captured, and had to pay 800,000 pieces of gold as a ransom. Even after this, in 1270, he headed another crusade, but died at Tunis. Among those who joined this expedition was Prince Edward of England (afterwards Edward I.), who a few months later led his own followers to Acre, but achieved no results. He was the last royal crusader, except Peter of Cyprus, who in 1365-67 carried on a holy war in Egypt and Syria, but was assassinated. Though later on several popes preached united war against the infidels, nothing came of it. Even when Constantinople was captured by Mohammed II. in 1453 Pius II. failed in trying to raise a crusade for its recovery. The Templars were suppressed, but the Hospitallers, at Rhodes and afterwards Malta, long

continued to be a bulwark against Turkish advance in the Mediterranean.

Though the Crusades failed in effecting the objects for which they were intended, they indirectly worked great and unforeseen benefits for Christendom. While princely adventurers and their turbulent followers left Europe to seek for fame and conquest in the East, astute monarchs were establishing the reign of law in the West. The Church, by preaching a theocratic movement which was unsuccessful, injured its own prestige, and, what is more, by the increased knowledge and breadth of view introduced by intercourse with another and in some respects a higher civilisation, a perceptible advance was made in Europe towards that freedom of thought which led in after years to the revolt against papal authority. The Templars themselves were accused of latitudinarianism and heresy. Trade was greatly stimulated; the merchants and mariners of the Mediterranean, especially of Venice and Genoa, found the demand for the shipping increased manifold, for the transport of armies and the bringing of new and rare commodities from the East. European craftsmen and soldiers learned valuable lessons from Saracen skill in art and in war. Sugar, cotton, and many other articles now of everyday use first became known in Europe through the Crusades. During the twelfth and thirteenth centuries rumours of a mysterious Christian potentate in Central Asia, Prester John, led to the sending of various missions, first in search of him as a possible ally and afterwards to attempt the conversion of the Mongols. Prester John was not found, nor the Mongols converted, but the missionary journeys of Carpini in 1245, and Rubruquis in 1252, and the trading journeys of Nicolo Polo and his son Marco, gave European geographers their first real knowledge of central Asia. Up to that time the wildest legends, such as those of Sir John Mandeville, had passed as truth. The bibliography of the Crusades, both as to contemporary records and modern compilations, is very extensive. See F. Gibbon, *The Decline and Fall of the Roman Empire*, 1776-88; T. Archer and C. H. Kingsford, *The Crusades*, 1894; S. Lane-Poole, *Saladin and the Fall of the Kingdom of Jerusalem*, 1898; Villehardouin and De Joinville, *Memoirs of the Crusades* (Everyman's Library), 1908; E. Barker, *The Crusades*, 1923; C. Erdmann, *Die Entstehung des Kreuzzuges*, 1935; H. Belloc, *The Crusade*, 1937; P. Rousset, *Les Origines et les caractères de la première croisade*, 1946; and Sir W. Scott's novel, *The Talisman*, 1825.

Crusca, Accademia della, one of the most famous of the many Italian academies, founded at Florence, 1532, and still in existence. 'Crusca' means the bran which remains after the bolting of flour. The Accademia della Crusca or Furfuratum aimed at purifying and cultivating Italian language and literature. Its arms were a bolter with the motto 'Il più bel fior ne coglie.' Its vocabulary of the Italian tongue (1st ed. 1612) is still a model

for works of the kind. The Fr. Academy was modelled on this one. Eng. residents in Florence who pub. inferior sentimental poetry and prose about 1785 were nicknamed the Della Cruscan school. In England many of their productions appeared in the *World* and the *Oracle*. Popular for a time, their work received its deathblow from the criticisms of Gifford, in his *Bariad* and *Mæviad*, 1851. The Della Cruscans included Topham, Mrs. Piozzi, and James Boswell.

Crusius, Otto (1857-1918), Ger. classical philologist, b. at Hanover. He studied in Leipzig, becoming prof. at Tübingen Univ. in 1886, at Heidelberg in 1898, and Munich in 1903. In 1888 he became ed. of the *Philologus*. He produced *Analecta ad Paræmigraphos Græcos*, 1883; an ed. of *Plutarchus de proverbii Alexandrinorum*, 1889-94; *Zur handschriftlichen Überlieferung der Paræmigraphen*, 1891. Other works are *Beiträge zur griechischen Mythologie und Religionsgeschichte*, 1886; *Untersuchungen zu Herondas*, 1892; *Die Delphischen Hymnen*, 1894; a fourth ed. of the *Anthologia Lyrica* of Bergk and Hiller; and a biography of Erwin Rohde, 1902.

Crustacea (Lat. *crusta*, crust, referring to the incrustation of the external skeleton with lime in the larger species), large and greatly varied class of animals, classed with insects, spiders, and myriapods (centipedes and millipedes) in the phylum Arthropoda. The astonishing variety in common characteristics will be recognised when it is seen that the group includes crabs, crayfish, lobsters, barnacles, acorn-shells, water-fleas, wood-lice, pill-bugs, sand-fleas, and shrimps, and is composed of both terrestrial and aquatic animals, the latter being either marine or fresh-water species. The features which are shared by all are few, and in degraded form some of the chief characteristics are lost. Nearly all breathe by means of gills, the head has five pairs of appendages (namely two pairs of antennae and three pairs of jaws), the thorax bears numerous appendages which are usually biramous, and the segmented abdomen also frequently has limbs. Reproduction is sexual, the sexes being nearly always distinct, and all crustaceans are oviparous; the female carries her eggs with her under the abdomen or thorax until they hatch, when a series of extraordinary metamorphoses generally take place. The distribution of C. is very wide. They frequent the sea at all depths, occur in fresh-water lakes and rivers, and a few dwell under the bark of trees; the extinct species date from the Cambrian period. They function as scavengers of the sea, are used as bait for fish, and by some people crabs, lobsters, prawns, shrimps, and crayfish are regarded as food. About 6000 species, fossil and recent, have been classified, the grouping being based upon the character and number of the segments and appendages. The Trilobita were formerly classed with the Entomostraca, but are now generally considered as distinct arthropods, and the two sub-

classes are known as the Entomostraca and Malacostraca. The Entomostraca contains four orders of small aquatic animals: (1) Branchiopoda (g.v.) or Phyllopoda, e.g. the brine-shrimps and water-fleas; (2) Ostracoda, e.g. the genus *Cypris*; (3) Copepoda, e.g. Cyclops and fish-lice; (4) Cirripedia (barnacles), e.g. the barnacle-geese and acorn-shell. The Malacostraca contains sev. orders of which the chief are the Decapoda, e.g. the crab and lobster; Amphipoda, e.g. the sand-hopper; Isopoda, e.g. the wood-lice; Stomatopoda, e.g. *Squilla*; Cumacea, e.g. *Cuma*.

CRUTCH

Crutched, or **Trinity Friars**, order of friars who came to England from the Continent in 1244, called *Frères crucifères*, or *croisiers*, from the staff, bearing a cross on the top, which they carried in their hands. This name was in England corrupted into 'Crouched,' or 'Crutched' F., and is still preserved in Crutched-friars, Mark Lane, E.C. They belonged to the Trinitarians who followed the Augustinian rule. Later they had a scarlet cross on their habits changed to a blue cross in 1460 by Pope Pius II. They had monasteries in London (between Jewry Street, Aldgate, and Mark Lane), Oxford, and Reigate, and also in Scotland and Ireland at the Reformation. They were suppressed in the Brit. Isles in 1536.

Cruz, see **SOUTHERN CROSS**.

Cruyshaute, see **KRUISHOUTEM**.

Cruz, St. Juan de la (1542-91), Sp. mystic and poet, b. at Fontiveras, in Old Castile. His family name was Juan de Yepes y Alvarez, that of de la C. being assumed on his becoming a Carmelite friar in 1563. He aided St. Theresa in her reformation of the Carmelite Order. He wrote both in prose and in verse, marked by fervour of style and harmonious beauty of language. His works include *Noche oscura del Alma*, and have frequently been trans. into other tongues. His *Collected Works* was first pub. in 1580, and trans. into Fr. by

Maillard in 1694. *Obras Espirituales* (Seville, 1703, 12th ed.) was reprinted in 1849, forming vol. xvii. of the *Biblioteca de Autores Españoles*. De la C. was canonised in 1726. See D. Lewis, *Complete Works of St. John of the Cross*, 1889, and life, 1897; E. Allison Peers, *St. John of the Cross*, 1932. There is a superb life by Father Bruno (1938), containing a striking description of his escape from prison in Toledo.

Crwth, or Crowd, obsolete lyre-shaped musical instrument with six strings, four being played with a bow and two plucked by the thumb. It is very auct. in origin, probably the oldest stringed instrument played with the bow, mentioned about A.D. 609 by Venantius Fortunatus, bishop of Poitiers, in some elegiacs as 'chrotta.' The C. trithant had only three strings. Bow instruments probably came originally from India, but the C. was apparently the first of the viol family in Europe. It was an especial favourite in Wales, and was heard there as late as 1801. In England, Ireland, and Brittany it was also much played. The sound-holes were circular, the bridge slanted to the right, the *nut* fast passing through the sound-hole and resting on the back of the instrument, thus doing the work of a sound-post. The C. is frequently mentioned in T. Watts-Dunton's romance *Aylwin*, 1898.

Crying Bird, see COURLAN.

Cryolite, mineral with a shimmering pearly lustre, found in abundance on the W. coast of Greenland. It is composed mainly of the fluorides of aluminium and sodium ($6\text{NaF} \cdot \text{Al}_2\text{F}_6$). It was largely employed in the production of aluminium, but its most important use is in the production of alum and soda bicarbonate.

Cryophorus, apparatus invented by Wollaston to demonstrate the loss of heat due to evaporation. The instrument consists of a bent glass tube provided with a bulb at each end; it is prepared by introducing a small quantity of water, which is boiled until the tube and bulbs contain only water and water vapour, when the apparatus is hermetically closed.

Crypt (Gk. κρυπτός hidden), subterranean, vaulted structure under a church (especially directly beneath the choir or chancel), used for sepulture, or (rarely) as a chapel. Anciently it was a subterranean chapel in the catacombs. Cs., when large enough for an altar and having room to worship the relics, grew out of the confessions or underground tombs designed to receive the bodies of saints, martyrs, and church dignitaries. Cs. were most usual between the ninth and thirteenth centuries, but were not common after the early Romanesque or Norman period. One of the finest examples is that of the cathedral at Glasgow. In England there are good examples under Canterbury Cathedral (1096), St. Paul's, London, and the cathedrals of Winchester, Worcester, Hereford, and Gloucester. Others are under Chartres Cathedral; cathedral of Otranto; St. Mark's, Venice; St. Eutrope, Saintes; St. Peter's, Rome.

Cryptogamia (Gk. κρυπτός, hidden, γάμος, marriage), name given to the twenty-fourth class of the Linnean system of plants. It is used to distinguish the plants which do not possess perianth, stamens, pistil, or any floral parts like the *Phanerogamia*. They are mostly reproduced by spores. The C. consists of three groups, the Thallophyta, e.g. seaweeds and fungi; the Bryophyta, or mosses and liverworts; the Pteridophyta, e.g. ferns and selaginellas.

THE CRYPT, CANTERBURY CATHEDRAL

Cryptography (from Gk. κρυπτός, hidden, secret, and γραφειν, to write), or writing in cipher, the art of writing messages in such a way that they can be read only by those possessing the key to the cipher. Plutarch tells of a system in use among the Spartan generals, known as the *scytale*, from the staff (σκυτάλη) used to write and to decipher the messages. The writer wrapped a long strip of parchment round his staff, so that the edges touched all the way round. The message was then written along the joined edges, so that each letter was written half on one side of it and half on the other. The parchment strip was then unrolled, and sent to its destination. It could only be read by rolling it on a similar staff to that used by the sender, so that the letters again became whole. Julius Caesar also made use of a simple cipher, by which the fourth letter of the alphabet stood for the first, the fifth for the second, and so on. A cipher formed by reversing the order of the alphabet was in use among the Jews, as we learn from Jeremiah xvi. Francis Bacon, Lord Verulam, in *The Advancement of Learning* (1605), classes C. as a part of grammar, and gives three

requisites for a good cipher. It must be easy to write and read; it must be difficult of detection; it must be void of suspicion, i.e. it must not appear to be a secret message at all. He himself furnished an ingenious bi-literal cipher, by which the letters of the alphabet were represented by various combinations of the letters A and B in groups of five, three As and two Bs or three Bs and two As. Before this time, however, some literature had already gathered round the art. The first writer on the subject was John Trithemius, abbot of Sponheim. At the request of the duke of Bavaria, he composed *Polygraphia* (1500). The same prelate may also be the author of *Stenographia*, pub. some fifty years later at Lyons. During the period of the Civil wars in England, most of the important messages from the leaders of both parties were sent in cipher. The Royalist party especially made free use of this means. King Charles I. and his queen were especially adept at the art, and a large number of their letters and papers remained untranslated until the nineteenth century.

The various different methods of C. fall mostly under the following heads: (1) Writing with invisible ink which becomes visible when the paper is heated; (2) the insertion of superfluous words and letters, where it is agreed upon that words at regular intervals form the message, the rest being padding; (3) the misplacing or rearrangement of words or letters; (4) reading vertically or diagonally; (5) the substitution of letters; (6) by stencil plates or papers which are placed over the cryptogram, the words which then appear forming the message; (7) the use of two or more letters (Bacon's system); (8) the employment of numerals instead of letters, a system often used by Charles I.; (9) by a special key containing an arbitrary code; (10) the use of specially arranged counterpart tabulations, which vary at different stages in the message. A description of Hogg's secret code will give some idea of a cipher of this latter class. It consists of two columns, one fixed and containing the letters of the alphabet, another sliding by the side of the first column and containing two alphabets, one continuing below the other. A key word is arranged on by the correspondents, and this word is repeated again and again until the message be ended. The working may be best explained by an example. Suppose the key-word be Edna. The sliding column is then moved so that the E on its upper alphabet comes opposite the A on the fixed alphabet. Each letter on the sliding alphabet is used as a substitute for its equivalent on the fixed alphabet. With the columns in this position the first letter of the message is written down. Then the D of the sliding scale is moved opposite the fixed A and the second letter written down. Then N is moved opposite A and the third letter written. The fourth letter does not change. For the fifth letter the E scale is again used, and so on. Thus, with the key-word given above, the sentence 'Send help at once' would appear as

'Whad lhyp ew bugh.' The first work of the decipherer in cases of this kind is to see the letter which is used most frequently. In Eng., this will correspond to the letter e. The letters which are most frequent after e are the following: t, a, o, n, i, r, s, h, d, l, c, w, u, m, f, y, g, etc. All the single letters must be either A, O, or I. The double letters which recur most frequently are ee, oo, ff, ll, ss, and the commonest words of two letters are, roughly speaking, of, to, in, it, is, be, he, by, or, as, at, if, etc. A special study of the subject will discover a great number of symmetrical combinations of letters which occur with greater or less frequency in all languages, and which will materially aid in the work of solving cryptograms. See P. Thicknesse, *Treatise on the Art of Deciphering and of Writing in Cipher*, 1772; A. Langie, *Cryptography* (trans.), 1922; A. Fige, *Système des Chiffres*, 1926.

Cryptomeria, genus of plants belonging to the order Coniferae. *C. japonica* is a large pyramidal evergreen tree which grows to a height of 100 ft. It is a native of China and Japan.

Cryptoprocta Ferox, species and genus of Viverridae, or civets, is the fossa of Madagascar and constitutes in itself the sub-family Cryptoproctinae. In appearance it resembles a large pole-cat, 3 ft. in length, and in colour it is reddish-brown. It is active, carnivorous, and extremely ferocious.

Crystalline Rocks comprise those that have a crystalline structure, as opposed to those that are elastic. This crystalline form may be either original or may have been caused by the action of great heat and pressure. The origin, in fact, cannot be taken into account with these rocks, for some of the aqueous rocks, e.g. rock salt and gypsum, owe their origin to chemical precipitation from water, while others have arisen from igneous rocks, e.g. lava. Again, the crystalline schists (q.v.) belong to this group, although they present a foliated character. In this case it seems certain that the change in structure has been induced by the physical conditions. The igneous rocks are now known as *massive* crystalline, as opposed to the schistose crystalline structure.

Crystallisation, formation of crystals by a substance when it passes from a liquid to a solid state. The molecules tend to arrange themselves so as to form polyhedra. Most organic and inorganic substances can be obtained in a crystalline form. See further under CRYSTALLOGRAPHY.

Crystallites, stages in the formation of crystals which occur in volcanic rocks. When examined under the microscope, these rocks consist largely of a glassy base, and through this base are scattered great numbers of tiny crystals and C. C. may also be produced by allowing a solution of sulphur in carbon disulphide, mixed with Canada balsam, to evaporate slowly, and the development of the C. can then be noted on a microscopic slide.

Crystallography (Gk. *κρύσταλλος*, ice; *γράφειν*, to write), the study of the form, structure, and properties of crystals. When matter passes into the solid state from the liquid or the gaseous state, it may take an *amorphous* (shapeless), or a *crystalline* form, when there is a remarkable similarity between crystals of the same substance. The formation of crystals appears to be favoured by a gradual transition from the fluid to the solid state, as when a substance in solution is deposited by the gradual cooling or evaporation of the liquid or when the transition occurs directly from the gaseous to the solid state. The molecules then tend to arrange themselves so as to form polyhedra, and this tendency is encouraged by the presence of a crystal of the same, or of a similar, substance. Most organic and inorganic substances can be obtained in a crystalline form; sugar, salt, and alum readily crystallise from solution; metals such as cast iron and zinc solidify from fusion in a crystalline form; but the most perfect examples are those resulting from the gradual cooling of the earth's crust. The science of C. deals mainly with minerals thus crystallised, and may therefore be regarded as a sub-div. of the science of mineralogy. When the object of study is the form of crystals, it is known as *Morphological* or *Geometrical* C.; the structure and properties are studied under the name of *Physical* C.

There are three principles which characterise the crystalline form; they are indicated by the terms constancy of angles, symmetry, and rationality. Although there may be irregularities and imperfections of form in crystals of the same substance the angles between their faces are invariably the same. The symmetry of crystals is not necessarily one of position, but is one of direction; that is, the edges and faces may be arranged so as to give the same direction with respect to certain axes or planes without correspondence in linear dimensions. A cube is symmetrical about its central point; that is, its faces are arranged in parallel pairs about that point. It is also symmetrical about certain axes: the lines joining opposite corners (four axes); those joining the middle points of diagonally opposite edges (six axes); and those joining the middle points of opposite faces (three axes), giving a total of thirteen axes. A cube may also be divided into two symmetrical halves by certain planes: those passing through four corners (six planes), and those passing through the middle points of four edges (three planes); giving a total of nine planes. A cube therefore is symmetrical with respect to twenty-three elements altogether. Other crystalline forms display fewer types of symmetry. The principle of rationality depends on certain systems of notation by which the directions of the faces are indicated. Suppose three edges formed by the intersection of three faces be taken as axes of reference. Any face can now be defined by the intercepts cut off by it on these three axes. As the direction, but not the dimensions, of the face is re-

quired, the ratio of these intercepts is sufficient for the purpose. It has been found empirically that these ratios are simple numbers, as 1 1 2, 2 3 1, etc., and they can never involve incommensurable surds as $\sqrt{2}$ or $\sqrt{5}$. The system of notation indicated is known as Weiss's, but it has been to a great extent superseded by Miller's, in which the reciprocals of Weiss's figures are used. Thus the Weissian index (231) becomes, according to Miller, $\frac{1}{2} : \frac{1}{3} : 1$, or 3 2 6.

Systems.—According to the number and nature of the axes of symmetry, crystals may be divided into six groups or systems: (1) Cubic or isometric system, where the three crystallographic axes of reference are at right angles to each other and are equal in length. (2) Tetragonal or pyramidal system, where the three axes are all at right angles to each other, but only two are equal. (3) Rhombic, orthorhombic or prismatic system, where the axes are all at right angles, but are of different lengths. (4) Oblique or monoclinic system, where two of the axes are at right angles and the third oblique, all the axes being of different lengths. (5) Anorthic or triclinic system, where the angles between the axes are all oblique and the axes of different lengths. (6) Hexagonal system, where there is one principal axis of symmetry and six axes of symmetry at right angles to it. Where all the planes or faces required by the complete symmetry of the system are present, the form is said to be holohedral. Sometimes only half of the full number of faces are present; the form is then said to be hemihedral, and when only a quarter are present the form is called tetrahedral.

Crystals corresponding exactly to the types as set down in the systems are comparatively rare, imperfect or multiple development rendering it often necessary to assume the existence of faces which cannot be observed. Where a prism is terminated by pyramids, it often happens that one end only is complete, the other forming the surface of attachment to the rock. Occasionally *hemimorphism* is met with; this is a condition in which the ends belong to different forms. Crystals are often massed together to form a group. *Parallelism* then occurs, in which two crystals are compounded so that a line joining their centres lies along a crystallographic axis or is parallel to it. Alum commonly shows this phenomenon. In *twin-grouping* two crystals have a common face. If the crystals be regarded as penetrable, and the faces in contact are looked upon as moved parallel to themselves each through the other crystal, a form is obtained which is known as a penetration twin. There may be three or even more individuals in such a group, when their identification by form may become somewhat difficult. Many other irregularities occur, such as are commonly produced in the laboratory when a fairly regular individual is introduced into a solution to promote the deposition of the solid. Certain faces are developed at the expense of others, producing a distorted condition. When

Cubic system: 1. Relation of Cube to Octahedron; 2. Cubic Octahedron. *Tetragonal System:* 3. Square Octahedron (obtuse). *Rhombic System:* 4. Rhombic Octahedron (obtuse); 5. Rectangular Prism. *Monoclinic System:* 6. Prism in which two edges are truncated by the face and producing an oblique six-sided prism. *Triclinic System:* 7 and 8. Oblique Rhomboidal prisms. *Hexagonal System:* 9. Double six-sided pyramid.

imperfections are so numerous as to disguise the crystalline structure of a mineral completely, it is said to be *massive*.

Physical Crystallography.—There are certain physical properties characteristic of the crystalline form. By *cleavage* is meant the tendency of a crystal to split along certain planes when subjected to a wedging force. These planes are always parallel to a face or a possible face of the crystal. When a crystal is broken to pieces by a crushing blow, the fragments usually are bounded by a few planes only, showing the tendency to break in particular directions. When a crystal is struck by a sharp point, percussion lines are produced which agree in number and direction with the symmetry of the face. A crystal immersed in a solvent is acted upon in a manner which shows differing degrees of resistance according to the symmetrical arrangement of the particles. Etched figures are produced which beautifully illustrate the simple form of

the particular crystals. The hardness of a crystal face depends on its direction.

The optical characteristics of various crystals are often used as an aid to identification. They may be classified primarily as opaque, translucent, and transparent. Opaque crystals do not allow light through at all, translucent crystals allow light to pass without allowing definite outlines to be seen, just an oiled paper and ground glass act. Transparent crystals allow light to pass through, but the direction of the ray is bent or refracted. Crystals of the cubic system are isotropic, that is, they refract singly. Other crystals are doubly refracting, the ray being split into two. This property is best illustrated in calcite, or Iceland spar. It is found, however, that the difference in direction of the transmitted rays varies according to its direction with respect to an optic axis. When the ray travels parallel to an optic axis, it is transmitted as a single ray. Crystals which possess

one such axis are called *uniaxial*; to this class belong hexagonal and tetragonal crystals. Those with two optic axes are known as *biaxial*; such are rhombic, oblique, and triclinic crystals. The colour of crystals may be due to their own inherent absorptive qualities, when they are known as *idiochromatic*; or may be due to adventitious substances, when they are called *allochromatic* crystals. The behaviour of crystals with respect to heat corresponds to their optic properties; the conductivity is greatest along the optic axes. Expansion by heat also varies in different directions, producing change of form.

Substances identical in chemical composition may crystallise in two different forms. Such substances are termed dimorphous; examples are *Carbon*, crystallised in the cubic system as diamond, and in the hexagonal system as graphite; *Sulphur*, in the rhombic system when deposited from solution in carbon bisulphide, and in the oblique system when crystallised from fusion. An example of trimorphism is *Silica* crystallised in the hexagonal (tetrahedral) system as quartz, in the hexagonal (holohedral) system as tridymite, and in the rhombic system as *asmanite*. Minerals of analogous constitution often have similar crystalline forms. Such a condition is termed isomorphism. For example, the rhombohedral carbonates calcite, magnesite, dolomite, siderite, ankerite, etc., are similar in form, cleavage, and optical properties. In each case the mineral may be represented by $R'CO_3$, where R' denotes equivalents of the analogous metals, calcium magnesium, iron, manganese, zinc, etc., or combinations of two or more of those metals.

See J. D. Dana, *Manual of Mineralogy*, 1879; W. J. Lewis, *Treatise on Crystallography*, 1899; P. Groth, *Introduction to Chemical Crystallography*, 1906-8; W. Voigt, *Lehrbuch der Kristallphysik*, 1910; A. E. H. Tutton, *Crystallography and Practical Crystal Measurement*, 1922; and *Natural History of Crystals*, 1924; G. Friedel, *Leçons de cristallographie*, 1926; A. Joffé, *The Physics of Crystals*, 1928; D. B. Briggs, *The Study of Crystals*, 1930; and A. W. Wooster, *A Text Book on Crystal Physics*, 1938.

Crystallomancy (Gk. κρύσταλλος, crystal; μαντεία, prophecy, divination), means of divination by the hypnotic condition caused by gazing fixedly into a crystal, mirror, or pool of ink. This practice has been followed in all ages as a means of foretelling the future. A beryl was most often used. The operator, having muttered certain formulas over it, handed it to a pure youth or maiden, who was then supposed to be able to reveal the future. The desired knowledge was obtained by means of written characters on the crystal, or by the appearance there of the spirits invoked. Dr. Dee was a noted adept at C., two of his 'magic mirrors' being now in the Brit. Museum. See Shorthouse, *John Ingleton*, 1881; books on crystal-gazing by Melville, 1903, and Thomas, 1905.

Crystal Palace. This building, mainly of glass and iron, with wooden floors, was first erected in Hyde Park, London, for the Great Exhibition in 1851. It was designed by Sir Joseph Paxton, was 1608 ft. long, 21 ac. in area, and cost £1,540,000. It was taken down and re-erected at Sydenham, where Queen Victoria opened it in 1854. The central transept was 390 ft. by 120 ft. and 175 ft. high; the S. transept was 213 ft. long, and a similar N. one was burnt in 1866. Its greatest width was 384 ft. Intended as a permanent exhibition of the art and culture of all nations, it had a series of courts representing the architecture and sculpture of different civilisations, a picture gallery, museum, and school of practical engineering. From 1855 to 1901 the famous C. P. Saturday concerts (symphony concerts) were held there under the direction of August Manns. From 1859 to 1912 the Handel festival took place at the C. P. every three years, and after the First World War performances were given at irregular intervals. There are magnificent grounds of about 200 ac. and for many years the Football Association cup final was played there. The C. P. was burned down on Nov. 30, 1936.

Crystals, Etching of, see ETCHING OF CRYSTALS.

Csaba, tn. of Hungary in the co. of Békéscsaba. There are distilleries and flour mills, and a trade in corn, hemp, wine, etc. Pop. 44,000.

Csanád, co. and tn. of Hungary, bounded by the Maros on the S. The chief tn. is Makó. A considerable part of C. was allotted to Rumania after the First World War. Pop. 130,000.

Csárdás, or **Czardasch** (Hungarian *csárda*, tavern), Hungarian national dance, consisting of two movements, *andante* and *allegro*, in $\frac{3}{4}$ or $\frac{2}{4}$ time throughout. The two parts are called the 'lassu' and the 'friss' (*frischka*), the former being mostly in the minor mode, the latter in the major. Any number of couples may dance it, all doing different steps and figures.

Csepel: 1. Is. of Hungary, 30 m. long, enclosed by two arms of the R. Danube, just below Budapest. C. was once a favourite summer residence of the kings of Hungary. Fruit and wine are produced. 2. Suburb of Budapest on the C. Is., with metal and steel industries. Pop. 14,000.

Csokonay (Csokonai), Vitéz Mihály von (1773-1805), Hungarian poet and prof. at Debrecen. He was above all a lyricist, and inspired by the Hungarian folk-songs he helped to develop the national poetry. Among his most popular works may be mentioned *Magyar-Musa* (1796); *Amaryllis* (1803); *Dorottya* (1804, similar in style to Pope's *Rape of the Lock*); *Anakreoni Dalok*; *A Pásztor Király* (1806). His collected works appeared in 1844-45 and 1924.

Csoma de Kőrös, Alexander (Sándor) (c. 1790-1842), famous Hungarian traveller and orientalist, educated at Nagy-Ényed College, then at Göttingen. His life-long ambition was to discover the real

origin of his race—the Magyars—supposed to have come from Asia, but he d. leaving the problem unsolved in spite of all his efforts. While journeying to Tibet and China to continue his researches, he d. at Darjeeling. See T. Duka's life, 1885.

Csongrad, tn. of Hungary, in the co. of C. (pop. 150,000, cap. Szentes). An important trading centre situated at the confluence of the Tisza and Körös, 70 m. S.E. of Budapest. Pop. 27,000.

C.S.R., abbreviation for Československá Republika, or Czechoslovakia.

Ctenodactylus (Gk. κτείς, comb; δάκτυλος, finger), genus of rodent in the family Otodontidae, which contains the coypu and porcupine rats. *C. Massoni*, Masson's comb-rat, is the single species, and is a native of the Cape of Good Hope.

Ctenophora (Gk. κτείς, comb; φάρος, bearing), large div. of the Coelenterata (q.v.) which consists of free-swimming marine animals, gelatinous in structure, and usually phosphorescent. *Cestum veneris*, the Venus's girdle, is a beautiful example.

Ctesias (Κτήσιος) (d. c. 396), Gk. physician and historian of the fifth century B.C., native of Cnidus, Asia Minor. He accompanied the expedition of the younger Cyrus against Artaxerxes, and was captured by the Persians at the battle of Cunaxa, 415. For about seventeen years he then remained as physician at the court of Artaxerxes Mnemon. A contemporary of Herodotus, his jealous mind is revealed in his attempt to depreciate that historian's work. Fragments of his *History of Persia* (Ἱστορίκα), in twenty-four books, and *Treatise on India* (Ἰνδικά) are extant, and there are abridgments of each by Photius. He is more important as a source of romance than as a serious historian. Fragments of his works have been ed. by Müller (appendix to C. Dindorf, *Herodotus*, 1844); J. Bähr (1824), and J. Gilmore (1888). Consult C. Blum, *Herodotus and Ctesias*, 1836; J. Mahaffy, *History of Greek Literature*, 1895; and C. Wachsmuth, *Einleitung in das Studium der alten Geschichte*, 1895.

Ctesibius (Κτησιβίος) (c. 250 B.C.), Gk. physicist of Alexandria, famous for various mechanical inventions. Among these are the clepsydra (water clock), force-pump, hydraulic organ, and other machines. C. was first to discover the elastic force of air and to apply it as a motive power. Hero of Alexandria was his pupil and helper.

Ctesiphon (Κτησιφών), anot. city of Mesopotamia, on R. Tigris, 20 m. from Bagdad, materials for which city were supplied by its ruins. Mentioned by Polybius (v. 45) and Ammianus (xxiii. 6), it rose to importance under the Parthian, and later Persian, empire. Strabo describes it as the winter residence of the Parthian kings, and Tacitus (*Ann.* vi. 42) calls it 'redes imperii.' The modern equivalent is Tak-i-Kesra, while the ruins of anot. C. and of Seleucia (on opposite bank) are together called El-Modell (Al Madain, the two cities) by the Arabs. It was captured by various Rom. emperors

between A.D. 116 and 362. In the fourth century C. was the cap. of the Sasanian dynasty. Yezdigerd surrendered it to the conquering Arabs, 637. The façade and arched hall or throne-room of a marvellous palace, said to have been built by Chosroes I., are included in the ruins left. During the First World War an important battle was fought here between the Turks and the Brit. In the summer of 1915 Gen. Sir Charles Townshend advanced up the R. Tigris, capturing Amara and Kut-el-Amara. Pushing on from here with an inadequate force he advanced towards C. and on Nov. 21 drove the Turks from a strong position at Lajj and then prepared for an assault on their position at C. itself. He attacked on

E.N.A.

THE PALACE OF CTESIPHON

The parabolic vaulting has a span of 86 ft. On the left is the façade of the east wing of the palace

the night of Nov. 22; but, though he met with some initial success, the Turkish reinforcements were so overwhelmingly strong that Townshend was compelled to withdraw to Kut-el-Amara, where he eventually surrendered. See S. W. G. Benjamin, *Persia and the Persians*, 1887; and O. Renter, *Die Ausgrabungen der deutschen Ktesiphons-Expedition im Winter 1928-29* (with bibliography), 1930.

Cuango, see CONGO.

Cuanhuahua, see CUERNAVACA.

Cuba, largest is. of the W. Indies, an independent republic, at the mouth of the gulf of Mexico, 130 m. from Florida, separated from it by Florida Strait. Lies between 74° and 58° W. long., and 19° and 23° N. lat. Separated from Haiti on the E. by Windward Passage, from Jamaica on the S. by the Caribbean Sea, from Yucatan on the W. by Yucatan Channel. Length from Cape Maisi (E.) to Cape San Antonio (W.), 730 m.; breadth 20-90 m.; area (with is. of Pines and numerous is.) 46,730 sq. m. The coast-line is mostly abrupt and steep; a large marshy depression (*trocha*), 45 m. wide, connecting Morón and the S. coast, divides C. into two distinct parts, E. and W. There is a series of terraces on the E.

The coasts are very dangerous owing to reefs and shallows extending nearly 2½ m. out to sea, but there are good harbours and bays, as at Havana (cap.), Guantánamo, Santiago de Cuba, Manzanillo, Bahía de Jagua, Cabañas, Padre, and Matanzas. There are mt. ranges all over the is., the highest being in the E., and all grouped near the coasts. The Sierra Maestra, or Grupo Macabá, culminates in Pico Turquino or Monte Azul (about 8400 ft.), and is continued in the Sierra del Cobre. Near by is the hill region W. of Yunque (the Anvil of Baracoa, 1825 ft.), with Sierras de la Vela, Toar, etc. In the W. is a hilly dist., with Pico de Potrerillo, Sancti Spiritu, Pan de Matanzas in the N. (1280 ft.); Cordillera de los Orgaños (Pan de Guajabón, about 2000 ft.), stretching through Pinar del Río to Havana. Other peaks are Gran Piedra (5000 ft.) and Cerro de Oro (3000 ft.). The rvs. are not very large, the chief being the R. Cauto, flowing into Manzanillo bight; others are R. Saza, draining the swamps (*ciénegas*) to the N. of the Zapata peninsula, and Sagua la Grande. The climate is tropical, average temp 77°, rarely falling as low as 50°. Chief rainy season, May to Oct. Earthquakes are more frequent in the E. than in the W. The numerous forests contain mahogany, ebony, cedar, fustic wood, besides yielding dye-woods, fibres, gums, and resins. Flowers and shrubs also abound, including the royal palm. Bats, agoutis, and the solenodon are the only indigenous mammals. Birds are very numerous. The crocodile and caiman are found in the marshes. Other reptiles are the boa and iguana. C. is famous for scenic beauty, the Yumuri valley being one of the most lovely.

The chief products are sugar (nearly half the cultivated area being planted with sugar-canes, especially in Santa Clara and Matanzas, which supply one-quarter of the world's crop) and aromatic tobacco in Pinar del Río, particularly in the dist. of Vuelta de Abajo, the finest being produced on the banks of the San Sebastián, and made into the famous Havana cigars. Coffee-planting is now of minor importance, and none of the crop is exported. Other products are Indian corn, maize, rice, cacao, indigo, potatoes. There are many fruits (oranges, bananas, lemons, shaddocks, figs, etc.) and vegetables; mallochia grass and cassava are grown; cattle and poultry breeding are carried on, and wax and honey produced. Over 1,000,000 tons of sugar were produced in 1909, largely exported to the U.S.A., while in 1925-26 the crop amounted to 5,292,000 tons, some 1,600,000 ac. being under sugar plantations. The production then declined heavily, being limited by presidential decree and also by quota under an international agreement. In 1937 the crop was 2,971,000 tons. In 1947 there were about 2,750,000 ac. under sugar, and 500,000 ac. under tobacco, sweet potatoes, and bananas, and the sugar crop rose to nearly 6,500,000 ton after the removal of the above-mentioned restrictions. In the same year the tobacco crop was 60,000,000

lb., coffee 600,000 bags (each 132 lb.). The average tobacco crop is 500,000 bales (bale, 120 lb.). In 1943 the U.S.A. sent 78 per cent of imports and received over 88 per cent of the exports. Exports are mainly sugar, molasses, and tobacco; imports food, beverages, textiles, and machinery.

Iron ore is mined by Amer. companies near Santiago and Juragua. There are also manganese deposits, still some copper in Sierra del Cobre, asphaltum in the bay of Cardenas, and salt. Gold and silver are rare. There are more than 8700 m. of railway, admirably managed (public services 3000 m., private lines on plantations and in mining areas, 5600 m.). There are about 2200 m. of roads. Automobiles are much used and popular, and electric street cars run in most tns. Hotels are generally good. There is no colour bar. Sp. is the language of the is., but Eng. is widely understood. Education is free and compulsory. In 1861 only 19 per cent of the pop. could read and write, in 1925 85 per cent, but the percentage of illiterates rose in 1945 to 35-6. The Havana Univ. was opened in 1728, but until its enlargement under Amer. auspices in the first twenty-five years of this century no marked advance was made in secondary or higher education. Some Cubans work well, but the average countryman is said to work from Tuesday to Thursday and play the guitar, dance, and attend cock-fights the rest of the week. The poor are so because they are lazy. Bull-fights were abolished in 1899. In 1922 the first broadcasting station in Lat. America was installed at Havana. Chinese coolies and Negroes are much employed for labour. Chief tns.: Havana, 673,300; Holguine, 171,900; Camagüey, 156,800; Santa Clara, 122,200; Santiago de Cuba, 120,500; Sancti Spiritus, 104,500; Cienfuegos, 94,800; Guantánamo, 91,700; Bayamo, 90,100; Manzanillo, 79,300; Ciego de Avila, 78,500; Pinar del Río, 77,000; and Matanzas, 73,700; the six provs are Havana, Oriente, Las Villas, Camagüey, Matanzas, and Pinar del Río.

History.—Discovered by Columbus during his first voyage, on Oct. 27, 1492; he saw sev. of the natives going about with fire-brands in their hands, and certain dried herbs, which they rolled up in a leaf and, lighting one end, put the other in their mouths, and continued puffing out the smoke. A roll of this kind they called a *tabaco*. C. was colonised by Spaniards about 1510, Negroes replacing the Indians as slaves; it was a Sp. possession till 1898. (The is. was actually under Brit. rule for one year, 1762-63, when it was returned to Spain in exchange for Florida). In the seventeenth century C. was harassed by raids of Eng., Fr., and Dutch, who built the primitive fortifications of Havana and Matanzas as defences. The slave trade was abolished early in the nineteenth century, and the slaves were emancipated from 1880 to 1886. During 1868-78 there was war against the Spaniards for Cuban independence. In 1880 the Cortes

passed an Act to abolish slavery. The gov. of Spain was characterised by a generally corrupt administration, aggravated by internal unrest fermented by attempts at independence and consequential military repression. The separatist and autonomous movement culminated, late in the nineteenth century, in a fierce war, and, although the Madrid Gov. showed a conciliatory spirit, the agitation was continued. In 1898, during a second war for independence, the U.S.A. Gov. carried out their threat of intervention by sending the battleship *Maine* to Havana harbour. On Feb. 15 of that year the *Maine* was blown up in Havana harbour and 264 men were killed. War with Spain followed. C. was under Amer. military control, 1899-1902. In 1901 a republican form of gov. was estab., the first president being Estrada Palma. The 'Platt Amendment' contained guarantees against foreign interference. In 1903 a commercial convention was signed between C. and the U.S.A. In 1905 a rebellion against the governor was quelled by the U.S.A. Mr. Taft, U.S. secretary of war, was sent by President Theodore Roosevelt as mediator and became provisional governor, being succeeded by Magoon. The U.S. troops, under Gens. Funston and Bell, restored order. New educational measures were enforced, 1900. The new gov. was settled by President Roosevelt in Jan. 1909. The Amer. troops were finally withdrawn on April 1, 1909, and henceforth affairs ran smoother. During the First World War the high price of sugar brought phenomenal prosperity, which ended when the price of sugar fell from 23 cents to 2 cents a pound. The Cubans have left the development of their ls. largely to Amers. In 1933 a revolution was followed by provisional gov. until May 1936, when a constitutional gov. was elected. A new constitution was promulgated on July 5, 1940. Following the Socialist-Democratic victory at the general election of that year, Col. Batista assumed the presidency on Oct. 10 when the new constitution came into force. According to this constitution the Cabinet is responsible to Congress; if it receives a vote of no confidence, the Cabinet must resign in forty-eight hrs. C. declared war on the Axis (q.v.) on Dec. 11, 1941. The president for 1944-48 was Ramon Grau San Martin. The pop. is 4,778,500, of whom 3,553,300 are white and 1,225,200 coloured.

Leslie, *Official History of the Spanish-American War* (Washington), 1899; —, Robinson, *Cuba and the Intervention*, 1906; I. A. Wright, *The Early History of Cuba, 1492-1536*, 1917; W. F. Johnson, *History of Cuba*, 1920; P. Terry, *Terry's Guide to Cuba*, 1926; C. E. Chapman, *A History of the Cuban Republic: a Study in Hispanic American Politics*, 1927; H. F. Guggenheim, *The United States and Cuba: a Study in International Relations*, 1934; H. Strode, *The Pageant of Cuba*,

1935; R. H. Fitzgibbon, *Cuba and the United States, 1900-1935*, 1935; R. G. Sanchez, *Manual de Historia de Cuba*, 1938; and H. E. Friedländer, *Historia Económica de Cuba*, 1944.

Cubango, Okavango, or Kubango, riv. of W. Africa, about 1000 m. long, rising near the Cuanza's sources, E. of Benguela, forming part of the boundary between S.W. Africa and the Portuguese Angola. It flows in a S.E. direction, and into Lake Ngami, under the name Tioje or Tonke (Tankhe).

Cubature, process of finding the volume of a solid. The word is parallel to quadrature, which means resolving an area into a number of squares, while C. means resolving a volume into a number of cubes. To find the value of a volume from particular data is an arithmetical problem in the case of parallelepipeds and is usually dealt with under the name of mensuration (q.v.). Where figures are bounded by curves the process is usually analytical, and is based on the theorems of Pappus of Alexandria, which state: (1) If any plane figure revolves about an external axis in its plane, the volume of the solid generated by the revolution is equal to the product of the area of the figure and the distance travelled by the centroid of the figure; (2) if any line in a plane revolves about an external axis in the plane, the area of the curved surface generated by the revolution is equal to the product of the length of the line and the distance travelled by the centroid of the line.

CUBE

Cube, regular solid bounded by six square plane faces, opposite sides being parallel, in such a way that three edges always meet at right angles to each other. In arithmetic the C. of a number is found by multiplying it by itself three times; thus the C. of $2 = 2 \times 2 \times 2 = 8$. Similarly the C. root of any number is that number which multiplied by itself three times gives the original number; thus the C. root of 64 is 4. The volume of a C. is measured by the C. of the length of a side; thus the volume of a C. with sides 2 in. long is 8 cubic in.

Cubebæ, berries of *Piper cubeba* and *P. guineense*, family Piperaceæ. Picked unripe and dried for medicinal use in cases of urinary and bronchial diseases. C. yield the oily compound cubebene and a resinous compound, cubebic acid.

Cubic Measure, see under **WEIGHTS AND MEASURES**.

Cubism. This term, applied to a school of art arising from Post-Impressionism, was first used by Henri Matisse in 1908 in reference to a picture by Braque: 'Encore des cubes! assez de cubisme!' But scorn and derision could not kill the movement, and three years later exhibitions of Cubist art were held in Paris and Brussels, while 1912 witnessed one in Barcelona. The actual founder of C. was the Sp. artist Pablo Picasso (b. 1881), follower of Paul Cézanne, the great Fr. Post-Impressionist, and Georges Braque was a close runner-up of Picasso. Cézanne had formulated the theory that 'everything in nature is modelled on the sphere, the cone, and the cylinder; one must first understand how to paint these simple figures, and one can then paint anything.' The Cubist makes no attempt to give an exact reproduction of any objects visualised, but by means of portraying their colours and solidity in his own peculiar style to show the impression they make on the artistic mind. C. is a passing phase of art and has made especial appeal to the Fr. mentality and temperament. Some of its chief exponents are André Derain, Fernand Léger, Albert Gleizes, Jean Metzinger, Francis Picabia, Joan Gris, the Russian sculptor Archipenko, and the Amer. Arthur Dove. See also **PAINTING**. See A. J. Eddy, *Cubists and Post-Impressionism*, 1915; A. Gleizes, *Du Cubisme*, 1920; F. Rutter, *Evolution in Modern Art*, 1926; R. H. Wilenski, *Modern Movement in Art*, 1927; and C. Giedion-Welcker, *Moderne Plastik*, 1937.

Cubit (Lat. *cubitum*, elbow), primitive linear measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the middle finger. There is much discussion as to the exact length of the Heb. C., now generally fixed at 17 to 18 Eng. in. or 45.72 cm. The Rom. C. was about 17½ in., and the Egyptian C. ('C. of Memphis') about 20.7 in. See also **FOOT**, **PALM**, **SPAN**. See W. Smith, *Dictionary of the Bible*, 1863; 'Weights and Measures' in J. Hastings's *Dictionary of the Bible*, 1898.

Cubitt, Sir William (1785-1861), Eng. civil engineer of Norfolk. He was known as an inventor of machines, such as self-regulating sails for windmills, and the treadmill (1818, soon introduced into the jails of Great Britain). C. came to London, 1826, becoming engineer of the S.E. railway. He constructed the canal at Oxford, docks at But. Cardiff, and Liverpool, the Berlin waterworks, and various bridges. He also superintended the erection of the Crystal Palace in Hyde Park, 1851, and was knighted for this service.

Cucamas, see **COCOMAN**.

Cuchullin, **Cuchullinn**, or **Cuchulainn**, name of the chief warrior and hero in the Conchobar-Cuchullinn heroic cycle of Ireland. He is usually styled son of Sualdam, an Ulster warrior, but seems to stand in a special relation to the god Lug. C.'s earliest name was Setonta, and he was brought up at Dún Imbriht (Louth).

At the age of six he went to the court of Conchobar, king of Ulster. He slew the hound or watch-dog of Culann the smith, becoming for a time guardian of his domain instead, hence his name Culann's hound (Cu-Chullinn). Later the warrior slew the three sons of Necht, hereditary foes of the Ulstermen. After learning chivalry with Donnall the Soldierly and the Amazon Scathach in Alba, he married Emer, daughter of Forgall the Willy. At the age of seventeen he defended the Ulster frontier against the forces of Medb of Connaught. He was killed some ten years later by Lugaid and the children of Calatin Dána. Some place the date about the beginning of the Christian era. In *Fled Bricrenn* (Bricriu's Feast, eleventh or twelfth century) C. tells the story of a challenge and beheading similar to that of the Middle Eng. poem, *Sir Gawayne and the Green Knight*. See Eleanor Hull, *The Cuchullin Saga in Irish Literature*, 1898; and A. Nutt, *Cuchulainn, the Irish Achilles*, 1900.

Cuckfield, small mkt. tn. of Sussex, England, 12 m. N.W. of Lewes. It is noted for its fairs, held three times a year. Pop. of urb. dist. 11,000; of par. 2000.

Cuckoo, sub-family of the Cuculidae, family of the Cuculidae, containing nearly 200 species. The name is derived from the note of the common European C. (*Cuculus canorus*), which appears in England in the spring, migrating again to warmer climes as early as Aug. Most species are remarkable for their parasitic habits. There is no permanent attachment of male to female, and no nest is built. When the female has laid an egg on the ground she takes it in her bill and lays it in the nest of some other bird. The egg is then hatched, and the young bird is fed by the owner of the nest. When the young C. attains sufficient strength (and it early does this) it expels its foster-mother's young from the nest by working itself under them and jerking them out. The yellow-billed C. (*Coccyzus americanus*) incubates its own eggs.

Cuckoo-spit, or Froghopper. Sub-section Cicadellina, or the genus *Cercopidae*, ranked under the Homopterous sub-order of insects. The name froghopper refers partly to the form of their body, partly to their great powers of leaping. The common froghopper is *Aphrophora spumaria*; another species frequently met with in gardens is *A. bifasciata*. The larva of these insects, which, except in the lack of wings, resembles the perfect insect in most respects, envelops itself in a froth resembling human spittle. This is often observed on plants.

Cuculidae, family of the sub-order Cuculi of the order of birds Cuculiformes. It includes the cuckoos (q.v.) and their kin. They are found in greatest variety in the Indian regions. Cuculinae is Swainson's name for the sub-family of the C. which comprises the true cuckoos. The voice of the female is a mere clattering, and it is the male which utters the familiar call-note in the breeding season.

Cucumber, or Cucumis sativus, species of Cucurbitaceae, which is largely cultivated. It is a kind of trailing ann., and the unripe fruit is used for salads and pickles. The finest specimens are obtained from shaded plants growing in a warm, damp atmosphere, and therefore developing rapidly. When fine and long fruit are desired, the plant should not be allowed to bear early, and the female blossoms should be destroyed until the plant has become vigorous and well rooted in the bed.

Cucumis, genus of Cucurbitaceae, is indigenous to the tropics and to sub-tropical lands. In this genus the stamens are free and the tendrils are believed definitely to be modified leaves. *C. Melo*, the melon, is a valuable plant of which the native country is unknown, and with *C. sativus*, the cucumber, has been in cultivation for centuries. Tartary is sometimes assigned to the cucumber as its home.

Cucurbita, genus from which the order Cucurbitaceae takes its name. The species all grow in America, but their native country is entirely unknown, and they are cultivated in Europe, Asia, and Africa; most of them are edible and harmless. *C. Pepo* is the pumpkin, of which the squash and vegetable marrow are varieties; *C. maxima*, the common gourd or giant pumpkin, is well known in N. America.

Cucurbitaceae, widespread natural order of dicotyledonous plants, most of which are of a trailing or climbing habit. Many of the species are useful or remarkable, for the order comprehends such plants as the melon, gourd, cucumber, colocynth, and bryony. The fruit is generally fleshy, and is often very large; the melon is typical, with a berry-like fruit called a *pepo*; the seeds are exalbuminous. Some of the prin. genera are *Cucurbita*, *Cucumis*, *Lagenaria*, and *Bryonia*.

Cucuta, or San José de Cucuta, tn. of the dept. of Norte de Santander, Colombia, S. America, on the Venezuelan frontier. The tn. was destroyed by an

earthquake, 1875. Coffee is largely cultivated there. Pop. 77,400.

Cud, sodden bolus of hastily swallowed fodder which ruminants drive back from the paunch into the mouth to be leisurely chewed, when semifluid is formed which repasses into the stomach.

Cudahy, manufacturing city in Milwaukee co., Wisconsin, U.S.A. Pop. 10,500.

Cuddalore, Kudalur, or Gudalur, tn. and port of Madras, India, cap. of S. Arcot dist., 15 m. from Pondicherry on the Coromandel coast. It has extensive trade, exporting quantities of grain and ground nts by sea, and carrying on much trade also by land. Native craft only can come right up to the tn., but there is good anchorage in the roads, 1½ m. from shore. Two naval actions took place off C.: (1) The drawn action of 1758 between Vice-Adm. Pocock and Comte d'Aché, in which the Fr. suffered heavier losses than the Brit.; (2) the engagement between Vice-Adm. Hughes and the Bailli de Suffren in 1783. This too was indecisive, but Suffren gained the relief of C., and Hughes had to go on to Madras. In 1795 it was finally acquired by the Brit. Pop. (mostly Hindus) 52,000.

Cuddapah, tn. and dist. of India, in the Madras presidency, situated on the R. C., 140 m. N.W. of Madras. It has a dist. court-house and jail and, formerly, had a cantonment. Soda is obtained from the hills in the dist., also salt and saltpetre; there are diamond mines in the neighbourhood. Pop. 18,000.

Cuddesden, or Cuddesdon, par. of Oxfordshire, England, Henley div., 6 m. from Oxford, 2 m. from Wheatley station. The palace of the bishops of Oxford is here, and a theological college. Pop. 900.

Cudgogong, mining township of Wellington co., New S. Wales, 45 m. from Bathurst, on R. C. Gold, iron, coal, and copper are found. Pop. about 3000.

Cudillero, or Oleiro, small seaport of Spain, in Asturias, 20 m. from Oviedo, on the bay of Biscay. Pop. about 11,000.

Cudworth, Ralph (1617-88), Eng. philosopher and clergyman, son of a chaplain of James I., b. in Somersetshire. He graduated at Cambridge, becoming fellow and tutor of Emmanuel's, 1639. C. was at one time rector of N. Cadbury, Somersetshire (1650). In 1642 he pub. *Discourse Concerning the True Nature of the Lord's Supper and The Union of Christ and the Church shadowed or in a Shadow*, the first causing much controversy long after his death. In 1645 master of Clare Hall, and in the same year regius prof. of Heb. In 1654 C. was elected master of Christ's College; 1678 he became prebendary of Gloucester. His chief work, *The True Intellectual System of the Universe*, also appeared in 1678. It displays great learning, liberality, and independence of mind. He favoured the platonic philosophy, but in physics adopted the atomic theory. From their views the group of which he was leader was known as Cambridge Platonists. This famous work attempted to confute all the reason and philosophy

of athelism, and to demonstrate its impossibility. His *Treatise Concerning Eternal and Immutible Morality* was pub. in 1731. A number of his unpublished MSS. are in the Brit. Museum. Among C.'s sermons was one preached before the House of Commons, showing the close connection of religion and morality, and laying the basis for union between philosophy and religion. His daughter, Lady Masham, was a friend of John Locke. See J. Tulloch, *Rational Theology and Christian Philosophy*, 1872; C. de Remusat, *Histoire de la philosophie en Angleterre*, 1875; C. E. Lowrey, *The Philosophy of Ralph Cudworth*, 1884; J. Multhead, *Platonic Tradition in Anglo-Saxon Philosophy*, 1931; and J. Beyer, *Ralph Cudworth als Ethiker, Staatsphilosoph und Aesthetiker*, 1935.

Cue, tn. of W. Australia, chief in the Murchison goldfield dist. It is connected with Geraldton by rail.

Cuenca: 1. Prov. of New Castle, Spain, chiefly a mt. and plateau region. The elevated tract Serranía de C. has large coniferous forests. Area 6588 sq. m. Pop. 349,700. 2. Also cap. of above prov. on R. Júcar, 80 m. from Madrid. It has ruined walls, a cathedral (with chapel of the Albornoces), many churches, and the episcopal palace. Its industries are unimportant. There is a famous bridge, 140 ft. high, across the stream Huecar. Near by is Ciudad Eucantada, with its wonderful stalactite deposits. Pop. 15,600. 3. Cap. of the prov. of Azuay, Ecuador, S. America, is 9000 ft. above the sea. It has 53,800 inhab., a cathedral, univ., trades in conserves, corn, and cheese, and makes woollen goods, hats, and earthenware. Near by are sulphur springs.

Cuernavaca (formerly Cuauhuahua), tn. of Mexico, cap. of Morelos state, 36 m. from Mexico. It is finely situated, and has an agric. academy, a church built by Cortés, and important sugar industries. It is growing popular as a health resort. Pop. 8200.

Cues, Nicolaus von, see CUSA, NIKOLAS OF.

Cuesmes, com. and tn. of Hainault, Belgium, 3 m. from Mons. It has coal-mines and railway workshops. Pop. 10,000.

Cuesta, name given by Amer. geologists to a certain land formation consisting of an unsymmetrical ridge with a strong escarpment on one side and a gentle slope on the other. Of Sp. origin, the name is used in New Mexico and S.W. U.S.A. for low ridges of this kind. The Cotswold and Chiltern Hills are Cs. or scarped ridges.

Cueva, Juan de la (1550-1607), Sp. poet, b. at Seville. He wrote various kinds of poetry, and his plays are important for their departure from the classic model and their more romantic style. He was one of the founders of the Sp. national drama. Among his works are *Primera Parte de las Comedias y Tragedias* (1588); the epic *Betico* (1603); and *El Exemplar Poético* (1605), the first Sp. didactic poem. See G. Ticknor, *History of*

Spanish Literature, 1849, and M. Menéndez y Pelayo, *Ideas Escléticas*, 1940.

Cuevas de Vera, tn. of Spain on R. Almanzora, 42 m. from Almería. Important for the silver mines in the Sierra Almagera. There is a rich agric. dist. all round, and saltpetre is found. Pop. 24,000.

Cui, César (César Antonovitch) (1835-1918), Russian military engineer and musical composer, b. at Vilna, son of a Fr. officer, a survivor of Napoleon's army, who was unable to follow the retreat from Moscow (1812). C. was educated at the Vilna Gymnasium, and studied music with Moniuszko. He soon entered the military college at St. Petersburg (1850), becoming prof. on fortification there and elsewhere. Among his most noted pupils were Skobeloff and the Emperor Nicholas II. His songs, choral and orchestral works, etc., include *William Ratcliff* (1869); *The Captive in the Caucasus* (1873); *Angelo* (1876); *Le Flibustier* (for Richelieu's comedy) (1894); and *Mam'zelle Pif*. Other works are *La Musique en Russie* and *A Short Manual of Field Fortification*. See Countess de Mery-Argeteau, *César Cui*, 1888.

Cuinchy, vil. in N. France, to the S.W. of La Bassée. In the First World War, C. came within the area covered by the battle of Loos. Sept. 1915 (see LOOS, BATTLE OF). The main advance took place on Sept. 25. This was preceded by a two days' bombardment. Although the Brit. had used gas, the atmospheric conditions proved unfavourable for its employment, and to this cause is attributed the initial unsuccessful attack on C.; but the Brit. success on other parts of the front caused the Ger. forces to give way eventually at C.

Cuirass (Lat. *corium*, leather), originally a jerkin or leather garment for soldiers, strong enough to be proof against pistols or even muskets. The name was later applied to plate armour protecting the body from the neck to the waist. The C. was strictly the metal covering the front of the wearer, but is now commonly applied to both breastplates and back-plates. These are hooked or buckled together, with a piece joined to the back called the *culet*, or *parde de retines*. In antiquity they were commonly made of bronze or iron, and in the fourteenth century formed a regular part of medieval armour. After Waterloo certain historical Cs. were adopted for modern use. For parade purposes various corps wear richly decorated leather Cs.

Cuirassiers, name of a kind of heavy cavalry, a survival of the men-at-arms of feudal armies and of the troopers of the sixteenth and seventeenth centuries, who wore cuirasses and helmets. The first Austrian corps of 'kryassers' was formed in 1484 by Emperor Maximilian; by 1705 there were twenty such regiments. The Prussians C. were so called under Frederick William I., playing a prominent part in the wars of Frederick the Great. In France C. date from 1666. Until comparatively recent years both Fr. and Ger. armies had twelve cuirassier regiments

each, the Russian four. The Eng. Life Guards and Royal Horse Guards had steel cuirasses given them in 1821, but they are not worn on active service, and the name C. is no longer used.

Cujas, Jacques (Latinised name, Cujacius) (1522-90), Fr. juriconsult, b. at Toulouse. He studied law under Arnoul Ferrier. His great reputation as a jurist was gained through his lectures on Rom. law as studied from the originals instead of from the works of commentators. He had an enormous library of old Rom. MSS., of which the greater part have unfortunately been scattered and lost. Besides his lectures on Justinian, he pub. notes on the *Receptæ Sententiæ* of Paulus and *Paratitla*, or summaries of the *Digest*, particularly of the Code of Justinian. The best collection of his works is that pub. by Fabrot at Paris (1658) in ten vols.; republished at Naples and at Venice with additions (1758-83) in eleven vols. See J. Berriat Saint Prix, 'Mémoires de Cujas,' appended to his *Histoire de Droit Romain*, 1821, and E. P. J. Spangenberg, *Jacob Cujas und seine Zeitgenossen*, 1822.

Culasi, or Colasi, tn. of the Philippine Is. It is situated on the coast of Panay, and is noted for its fisheries. It produces also rice, pepper, coco-nut oil, and cotton. Pop. 15,000.

Culbin, regions of sand situated in the N.W. of Morayshire, in Scotland.

Culdees (Celtic *ceile De*, a companion of God), anct. religious community once found in Ireland and Scotland. Their origin and early hist. are very obscure. It is probable that they originated when the rule of St. Chrodigang, archbishop of Metz (d. 766), was introduced into Ireland by the Irish priests. The rule, originally instituted for secular priests under no monastic vows, was extended to include the anchorites, and the order of C. became a sort of annex to the regular monasteries. They apparently had charge of the sick and poor, and assisted in the musical part of the religious services. They never attained to great importance in Ireland, but when they crossed to Scotland at the end of the eighth century they found their opportunity awaiting them by reason of the gap left by the expulsion of the Iona monks by Nechtun, king of the Picts, in 717, and the inadequacy of the Rom. monks from Northumbria who had come to fill their place. Their life henceforward was very similar to that of the secular canons in England. The pictures of them in the twelfth century, when the first authentic records of them are found, vary considerably. Each culdee monastery was an independent community which gave obedience to none save its own abbot, and with no ties connecting it with the others. The community within the monastery seems to have been divided into two sections, one conducting the religious services and the general offices of a religious body, while the other had apparently so far cast off the rules of monastic discipline as to marry and practically live the life of ordinary laymen. Indeed, tradition says that the C.

of Dunkeld were all married, only living apart from their wives during their period of service at the altar. The chief culdee houses were at St. Andrews, Dunkeld, Loch Leven, Monymusk, and Abernethy. In the reforms inaugurated by St. Margaret and carried out by her son David I. the C. became canons regular or were absorbed into the regular religious orders. By the beginning of the fourteenth century, the C. as a separate body had disappeared in Scotland. The older view, which was held by some Protestant and Presbyterian writers, that the C. were the first teachers of Christianity, which they preserved free from the corruptions of the Rom. Church, until they were finally stamped out by the persecutions of the latter, has been effectually disproved by Wm. Reeves (1815-92), bishop of Down, Connor, and Dromore. See J. Jamieson, *Historical Account of the Ancient Culdees*, 1811; W. Reeves, *The Culdees of the British Islands*, 1864; and W. F. Skene, *Celtic Scotland*, 1876-80.

Culebra, or Passage Island: 1. An is. of the W. Indies in the Virgin group, 18 m. from Cape San Juan, Porto Rico. 2. A naval station of the U.S. fleet Pop. about 1000.

Culenborg, see KULENBURG.

Cullacan, Mexican tn. and the cap. of the state of Sinaloa. It stands on the R. C. lles W.N.W. of Durango, and a line of railway connects it with Altata, the port. The tn. itself was founded in 1531, and is the seat of a bishop. Pop. about 93,300.

Culcides, the dipterous insects known to us familiarly as the mosquito, midge, and gnat family, are widely distributed, and in Britain they are represented by about a dozen species. The female is extremely harmful, but the male is harmless. The eggs are laid on substances floating in stagnant water, and the larvae live on the surface. *Culex pipiens* is a mosquito frequently found in Britain, and it also inhabits the E. Indies.

Cullon, community of nearly 5000 lepers on a small is. to the N. of Palawan prov., Philippine Is. They elect their own council and supply the policemen and other subordinate officials. Many have been completely cured.

Cullar de Baza, tn. of Granada, Spain, 68 m. from Granada. Pop. 8000.

Cullen, Paul (1803-78), Irish Rom. Catholic prelate; educated in Rome, and rector of the Irish college there, and of the Propaganda College in 1848, securing Amer. protection for it to prevent confiscation of its property during the revolution under Mazzini. Plus IX. made Dr. C. archbishop of Armagh and primate of Ireland in 1849. He was translated to the diocese of Dublin in 1852, and was created a cardinal in 1866, being the first Irishman to attain to that dignity. Cardinal C. aided O'Connell, and helped the Brit. Gov. to suppress Fenianism. At the Vatican Council he advocated the definition of papal infallibility. C. was the reputed author of a treatise to prove that the earth did not move. He disapproved of the clergy taking an active

part in politics. He estab. numerous schools, convents, hospitals, and churches in Ireland (Mater Misericordie hospital).

Cullen, William (1712-90), distinguished Scottish physician, b. at Hamilton, Lanarkshire. He attracted great attention by the novelty of his views on the functions of the nervous system, and his pathological doctrine of excitement and collapse. His chief works are *Synopsis Nosologiae Methodicae* (1769); *First Lines of the Practice of Physic* (1777); and *Treatise on Materia Medica* (1789). See life by J. Thomson, 1832.

Cullen, bor. of Scotland, in the co. of Banff, situated on C. Bay. Since 1200 it has been a royal bor. There is a fine market-place, with a council chamber, assembly hall, and court-room. It possesses a good harbour. Fish is exported. Pop. 1700.

Cullera, Sp. tn. in the prov. of Valencia and stands on the R. Jucar. It is also a fort. tn. and the remains of its walls are still standing. Pop. 15,000.

Cullinan, mining tn. of Transvaal, S. Africa, E. of Pretoria. Pop. 15,000.

Cullinan Diamond, largest known diamond, found in the Premier Mine, E. of Pretoria, Transvaal, in Jan. 1905, and called after Thomas C., the chairman of the company owning the mine. Uncut, its weight was about 3030 carats, three times heavier than that of any other known one. The gem measured about $4\frac{1}{2}$ by $2\frac{1}{2}$ by 2 in., and its girth was $8\frac{1}{2}$ to $11\frac{1}{2}$ in. It had fine cleavage planes, as though only a portion of a larger crystal. The colour for so large a stone is exceptionally pure. It has been valued at from \$2,500,000 to \$5,000,000.

Culloden, moor (known to Highlanders as Drummossie Moor) in Inverness-shire, Scotland, famed for a victory gained in 1746 by the duke of Cumberland over the Pretender, Charles Stuart. The victors cruelly massacred the wounded Highlanders. This was the last battle fought in Britain; a cairn and green mounds mark the soldiers' burial-places.

Cullompton, tn. of Devonshire, England, on R. Culm, 12 m. from Exeter. It has an old church in the Eng. Perpendicular style, with a tower 100 ft. high. Pop. 2,900.

Culm (geology), rocks of upper carboniferous age occurring in Cornwall and Devon. They are merely barren coal-measures. In mining C. denotes an inferior grade of small steam coal or anthracite. In brewing Cs. are the rootlets which form on the cereals used after steeping and subsequently removed for use as cattle food or manure.

Culmination (Lat. *culmen*, the summit), astronomical term for the passage of a heavenly body when it crosses the meridian. There are two Cs. in the course of twenty-four hours, the upper, above the pole, and the lower, below the pole.

Culpeper, John, see COLPEPER.

Culpeper (Culpepper), Nicholas (1616-1654), Eng. medical writer and astrologer, a supporter of the Parliamentarians and religious sectaries. In 1640 he set up as astrologer and physician in Red Lion

Street, Spitalfields. *A Physicall Directory* (1649), his unauthorised trans. of their *Pharmacopoeia*, excited great indignation among the College of Physicians against C. for infringing the monopolies of medical writers. Other works are *Semeiastica Uranica* (1651) and *The English Physician* (1652, 1653). The latter has been reissued in various eds. ever since, the last in 1932. C.'s works were ed. by G. A. Gordon in 1802. See L. Powys, *Thirteen Worthies*, 1923.

Culpeper, Sir Thomas, the Elder (1578-1662), Eng. writer, author of *Tract against the High Rule of Usury* (1621).

Culpeper, Sir Thomas, the Younger, (1626-97), Eng. writer on usury, son of Sir Thomas (d. 1662).

Culross, par. and burgh of Scotland in the co. of Fifeshire. It stands on the N. side of the frith of Forth, and lies W.N.W. of Edinburgh. It contains the ruins of a Cistercian abbey which was founded in the thirteenth century. Its former deep submarine coal-mines are exhausted. Pop. 4000.

Cultivated Plants. It is almost impossible to say when plants were first cultivated, but it is known that millet, rice, and figs are among some of the very oldest of our present-day products. Investigation has proved the original habitat of most plants, and the wild form has in many cases ceased to exist. At the present day cultivation has reached such a pitch that the form in which we know the plant varies very much from the original wild one, and there are various devices known for the further improvement or development of the plant in question. Some plants are cultivated for their seeds, such as all cereals, peas, beans, mustard, etc.; others for their leaves, such as cabbage of all kinds, spinach, tobacco, tea, water-cress, etc.; others again for their flowers, such as auliflowers, cloves, etc.; some for their young shoots and stems, as asparagus and rhubarb; and some again for their fruits, such as plums, oranges, gooseberries, all kinds of nuts, cucumber, tomatoes, etc.; and last but not least is that large class of plants of great service to man cultivated for their roots and tubers. There are many useful products from certain plants which are much cultivated for various purposes apart from edible uses, e.g. starch, vegetable acids such as citric and oxalic, gums, rubber, all the numerous narcotics, such as opium, morphia, etc.

Cultivation, or Tillage (Late Lat. *cultivare*, to cultivate, from Lat. *colere*, to till; O.E. *teolian*, *tilian*; Gothic *tilon*, to strive for), denotes the process of cultivating soil for the purpose of agriculture. It consists of digging, ploughing, harrowing, rolling, spading, hoeing, etc., all of which operations tend to increase the goodness of the soil, and thus to increase its fertility. For surface tillage harrows, weeders, and other agrie. instruments of the fork and spade variety are used. Pulverisation of the soil is essential for the root growth of plants. Breaking up the soil and removing stones and impedimentary matter facilitates

the free development of roots and also the free passage of earth and air which increases the health of the plants. Deep ploughing is generally done in the autumn, as during the winter months the changes in temp. affect the soil, causing expansion or contraction according as the weather is wet or frosty. Pulverisation also favours the activity of beneficial organisms in the soil (see NITRIFICATION), and promotes the solution of mineral matter. It also brings about the destruction of weeds and insects which are injurious to the development of cultivated plants. 'Cultivators' are the best instruments for destroying weeds. They are also called grubbers, and a special variety is called scarifier. The cultivator consists of a triangular or rectangular iron frame, with fixed teeth or tines. Harrows and rollers are useful in separating the weeds from the soil. When the weeds have been removed the earth is well ploughed, and manure dug deep into the soil. Sub-tillage, or sub-soiling, forms a very important part of C. Below the surface clay, chalk, and gravel are found, and it is the aim of the agriculturist slowly to cultivate his soil to a deeper depth. Heavy clay soil needs constant turning over, and manure should be worked into it. Inter-tillage is carried on while the soil is still occupied by a crop. Trenching and draining also form an important part of C. See AGRICULTURAL MACHINERY; AGRICULTURE; PLOUGHS AND PLOUGHING.

Culverin (Fr. *coulervine*; more remotely Lat. *colubra*, snake), term applied loosely to any small gun in the early days of firearms. In the sixteenth century it meant the heaviest gun in ordinary use, throwing a 15-pound shot. It was so called from its serpent-shaped handle. Culver and whole C. (as distinguished from demi-C., a smaller piece of ordnance) were variations of the name.

Culverwell, Charles, see WYNDHAM, SIR CHARLES.

Cumae, ant. city on the coast of Campania, Italy, W. of Naples. According to Strabo it was the earliest of all Gk. colonies either in Italy or Sicily, although 1050 B.C. is probably too early a date for its foundation. It rapidly became the wealthiest and most prosperous city in this part of Italy, planted colonies at Zancle (Messina), Puteoli, and Neapolis, and extended the influence of Gk. civilisation all over S. Italy. From 700 to 500 B.C. C. was at the height of its power, but by 474 B.C. it was compelled to invoke the aid of Hiero, tyrant of Syracuse, to crush the fleet of its enemies, the Etruscans. In 473 B.C. C. was taken by the Samnites, and in 350 B.C. fell into the hands of the Romans, and became a Rom. municipium and colony. In the Hannibalic wars C., in the hands of Sempronius Gracchus, resisted a Carthaginian siege (Livy, xxiii.). Under the Rom. emperors C. fell into decay, although Cicero chose to live there. It was garrisoned by the Goths, and was the last place in Italy to hold out against Narses. C. was the residence of the abbi who gave

the Sibylline Books to Rome. Very few remains of the city still exist.

Cumana, tn. of Venezuela, cap. of the state of Sucre, situated about a mile from the coast, near the mouth of the gulf of Cariaco. It claims to be the oldest European city in America. The climate is hot, and earthquakes often occur. There is a trade in sugar, cacao, tobacco, etc. It was completely destroyed by an earthquake in Jan. 1929. Pop. 19,000.

Cumania, see KUMANIA.

Cumberland, Ernest Augustus, Duke of, and King of Hanover (1771-1851), fifth son of George III. At the first battle of Tournay, 1794, he lost the sight of his right eye and was severely wounded in the arm, but this did not prevent his remaining in the army. Subsequently he held high military commands in England, and he went again on active service during the last two years of the Napoleonic wars. On May 31, 1810, he was found wounded in his bed, and his valet, Sellis, dead in an adjoining room. The coroner's jury accepted the view that Sellis had tried to murder his master and had then committed suicide; but public opinion believed that the duke had murdered Sellis. It was also rumoured that the duke was guilty of other crimes. On the accession of Victoria, he became king of Hanover. Hated in Great Britain, he was beloved in Hanover, over which he reigned wisely and well.

Cumberland, Richard (1632-1718), Eng. moral philosopher and bishop of Peterborough, b. in London, and educated at St. Paul's School and Magdalene College, Cambridge. Among his college friends was Samuel Pepys. C. won a great reputation for learning both in science and philosophy and for his simple and upright life and fulfilment of his episcopal duties. Among his works is *De Legibus Naturæ disquisitio in qua Elementa Philosophiæ Hobbianæ refutantur* (1672, trans. 1727), written in reply to Hobbes and upholding the utilitarian principle of the public good being the end of morality. He dedicated his *Essay on Jewish Weights and Measures* (1686) to his old friend Pepys. See *Pepys's Diary*.

Cumberland, Richard (1732-1811), Eng. dramatist, was educated at Westminster and Cambridge. On leaving the univ. he became private secretary to Lord Halifax at the Board of Trade, the office being almost a sinecure. He wrote more than fifty plays, the first to be produced being *The Summer's Tale* in 1765, and the most successful *The West Indian*, brought out by Garrick six years later at Covent Garden. C. now moved in literary circles, but his sensitiveness to criticism prevented him ever becoming popular therein. He quarrelled with Goldsmith and Sheridan, whom he had offended, caricatured him as Sir Fretful Plagiary in the *Critic*. He wrote many poems and prose works between 1754 and 1811, of which *Memoirs of Richard Cumberland Written by Himself* (1806-7) is best known. He was buried in Westminster

Abbey. See S. T. Williams, *Richard Cumberland: his Life and Dramatic Works* (with bibliography), 1917.

Cumberland, William Augustus, Duke of (1721-65) was the third son of George II., then Prince of Wales. Educated for the navy, the duke for a while served under Adm. Sir John Norris; but when he grew up his tastes inclined to the army, and he was allowed to follow his bent. Promotion for a prince of the blood was rapid in those days, and at the age of thirty-one he was gazetted major-general. Two years later he was appointed to the command of the allied forces in the Netherlands, with Konigsberg as his

Lake Dist., shared with the neighbouring co. of Westmorland. Here are the Cumbrian Mts., with the peaks of Scafell (Scafell Pike, 3210 ft., the highest point in England), Scawfell (the lower summit, but the finer peak, 3162 ft.), Skiddaw (3058 ft.), and Helvellyn (3118 ft.); and the lakes of Derwentwater with the falls of Lodore, Bassenthwaite, Ennerdale, Buttermere, and Crummock Water, Westwater, Thirlmere, and, on the Westmorland border, Ullswater. From the Lake Dist. a network of valleys runs N., W., and S. to a wide coastal plain, and the valley of the Eden divides it from the Pennine Chain, which reaches its

CRUMMOCK WATER, CUMBERLAND

On the left is Mellbreak (1688 ft.); on the right Grassmoor (2787 ft.).

adviser; and in 1745 the office of captain-general of the Brit. land forces at home and in the field, dormant since Marlborough's day, was revived in his favour. He took an active part against the rising of '45, and after the battle of Culloden in 1746 treated the rebels with such severity that he was nicknamed Butcher. His methods, though drastic, were not injudicious, for, in part at least owing to his proceedings, the Stuarts did not engineer another insurrection in the kingdom. Subsequently the duke held, from time to time, high command abroad, but he never achieved any signal success in the field. See lives by A. Henderson, 1766; R. Rolt, 1767, and E. Charters (2 vols.), 1913 and 1920.

Cumberland, the most N.W. co. of England, bounded on the W. by the Irish Sea and Solway Firth, on the N. by Roxburgh and Dumfries, on the S. by Westmorland and Lancashire, and on the E. by Northumberland and Durham. The greater part of its surface is mountainous. The S.W. half is taken up by the beautiful

highest point in this co. in Cross Fell (2930 ft.). The N.W. portion, bordering on the Solway Firth, is low and flat. The chief rivs. of C. are the Eden, the Liddel, the Esk, the Derwent, and the Uddon. Considerable tracts of land and mts. are owned by the National Trust.

The climate is mild except on the uplands during the winter. The rainfall of the Lake Dist. is the heaviest in England. In the mountainous dists. the soil is black, peaty earth, but in the plains dry loam predominates, and produces large quantities of oats and turnips, and a little wheat and barley. In the hill pastures cattle and sheep are reared, the Herdwick variety of the latter being peculiar to the co. C. is rich in minerals, coal being worked extensively round Whitehaven, Maryport, and Workington, with much accompanying iron ore, which is also found in the S. near Millom. Gypsum, zinc, and lead are mined, and limestone, granite, and slate are quarried. A little silver is still found, but the copper mines near Keswick and the plumbago works

near Borrowdale have been closed. There are various manufs. in the co., woollens, cottons, earthenware, glass, biscuits at Carlisle, pencil-mills at Keswick, and shipbuilding at Whitehaven. Large quantities of salmon are caught in the Solway. The chief tns. are Carlisle (the cap.), Cockermouth, Whitehaven, Workington, Maryport, Wigton, Penrith, and Keswick. C. is part of the diocese of Carlisle, and is divided into four parl. divs.: N., Penrith and Cockermouth, Whitehaven, and Workington, each returning one member. The municipal bors. are Carlisle, Whitehaven, and Workington. After the withdrawal of the Romans, who left many relics, coins, altars, and inscriptions, C. became part of the Brit. kingdom of Strathclyde. In 875 the first reference is made to the kingdom of the Cumbri, and in 945 it was ceded by Edmund to Malcolm of Scotland. Henceforward, until the union of the crowns, it was a constant cause of quarrel between the two nations, now in the hands of one, now of the other. The small landowners in the co., whose lands have been in their families for centuries, are known as 'statesmen,' but most of such small estates have now been absorbed by the large landowners. Area 968,598 ac. Pop. 273,000.

Cumberland: 1. Co. seat of Allegheny co., Maryland, U.S.A., situated on the R. Potomac, N.W. of Baltimore, in mt. scenery. It stands on sev. railways, among them the Baltimore and Ohio Railway, and is also situated on the Chesapeake and Ohio Canal. Chief industries: iron and steel, glass, railway cars and locomotives, artificial silk, etc. It exports large quantities of coal. There is a large dyeing and cleaning estab. Pop. 39,400. A fort was built here in 1754. 2. Tn. in the co. of Providence, Rhode Is., U.S.A. It includes ten vils., which manuf. cotton and silk goods. Pop. 10,600.

'Cumberland,' Brit. cruiser (class A.C., 9800 tons displacement), completed in 1904; and a Kent class Brit. cruiser of the same name, completed in 1928, a 10,000-ton ship carrying eight 8-in. and four 4-in. anti-aircraft guns. Ships of this name figured largely in the eighteenth and nineteenth centuries, as at the capture of Calcutta, 1757. A Federal war vessel of this name, commanded by Lt. Morris, was sunk by the Confederate ram *Merrimac* in Hampton Roads, March 1862.

Cumberland Gap, a pass in the C. Mts., is situated in the S.W. of Virginia, U.S.A. Its chief importance during the time of the Civil war lay in its position.

Cumberland Island, in Baffin Land. It is in reality not quite an is., and is situated in the Arctic regions of America, while Davis Strait lies to the N.E.

Cumberland Lodge, in Windsor Park, was formerly the residence of the ranger. It was enlarged by Wm. Augustus, duke of Cumberland (q.v.), who resided there.

Cumberland Peninsula, deeply indented peninsula of Baffin Is., in the Arctic N.W. tern. of Canada with C. sound on the S. ...

Cumberland Presbyterians, Amer. religious sect formed at the beginning of the nineteenth century in Cumberland co., Kentucky. It was the outcome of a great 'revival,' when there was a dearth of fully trained preachers to meet the public demand, and men without the usual high standard of theological and educational training demanded by Presbyterianism were ordained. In 1816 the C. Synod adopted a confession of faith based on the Westminster Confession with certain additions and amendments, and this was again revised at a later date. The doctrines of predestination and unconditional election were eliminated, and the universality of the atonement was accepted. In 1826 a college was estab. in Princeton, Kentucky, but was transferred to Lebanon in Tennessee in 1842, becoming the C. Univ. The coloured C. Presbyterian Church was an offshoot of the original C. Church, establishing a separate identity in 1869 at the time when the slavery question was rife. Its estab. was inevitable as the C. P. had their strongest following in the S. States.

Cumberland River, U.S.A., trib. of the Ohio, rises in the C. Mts. in Kentucky. Its course assumes a S.W. direction and then a N.W. one till it joins the Ohio. This riv., which is navigable as far as Nashville, is over 600 m. in length.

Cumberland Valley, in Pennsylvania, U.S.A., a fertile piece of land watered by the tribs. of the Susquehanna R., its position being between that riv. and Maryland. It is a continuation of the Shenandoah valley.

Cumbernauld, par. in the co. of Dumbarton, Scotland. It lies to the N.E. of Glasgow. Pop. 5000.

Cumbræ, Great and Little, are two is. in the firth of Clyde, Scotland. They belong to the co. of Bute. The tn. of Millport is on the G. C. and on the smaller one is built a lighthouse. Pop. 6000.

Cumbre, La, known also as *Uspallata*, pass in the Andes S.W. of Mt. Aconcagua. It is over 12,000 ft. high, and the tunnel through which the railway is built is about 3 m. in length.

Cumbrin Mountains, group of mts. in England, stretching from Fell Top, Cumberland, to the state quarries in Lancashire, about 40 m. from N. to S. Scafell Pike (3210 ft.) is the highest point.

Cumbrin Rocks, forming the C. Mts. of England, consist in the N. and E. of lower carboniferous (shale and grit) rocks, with limestone beds. In the S. are volcanic ashbeds and lavas. A few species of Graptolites and Trilobites have been found, but fossils are rare.

Cumene, or Isopropyl Benzene, liquid obtained by distilling cuminic acid with soda-lime, or by boiling benzene and isopropyl chloride in the presence of anhydrous aluminium chloride. It has an agreeable odour and, on oxidation, gives benzoic acid.

Cumiana, It. tn. in the prov. of Turin (Piedmont). Pop. 6000.

Cumin, or Cummin, fruit of a plant

which grows wild near the Nile and is cultivated in S. Europe and India. The fruit, improperly called seeds, is greyish-yellow, strongly aromatic, and the taste is bitter and disagreeable. These C. seeds were formerly used in ordinary medicine, but they are now employed only in veterinary practice except when forming an ingredient of curry powders. C. is mentioned in the Bible.

Cumming, see COMYN.

Cummings, Bruce Frederick, see BARRELLION, W. N. P.

Cummins, Maria Susanna (1827-66), Amer. novelist, b. at Salem, Massachusetts. Her chief works are *The Lamplighter* (1854); *Mabel Vaughan* (1857); *El Fureidis* (1860); and *Haunted Hearts* (1864).

of sailing vessels which plied between Boston and Bermuda. His original idea was a regular service of steamships which could do the journey across the Atlantic in less time than the boats which usually carried the mails. Accordingly when he came to England in 1838 he obtained the help of Mr. George Burns and Mr. David MacIver and founded what is now known as the C. Line—at the same time obtaining a contract from the gov. to carry the mails. The first boat of this line was the *Britannia*. Larger and swifter vessels were added from time to time—the largest since the 1830's being the *Umbria* and *Etruria*, speed about 19 knots, the *Campania* and *Lucania* with a speed of 21-22 knots, and the *Lusitania* and *Mauretania*, the latter until recent

THE 'QUEEN ELIZABETH I'

Cunard White Star

Cumnock: 1. Old C. is a Scottish tn. in the co. of Ayr. It is situated to the E. of Ayr on Lugar Water and possesses coal-mines. Alexander Peden the covenantor is buried here. Pop. 3500. 2. New C. lies to the S.E. of Old C. Pop. 2000.

Cumnor, vii. in Berkshire, England, 3½ m. W.S.W. of Oxford. Here was C. Hall, the house where Amy Robsart, the ill-fated wife of Robert Dudley, earl of Leicester, was murdered. It is described by Scott in *Kenilworth*, but has since been destroyed. Part of the church dates from the thirteenth century, and contains a statue of Queen Elizabeth, said to have been erected at the hall by Leicester. Pop. 1400.

Cumyn, see COMYN.

Cunard, Sir Samuel (1787-1865), shipowner, b. at Halifax, Nova Scotia, where he began life as a merchant. In 1838 he left for England, and in the following year founded the Brit. and N. Amer. Royal Mail Steam Packet Company. He afterwards contracted to carry the mails between England and America. In 1850 C. was made a baronet. See CUNARD STEAMSHIP LINE.

Cunard Steamship Line, founded by Sir Samuel C. (q.v.), who was the owner

years the fastest liner in the world, with an average speed of 26 knots (see below). All the vessels to-day in the fleet are fitted with wireless telegraphy, and a newspaper, known as the *Ocean Times*, is also printed on board. Early in the present century the company, in agreement with the Brit. Gov., decided to build two leviathan liners—the *Lusitania* and *Mauretania*—in order to wrest honours of size and speed from all competitors. The *Mauretania* broke all records in 1909 by crossing from Queenstown to New York in 4 days 10 hrs. 41 mins. at an average speed of 28-06 knots. In 1924 she crossed from New York to Cherbourg in 5 days 1 hr. 49 mins., but in 1929 the *Bremen*, a newly built Ger. vessel of the Norddeutscher Lloyd line, did the latter voyage (outward) in 4 days 18 hrs. 17 min. The *Aquitania* (1914), with a tonnage of 46,000, has also many speedy crossings to her credit. During the First World War 56 per cent of the company's tonnage, including the *Lusitania*, was lost through enemy action, but a big shipbuilding programme resulted in the replacement and extension of services until in 1930 the C. fleet consisted of eighteen big liners ranging from 14,000 to 33,000 tons, the gross tonnage of C. and Associated Lines' ships being

nearly 1,000,000. In the same year two huge new liners were projected, of size, speed, and luxury unsurpassed.

The first of the new vessels, built with the assistance of state credits, was the *Queen Mary* (gross tonnage 81,235, length 1019 ft., breadth 118·6 ft., speed 28·5 knots) completed in 1936. In May of that year she crossed the Atlantic on her maiden voyage in 4½ days. The sister ship *Queen Elizabeth*—like the *Queen Mary* a quadruple screw vessel—was completed in 1940 (gross tonnage 85,000; 14 decks, including 724-ft. promenade; length 1030 ft., breadth 118 ft., accommodation for 2200 passengers; main machinery is geared steam turbines developing a service horse power of 158,000 and driving four propellers). In 1940 she made a secret maiden voyage to New York for an indefinite stay and thereafter sailed as a troop transport. On reconversion after the war this £9,000,000 ship made her first post-war voyage as a luxury liner in Oct. 1946. New cargo liners and combined passenger and cargo ships representing 76,000 tons gross are being added to the company's fleet to replace war losses, including the *Caronia* (34,000 tons) launched in 1947. All three vessels were built by John Brown & Company of Clydebank.

In 1934 the N. Atlantic fleets of the C. S. L. and the White Star Line Company (Oceanic Steam Navigation Company) were amalgamated under the name of C. White Star Ltd.

Cunas, race of Amer. Indians living in the isthmus of Darien and in the alluvial plains of the Atrato. They call themselves Talé, and are connected with the San Blas Indians. They are of medium stature and have a profusion of long black hair.

Cunaxa, anct. tn. about 60 m. from Babylon. It was here that a battle was fought between Artaxerxes and Cyrus the Younger, in which Cyrus was killed—the story of the battle being related by Xenophon.

Cundigurri, or **Khandgiri**, name of a vil. 15 m. S. of Cuttack, in the Puri dist. of Orissa, India. Near by are two sandstone hills, Khandgiri and Udayagiri, commanding on opposite sides a narrow gorge in the jungle. The numberless caves undermining these hills are thought to conceal many memorials of primitive Buddhism.

Cunégo, Domenico (1727–94), celebrated It. engraver, b. at Verona. He studied as a painter under Francesco Ferrari, but deserted painting for engraving and settled in Rome, 1761. He engraved twenty-two plates for Gavin Hamilton's *Scota Italica*, among which were some of the frescoes of Michelangelo in the Sistine Chapel, 'La Fornarina' of Raphael, and also his 'Galatea.'

Cuneiform Writing is probably the earliest known system of writing. The name cuneiform, from Lat. *cuneus*, wedge, was suggested about 250 years ago by Thomas Hyde, regius prof. of Heb. at the univ. of Oxford, and is given to anct. scripts in use among the peoples of

Mesopotamia and neighbouring countries. The characters of these scripts were formed of combinations of strokes having the shape of a wedge, cone, or nail, and called, by the anct. users, fingers. This peculiar form of the characters was not a device deliberately chosen, but came about more or less by accident. The chief writing material of Mesopotamia was clay of a particularly fine but coherent kind, which was found in the alluvial soil of that country. The early users of this clay for the purpose of writing soon discovered that one could draw the characters in the moist clay much better and more quickly by impressing them than by scratching. As curves and fine lines could not be impressed satisfactorily, C. W. consists of short, straight, vertical, horizontal, or oblique strokes or angles. Naturally the strokes impressed were thick on the top and on the left, thus giving birth to a series of wedge-shaped characters. These were impressed, line by line, with a special instrument, now known as stylus, and called by the users tablet-reed. Indeed normally it was made of reed, although sometimes the wooden stylus was employed. During the long period of over 3000 years for which C. W. remained in use the characters naturally underwent considerable transformation. Indeed at the beginning the writing was not cuneiform at all. The characters may have been purely pictorial, the picture symbols representing various objects, animate and inanimate. However, even the earliest extant written tablets (from Uruk IV., see below) do not represent the primitive stage in which all the signs in use were fully pictorial. It is therefore disputed whether such a stage ever existed, the Uruk IV. tablets representing instead the actual first essays at writing *ex nihilo*, and already containing many schematic signs, so far conventionalised that the objects depicted cannot be identified at all. At a later stage the script became linear; curved lines began to disappear and to be replaced by straight lines set at angles to one another. Finally the strokes were converted into wedges, and the objects originally depicted, except in the rarest cases, became nothing but unrecognisable symbols.

The exact date of the invention of the C. W. is unknown. The aforementioned earliest extant written tablets, numbering about 570, were discovered in the fourth or lowest archaeological stratum of Warkah (known as Uruk IV.), the biblical Erech, and generally are assigned to the middle of the fourth millennium B.C. It is also uncertain what people invented this writing, but it is generally believed that they were the Sumerians, the non-Semitic creators of the most anct. civilisation of Mesopotamia.

The development of the C. W. was parallel in some respects with that of the Egyptian, Chinese, and other 'ideographic' scripts. In other respects the C. W. was perhaps unparalleled; so, for instance, during the transition period from pictograph to cuneiform signs, perhaps about 3200 B.C., there was a complete change of

the direction of the signs. The reason of this change is thus explained. The earliest tablets were small enough to be held in the palm of the left hand, and the characters were impressed vertically. When the tablet increased in size it could not be so held; it was then laid on a table at right angles to the body. The signs were written as before, but when read in the turned position of the tablet the symbols appeared to be lying on their back, i.e. turned at an angle of 90°. Afterwards the symbols were ever drawn in this position. In inscriptions on stone or metal the old position of the signs persisted for a few centuries more, but in the course of time the practice came into line with that followed on clay tablets. As in the Egyptian or Chinese scripts, the range of expression of cuneiform signs was very wide. In the first place the signs represented concrete objects: at a second stage the use of the signs depicting concrete objects was extended to express concrete concepts and abstract ideas related in meaning; for instance, the solar disk also came to indicate the ideas of day and time. The characters thus were ideographic word-signs or ideograms. At a later stage, introducing the phonetic principle, the C. W. became a *rebus-script*; many signs became phonograms, i.e. signs representing sounds. Without any regard to their original meaning they also were taken to represent syllables, which could be used in writing any word, either consisting of that syllable or of which that syllable was a component element. This device was particularly used to indicate grammatical relations (such as pronouns, adverbs, prepositions), prefixes and affixes, foreign words, place-names and personal names, and so forth. On the whole, the Sumerian cuneiform script mainly consisted of word-signs, while the Mesopotamian Semitic peoples mainly employed the syllabic value of the characters (without, however, eliminating the use of old ideographs as word-signs). The highest achievement of the users of C. W. was to isolate the vowels and represent them by distinct signs, but there was never shown any tendency towards an alphabetic system, including the representation of the consonants by distinct signs. There were two exceptions to this general rule, the cuneiform alphabetic writing of Ugarit and the Early Persian script. The former was a script (of the sixteenth to thirteenth centuries B.C.) connected only in the external form of the characters with the cuneiform system of writing; the latter was a semi-alphabetic and semi-syllabic script, also including four ideograms, and was perhaps suggested by the Aramaic alphabet.

The employment of the cuneiform characters, both with their ideographic and phonetic values, on the one hand, and their adaptation to the needs of languages belonging to different linguistic groups, had the result that many signs became *polyphones*, i.e. representing many sounds; others were *homophones*, having similar phonetic values, but representing entirely different objects. In order to remove

ambiguities and confusion in the interpretation of the texts, two devices were introduced: (1) *determinatives*, that is signs which were not pronounced and were placed before or after the ideograms to be determined; these determinative signs defined the meaning of the ideograms by denoting the class to which the concerned ideogram belonged, such as deities, men and women, animals, plants, countries, numbers, plural, and so forth; (2) the use of syllabic signs as phonetic complements, consisting of a consonant and a vowel, which were placed after a polyphone sign ending with the same consonant.

The hundreds of thousands of clay tablets extant, written in cuneiform characters, are couched in the following languages: Sumerian, Babylonian, Assyrian, Cassite, Elamite, Early Armenian (also known as Chaldean or Urartu), Hittite, Mitannian, Hurrian, and Canaanite. Their importance for the knowledge of the anc. world is paramount. They reflect the classical age of Babylonian literature and science of Hammurabi (eighteenth or seventeenth century B.C.) or the period when C. W. and the Accadian language were the lingua franca of the anc. world (middle of the second millennium B.C.); they are the remains of the rich libraries of the Assyrian kings (ninth to seventh centuries B.C.). The decipherment of the cuneiform script was the achievement of the nineteenth century. Maj. (later Maj.-Gen. Sir) Henry C. Rawlinson, who in 1846 pub. a trans. of the Early Persian part of the famous Behistūn (or Bisitūn) trilingual inscription, may be considered as the father of modern decipherment of the cuneiform scripts.

See G. R. Barton, *The Origin and Development of Babylonian Writing*, 1913; E. A. Wallis Budge, *The Rise and Progress of Assyriology*, 1925; M. Rutten, *Éléments d'Accadien*, 1937; G. Ryckmans, *Grammaire accadienne*, 1938; D. Diringer, *The Alphabet, a Key to the History of Mankind*, (pp. 41-57), 1948; and G. R. Driver, *Semitic Writing from Pictograph to Alphabet*, 1948.

Cuneo, Riv., some 720 m. long, in Angola, Portuguese W. Africa. It rises on the tableland of Benguela, and descends in a series of rapids and reaches the sea with a westerly course, its mouth being blocked by sandbanks. The C. drains an area of 42,800 sq. m.

Cuneo, or Coni: 1. Prov. of N. Italy belonging to Piedmont, situated between the Cottian Alps, the Maritime Alps, and the R. Po. Its products are mainly agric., corn, hemp, flax. Its manufs. are linen, silk, and marble goods. Area 2868 sq. m. Pop. 609,000. 2. Cap. of the above, an episcopal see of Piedmont, 55 m. S. of Turin by rail. It was once strongly fortified, and was the scene of sev. sieges on account of its strategic importance. It has a fine cathedral, lately restored, and a Franciscan church of the twelfth century, now used as a military storehouse. The chief manufs. are silk, cotton, and paper. Pop. of com. 35,400.

Cunha, Nuno da (1487-1539), Portuguese commander, distinguished himself by the capture, in 1529, of Mombasa, now in Brit. E. Africa. In the same year he superseded Sampeyo as viceroy of the Indies, and on his way out took Ormus, one of the E. Indies, which had rebelled and massacred the Portuguese, and dispatched the traitor Xaref, who had encouraged the revolt, to Lisbon. Without firing a shot C. succeeded in gaining possession of Diu, a stronghold on the gulf of Cambay, which it was necessary to secure for the safety of his country's settlements. In 1537 he was bravely defending Diu with a garrison of 700 against the assaults of Soliman, the Turkish admiral, when he was recalled home.

Cunha, Tristão da (1460-1510), Portuguese navigator and discoverer, was in 1504 nominated the first viceroy of Portuguese India, but a temporary attack of blindness prevented him from filling the post. Two years later King Emmanuel entrusted C. with a fleet of sixteen vessels, five of which formed a squadron under the command of Alphonsó D'Albuquerque. With this detachment C. discovered a group of three volcanic is. in the S. Atlantic, which still bear his name, visited Madagascar and Mozambique, defeated the Arabs in Brava, and took possession of Sokotra (1507). His object was to gain control of all the trade with the E., and as an aid to this he built a fort at Coco (Tamarida). In 1514 the king chose him as envoy to Pope Leo X., who received homage from C. for the new Portuguese lands.

Cunningham, Sir Alan Gordon (b. 1887), Brit. soldier, son of Prof. D. J. C. and brother of Sir Andrew Browne C. Educated at Cheltenham and Royal Military Academy, Woolwich. Entered army, 1906. Served on W. front in First World War, and five times mentioned in dispatches. Instructor, machine-gun school, 1928-31. Commander Royal Artillery, 1st Div., 1937-38. Major-general, 1938. Commander-in-chief of the victorious imperial troops which conquered It. E. Africa, 1940-41 (see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941)). Commanded imperial troops which advanced into Cyrenaica, Nov. 1941; replaced by Maj.-Gen. Ritchie the same month after armoured actions at Sidi Rezegh (see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGN IN). Commandant, Staff College, Camberley, 1942. Lieutenant-general, 1943. General officer commanding N. Ireland, 1943-44. General officer commanding in chief E. Command, 1944-45. High commissioner and commander-in-chief for Palestine and high commissioner for Transjordan, 1945.

Cunningham, Sir Alexander (1814-93), authority on Indian archaeology, was a son of the poet, Allan C. Many years of his life were spent in the Brit. Army in India, and his various writings on Indian statistics and architecture are the fruits of a wide experience. His *Archeological Survey of India* appeared in 1871.

Cunningham, Allan (1784-1842), Scot-

tish poet and biographer, was b. near Dalswinton, Dumfriesshire. He was apprenticed to his uncle, a builder, but in 1810 he went to London and wrote for the press. In the same year appeared *Remains of Nithsdale and Galloway Song*, pub. by Cromek, most of which were composed by C. In 1814 he became secretary to Sir Francis Chantrey, the sculptor, to whom he rendered many valuable services, offering him suggestions and inducing Sir Walter Scott and Southey to sit to Chantrey. In 1822 he pub. his drama *Sir Marmaduke Marvell*, and in the same year *Traditional Tales of the English and Scottish Peasantry*. In 1825 he ed. *The Songs of Scotland, Ancient and Modern*, and in 1829-33 he pub. *Lives of the Most Eminent British Painters, Sculptors, and Architects*, in six vols., for the Family Library. His epic poem in twelve parts, *The Maid of Elrar*, appeared in 1833. In 1834 he pub. an admirably re-ed. ed. of Burns's works in eight vols., with a biographical preface containing many new and interesting facts of the poet's life; this was followed in 1836 by *The Life and Correspondence of Robert Burns*. Just before his death C. had a stroke of paralysis, the effects of which are obvious in *The Life of Sir David Wilkie*, pub. in 1843, after his death. C.'s songs were for the most part in the manner of Burns, and although they were much inferior to his model's, still retain some popularity. See D. Hogg, *The Life of Allan Cunningham*, 1875.

Cunningham of Hyndhope, Sir Andrew Browne Cunningham, first Baron (b. 1883), Brit. admiral, son of Prof. D. J. C. and brother of Sir Alan Gordon C. (q.v.). Educated at Edinburgh Academy, Stubbington House, Farnham, and H.M.S. *Britannia*. Entered R.N. 1898 as a midshipman on cruiser *Doris*, which operated off S. Africa during the Boer war. Before he was thirty he was in command of his own ship, the 900-ton *Scorpion*. Won distinction in the Gallipoli campaign, 1915. Commanded a destroyer in the Dover patrol, and was then transferred as a rear-admiral to command of destroyer fleet in the Mediterranean, 1933-36. In 1937 he was made vice-admiral in charge of the Mediterranean battle cruiser squadron, and second in command of the Mediterranean fleet. Lord commissioner of the admiralty and deputy chief naval staff, 1938-39. Famous for his brilliant aggressive strategy in the Second World War, in which he began his war service as commander of the first cruiser squadron in the Mediterranean and then, from Oct. 1939, in the North Sea, where his ships took part in the N. patrol, blockading Germany. His flagship, *Devonshire*, brought King Haakon and the Norwegian Gov. to Britain, after playing a gallant part in the ill-starred campaign in Norway. The Fr. Foreign Legion, whose forces he landed there, and subsequently took far S. to Duala after the ill-planned venture at Dakar (q.v.), bestowed a much-valued honour for his leadership. Under his direct command were the naval

forces, both surface vessels and fleet air arm, which crippled Italy's fleet at Taranto, the battle of Calabria, and the battle of Cape Matapan (q.v., and see also NAVAL OPERATIONS IN SECOND WORLD WAR). Made admiral G.C.B., 1911. Was in general command of the immense convoy of more than 800 vessels which landed the Brit.-Amer. expeditionary forces on the Algerian and Moroccan coasts on Nov. 8, 1942. In the matter of transporting, supplying, and maintaining the enormous invasion forces in many parts of the world he proved a great Fourth Sea Lord. Head of the Brit. Admiralty delegation to the U.S.A., 1942. Promoted admiral of the fleet, Jan. 1943. As commander-in-chief Levant he mounted a great part of the assault forces for the attack on Sicily at a time when the R.N. in the E. Mediterranean was heavily engaged in the Dodecanese operations. It was he too who planned and commanded the—from a naval standpoint—brilliantly successful Anzio landing and the still greater undertaking—the assault on the S. of France in Aug. 1944. After the Second World War he became First Sea Lord and chief of the naval staff at the Admiralty. C. has had a spectacular career, and it was well said of him by Mr. A. V. Alexander that he was 'the greatest sea captain since Nelson.'

Cunningham, John (1819-93), Scottish church historian, whose fine scholarship renders his *Church History of Scotland* (1859-82) an invaluable book of reference. In 1868 appeared his *History of the Quakers*.

Cunningham, Peter (1816-69), publisher and author, was a son of Allan C., the poet. As publisher he brought out Dr. Johnson's *Lives of the most Eminent English Poets* (1854), whilst his chief original works were *Inigo Jones* (1848) and a memoir of J. M. Turner (1852). Though condensed and voluminous, this last is flavoured with diverting anecdotes and gives many quaint pictures of the manners of different times. He also ed. his father's *The Life of Sir David Walker* (1843) and *Poems and Songs* (1847).

Cunningham, William (1805-61), Scottish theologian. During the ten years' conflict which preceded the disruption and the foundation of the Free Church in 1843, C. threw himself heart and soul into the controversy, giving the whole force of a fine intellect and the full moral support of a splendid character to the Non-intrusionist principles he had adopted. In 1847 he was appointed principal of New College, Edinburgh, where he had already lectured since 1843 with fervid interest and withal surprising impartiality on church hist. and divinity. A founder of the Evangelical Alliance, he was in 1859 moderator of the General Assembly.

Cunningham, William (1849-1919), theologian and political economist, b. at Edinburgh, was educated at Edinburgh Academy and Cambridge. In 1899 he gave a course on economic hist. at Harvard Univ., and was chosen Hulsean lecturer in 1885. Became archdeacon of Ely, 1907. Among his valuable

textbooks and hist. may be cited *The Growth of English Industry and Commerce* (1882, 1925-29); *English Industrial History* (1895); *Use and Abuse of Money* (1891); *Western Civilisation* (1894); *Modern Civilisation* (1896); *Rise and Decline of Free Trade* (1904); *Growth of English Industry and Commerce in Modern Times* (1907); *Cure of Souls* (1908); *Christianity and Social Questions* (1910); *Case against Free Trade* (1911); *Efficiency in the Church of England* (1912); *Christianity and Economic Science* (1914); *English Influence on the United States* (1916); *Progress of Capitalism in England* (1916); and *Increase of True Religion* (1917).

Cunninghame Graham, Robert Bontine (1852-1936), writer and Socialist agitator. Scots laird and Sp. grandee. He was educated at Harrow, and represented N. Lanarkshire in Parliament from 1886 to 1892. He spent much of his youth cattle-farming in the Argentine, and was a fine horseman. Closely associated with Keir Hardie and John Burns in the early days of the Labour party. His pub. include *Aurora la Cujini* (1898); *Mogreb el Arkesa: a Journey in Morocco* (1898); *A Vanished Arcadia* (1901); *Success* (1902); *Life of Hernando de Soto* (1903); *His People* (1906); *Charity* (1912); *Brought Forward* (1916); *Cartagena* (in Colombia) and *Banks of the Sinú* (1920); *Doughty Deeds* (1925); *Pédro de Valdivia, Conqueror of Chile* (1926); *Jose Antonio Piez, 1790-1873* (1920); *The Horses of the Conquest* (1920); *Writ in Sand* (1932); *Portrait of a Dictator* (1933); and *Mirages* (1936). See L. Chaundy, *A Bibliography of the First Editions of the Works of Robert Bontine Cunningham Graham*.

Cunninghamia, genus of coniferous trees of the Pinaceae family. Found in China and other countries in the Far E. The Chinese species (*C. sinensis*) is grown as an ornamental tree; but the Indo-Chinese variety (*C. gensis* or *Sa Mou*, as it is called in the vernacular) is noted for the provision of coffin wood for Chinese funerals.

Cunoniaceae, order of trees or shrubs inhabiting S. Africa, S. America, and sometimes the E. Indies. Little is known of their properties except that the bark is often very astringent and used for tanning purposes. The fruit is generally a capsule with albuminous seeds. The chief genus is *Cunona*.

Cuntis, tu. with thermal sulphur springs, 15 m. N. of Pentevedra, in the dist. of Cádiz in Galicia, Spain. Pop. 8000.

Cuoco, Vincent, see *Coco*.

Cup and Ring Marks are found on sepulchral monuments of the stone and bronze ages, on small, loose stones, rock faces, and earth-embedded boulders round the sites of primitive communities and habitations in almost every part of Europe, and also in many quarters of America, although the rings are rarely found on this continent. In Scandinavia they are still regarded with superstitious awe, and most archaeologists agree in tracing a close connection between these cups and circles

and the fetishes and ceremonial symbolism of our remote forefathers. Frequently they occur in the neighbourhood of the megalithic remains of India and Europe, and in Prussia they are found, curiously enough, on church faces. It seems, further, that they are not unlike the symbols of Siva engraved in modern temples. The cups are circular cavities, sometimes grouped in hundreds, with diameters varying from 1 to 4 in., and with their rims usually quite independent, though rarely these touch. It is suggested that these cavities arose from the Indian practice of cracking hickory nuts in some such hollow by striking them with a stone, whilst it is quite possible that the larger basins in rocks were used as mortars. The rings, up to six in number, flow concentrically round the cups, though they are not always found with them. Where the circles are incomplete a tiny passage usually radiates from the cup in the centre to the outermost ring. Achinabreac, in Argyllshire, Scotland, affords excellent illustrations of these curious sculptures.

Cupar, or **Cupar-Fife**, royal, municipal, and police bor. and the co. tn. of Fife, Scotland, on the R. Eden, 10 m. S.W. of St. Andrews, 30 m. N.N.E. of Edinburgh. Its chief industry is linen-weaving, and there is a beet sugar factory and a large oom market. The chief buildings are the tn. hall, corn exchange, and Duncan Institute. The anct. seat of the Macduffs, earl of Fife, is now a school. In front of it in 1552 there took place one of the earliest performances of Sir David Lyndsay's *And Satyr of the Three Estates*. Pop. 4500.

Cupellation, process for the separation of precious metals from lead, in which the alloy is heated on a cupel (hearth of porous, refractory material like Portland cement or marl) in air, whereby the lead is oxidised and removed as litharge, and the precious metal left behind. *See also* ASSAYING.

Cupid (Lat. *cupido*, desire), Rom. name for the god of love (Gk. *Ἔρως*), also Amor. He is generally represented as a winged, nude child, joyous and mischievous, with a bow and arrows, and sometimes a torch and quiver, and blindfolded. The arrows he aimed at the hearts both of men and of the gods of Olympus to kindle them into the flame of love. He is generally represented as the son of Venus by Mars, the god of war, but sometimes by Jupiter or Mercury. For the story of the love of C. and Psyche, *see* PSYCHE, also Andrew Lang's beautiful version of the Apuleian myth which denotes the striving of the soul after perfection.

Cupola (It., from Lat. *cupula*, small vault or cask), term in architecture for a spherical vault or concave ceiling—the dome of a building. The form is of Byzantine origin and was adopted by the Romans. It was much used in eccles. buildings, where it was lit by windows of coloured or painted glass. In domestic architecture the C. is generally of glass.

Cupping, almost obsolete remedial measure designed to relieve inflammation

by blood-letting. In dry C. the blood is withdrawn from deep-seated regions to the surface. In wet C. the blood is withdrawn from the body through a number of incisions made by a special instrument. The apparatus used is a glass cup with rounded or roughened edges, designed to adhere to the skin. The glass is heated by being warmed in a flame or by burning spirit within it. It is applied while hot and the subsequent cooling causes a contraction of the contained air which so diminishes the surface pressure that the blood is quickly drawn from the lower vessels to the skin.

Cupreine, alkaloid in the bark of *Cinchona cuprea*, a tree of S. America. From the same bark quinine is also obtained, the C. being separated from the mixture of the two alkaloids by treatment with ammonia and boiling ether.

Cupressus, *see* CYPRRESS.

Cura, or **Ciudad de Cura**, tn. 56 m. S.W. by W. of Caracas, in the N. of the prov. of Aragua in Venezuela, S. America. The tn. was almost destroyed by an earthquake in 1900.

Curaçao, or **Curaçoes**, most important of the Dutch W. Indian Is. It lies 40 m. from the N. coast of Venezuela, is 40 m. long by 10 m. wide, and has a total area of 210 sq. m. The soil is largely unproductive; sugar, aloes, tobacco, and divi-divi are cultivated in some fertile tracts, and salt, phosphates, cattle, and straw hats are exported. C. liqueur was originally made here from a peculiar variety of orange found on the is. Willemstad (pop. 39,600), on the harbour of St. Anna, is the cap. not only of C., but of the neighbouring is. of Aruba (pop. 39,100); Bonaire (5500); St. Eustatius (970); Saba (1100); and the S. part of St. Martin (1600); the N. part belongs to France. C. was discovered by Spain in 1527, but has been held by the Dutch since 1634, except for a short interval when it was in the hands of Great Britain. The official language is Dutch, but Sp., Eng., and a lingua franca, Papiamentu, are also spoken. Pop. of the whole colony 136,700 (C. is. 88,300); of the Dutch W. Indies, 57,000. *See* K. Martin, *West-Indische Skizzen*, 1887; de Veer, *La Colonie de Curaçao*, 1899.

Curaçoes, esteemed liqueur, manufactured chiefly in Holland. In dry C. there is 39 per cent. in the sweet variety 36 per cent. of alcohol. Jamaica rum is sometimes added to improve the flavour, but the latter depends mostly on the dried peel of the C. orange, *Citrus aurantium Curassaviensis*. A portion of the peel, after maceration in water, is distilled with diluted spirit, the rest of the peel being softened in a part of the distillate so obtained. After 48 hrs. the infusion strained off from this latter part of the distillate is mixed with that part of the first distillate hitherto unused. The resulting liqueur may be sweetened.

Curare, **Curara**, or **Urari**, vegetable extract obtained from *Paullinia curare* and members of the Strychnos family. It is used by the natives of S. America as an arrow poison. Its active principle is

curarin, and it has been used hypodermically in hydrophobia and tetanus. It is a dangerous drug, causing paralysis of the motor nerves and eventually death through paralysis of the respiratory organs.

Curassow, or *Craiinae*, sub-family of the galliform birds, is common to the forests of tropical America. The species are handsome game-birds, and often easily domesticated. *Craz alector*, the crested C., bears on its head a curious crest of feathers movable at will of their owner.

word is so used in the Church of England Prayer Book: 'All bishops and curates and congregations committed to their charge'; a curacy is the office held by a C. The word is now restricted in general use to an unbeneficed parochial Church of England clergyman, who is in reality an assistant C. Cs. in earlier times were generally deputies for some incumbent who never visited his par., now they are ministers employed by the rector or vicar of a par. to assist in parochial work generally, and in taking the service at the par. church.

P. H. Hiss: Netherlands Information Bureau

CURAÇAO: THE BEACH AND TOWN OF WEST POINT

Curate (from the Lat. *curare*, to care for), word which has become considerably altered in meaning with the passing of old customs. In former times benefices were sometimes handed over to religious houses who, in their turn, might transfer them to laymen. Such members of the laity were styled impropiators and were obliged to apply for a licence of the ordinary to allow a clerk in holy orders to take over the cure or par. in question. These clerks were called perpetual Cs., because the impropiators could not remove them, but by an Act of Parliament of 1868 all perpetual Cs. were allowed to use the title of vicar, even although they were given no vicarage nor tithes. On the Continent (*cf.* Fr. *curé*, It. *curato*, etc.) the word corresponding to C. is still used of the par. priest. C. is, in its etymological sense, 'one who has the care of souls,' and the

The bishop of the diocese, or an ordinary having episcopal jurisdiction, licences and admits the C. to his par., and assesses the amount of his salary. If a C. is not inducted to his curacy in due course he is liable to receive six months' notice from his vicar. The incumbent in a par. where the tithes are impropriated and no vicarage has ever been endowed is called a perpetual C.; in such a case he is not removable, and the impropiators are under the necessity of maintaining him. Where new pars. are formed in a dist. such incumbents are now called vicars.

Curator (Lat. *curator*, one who has charge of a thing—a guardian), in Rom. law the guardian or caretaker of a person over age who for some reason—for instance, if he be a spendthrift or of unsound mind—is unable to take charge of his own affairs. In civil law a C. is the

guardian or caretaker of the property of a minor. Under the Rom. Empire the title was given to those who occupied public official positions of trust. In modern times the name is generally given to the caretaker of a museum or public gallery, but it is still retained with something of its old significance at the univs.

Curb, term used in masonry to describe any fence or wall, designed to keep a mass of earth in its place. It is applied to various enclosing borders, being originally limited, as the word itself suggests (curb from Lat. *curvus*, crooked) to the framework or border of something circular. Thus it is still used of the framing round the top of a brewer's copper, of the cylindrical ring of iron or wood forming the foundation of a brick shaft, and of the wall or coaming round the top of a well. But its most common application is to the stone or other durable material placed edgewise along a sidewalk to separate it from the road, and to form a finish to the path or pavement.

Curb (in horses), see under HORSE (DISEASES).

Curel, **Carlo Maria** (1809-91), It. theological writer, became a priest of the Order of Jesuits in 1837. At Naples, where he had a cure, and where also he was rector of the schools and visited the prisons, he came into contact with Gioberti and other advanced religious thinkers, and in 1847 wrote a spirited reply to Gioberti's *Il Genio moderno*. In 1877 Leo XIII. expelled him from his Order in consequence of a pamphlet in which he advocated the reconciliation of the papacy with the people. He was to some extent reconciled; but his two books *La Nuova Italia* (1881) and *Il Vaticano Regio* (1883) were, upon pub., placed on the Index. Towards the end of his life he retracted again.

Curcuma, genus of Zingiberaceae. *C. angustifolia* is a native of the forests of India and *C. leucorrhiza* grows in the forests of Bahar. From the tubers of both species E. Indian arrowroot is obtained. *C. longa*, the common turmeric, is cultivated all over India, and also very largely in China; the Chinese sort is most esteemed for its superior richness in colouring matter. The rhizome of this plant is dried and then ground, when it yields the yellow dye known as turmeric. *C. Zedoaria*, the broad-leaved turmeric, has aromatic tubers used by the Hindus as a stimulating condiment, as a medicine, and as a perfume. Colic, cramp, and torpor are some of the diseases it alleviates in the E.

Curel, **François**, **Vicomte de** (1854-1928), Fr. dramatist, was educated as a civil engineer at the École Centrale. But he early turned to literature, and his first accepted play was *La Figurante* (1896). *La Nouvelle Idole* (1899), in which C. presents the eternal conflict between faith and reason, is probably his most popular play, but *Le Repas du lion* (1898) and *La Fille sauvage* (1902) are finer. The latter is a symbolical picture of the religious evolution of humanity; the former deals with the struggle, within an individual,

between progressive and conservative instincts. Other plays are *Les Fossiles* (1892) and *Le Coup d'aile* (1906). In 1914 he issued an ed. of his plays with a preface to each. He became a member of the Academy in 1918. He produced two plays after the war: *Terre inhumaine* (1923) and *La Viveuse et le Moribond* (1926). C. was passionately fond of hunting, and solitude. See P. Blanchart, *François de Curel et son œuvre*, 1926.

Curepipe, favourite and fashionable residential quarter, connected by rail with Port Louis, and situated at an elevation of some 1850 ft. in the interior of the is. of Mauritius. Pop. 28,000.

Cures, bp. of Numa, was a Sabine city, 25 m. from Rome, on the l. b. of the Tiber. It was probably destroyed by the Lombards in A.D. 589, but the site remains, namely a hill with two peaks, which were crowned formerly by the citadel and necropolis respectively. It was from C. so the story goes, that Titus Tatius led to the Quirinal the Sabines, with whom the Romans in time coalesced to form the Quirites.

Curetes, protectors of Zeus and Rhea, his mother, on the is. of Crete, whither they had fled from the wrath of Cronus, the father. In historical times they were regarded as gods, and their worship was celebrated in Greece with Pyrrhic dances.

Curstus, tribe of S. Amer. Indians who dwell peaceably in vills, each under a chief. They live in thatched round huts with tall conical roofs in the country bounded by the Rs. Vaupés and Japura of N.W. Brazil.

Curfew (Fr. *couvre-feu*). The custom of ringing a bell at sunset in summer and at eight o'clock in winter to warn all householders to extinguish their lights and fires was introduced into England from the Continent by William the Conqueror. It was not a tyrannical decree, but was a caution against leaving fires burning at a time when all houses were built of wood. The formal practice of ringing a bell at a stated hour is still continued in some dists. It is still resorted to in periods of civil unrest as, for example, in Palestine during the racial feuds between the Jews and Arabs; and in war-time to restrict or suppress nocturnal movements of civil pops.

Curia Muria Islands, see KURIA MURIA.

Curia Regia, or **Aula Regia**, king's council, estab. at the Norman Conquest. It was at first much the same as the committee of the *commune concilium*, known as the permanent council or *concilium ordinarium*. The C. R. gradually, however, assumed a distinct position from this council or committee owing to the continuity of its existence—whence its alternative name, continual council—and to its members being available for consultation at any moment, instead of at only three stated periods in the year, as in the case of the national council. By degrees the term C. R. or *aula regia* began to be used to denote the king's council in its capacity of a supreme court of justice with the king at its head, and in the reign of Henry I. appear traces of

a definite organisation and staff. The C. R., which at this time always followed the king, was occupied at first more especially with financial business, in which capacity it was called the Exchequer (*q.v.*). Its members were the great officers of the household, such as the constable, chamberlain, steward, marshal, and butler, and such officials as the justiciar and chancellor and treasurer, who were appointed by the king to help carry on the work of government. In its judicial capacity the C. R. acted as a court of appeal from the local courts and as a court of first instance in cases in which the powerful tenants-in-chief were concerned. The C. R. also was in close communication with the local courts by means of its travelling justices who, in Henry I.'s reign, began to make circuits of the country for the purposes of finance and justice. In 1178 the increased business of the C. R. had caused the number of judges to become so large that the king appointed five of them to sit regularly *in banco* to hear all complaints and to transact all the business which subsequently fell to the three courts of common law, while at the same time the appellate jurisdiction was transferred to the *concilium ordinarium*. This limited body of judges was the origin of the courts of king's bench and common pleas. The system was slightly modified in 1179. The C. R. still continued in theory, though not in practice, to transact its business in the presence of the king and continued to follow him, to the great inconvenience of all concerned and was shortly after broken up into the three courts of common law, namely the court of exchequer, court of common pleas, and court of king's bench.

Curia Romana, name used to denote the collective judicial and administrative institutions by means of which the pope carries on the general government of the church. It is also used in a secondary sense, to mean either the persons who form part of the general government of the Church or the Holy See itself. There is no separation of powers in the C. R., each dept., besides performing the business entrusted to it, having a share in the legislative, judicial, and administrative power. All depts. derive their powers directly from the pope, and exercise them in the papal name, while the pope is responsible officially for all the acts of the C. R. The decisions of some depts. must in nearly every case be referred to the pope for his ratification, but there is not the same necessity for ratification in others. Acts performed directly by departmental heads are generally called Acts of the Holy See, while those of the pope himself are designated Pontifical Acts, *e.g.* bulls, briefs (*q.v.*), and encyclicals. In all cases however, the disciplinary authority is the same, though Acts which concern individuals have not the force of general law.

The component parts of the C. R. are (1) the tribunal and offices, and (2) the permanent commissions of cardinals, known as the Rom. Congregations. The former have been in existence for cen-

turies, but the latter, though of much later institution, have taken precedence, and now perform a great many of the transactions formerly in the jurisdiction of the former. The Congregations consist of the highest dignitaries of the church, and are practically subdivisions of the Consistory, in which latter council the entire Sacred College takes part. The old machinery of the eccles. administration of the tribunals and offices still exists, but the prelates who once were at the heads of these depts. have been replaced by cardinals. The tribunals are (1) the *forum internum*, the Penitentiary, (2) the *Rota (forum externum)*, and (3) the papal Signatura, the two latter being for judicial matters.

The offices are (1) the Chancery which sends out papal bulls, (2) the Apostolic Dataria, which transact matters of grace, like nominations to benefices; (3) the Apostolic Chamber, which administers the property of the Holy See; (4) the palatine secretaries, the chief of which, the cardinal secretary of state, deals with the political affairs of the church; (5) the pontifical family, of domestic prelates of the household, one of whom presides over the arrangement of audiences, while another revises books pub. at Rome; and (6) the pontifical chapel, or papal court for religious worship.

Curicó: 1. central prov. of Chile, stretching from Argentina to the Pacific, and separating the provs. of Talca and Colchagua. Except for salt deposits on the coast the other minerals, copper, silver, etc., are as yet undeveloped. Irrigation has greatly assisted agriculture, and wheat, Indian corn, and the vine are widely cultivated. Area 2214 sq. m. Pop. 75,000. 2. Tn. situated on the Mataquito R., 114 m. S. of Santiago by the Chilean Central line. Pop. 18,000.

Curie, Marie (Marya Skłodowska) (1867-1934), physicist and chemist, was b. in Warsaw, daughter of Prof. Skłodowska. Educated at the Lyceum of Warsaw; went to Paris and studied with Pierre C. (*q.v.*), whom she married in 1895. It was she who carried out the many experiments necessary to obtain the atomic weight of radium, the element they had jointly discovered. She became licentiate in physics and mathematics, then doctor of science, and succeeded her late husband as prof. of physics and director of the physical laboratory at the Sorbonne in 1906, being the first woman prof. to be appointed to that univ. Besides the honours gained in common with her husband, she obtained the medal of the Royal Society of Arts (England) in 1910, the Nobel prize for chem. in 1911, and shared with her husband and Henri Becquerel the Nobel prize for physics. She visited the U.S.A., and her admirers there raised a fund with which they purchased a considerable portion of radium so that she could more easily carry on her investigations. The Marie Curie Skłodowska Institute of Radiology was opened in Warsaw in 1932. Pubs.: *Recherches sur la propriété magnétique des sels trempés*; *Recherches sur les substances radioactives* (1903); *Traité de*

radioactivité (1910); *Les Progrès de la physique Moléculaire* (1914); *La Radio-logie de la guerre* (1921); *Radioactivité et phénomènes connexes* (1923); *L'Isotopie et les éléments isotopes* (1924); and *Pierre Curie* (1924). See Eve Curie, *Madame Curie*. 1935.

'Picture Post' Library

MADAME CURIE

Curie, Pierre (1859-1906), Fr. physicist, was educated at the Sorbonne, Paris, where he eventually became *Licencié* ès Sciences Physiques, and *Docteur ès Sciences*, and where also from 1900 he held the chair of physics. In time he was chosen as *chef des travaux* at the school of physics and chem. in Paris, and in 1895 was appointed prof. at the same institution. In his earlier years he carried on some valuable research into piezo-electricity and the magnetic properties exercised by bodies in different degrees of heat. But his greatest service in the field of science was the discovery of two new elements, polonium and radium. Already, in 1896, Henri Becquerel had pub. his observations on the radioactivity of uranium—a property manifested in a still higher degree by the compound known as pitchblende. M. and Mme C. (see CURIE, MARIE)—for his wife took a full and equal share in the whole of C.'s laboratory work—immediately began to subject pitchblende to fractionation, hoping thereby to bring to light some hitherto unknown substance which must be radioactive to a still greater extent than uranium. Their hopes were fully realised, and resulted in the discovery of radium and its transformation product, polonium. In 1903 the Cs. received the Davy medal of the Royal Society and also half of the Nobel prize for physics, the other part being awarded to Becquerel. A year after his election to the Academy of Sciences (1905), C. was killed by a dray which ran over him. His investigations were regularly pub. in the *Journal of Physics*, *Annals of Physics and Chemistry*, and other scientific records.

Curio, Gaius Scribonius: 1. Rom. statesman who lived in the first century B.C.

Consul in 76, he prosecuted a successful war against the Thracians in his capacity of governor of Macedonia, and was the first Rom. to reach the Danube. 2. Son of the above, transferred his allegiance from Pompey to Caesar during his tribuneship of 59 B.C. After mustering troops for Caesar in Umbria and Etruria, he more than held his own against the Pompeians in Sicily (49), and was finally slain by Juba, the Numidian king, whilst crushing the Republican cause in Africa.

Curisches Hafl, see KURISCHES HAFF.

Curityba, or **Curitiba**, cap. of the state of Parana, Brazil. Situated on a pleasant plateau, 2916 ft. above the sea, it is watered by the Iguaçu, an affluent of the Parana, and is connected by rail with its seaport, Paranagua, 68 m. to the E. There is a univ. and a large Ger. colony. Its staple exports are maté or Paraguayan tea, beef, cereals, and tobacco. Pop. 117,000.

Curius Dentatus, Marcus, see DENTATUS.

Curlew, shore bird of the genus *Numenius*. It is found in all countries, and is remarkable for its very long and decurved bill, and its elongated legs. It breeds especially on moorlands, the nest being quite exposed. The plumage is pale brown in colour, with dark bars, the under and lower parts being mainly white. It is found on Brit. shores from autumn to spring, and feeds on insects, worms, and berries.

Curling, kind of bowls on ice which has been a popular Scottish sport during the last three centuries and which has now found a home in most parts of the world where the climate is favourable, especially Canada and Switzerland. The stone, which takes the place of the bowl, is a block of granite or whinstone rounded to the shape of a Dutch cheese and polished smooth. On the top is an iron handle by which the player grips it. The stone may be thrown in various ways, according to the direction in which the player wishes to send it. The weight varies from 35 to 40 lb., but 44 lb. is the maximum allowed. By giving it a rotary motion to a greater or less degree it may be made to go in more or less of a curve. The first thing done by the players is to prepare the rink. The ice is swept clean and two tees are constructed, 38 yds. apart, one at each end of the rink. With the tee as centre, a circle of 7 ft. radius is then drawn at each end. Behind each tee a line is drawn back from the tee to a distance of 4 ft., these being called the *central lines*. At the hinder extremity of the central lines *foot-scores* are drawn at right angles to them, 18 in. long, on the left hand on the central line as one faces the tee. With part of the foot-score as diameter and with their centres 6 in. from the central line, small circles 3 in. in radius are drawn. On these players must place their left feet when casting their stones. Those stones which are inside the tee circle and nearest to the tee count for the score, and a game consists of a number of 'heads' or 'ends', after each of which the players change ends. Seven yds. from each tee a wavy line is drawn, known as the hog-

score, and any stone which does not cross this is called a *hog* and removed from the rink. Midway between the tees a straight *middle* line is drawn. The rink having been prepared according to the above rules, each side chooses its captain or *skip*. A side generally consists of four players with two stones apiece, and the skip is an autocratic director, giving minute direction to the other players where they must send their stones. The leader is generally directed by his skip to send his stone straight towards the tee, but on no account to go beyond it. The skip of the opposing side may then direct his first player either to send down a shot to remove his adversary's stone, or to try to get his own stone nearer. The second and third players are similarly told exactly what to do. The skip generally plays last, though this is not obligatory, and he himself is directed by a player, generally the third, whom he has picked out for this purpose. As a rule when one good shot has been made it is customary for the following players to be directed to lay their stones as *guards* to protect this one. All the players are provided with brooms and a right judgment in 'sweeping' (sweeping) forms no small part of the skill of the game. The broom is used to sweep away any particles of ice or snow that seem likely to impede the progress of the stone, and is used only on the skip's orders. The player's party may sweep from the middle line to the tee, so long as they do not disturb either the running stone or any of those at rest. An umpire is generally chosen to settle disputed points. The rules for C. are made and issued by the Royal Caledonian C. Club. Much effort has been exerted to find the origin of the game, but it seems impossible finally to settle this point. The balance of opinion inclines to give it a Dutch or Flemish origin, but there are many references to the game in the early seventeenth-century Scottish records. Camden, in 1607, speaking of the Orkney Is., says, that they supply 'plenty of excellent stones for the game called curling.' The game at first bore a much closer resemblance to quoits than it at present does. It was for a long time known as *coiling* or *kuling*, and the old name still survives in many parts. At this time the stones were much smaller, weighing only a few pounds, and the impulse was given by the fingers, to receive which a small hole was made in the top of the stone. Then for a short time the stones were of enormous weight, 70 or 80 lb. each, and shaping was not carefully attended to. With an increase in the symmetry of the stones came a decrease in their size. In 1834 an attempt to revive the anct. sport was made by the Amateur C. Club of Scotland, attended with but little success. In 1838 the Grand Caledonian C. Club was formed on more professional lines, and this club, which took the title of Royal from Queen Victoria in 1842, extended the game to Canada and the U.S.A., where it is played under slightly different conditions. See J. Ramsay, *An Account of the Game of*

Curling, by a Member of the Duddingston Curling Club, 1811, 1882; J. Taylor, *The History of Curling, and Fifty Years of the Royal Caledonian Curling Club*, 1890; and J. Kerr and C. G. Tebbutt, *Skating and Curling*, 1894.

Curll, Edmund (1675-1747), notorious London bookseller, b. in London. He is responsible for the origin of the word Curlicue, having achieved a reputation for issuing obscene literature. He lived chiefly by piratical publishing, and Arbuthnot said of his biographies that they added a new terror to death. He quarrelled, in 1716, with Alexander Pope, the poet, in consequence of which Pope pilloried him in his work, the *Dunciad*.

Curly Coated Retriever, see RETRIEVER.

Currach, see CORACLE.

Curragh Incident, name by which that dramatic and unexpected gesture made at C. Camp by Gen. Hubert Gough and other officers under his command came to be known. On March 20, 1914, they tendered their resignations as a protest against the likelihood of being sent to enforce Home Rule upon N.E. Ulster. This action caused a political crisis of the first order. See also HOME RULE.

Curran, John Philpot (1750-1817), Irish judge and orator, won in 1769 a sizarship at Trinity College, Dublin. He was called to the Irish Bar in 1775, and in 1782 he was created king's counsel, and in the following year entered the Irish Parliament as member for Killebegan. A staunch supporter of Grattan, his fervid and sarcastic speech nevertheless failed to secure for him in the House that pre-eminence which he enjoyed in an Irish court. C. was a convinced Protestant, but when the oppressed Catholics of his country were goaded at length to open rebellion, he threw himself wholeheartedly into the defence of their leaders in the series of state trials which followed. Thus he exerted himself to save Archibald Rowan (1794), the Rev. Wm. Jackson (1795), Peter Finerty (1797), the brothers Sheares (1798), Napper Tandy (1800), and a host of other victims of gov. persecution. C.'s last years were darkened alike by the political outlook and by domestic troubles. The union, which he had prophesied would be 'the annihilation of Ireland,' was in the last degree abhorrent to him: his wife eloped with a clergyman, and Sarah, his daughter, d. in Sicily after the execution of her lover, Robert Emmet, who rebelled in 1803. From 1806 to 1814 C. served the Whig Gov. as master of the rolls in Ireland.

Currant, term applied properly to species of *Ribes*, a genus of Saxifragaceae which flourishes in N. lands and has four representatives in Britain. *R. rubrum* is the red C., a plant remarkable for the mixture of sweetness and acidity in its fruit and for the beauty of its semi-transparent red or yellow berries. *R. nigrum* is the black C., in the fruit of which a powerful and agreeable aromatic principle takes the place of acidity. *R. sanguineum*, the flowering C., is well known in Brit. shrubberies for its beautiful pendant racemes of flowers, which are white when

very young, and gradually become rose-coloured. The Cs. sold in grocer's shops are the dried berries of a small kind of grape which is cultivated chiefly in the Is. of the Mediterranean and in Corinth, the word C. being a corruption of the name of this In. Various plants of different genera and orders are named C.-trees and C.-bushes, but they bear no true resemblance to species of *Ribes*.

Currant Wine, inferior vintage made from a seedless variety of the *Vitis tinifera*, or grape-vine, which is cultivated chiefly in Zante, Cephalonia, and Ithaca, and near Patras in the Morea. The fruit is grown on the lower hills and in the valleys, the higher slopes being left for the cultivation of the grape-vine.

Currency (Money), that which is current or in circulation, as a medium of trade. The word is generally applied to coins and what is termed paper money, comprising bills issued by authority, and to bank-notes or notes issued by government. In the science of political economy it more properly connotes money in the sense of coin, bills of exchange, notes, or other paper substitutes, being no more than a means of economising the amount of coin or bullion in any country. Money in this more restricted sense may be defined as the means by which two persons who do not deal together mutually as producers and consumers are enabled to enter into transactions. Some common measure of value must necessarily be adopted as an essential part of the machinery of trade, or in the language of economists, for the purpose of facilitating exchanges. Various substances have been used in different countries to serve as money, e.g., the Chinese formerly used cubes of tea and ant. classic nations used cattle. But as the precious metals, gold and silver, and in a lesser degree copper, have been for long the universal substances selected for the purpose by reason of the possession of their qualities of intrinsic value, durability, susceptibility to div., and portability, it is unnecessary to consider any other kinds. The original meaning of the word coin was a wedge-shaped disk for stamping money. Etymologically, coin is a doublet of *coign*, from Lat. *cuneus*, wedge; the Fr. word means also 'stamp.' Neither the Bible nor Homer gives any evidence of the use of coins in very early times. Herodotus ascribes the invention of stamped money to the Lydians, and the *Parian Chronicle* to the Æginetans in the ninth century B.C. Numismatic research points to the silver coins of Ægina, stamped with a turtle, as the most ant. known, while those of Lydia probably come next, followed by the gold and silver Darics of the Persian Empire in the fifth century B.C. Metal was very early used as a medium of exchange, but was weighed out by scales. The monetary systems of most European nations can be traced back to the pound of silver, still represented in the Eng. pound. A few instances are known of coins of other than circular shape, but convenience and the prevention of the depreciation of the coin by clipping or shearing portions from the edges have

tended to the universality of the round metal disk. The integrity of the coin as regards weight is also protected by milled and raised edges, and by the inscriptions and designs on its surface; all of which make mutilation easily perceptible. The design, etc., stamped on coins are usually symbols of the authority by whom they are issued, and the lettering confirms this, and generally includes the date of issue of the coin. Among the numerous minor Grecian states, and in early medieval Europe, a tremendous number of coins were made, separate coinages being issued not only by individual nations, but also by cities and even by families (see also **TOKENS** and **TRADE TOKENS**). Such local coinage was valid only within a restricted area, and the gradual centralisation of power led to the adoption of certain standard coins for international circulation. In modern times the right to coin money is a state monopoly, and coins are issued of two kinds; standard, where the weight of metal is equivalent to the face value of the coin, and token, where the actual value of the metal is less than the face value of coin, the as in the case of copper coinage. This is a matter which involves financial problems of considerable importance and difficulty. Gold, silver, bronze, and nickel are the chief metals used for coins. In Great Britain the silver coins are for 6d., 1s., and 2s. 6d. Threepenny pieces are occasionally seen, but the present twelve-sided threepenny piece is a nickel-brass coin. The existing bronze coins are penny, halfpenny, and farthing. Gold coins have disappeared. Five-pound and two-pound gold coins are issued on special occasions; but the sovereign and half-sovereign were withdrawn from circulation since the early days of the First World War. The 5s. silver crown and the double florin have also been discontinued. In the Brit. Empire New Zealand uses the Brit. coinage. Australia, S. Africa, and Elre use the same units, but with their own designs. Canada has the dollar and various cent pieces, and India the rupee. In Sept. 1916 the Brit. Gov. announced that the existing silver coinage was to be replaced by one of cupro-nickel. The process of withdrawal is to be made over a period of years, and for some years both types of coin will circulate side by side. The reason for the withdrawal in the case of silver in Brit. coins was the world shortage of silver and the dearness of the metal. Further, Britain received about £75,000,000 worth of silver from America under Lease-Lend and that has to be repaid. In 1946 the price of silver was 4s. 7½d. an oz., compared with 2s. during the war. In 1920 the price of silver rose to such a height that the silver in a half-crown cost 3s. In those days our coins contained 92½ per cent of pure silver, but the gov. passed the Coinage Act of 1920, which reduced the silver content by nearly half. The old rich alloy, 92½ per cent, had been in use for 350 years. The coins that resulted from this reduction contained half silver and about half copper, and they turned red,

green, and yellow. Some years later, however, the Mint changed the alloy again and called in the earlier coins. All the pre-1920 coins were called in too, but it was not until 1938 that the withdrawal was practically complete. In 1946 there were double the number of silver coins in circulation that were in circulation in 1920. The nominal value of silver coin in circulation in 1946 was about £113,000,000, and it had an intrinsic value of about £49,000,000 against £21,500,000 with silver at 2s. or, in other words, the intrinsic value of a half-crown had risen from 6d. to 1s. 1½d. The total number of coins struck in 1945 was 398,371,607, of which 91,571,222 were for foreign and colonial govs. Numismatics, or the study of coins, is valuable from antiquarian, historical, chronological, and artistic points of view. Much of our knowledge of (i)k. and Rom. hist. and biography, and many of our ideas of the appearance of men and buildings, are due to the evidence afforded by the contemporary coinage, while many coins such as those of Syracuse, are of high artistic merit.

In addition to its function of acting as a medium of exchange, money performs the no less essential functions of serving as the measure of the value of all other substances and as a means for effecting credit (*q.v.*). An appreciation of the true use of money and, in Adam Smith's phrase, of its nature as merely 'a branch of the general stock,' has led to the rejection of the old fallacy that a country's wealth was in direct proportion to the amount of money in the country, a fallacy which resulted from a confusion of capital with money. The former policy of the laws and trade of Great Britain was to retain as much money as possible, and hence to discourage imports and encourage exports (*see* CAPITAL, CUSTOMS DUTIES, and FREE TRADE). As a general rule it may be said that the value of money, that is to say, its purchasing power, varies inversely as general prices (*Mill*). The complex industrial organism of a country cannot be properly carried on unless there is at any given time an adequate quantity of money in that country. What is the proportion which the circulating money of any country bears to the whole value of the ann. produce circulated by means of it, it is impossible to determine. The point is a controversial one, but as only a part, and frequently a small part, of the ann. produce is destined for the maintenance of industry, it must always bear a very considerable proportion to that part (*Adam Smith*). The problem appears in the opinion of modern economists not to be capable of an answer in exact figures, owing to the difficulty of deciding the causes which determine the value of money. The value of money is regulated by the same laws as those which determine the value of other mineral produce; hence the causes which determine that value are, though complicated, reducible to the law of supply and demand. 'Supply' of money means, according to *Mill*, the total amount of money in circulation at any

given time, and 'demand' for money the total quantity of goods offered for sale. But as *Mill* points out, the element or factor of supply is itself complicated by the varying rates of circulation, or what he terms the 'efficiency' of money. Furthermore, demand in this context is to be taken to indicate not so much the total quantity of commodities as the number of sales to which any particular article is subject before it ultimately gets to the hands of the consumer. The net result is that the value of money varies inversely as its total amount in circulation multiplied by its efficiency (*Cairnes*). As men economise to the fullest possible extent the machinery of production, so do they economise as far as they can the machinery of exchange, or money. If actual money in the primary signification of current coin passed on every mercantile transaction, the trouble and difficulties of the social organism would be enormously increased; in all probability it could not be carried on at all as at present constituted. In a word, some system of credit has to be adopted (*see* CREDIT), and as a corollary, civilised communities attain to the idea of what is known variously as paper money or representative money in the shape of bank-notes, promissory notes, and bills of exchange (which latter term legally comprises cheques). These paper instruments are therefore a substitute for money. In most modern countries that form of promissory note known as a bank-note is part of the ordinary C. Notes are made legal tender provided they are issued by the State or by a State bank. When once in circulation such notes discharge debts as completely as current coin, in spite of fluctuations in value; promissory notes issued by bankers may of course be refused as payment of a debt, and can only be circulated with the entire concurrence of those who receive them. Bank of England notes have now long been legal C. and tender, and under certain circumstances the notes of country banks may be treated as C. and payment. A bank must always give gold or Bank of England notes, on demand, in exchange for its own notes. These rules give rise to the assertion that in the United Kingdom there is a 'convertible paper C.' Where notes are not convertible into money on demand, they are what is called 'inconvertible C.' The danger of inconvertible paper C. is that there is no real limit to the issue, with the result that there may be a poor prospect of redeeming the notes, and such huge sums may therefore by their means be added to the C. as to exercise a prejudicial influence on the financial resources of a country and ultimately to injure the credit of a gov. Gold coins are valid tender up to any amount; silver coins not beyond 40s.; copper coins not over 1s. By a statute passed in the third year of William IV., Bank of England notes are legal tender for all sums above £5, if the notes are payable on demand to bearer. In the United Kingdom there is therefore no double or treble standard of value, although there are three kinds of metal used in coinage,

the silver and copper coinages being no more than subsidiary. Advocates of a double standard insist upon the relative value of gold and silver being fixed by international agreement; but the fallacies underlying this proposal, which is commonly known as bi-metalism, may be refuted by consideration of the effect of the cost of production of the precious metals.

The outbreak of the First World War in Aug. 1914 necessitated an early departure from the C. practice which had been established for years in Great Britain. On Aug. 6, 1914, an Act known as the Currency and Bank Notes Act was passed. This Act authorised the Treasury to issue C. notes of the value of £1 and 10s. These were to be legal tender for any amount, the holder of a C. note being entitled to obtain on demand at the Bank of England, London, payment of the note at its face value in legal tender gold coin. The Act also provided that postal orders were to be temporary legal tender for the payment of any amount and these were actually used as C. for a short period. The provision with regard to postal orders was revoked by proclamation as from Feb. 3, 1915. Another very important provision of the Act was the power given to the Bank of England and to any Irish or Scottish Bank to issue notes in excess of the limits fixed by the law. The proviso attaching to these excess issues was that they should be authorised by H.M. Treasury and subject to any conditions imposed by that authority. It is important to note that banks of issue were to be indemnified against liability on account of excess issue after Aug. 1, 1914, provided that such excess resulted from authority received from the Treasury. It is a noteworthy fact that for a very short period the Bank of England did exceed the issue limit of uncovered notes fixed by the Act of 1844. C. notes were obtainable by bankers from the Bank of England up to 20 per cent of their liability on deposit and current accounts. The first issue of C. notes by the Treasury was made on Aug. 7, 1914, and the value of outstanding issues grew rapidly until Aug. 4, 1920, when the figure against outstanding C. notes and C. note certificates was returned at £366,679,828. It should be stated here, perhaps, that the holder of C. note certificates is entitled to demand from the Bank of England, acting for the Treasury, the amount of C. notes stated thereon. The great utility of the C. note issue was made manifest during the period 1914-18 covered by the First World War, when the national finances had to be treated with marked care. The banks were able to meet continuous and increasing demands for C. by the public. The Bank of England was enabled to conserve the gold stocks in the country. Credit was extended and this led to inflation. The gov. found the issue of C. notes of the greatest use, inasmuch as it was provided with a loan of nearly £400,000,000 to help to carry on the war. In Jan. 1918 a committee known as the Cunliffe Com-

mittee was appointed under the chairmanship of Lord Cunliffe to consider the various problems which would arise in connection with C. and the foreign exchanges during the period of reconstruction. Among the prin. recommendations of this committee were that an early return should be made to the gold standard and that gov. borrowings should cease at the earliest possible moment. It was also advocated that an adequate sinking fund should be provided out of revenue, so that there might be a regular ann. reduction of capital liabilities. The important recommendation was made that in order to reduce the C. note issue the actual maximum fiduciary circulation in any year should become the legal maximum for the following year. The committee also recommended that the principle of the Bank Charter Act, 1844, should be maintained, namely, that there should be a fixed fiduciary issue beyond which notes should only be issued in exchange for gold. The Macmillan Committee on Finance and Industry, which was appointed in 1929, found, however, that the return to the gold standard had fallen short of expectations, and emphasised that the only purpose of a gold reserve was to meet deficits in international payments until equilibrium was restored. In 1931 there were heavy withdrawals of borrowed capital in a brief space of time, such withdrawals being met partly from gold and partly from foreign C. held by the Bank of England, and partly from credits secured from Paris and New York. In consequence the National Gov., which succeeded the Labour Gov. in that year, introduced a Bill to suspend the gold standard and the gold standard has never since been restored. The Monetary and Financial Commission of the World Economic Conference, 1933, resolved that it was in the interests of all that gold should be re-estab. as the international measure of exchange values, the time and parity being for each country to determine. It was realised that in modern conditions monetary gold was required not for internal circulation but as a reserve against central bank liabilities and, above all, to meet external demands for payments caused by disequilibrium on the foreign account. On Feb. 1, 1939, Sir John Simon, chancellor of the exchequer, introduced a Currency and Bank Notes Bill under which the Bank of England's gold reserve, which had theretofore been valued in the bank return at the statutory price of 85s. an ounce should in future be valued weekly at the current market price (about 148s.). Any excess of its total value over the total note issue was to be transferred to the Exchange Equalisation Fund, and, conversely, the fund would make good to the bank any deficiency.

U.S.A.—An attempt to provide a sound and uniform C. was made by the estab. of a U.S. bank in 1791, which was given up in 1811, and of a second in 1816, which was closed in 1832 owing to President Jackson's opposition. The

bimetallio standard (the 'dollar,' without decision as to whether it was to be of gold or silver, having been made the unit) caused speculation in gold and silver coin, and in 1834 the ratio of coinage was changed from 15:1 to 16:1. Between 1837 and 1844 sev. state banks collapsed and Federal credit was so impaired that payment for land was ordered to be made in specie. Some of the states repudiated their public debts. Radical experiments ensued. An independent U.S. treasury was estab. in 1846, and also a sub-treasury. Treasury notes were made receivable for public debts, and selected cities were named as centres of deposit for gov. funds. In 1861 a panic occurred, specie payments being suspended, and in 1862 secretary Chase issued legal tender notes, founded on specie support (greenbacks), though owing to the rise of prices and depreciation of notes specie payment of notes was later suspended. In 1863 the National Bank system was estab., a national C. was provided for, secured by U.S. bonds, the banks being allowed to issue C. up to 90 per cent of gov. bonds deposited. In 1869 occurred the gold panic of Sept. 24 due to the attempt of Jay Gould and others to corner the Amer. gold market. This was foiled when the gov. threw \$5,000,000 of gold into the market. The day of the break was known as Black Friday. In 1893, after a period of depression, a serious political agitation led by W. J. Bryan arose for the re-estab. of a bimetallio standard. In 1900 the Currency Act was passed, definitely making gold the standard, and creating more favourable conditions for national banks. The 1907 panic was followed in 1908 by the Aldrich Currency Bill, allowing banks to issue C. on security of other than gov. bonds. The Owen-Glass Bill in 1913 (the Federal Reserve Act), passed by Congress under the impulsion of President Wilson, was intended to replace the outworn system of the Civil war days. The Federal Reserve Banking system is under the control of a board of seven directors, including the secretary of the Treasury, the comptroller of the Treasury, and five members named by the President of the U.S.A. Instead of one central bank, there are twelve regional banks, located in important cities scattered all over the country. Banks holding state and not Federal charters may join, but are not compelled to do so. Each regional reserve bank is under control of nine directors, under orders from the central board of seven, whose headquarters are in Washington. Each regional bank is supplied with large gov. deposits and with its own very considerable reserves. At all times it can supply its member banks with all the money that is needed, especially in crop-moving time. These regional banks also issue paper money in the shape of Federal Reserve treasury notes which are legal tender. The object of President Wilson was to place the money power in the hands of the gov. itself and take it away from the Wall Street bankers, who had hitherto con-

trolled the money market, taking advantage of the business interests of the country by exacting high rates of interest. The system showed its great value when the U.S.A. entered the First World War and the gov. was compelled to borrow huge sums from the people. The great panic and business depression of the winter of 1929-30 which extended up to the time of President Roosevelt's election in March 1933, resulted from the huge stock speculation in which the Amer. public had indulged, by over-production of manufactured goods, and by general bad economic conditions throughout the world rather than through any inherent defects in the Federal Reserve Act. *See also MINT; MONEY; NUMISMATICS.*

Currency Bonds, gov. bonds of the U.S.A., which are so called because they form part of the circulatory system of exchange. This they do in virtue of their interchangeability with the notes of the national banks, as a security for which they are deposited by the gov. with the Treasury.

Currency, Foreign, *see* WEIGHTS AND MEASURES, *Table of Foreign Monies.*

Currie, Sir Donald (1825-1909), founder of the Castle Steamship Company, *b.* at Greenock. At the age of fourteen he entered a shipping office, and in 1844 joined the Cunard Steamship Company in Liverpool. The 'Castle' line, which he estab. in 1862, rapidly grew in importance, and in 1872 he started a line of steamers to Cape Town, thus breaking the monopoly held by the Union Steamship Company. These two companies were amalgamated in 1900 as the Union-Castle Mail Steamship Company, with Sir Donald as chairman.

Currie, Sir William Arthur (1875-1933), Canadian general, *b.* at Napperton, Ontario, Canada. He quickly came to the fore in the First World War, and proved himself an able administrator as well as general. He took the field in command of the 1st Canadian Div. in 1914, and then of the Canadian Corps in 1917. His many military decorations include the Legion of Honour, Grand Officier de l'Ordre de la Couronne de Belgique, the Fr. and Belgian Croix de Guerre and Amer. Distinguished Service Medal. Principal of McGill Univ. from 1920 until his death.

Curry, Indian dish, seasoned with C. powder or paste. C. is a concoction of pepper, ginger, turmeric, coriander, caraway, tamarind, and many spices.

Curse of Scotland, nine of diamonds, which resembles the coat of arms of the early Stair, who was connected with the massacre of Glencoe in 1692.

Cursor, L. Papius, distinguished Rom. general in the second Samnite war, was five times consul (B.C. 333-313), and twice dictator (325-309). He frequently defeated the Samnites, but his greatest victory over them was gained in his second dictatorship. Although a great general, he was not popular with the

soldiers on account of his severity. In his second consulship, 272, he brought the third Samnite war to a conclusion.

Cursor Mundi, fourteenth-century verse homily, purposing to give a hist. of the world from its creation to its ultimate destruction. The poem is based on Bible hist., but, in a very attractive manner, the author incorporates with the scriptural narrative any legendary story he may know, such as that of the *Three Trees*. He also owes probably something to Cædmon's *Genesis*, Grosseteste's *Castle of Love*, and to the works of Wace and of Isidore of Seville. See the ed. of Dr. Morris, pub. by the Early Eng. Text Society.

Curtain, term used in fortification with regard to the part of a rampart which connects one bastion with another. See **BASTION**.

Curtatone, com. of N. Italy, in Lombardy, 4 m. W. of Mantua. It was the scene of the defeat of the It. patriots by the Austrians on Aug. 29, 1848. Pop. 9000.

Curtea de Arges, tn. and episcopal see of Rumania, in Wallachia, on the R. Arges, a trib. of the Danube. The fine cathedral, dating from the sixteenth century, is of great interest. There are sev. fine churches, including one built in 1512 by Prince Neagoe in the Byzantine style. Pop. 6500.

Curtsey (also *Courtesy*). The right of a husband to enjoy for life, after his wife's death, the freehold lands of which his wife was solely *seised* (i.e. possessed) in her lifetime, provided such issue of the marriage was *b.* as might by possibility inherit as the heir of the wife, made the husband on the right accruing *tenant by the C. of England*. From the passing of the Married Women's Property Act, 1882, tenancy by the C. only attached to lands of which the wife dies intestate. Abolished in England in 1925.

Curtin, Andrew Gregg (1817-94), Amer. statesman, *b.* at Bellefonte, Pennsylvania; was secretary to the commonwealth of Pennsylvania, in 1855, and governor (Republican) 1860. During the Civil war he strongly supported Lincoln, and Pennsylvania, under C., furnished 390,000 men to the N. army.

Curtin, John (1885-1945), Australian statesman, *b.* at Creswick, Victoria, and educated in state schools. Began work as a printer's devil. From 1911 to 1915 he was secretary of the Timber Workers' Union. During the First World War he became secretary of the Anti-Conscription League, and, in that capacity, came into conflict with the law and was imprisoned. From 1927 to 1928 he was editor of the *West Australian Worker*. In 1928 he was elected to the House of Representatives for Fremantle, and held the seat (except from 1931 to 1934) till his death. In 1935 he was elected leader of the Federal Labour party in succession to Scullin. On Oct. 3, 1941, Fadden's administration, after being in office for only a month, fell on a vote of censure on the budget and C. was summoned by the governor-general to form a gov. When Japan

opened hostilities in 1941 C. confronted the gravest crisis in Australian hist. and turned to the U.S.A. for aid, writing in the *Melbourne Herald* that Australia looked to them 'free from any pangs as to traditional links or kinship with the United Kingdom.' In Feb. 1942 his Cabinet ordered for the defence of Australia the complete mobilisation of all the human and material resources of the country and, with Brit. consent, secured the repatriation of the Australian Imperial Force, entrusting the supreme direction of the war in the Australian zone to the Amer. general MacArthur.

Press Portrait Bureau
JOHN CURTIN

He himself assumed the title of defence minister. In Nov. 1942, he obtained the consent of his own party to negotiate for the service of the A.I.F. and the militia as a homogeneous army in the S.W. Pacific area. In Aug. 1943, after the Jap. threat to Australia had passed, he secured at the election a two-house victory for Labour with a working majority. In March 1944 he visited London to attend the prime ministers' conference and won a reputation there as a commanding and whole-hearted leader of the Australian people. He differed, however, from Mr. Mackenzie King in regard to his own suggestions for improved machinery of consultation within the empire. His health, however, began to deteriorate at the end of 1944 and he *d.* in July of the following year. C. had a simple strength and directness of character and utterance which helped him, as neither mere brilliance nor astuteness could have

helped him, to fill the position of national leader demanded by the exigencies of a desperate crisis in Australian hist. Hist. may justly hold of him that in her most fateful emergency he served his country with an entire fidelity and an ability which were no small factors in her victory and in winning recognition of Australia in the war councils of the Allies in Washington and London.

Curtis, Charles Gordon (b. 1860), Amer. inventor; b. in Boston, Massachusetts; son of George Ticknor C. For eight years a patent-lawyer. He organized the C. & C. Electric Motor Company, the first company to make electric fans and motors; also the C. Manufacturing Company, of which he was president. Inventor of the C. improved steam turbine, of which the land rights were sold to the General Electric Company, and which is used in the navies of U.S.A. and Great Britain. Member of the Society of Naval Architects and Marine Engineers.

Curtis, Cyrus Hermann Kotzschmar (1850-1933). Amer. publisher; b. in Portland, Maine, son of Cyrus L. C. Had a common school education in New England. When married, went in 1876 to Philadelphia; there pub. the *Tribune and Farmer*, and estab. the *Ladies' Home Journal*. Later he became head of the C. Publishing Company, and *The Country Gentleman* and *The Saturday Evening Post*, the latter of which had been founded in 1728 by Benjamin Franklin, became the property of his firm. In Jan. 1913 he acquired the *Philadelphia Public Ledger* (owned by A. S. Ochs from 1902 to 1912), and in Dec. 1923 *New York Evening Post*.

Curtis, George Ticknor (1812-94), Amer. lawyer and historian, b. in Watertown, Massachusetts; graduated at Harvard in 1832; admitted to the bar, 1836; practised in Worcester, Boston, New York, and Washington, appearing before the U.S. supreme court in the Dred Scott case. He wrote *A History . . . of the Constitution of the United States* (1854); republished with embellishments as *Constitutional History of the United States*, (1889-96); *Life of Daniel Webster* (1870), and other political biographies.

Curtis, George William (1824-92), Amer. man of letters, b. in Providence, Rhode Is. He began life as a clerk in New York, and after having spent over a year with the Brook Farm Community, W. Roxbury (1842) he travelled on the Continent and in Egypt and Syria. On his return to America in 1850, he pub. his travels, and soon acquired a reputation. He was appointed editor of *Fulham's Monthly* in 1852, and contributed the series 'The Editor's Easy Chair' to *Harper's Monthly* from 1853. In 1857 he became editor of *Harper's Weekly*, and contributed serially to many magazines. C. was well known as a lecturer and public speaker, and was a keen member of the anti-slavery movement. His chief pub. are *Nile Notes of a Hovoadji* (1851); *Lotus Eating* (1852); *Potiphar Papers* (1853); *Prue and I* (1856); *Eulogy on Wendel Phillips* (1884); and *Party and Patronage* (1890). His *Letters* to Dwight were pub. in 1898, and his

Orations and Addresses in 1893-94. See life by E. Cary, 1894.

Curtis, Sir Roger (1746-1816), Brit. admiral, b. at Downton in Wiltshire. He entered the navy in 1762, and as a lieutenant was sent out to Newfoundland in 1771. In 1771 he served on the flagship under Lord Howe, and in 1780 commanded the *Brilliant* at the siege of Gibraltar. He took part, under Howe, at the action of the 'glorious 1st of June', 1794, was sent home with the dispatches, and in July was raised to the rank of rear-admiral, and was created a baronet. In 1798 he joined Lord St. Vincent at Cadiz, and in the following year became commander-in-chief at the Cape of Good Hope. He was made admiral in 1804, commander-in-chief at Portsmouth in 1809 and G.C.B. in 1815.

Curtius (Quintus Curtius Rufus), Rom. historian who probably lived towards the end of the first century A.D. He wrote a hist. of Alexander the Great, *Historia Alexandri Magni*, in ten books, of which the first two and portions of others are lost. The first ed. was pub. about 1471 at Venice. There is an Eng. trans. by P. Pratt (1821). The best modern eds. are those of Vogel (1884) and Dosses (1887); Ger. trans. by W. Felsing (1929).

Curtius, Ernst (1814-96), Ger. archaeologist, b. at Lübeck. He became prof. of archaeology and philology at Göttingen (1856-63), and of anct. hist. at Berlin, 1868. C. superintended the Ger. excavations at Olympia. His writings include *Peloponnesos* (1851-52), *Griechische Geschichte* (1857-61); and *Allische Studien* (1863-64). *Consult* L. Gurlitt, *Erinnerungen an Ernst Curtius*, 1902; and F. Curtius, *Ernst Curtius, ein Lebensbild*, 1903.

Curtius, Georg (1820-85), Ger. philologist, brother of Ernst C., b. at Lübeck. His books on comparative philology are standard works on the subject. His chief pub. are *Griechische Schulgrammatik* (1852); *Grundzüge der Griechischen Etymologie* (1858-62); and *Das Verbum der Griechischen Sprache* (1873-76).

Curtius, Mettius, distinguished Sabine. The legend goes that in B.C. 362 the earth in the forum gave way, and a great chasm appeared, which the soothsayers declared could only be filled up by throwing into it Rome's greatest treasure; that thereupon C., a noble youth, mounted his steed in full armour, and declaring that Rome possessed no greater treasure than a brave and gallant citizen, leaped into the abyss, upon which the earth closed over him.

Curule Chair (Lat. *sella curulis*), throne or seat of honour of the old Rom. kings. Later dictators, consuls, praetors, curule ediles, and magistrates, with senatorial rank, might use this chair on certain public occasions. It was made like a folding-stool, with curved legs, and was ornamented with gold, silver, or enamel.

Curvature, Circle of, see CIRCLE.

Curvature of the Spine, see SPINE.

Curve, line which is continuously changing its direction. It is described by a point moving under some given

conditions, and curves can therefore be denominated and classified by naming those conditions. For instance, a circle is a C. formed by a point moving at a constant distance from a fixed point. Other well-known Cs. are the ellipse, parabola, and hyperbola (q.v.), which, when referred to cartesian co-ordinates, involve equations of the second power. If an inelastic thread is made to coincide with a C. and is then uncoiled while being kept tense, its extremity forms a C. which is called the *involute* of the original C.

constructed a cycloidal pendulum in which the bob was made to describe a cycloid; such a pendulum has exactly the same period of oscillation for all amplitudes. Another famous special curve is the *catenary*, or the curve in which a heavy, uniform, perfectly flexible, and inextensible chain would hang when supported at its two ends. The thread of a screw forms the curve known as the *helix*; the *caustic curve* is seen every day when light is reflected by the sides of a tea-cup, while the *sine curve* is of special

CURZOLA

Yugoslav Embassy

The term *evolute* is applied to the original C. with respect to the involute as given C. In another aspect the evolute may be defined as the locus of the centres of curvature of the given C.

Curved Space, logical sequence of the theory of relativity.

Curves (Special). The properties of a large number both of two-dimensional and three-dimensional C. that are not so familiar as the circle, ellipse, etc., have been investigated in detail, and such C. are included under the title of special C. The *cycloid* is a very familiar special curve; it is traced out by a point on the rim of a circle (or wheel) rolling along a straight line. Its interest lies in the fact that it is the *brachistochrone* or curve of quickest descent under the action of gravity from one given point to another given point. Again in 1673 Huygens

importance not only in alternating current engineering, but also in the theory of light and sound. For a discussion of special C. in general, together with their properties, and the manner in which they can best be drawn, see J. Edwards, *The Differential Calculus*.

Curwen, John (1816-80), Eng. writer on music, b. at Heckmondwike, Yorkshire. He developed and improved the 'tonic sol-fa' system, invented by Sarah Glover. He founded the Tonic Sol-fa College at Plaistow in Essex (1875), and started a publishing house in London, which brought out his *Tonic Sol-fa Reporter*. His other writings include *Grammar of Vocal Music* (1843) and *People's Service of Song* (1850).

Curzola (anc. *Coreyra Nigra*, Serbo-Croatian *Korčula*): 1. Is. in the Adriatic, forming a part of Dalmatia and belonging

to Yugoslavia. Area 100 sq. m. Pop. 28,000. 2. Chief tn. of the above, on a rocky promontory on the E. coast. A strongly fortified port and an episcopal see. It has an anct. church (once a cathedral) and a Franciscan monastery of the fifteenth century with a superb Venetian-Gothic cloister. C. was ruled by the Venetians from 998 until in the twelfth century it was taken in succession by the Hungarians and Genoans, to return to Venice in 1420. During the Napoleonic wars it fell at different times into the hands of the Russians, Fr., and Brit., and was ceded to Austria in 1815 and to Yugoslavia after the First World War.

Curzon, George Nathaniel (first Marquess Curzon of Kedleston) (1859-1925), Eng. statesman, the eldest son of the fourth Baron Scarsdale. He was b. Jan. 11, at Kedleston, Derbyshire. Educated at Balliol College, Oxford. In 1883 he failed to obtain a Balliol scholarship—probably through lack of systematic application. In 1885 he became private secretary to the marquess of Salisbury. He entered Parliament as Conservative member for Southport the following year, and retained his seat till 1898. He was under-secretary of state for India (1891-1892); and, on the return of Salisbury to office in 1895, he became under-secretary for foreign affairs, which appointment he held till 1898. In that year he went out to India, viceroy and governor-general, as first Baron C. of Kedleston in the peerage of Ireland. Lord C. worked with untiring energy for the interests of the natives of India; and, though his tenure of office was completed in Aug. 1903, it was extended in order that he might carry out his schemes for reform. His autocratic disposition was not infrequently the subject of criticism, and in 1905 the partition of Bengal made him unpopular with the natives. In the same year Lord Kitchener, commander-in-chief of the forces, objected to the dual control, civil and military, in the Indian Army; and, though his view was opposed by Lord C., the gov. at home supported Lord Kitchener. This led to Lord C.'s resignation on Aug. 12, 1905. On his return to England he became a prominent member of the Opposition under the leadership of Balfour and afterwards of Bonar Law. He was refused a peerage of the United Kingdom by Campbell-Bannerman. He was elected chancellor of Oxford Univ. in 1907, and lord rector of Glasgow in 1908. In the latter year he was elected to the House of Lords as an Irish representative peer. He supported the policy of Lord Lansdowne in allowing the Parliament Bill to pass in 1911. In that year he was made Earl C. of Kedleston, Viscount Scarsdale, and Baron Ravensdale. He thus became a peer of the United Kingdom. Early in the First World War he spoke on many platforms in support of recruiting. In May 1915 he became lord privy seal in Asquith's reconstructed ministry, a member of the war committee and president of the air board. In Dec. 1916, on the formation of the Lloyd

George Gov., he became lord president of the council, leader of the House of Lords, and member of the War Cabinet. In Oct. 1919 he succeeded Balfour as foreign secretary; and he remained so under Bonar Law and Baldwin. In 1922-23 he was at Lausanne to negotiate peace with Turkey. In Aug. 1923 he sent a blatantly undiplomatic note to France about the Ruhr occupation. He retired at the beginning of 1924, having earned the reputation of being a great viceroy, a great foreign secretary, and one of the finest orators of his times. His father's barony and baronetcy had devolved on him in 1916; and on June 28, 1921, he had been created marquess. That year he received the Garter. He took great interest in architecture; all the old buildings that came into his custody were the subject of his closest care, e.g. Tattershall Castle, Lincolnshire; Bodiam Castle, Sussex; and Montacute House, Somerset. His manners and his outlook on life were more appropriate to the eighteenth than to the twentieth century; the former were so magnificent that his colleagues alluded to him as 'the purple emperor.' He was twice married—first to a Miss Leiter of U.S.A. (d. 1906), second (1917) to the widow of Alfred Duggan of Buenos Aires. By the former he had three daughters—the second of whom was Lady Cynthia Mosley. All his life he had been subject to attacks of a spinal complaint, which often disabled him and caused him acute pain. He d. after an operation on March 9, 1925, at his London house, Carlton House Terrace. He left no male issue to succeed him in the marquessate. His viceregal speeches, *Lord Curzon in India*, were pub. in 1906. He had travelled widely in the E., and many of his writings concern his experiences there. Pubs.: *Russia in Central Asia* (1889); *Persia and the Persian Question* (1892); *Problems of the Far East* (1894); *Principles and Methods of University Reform* (1909); *Modern Parliamentary Eloquence* (1913); *War Poems and other Translations* (1915); *Subjects of the Day* (1915); and *Tales of Travel* (1923). See Lord Ronaldshay (Marquess of Zetland), *The Life of Lord Curzon*, 1927-28; and H. Nicolson, *Curzon, The Last Phase*, 1931.

Curzon Line, proposed E. frontier of Poland recognised by the Allies in Dec. 1919 on suggestions by Lord Curzon (q.v.), but not adopted as a boundary between Poland and Russia in consequence of the former's victory over the latter in 1920. The line ran N. from the old frontier of Russia and Austria-Hungary to Brest-Litovsk, then by the course of the R. Bug to Namirov, Jalkova, and Grodno. The line became a reality as Poland's E. frontier in 1945, having been accepted as the future demarcation at the Teheran Conference in 1943 by Russia, Great Britain, and U.S.A. See also POLAND.

Cusa, Nikolaus of, or Nikolaus Cusanus (1401-61), proper name of Chryffs, a Ger. cardinal and philosopher, b. at Kuos (or Cues) on the R. Moselle, in the diocese of Trèves, of humble origin. He was educated

at the univ. of Padua and became arch-deacon of Liège and sat in the council of Basle (1431-49). For the council he wrote *De Concordantia Catholica*, opposing the papal claims, but in 1440 he changed his views, entered the papal service, and was made a cardinal in 1448. Two years later he was consecrated bishop of Brixen in the Tyrol and papal legate for Germany. C. broke away from the prevailing scolasticism and indulged in mystical speculations which have been described as pantheistic—unjustly, however, for while asserting that the Spirit of God breathed over the world, he adds that the Divine Being never became part of the world. He was also a mathematician and believed in the revolution of the earth round the sun. In 1436 he suggested the reform of the Julian calendar. Consult F. A. Scharpf, *Der Cardinal und Bischof Nikolaus von Cusa*, 1871; Schang, *Cardinal Nikolaus von Cusa als Mathematiker*, 1872; J. Lanz, *Die Docta Ignorantia des Nikolaus von Cues*, 1923; and G. Kallen, *Nicolaus von Cues als politischer Erzieher*, 1941.

Cusco-China, bark of the *Cinchona pubescens*, which grows in Cuzco, Peru. It contains an alkaloid called cuscochinoline, or cusconine. When applied medicinally it excites warmth, and is therefore recommended in cold, intermittent, and typhoid states.

Cuscus, or **Phalanger**, genus of marsupials. There are five species, all of which are about the size of a cat, and these inhabit Australia and the E. Indies. They have a prehensile tail, an opposable big toe, and in habit they are arboreal. *C. (or P.) maculatus* is known as the spotted C. or tiger cat; *C. ursinus* and *C. celebensis* are natives of the Celebes.

Cush (Heb. *Kūsh*), according to the genealogy in Gen. x., the eldest son of Ham, and the eponymous ancestor of the Cushites.

Cushat (*Columba palumbus*), known also as the Ring Dove, or Wood Pigeon, member of the sub-family of the Columbine, family of the Columbidae. It receives one of its names from the white patches forming a ring round its neck. It is distributed throughout the Palaearctic region, and has recently multiplied greatly in Britain. Besides the white neck patches, it has also a white wing-bar. The eggs are white, the number being usually two.

Cushendun, Ronald John McNeill (1861-1934), first Baron, Brit. statesman; son of Edmund McNeill, of Craigdun and C., co. Antrim; descended from Torquill, chief of clan Neill in early part of fifteenth century. Educated at Harrow and Christ Church, Oxford; graduated 1884. Called to Bar, 1888. Assistant editor *St. James's Gazette*, 1899; editor, 1900-4. Assisted in preparation of 11th ed. of *Ency. Brit.*, 1906-11. After various unsuccessful attempts was elected M.P. (Conservative) for St. Augustine div. of Kent, 1911-18; for Canterbury div., 1918-27. Strongly supported Ulster's pre-war preparations against Home Rule. In Baldwin administrations parl. under-secretary for foreign

affairs, 1922-24 and 1924-25; financial secretary to Treasury, 1925-27. Ennobled Nov. 7, 1927. Chancellor of the duchy of Lancaster, 1927-29; acting foreign secretary (during illness of Sir A. Chamberlain), Aug.-Dec. 1928; signed Kellogg Pact. Pubs.: *Home Rule: its History and Danger* (1907); *Socialism (in The New Order)* (1908); *History of Australia and New Zealand (Historians' History of the World)*, (1908); and *Ulster's Stand for Union* (1922).

Cushing, Caleb (1800-79), Amer. politician, b. at Salisbury in Massachusetts and educated at Harvard. He was called to the Bar in 1822 and practised at Newburyport. He contributed legal articles to the *North American Review*, and in 1825 was elected to the state legislature, and in the following year to the state senate. He was elected to Congress in 1835, and under the presidency of Tyler became the first Amer. minister plenipotentiary to China. In this capacity he made a treaty between his own country and China in 1844, which opened up China to Amer. missionaries. From 1874 to 1877 he acted as the United States ambas. in Spain. Author of *The Practical Principles of Political Economy* (1826); *Historical and Political Review of the Revolution in France* (1833); *Reminiscences of Spain* (1833); *The Growth and Territorial Progress of the United States* (1839). Consult Livingston, *Portraits of Eminent Americans*, 1851.

Cushing, Harvey Williams (1869-1939), Amer. surgeon, b. in Cleveland, Ohio, son of Henry Kirke C., a physician and son and grandson of physicians. Educated at Yale (graduated 1891) and Harvard (A.M. and M.D. 1895). Began practice in 1895. Associate prof. of surgery at Johns Hopkins Univ., 1902-11; also pursued study abroad, at Berne and Liverpool. From 1911 prof. of surgery at Harvard. From May 1917 till March 1919 he was in France; director, U.S.A., Base Hospital No. 5 attached to Brit. expeditionary force; senior consultant in neurological surgery to Amer. expeditionary force, 1918; colonel, Medical Corps, U.S.A. (D.S.M., U.S.). He was responsible for some outstanding advances in the field of nerve and brain surgery. He bequeathed his great collection of old medical works to Yale Univ. Author of sev. medical works and *The Life of Sir William Osler* (1925).

Cushing, city in Payne co., Oklahoma, U.S.A., in a cotton and oil producing country. Pop. 7700.

Cushman, Charlotte Saunders (1816-76), celebrated Amer. actress, b. at Boston, of Puritan descent. She made her debut as an opera singer in 1834 in *The Marriage of Figaro*, but her voice suddenly failed, and in the following year she appeared as Lady Macbeth, to the end of her life her greatest role. She played in comedy parts, but excelled mainly in tragedy. In 1844 she made a successful tour through the N. Amer. States with Macready, and afterwards appeared in London and Rome. Her chief parts, besides Lady Macbeth, were Romeo

Rosalind, Meg Merrilees, and Ophella. See E. Stebbins, *Charlotte Cushman: Her Letters and Memories of Her Life*, 1878; and O. E. Clement, *Charlotte Cushman*, 1882.

Cusp, term applied to the foliated points which terminate the internal curves of the trefolled, cinquefolled, etc., heads of pointed arch windows.

Cusset, tn. of France in the dept. of Allier and the arron. of Vichy, 30 m. S.E. of Moulins. It is noted for its mineral springs, also for manuf. of linen, paper, and basket work. Pop. 8700.

Custard-apple, or **Bullock's Heart**, popular name of the species of Anonaceæ technically known as *Anona reticulata*. The plant is a native of tropical America and is allied to the Cherimoyer (*q.v.*). See ANONA ACERÆ.

CUSTARD-APPLE

Custer, George Armstrong (1839-76), Amer. soldier, b. in New Rumley, Ohio, U.S.A. He fought with distinction through the Civil war, serving successively under Kearny and McClellan. As major-general of the volunteers he defeated Gen. Early at Waynesboro in 1864. In 1867-68 he took part in Hancock's expedition against the Cheyennes. He sev. times defeated other hostile Indians in the W., and was finally killed with his men by a body of Sioux near the Little Big Horn in Montana. He wrote *My Life on the Plains* (1874). See F. W. Whittaker, *Life of General George A. Custer*, 1876; Mrs. Custer, *Boots and Saddles, or Life with General Custer in Dakota*, 1885; F. S. Dellenbaugh, *George Armstrong Custer*, 1917; and P. E. Byre, *Soldiers of the Plains*, 1926.

Customs or Usages. In a general sense, C. or U. may be said to be the source or basis of all principles of law. In England C. or U. are said to be either general or local; the former have prevailed from time immemorial, and form the foundations of the common law, while the latter are peculiar to certain dists. only, and in their nature form exceptions to common law principles. The 'Law Merchant,' or C. of merchants, furnished an instance of local or particular C., but by reason of the subsequent universality

of their application gradually became engrafted into the common laws. To be valid C. or U. must have existed from time immemorial (the time of legal memory is fixed as not going beyond 1189). In addition, they must be shown to have been continuous; universally acquiesced in; reasonable, i.e. not contrary to any known principle of law or public morality; definite; and in the opinion of those among whom the custom is alleged to exist, binding. See also COMMON LAW.

Customs Duties consist for the most part of taxes levied upon goods and produce brought for consumption from foreign countries, but may include taxes on certain exports. The term also embraces taxes on goods and produce passing from one port to another of the same country, like the Fr. *octroi* system. At the present time there is no duty on goods exported from the United Kingdom, that on coal, which was the last maintained, having been abolished in 1845, though for a short period, 1902-6, there was a small impost of 1s. a ton on coal to help meet the cost of the Boer war. C. D. furnish an example of indirect taxation, that is, they are taxes which, according to Adam Smith, are demanded from one person in the expectation and intention that he shall indemnify himself at the expense of another. The incidence of such taxation is borne by the person out of whose pocket the tax really comes. Historically C. D. sprang from the royal prerogative of regulating all commercial matters, and the liability of imports to a charge levied by the king is of very remote date. According to Sir Wm. Anson, customs originated in a charge intended by way of repayment to the king for the cost incurred in maintaining the ports and keeping the sea clear from pirates. Later on the charges were increased and embraced prisage, i.e. the royal right to one cask of wine out of every ten in the ship's cargo, at 20s. a cask; customs on general merchandise; and on wool, fish, salt, and leather. Then merchants began to complain of the levy of 'evil toll-' with the result that by Magna Charta they were to be allowed to trade without being subject to any but 'ancient and lawful customs.' In 1275 Edward I. by a statute which was probably the earliest passed in the United Kingdom whereby the Crown was authorised to levy C. D., was granted in exchange for the 'ancient and lawful customs' (*antiqua custuma*) of the charter an export duty of half a mark on every sack of wool, and one mark on the last of leather. By the *Confirmatio Cartarum*, 1297, these duties were excluded from the express surrender by the king of the right to impose arbitrary customs. In 1303, by the *Carta Mercatoria*, foreign merchants were charged forty pence on every sack of wool and half a mark on the last of leather in consideration of certain privileges. This charge was known as the *nova custuma*, and was refused by the representatives of the burgesses (*q.v.*). The *antiqua* and *nova custuma* remained,

however, together with *prisage* and *butlerage* upon imported wines, a part of the hereditary revenues of the Crown until their absorption in the subsidies of tonnage and poundage made to the Crown at the beginning of each reign or Parliament. The mode long employed in the collection of these duties was to affix a certain rate of value upon each kind or article of merchandise and to grant what was called a *subsidy* upon these rates. The word *tonnage* in the early statutes was applied to a specific duty charged on the importation of each ton or tun of wine and the exportation of each tun of beer; the word *poundage* was applied to other articles valued in the mode above mentioned. James I. made unconstitutional and illegal impositions, and in 1608 issued a Book of Rates imposing a number of new and heavy duties. Years of bitter controversy followed, and the resistance of the merchant *Bate* to the imposition of the added duty on currants and the judgment by *servile* judges of the Court of Exchequer in favour of the Crown form an epoch in the constitutional hist. of the United Kingdom, and confirm the celebrated aphorism of Hallam that our liberties were purchased by the money of our forefathers. The Petition of Right, 1628, declared these impositions illegal. The first Book of Rates agreed upon by the House of Commons is generally believed to be that compiled in 1612 by a committee of the House. In 1660, at the restoration of Charles II., the C. D. were consolidated and the principle of poundage was altered in regard to certain articles, upon which specific duties were imposed instead; but the old system of affixing a certain value on each article was adhered to in regard to the bulk of the articles, the time-honoured distinctions between *antigua* and *nova custuma* were abolished, and rates were classified under three heads, viz. tonnage on wine, poundage on imported and exported goods, and a duty on woollen cloth, which last duty was repealed in 1700. In the reigns of William III. and Anne many additional specific rates were imposed in place of the valuation for the subsidy. This course of substitution was pursued from time to time, until in 1747 there were as many as thirty-nine prin. branches of C. D. with subdivisions applying to different kinds of goods, the whole constituting an endless embarrassment to traders. In 1787 Pitt effected a new consolidation of C. D., and the entire revenue derived therefrom was to be paid into a single fund, called the Consolidated Fund, thus doing away with the old practice of allocating each duty to a specific service or particular public purpose. Sev. Consolidation Acts have been passed since that time, and new imposts created. In 1853 the solicitor for the customs was employed on a work of complete consolidation. The result of his labours was a condensation of the various acts into a clear methodical arrangement which formed the basis of the Customs Consolidation Act of

1853.* Under that Act provision was made for the first time for the acceptance of general or covering bonds in lieu of the immense number of separate or special bonds, which previously involved many thousand attendances per annum of merchants and their sureties. Between 1842 and 1853, however, a salutary change had come over the financial policy of the United Kingdom. With the advent of Peel came the intimation of the policy that was carried on by Gladstone and other statesmen after him, and which is in substance the fiscal policy of the country up to the year 1932, when a protective tariff was introduced. That policy, which was twofold, was directed to the simplification and cheapening of the collection of revenue by means of a reduction of the number of articles or commodities on which duty is leviable; to the strengthening of the home industries by the abandonment of all taxes on raw material imported into the country. By about 1872 all foreign products were free from duty on importation, with the exception of ten leading articles, comprising cocoa, coffee, currants, figs, raisins, spirits, sugar, tea, tobacco, and wine—and even these were allowed very considerable reductions. Until 1869 corn and flour contributed to the revenue at nominal rates, corn at 3*d.* and flour at 4*d.* per cwt. After 1869 both were admitted free, and it is hardly an exaggeration to say that the decision of the electorate in favour of the maintenance of a free trade policy was a decision due as much to fear that some corn duty might be imposed as to the fear that food prices would rise as an indirect result of tariffs proposed on imported manufactured articles. The management and collection of C. D. are committed by the Customs Consolidation Act of 1876 to a board of five commissioners, subject to the authority of the Treasury, each of whom holds office during the royal pleasure. In the Finance Act of 1925, Mr. Winston Churchill, as chancellor of the exchequer, imposed various new duties which were much criticised by free traders. A duty equal to 33½ per cent *ad valorem* was imposed on motor cars, motor bicycles, motor tricycles, with their component parts other than tyres; musical instruments, including gramophones, pianolas, and similar instruments, clocks and watches, with component parts, imported into Great Britain or N. Ireland, and by the same Act a customs duty equal to 33½ per cent of the value of the imports was also imposed for five years on numerous other manufs. The 1925 Finance Act was also noteworthy for introducing a measure of empire preference in respect of sugar, molasses, glucose, and saccharin produced within the Empire. Preferential rates of duty were fixed at three-quarters of the full rate on tobacco; at five-sixths of the full rate on silk and artificial silk, and so on. A fundamental change was introduced by the National Gov. of 1931, which, soon after coming into office, passed emer-

agency legislation to check dumping in anticipation of its projected reversion to protection. Under the Abnormal Importations (Customs Duties) Act, 1931, the Board of Trade was empowered to levy C. D. up to 100 per cent *ad valorem* on foreign manu. imported into the United Kingdom in abnormal quantities. The Act was to continue in force for only six months, but that interval was sufficient to allow the passing of the Import Duties Act, Feb. 29, 1932, which provided for the imposition of a general *ad valorem* duty of 10 per cent on all imports (except those already dutiable) subject to a free list, comprising chiefly foodstuffs and raw materials. This free list is, however, subject to amendment by Order in Council. The Act also provided for the imposition of 'additional duties' (i.e. over and above the general *ad valorem* duty) on articles of luxury. The principle of empire preference was followed by exempting dominion goods and the goods of the colonial empire absolutely.

The following table gives under various headings against respective years certain receipts from customs. The last column refers to Ottawa duties, i.e. the duties imposed on foreign goods as the result of the Imperial Economic Conference held in Ottawa in July-Aug. 1932 (see OTTAWA CONFERENCE). The resultant Act of Parliament confirmed the various agreements made with the dominions. Net receipts from C. D. for the year ending March 31 were £620,823,504 (1947) and £773,323,000 (1948). Duties on certain imports from Euro were: 1932-33, £2,515,000; 1933-34, £1,555,000; 1934-35, £4,695,000; 1935-36, £5,423,000; 1936-37, £4,712,000; 1937-38, £4,182,000; and 1938-39, £325,700.

and legal proceedings, civil or criminal, under the various Customs Acts. A drawback is an allowance made by the commissioners to merchants on the re-exportation of certain imported goods liable to duties, which allowance in some cases consists of the whole, in others of a part, of the C. D., which has been paid upon the importation. The effect is that goods can then be sold in a foreign market at their normal cost in the home market.

Customs Union, denotes a federation of independent states or nations with the object of assimilating their respective arrangements for the collection of duties on imports. The term was of especial significance in relation to Germany, for it may be said that the consciousness of a national unity among the different Ger. peoples was ultimately traceable to the estab. of the Zollverein (Zoll, toll; verein, union) between Prussia and some of the smaller states shortly after the Napoleonic wars. The political condition of the numerous petty Ger. sovereign states was then one of entire confusion. The Zollverein was organised as the outcome of a general reform of the existing tariff conditions, which imposed tariffs on no fewer than 2800 classes of goods in various parts of Prussia, while in others there prevailed a system of free importation. From the time Hesse joined the union in 1828 the hist. of the Zollverein down to 1871 was one continuous process of an absorption of one state after another until, in that year, the Ger. Empire itself was founded, and the Prussian Zollverein was finally transformed into the Ger. Zollverein. Hamburg and Bremen were included in 1888; prior to that time Germany's economic policy

Yr. en'd Mar. 31	Spirits	Sugar	Tobacco and Snuff	Wine	Tea	Oil	Imports Duty Act, 1932	Ottawa Duties

The Customs Consolidation Act, 1876, which, with the various amending Acts passed since that time, may be regarded as the prin. statute relating to C. D., contains a great number of provisions dealing in detail with the collection and management of duties; disputes and inquiries respecting C. D.; drawbacks; bonds and securities entered into by persons for the due performance of any condition relative to the customs, penalties for signing false declarations relating to the customs; prevention of smuggling;

had been one of free trade, but in that year was introduced a hard and fast protective system which, with subsequent modifications in the shape of commercial treaties (q.v.) with some of the neighbouring nations and most favoured nation treatment for Great Britain, continued until recent years. A somewhat parallel case is the development of the C. U. which was formed between Cape Colony, the Orange Free State, and Brit. Bechuanaland towards the end of last century, and which was joined shortly afterwards by

Rasutoland. The question of the adoption of some kind of C. U. or Zollverein for the different members of the Brit. Empire was before the Brit. public in a more or less urgent form from the time of the vigorous tariff reform campaign undertaken by Joseph Chamberlain in the autumn of 1903. But the proposals put forward by the dominion premiers at the Imperial Conference, 1930, for the imposition of a tariff on foreign foodstuffs were rejected by the Labour Gov. in London. A great impetus to what was in effect a C. U. of the Brit. Commonwealth of Nations was given by the combined operation of the Import Duties Act, 1932, and the Ottawa Trade Agreements concluded in Aug. 1932, between the United Kingdom and the dominion govts. and between the dominion govts. *inter se*. A C. U. has existed between Belgium and Luxembourg since 1922, with the exception of five years during the Second World War. The Netherlands on the one hand, and Belgium and Luxembourg on the other, agreed on a C. U. on Sept. 5, 1944, and this was brought into force, with certain reservations, on Jan. 1, 1948 (see *BENELEX*).

Custos Brevium. Offices so called existed until 1831, both in the court of king's bench and the court of common pleas. The duties appertaining to the office, which were always performed by deputy, were to take custody of all writs returnable to the above courts, and to file them.

Custos Rotulorum (Keeper of the Rolls), in England a justice of the peace to whose custody are committed the records or rolls of the co. sessions. It is the practice to appoint as C. R. the lord-lieutenant of the co.

Custoza, or Custoza, vil. of Italy, about 11 m. S.W. of Verona, the scene of two important battles in It. hist. Here in 1848 the Austrians, led by Radetzky, defeated Albert, king of Sardinia, and in 1866 the It. troops, under Lamarmora, were defeated by the Austrians. Pop. 700.

Cutch, or Kaoh; 1. Native state in Gujrat, Bombay, in the dominion of India. It is a peninsula, bounded on the N. by the Rann of C., on the W. by the Indus and Arabian Sea, on the S. by the Indian Ocean and gulf of C. It is crossed by two ranges of hills. Mineral products are coal, iron, alum, and salt. Wheat, millet, and cotton are grown, but cultivation is dependent on artificial irrigation. Volcanic eruptions and earthquake shocks are of frequent occurrence. The ruler is called the Maha Ras. Cap., Bhuji. Area, excluding the Rann, 6500 sq. m. Pop. 514,000. **2.** Rann or Rann of C., a salt morass on the N. of the state of C. During the S.W. monsoon it fills and becomes an arm of the sea. In the dry season it is divided into two shallow lakes, the smaller, on the E., having an area of 2000 sq. m., and the Great Rann on the W. an area of 7,000 sq. m. Wild asses are found on the shores of the lakes and swarms of flies. The Indian gov. is planning a new port at Kandla on the S. coast of the is. of C.

Cuthbert, St., of Durham (c. 635-87), was b. probably in Northumbria, of Lowland Scottish parentage, and originally a shepherd. In 651 he had a vision of a choir of angels bearing the soul of St. Aidan to heaven, and in the same year joined the monastery of Old Melrose. On the death of St. Boisil, in 661, he was chosen prior, with St. Eata as his abbot, whom he later accompanied to the monastery of Lindisfarne. In 676 he felt that he was called to a sterner and simpler life, and became a hermit on House Is. off Farne Is., where he built his hut with his own hands. Egfrid, king of Northumbria, and Trumwin, bishop of the Picts, persuaded him, in 684, to accept the bishopric of Hexham, which he subsequently exchanged for that of Lindisfarne. Two years later he resigned his bishopric, and once again withdrew to his cell, where he d. within a year. His body was removed from Lindisfarne in 875 for fear of its being desecrated by the Danes, and for a time remained first at Chester-le-Street and then at Ripon, ultimately finding its resting-place in Durham Sept. 4 was commemorated as the anniversary of his death. See Bede, *Historia Ecclesiastica Gentis Anglorum*, and lives by T. Raine, 1828, and C. Eyre, 1849.

Cuticle, see SKIN.

Cutler, Manasseh (1742-1823), Amer. clergyman, who acted as chaplain during War of Independence to Col. Ebenezer Francis. He took a leading part in drafting the ordinance of 1787 for the gov. of the N.W. Ter.

Cutlery (O.F. *cutellier*, Lat. *cutellus*, a little knife), term applied originally to cutting instruments of all kinds. The word is often extended to include all kinds of table implements, so that forks may be included, but has also been restricted in its application, so that the larger kinds of cutting instruments, such as chisels and saws, are excluded from its sense. Knives were not placed on the table till the early sixteenth century, diners being expected to carry on their persons such pocket-knives as they might require. Forks were introduced from Italy in the reign of James I. Sheffield was famous for its C. as early as the fourteenth century, but lost some of its pre-eminence by the seventeenth century, when Birmingham was regarded as the centre of the trade. But since 1800 Sheffield has increased in industrial prosperity, and its C. wares have now a world-wide fame. The term C. also applies to penknives, razors, scissors, to carpenters' tools, sickles, special surgical instruments, and to swords and rapiers, all of which see under separate articles.

Cuttaok, dist. in the prov. of Orissa, India, with an area of 3517 sq. m. It is watered by the Braminy, Mahanuddy, Coyle, and other rivs., all teeming with fish. Near the coast are hills covered with teak and other timber. Rice, pulse, and sugar are cultivated in the lowlands, and wheat and maize on the uplands. The city of C. is noted for its gold and silver filigree work. There is a college, medical school, and school of engineering.

and a fine gateway of a ruined fort. Pop. 51,000.

Cutter, Charles Ammi, Amer. librarian (1837-1903), b. at Boston, Massachusetts, originator of the dictionary catalogue, and of the widely used system of library book classification, known as expansive classification. See CATALOGUES AND CATALOGUING.

Cutter, name given to a small vessel, part of the equipment of a warship. They are used for sailing or rowing, and are carried amidships or at the davits. It is also used of a vessel with a single mast, a mainsail, a fore-staysail, and a jib at the bowsprit end.

Brest (1694), Namur (1695), at the capture of Fort St. Michael (1702), and was third in command at Blenheim (1704). C. sat in Parliament for sev. years, from 1689 to 1691, and again from 1702 to 1707. Besides being a gallant soldier, he was a scholar and a graceful versifier. His works include *La Muse de Cavalier* (1685); *Poetical Exercises written upon Several Occasions* (1687); and a 'monody' in *State Poems* (p. 199) on the death of Queen Mary (1695). He was a friend of Steele, who addressed to him his *Christian Hero*, but was made ruthless fun of by Swift, particularly in his somewhat scurrilous lampoon, *Ode to a Salamander*

THE 'CUTTY SARK' AT FALMOUTH

Brush Railway

Cuttle-fish, sometimes regarded as the name of any mollusc of the class Cephalopoda (q.v.), but is more usually applied to the species of the genus *Sepia*. The species, of which *S. officinalis*, the common C. of Britain, is an example, have two gills, eight arms, and two long tentacles, a broad and flattened body, an ink-bag, narrow and elongated fins, and the calcareous shell, called the cuttlebone, is internal. In length a C. may be from 6 to 10 in., and its colour varies from grey to brown. The genus is widely distributed and is notable as producing the pigment known as sepia.

Cutts, John, Baron Cutts of Gowran, Ireland (1661-1707), Brit. Lieutenant-general, was probably b. at Arkesden in Essex. He was educated at Catherine Hall, Cambridge, and joined the suite of the duke of Monmouth. He later served under Charles, duke of Lorraine, against the Turks, in Hungary, and in 1686 played a prominent part in the capture of Buda. He then served in Holland under William of Orange, whom he accompanied to England and with whom he fought in Ireland at the battle of the Boyne and the siege of Limerick (1690). For his services he was created Baron C. of Gowran. During the following twelve years he did brilliant service, being present at the battles of Steenkerque (1692),

(1703). See Macaulay, *History of England*, vols. iii. and iv., and S. S. Swartley, *The Life and Poetry of John Cutts*, 1917.

'Cutty Sark,' one of the most famous of the tea-clippers, which, with the *Flying Cloud*, *Ariel*, and others, was engaged in the China tea trade during the last century. One of the very few such ships still in existence, for many years afloat and preserved at Falmouth. John Massfield wrote a novel on the thrilling race sailed by these clippers. See also CLIPPER.

Cutworm, name given to the larvae of many species of Noctuidæ, or owl-moths from their displeasing habit of cutting off the young shoots of plants cultivated by agriculturists. They belong to the genus *Agrotis*, and are allied to the army-worm and cotton-worm. *A. messoria* is a common species in America.

Cuvier, Georges Léopold Chrétien Frédéric Dagobert, Baron (1769-1832), Fr. anatomist and naturalist, writer, and educational reformer, b. at Montbéliard, Doubs, France, then under the rule of the king of Württemberg. He studied at the Carolinian Academy at Stuttgart, where he distinguished himself in every branch of study. At the age of nineteen he became tutor to the only son of Count d'Hercy near Caen, where he was enabled to study the animals and fossils of the shore and rocks. It was here that he

pursued the researches which enabled him to reorganise the classification of invertebrate animals. In 1795 he went to Paris, and by the exertions of his friends, Tessier and Geoffroy St. Hilaire, became prof. at the Jardin des Plantes. In 1798 he began to publish his papers on the fossil bones of Montmartre, which led later to his great work, *Recherches sur les ossements fossiles des quadrupèdes* (1812). In 1800 was appointed prof. of natural hist. in the Collège de France. Here he came under the notice of Napoleon, who, struck by his administrative ability, appointed him one of the inspectors of the lycées in the prin. tns. of France, and later employed him in reorganising the

BARON CUVIER

educational institutions all over Europe, in N. Italy, Holland, and finally in Rome. In 1814 the emperor appointed him a councillor of state, which appointment was confirmed by Louis XVIII. In 1822 his services to the Protestant faith were acknowledged by his appointment as grand master of the faculties of Protestant theology in the Univ. of Paris. In 1832 Louis Philippe made him a peer, but he d. of paralysis the same year in Paris. In spite of the valuable results of his researches, C.'s mind was essentially cast in the mould of an older school. His method was to construct from facts or materials which he could himself observe; he had no patience with the speculative theories of his contemporaries, and was bitterly opposed to the dawning theory of evolution. In addition to the works already mentioned he wrote *Le Règne animal* (1816), a book which summarised his observations on the structure and habits of the animal kingdom, and was long the standard work on zoology; *Mémoire pour servir à l'histoire et à l'anatomie des mollusques* (1816), in which he followed out a classification of the

Mollusca, indicated by Adamson, founded upon the structure of the animal rather than the shell; *Rapport historique sur les sciences naturelles* (1789-1808); *Histoire naturelle des animaux* (1798); and many others. See H. D. de Blainville, *Cuvier et Geoffroy Saint-Hilaire*, 1890; and H. Dandín, *Cuvier et Lamarck*, 1926.

Cuxhaven, once fortified Ger. port, in the dist. of Stade, Hanover, on the S. shore of the estuary of the Elbe, 70 m. from Hamburg. The port was formerly only used for coasting vessels and fishing craft, but was rebuilt in 1892-95, and can now berth the largest ocean steamers. There are some fine fisheries and good sea-bathing. Pop. 26,200.

Cuyabá, cap. of the state of Matto Grosso in Brazil. In the dist. there are gold-mines, which have been worked since 1719. The traffic is chiefly in the exchange of gold for iron and other implements. The tn. is well built and has a military hospital, arsenal, palaces for the governor and the bishop, and collegiate schools. It is an important and rapidly developing distributing centre. The temp. varies between 106° and 39°. Pop. 44,000.

Cuyahoga Falls, city of Summit co., Ohio, with manufs. of iron and rubber goods, a suburb of Akron. Pop. 20,500.

Cuyapo, municipality of Nueva Ecija prov., Luzon, Philippine Is., growing rice. Pop. 20,000.

Cuyo, tn. and pueblo of the Philippines, cap. of the prov. of Paragua and Calamianes, on the S.W. shore of the is. of C. Pop. 13,000.

Cuyp, Aalbert, or Aelbert (1620-91), Dutch painter, b. at Dordrecht. He was the son of Jakob Gerritsz C., a portrait painter, with whom he began his study of painting. C.'s sunset pictures have been compared favourably with those of Claude. He painted, almost entirely, scenes of outdoor life—fields, camps, markets, and the like. His reputation has increased greatly since his death, England being among the first to recognise his genius. There are eight of his works in the National Gallery, London, and he is also represented in the Wallace collection and in Dublin and Dulwich. Among his best pictures are 'The Meuse near Dort' and 'Banks of a Lake.' See H. J. Buxton and E. J. Poynter, *German, Flemish, and Dutch Painters*, 1881, and T. Cole, *Old Dutch and Flemish Masters*, 1902.

Cuyp, Benjamin (1612-52), Dutch painter, an elder brother of Aalbert C. His landscape and biblical pictures show the influence of Rembrandt, and his familiar scenes that of Teniers. 'Joseph in Prison' and 'The Visit of the Magi' are among his best known works.

Cuypers, Petrus Josephus Hubertus (1827-1921), Dutch architect, b. at Roermond. He studied at the Academy of Antwerp, being a pupil of Viollet-le-Duc. A student of Gothic, to whom is due the revival of that style in Dutch Rom. Catholic churches. Architect of St. Jacob at The Hague, St. Barbara at Breda, St. Catherine at Eindhoven, Sacred Heart at Amsterdam, and St. Boniface at

Leeuwarden. He had charge of the restoration of the cathedral at Mainz; designed many tn. halls, besides the Rijksmuseum and the central railway station at Amsterdam.

Cuyuni, or **Cuyuwini**, riv. of Brit. Guiana; a trib. of the Essequibo. It is navigable for about 500 m. and has for one of its tribs. the gold-bearing Yuruari.

Cuzco: 1. Cap. of C., a div. of S. Peru, in a small valley 11,440 ft. above sea level and nearly enclosed by mts., 360 m. E.S.E. of Lima. It was the cap. of the Incas, and was captured by Pizarro in 1533, to be superseded later by Lima as the cap. of the Spaniards. One mile to the N.W. of the city, on the hill Sacsahuaman, are the ruins of a great fortress

was in London, where she appeared in Handel's It. Opera Company in 1722. Her jealousy was aroused by Faustina Bordoni (afterwards the wife of the composer Hasse), whom Handel engaged to sing in her place, with the result that she retired, and, on her marriage to Sandoni in 1727, returned to Vienna, where she sang at the court opera. She later went to Holland, and paid a second visit to London in 1748, but she had lost her voice and received no welcome. She d. in great misery and poverty at Bologna.

Cwmdu, par. of Glamorganshire, Wales, 6 m. N.W. of Bridgend; noted for its iron and coal-mines. Pop. 15,000.

Cyanamide, NH_2CN , is a white crystalline solid melting at 40°C . Its chief point

A VIEW OF CUZCO IN 1536

of the Incas. The chief buildings are the cathedral, the Dominican monastery and church (built on the foundations of the Inca sun temple of Coricancha), the univ. (1598), and a college of arts and sciences. The climate is cool and bracing, and the prin. products are wool, hides, cacao, rum, rubber, sugar, and gold. Indians furnish the chief market. Cotton and woollen goods, embroidery, gold and silver goods, and leather are manufactured. C. is connected with the coast and La Paz, the cap. of Bolivia, by a branch line from Juliaca on the Mollendo-Puno railway. The pop. of 40,000 is mainly Indian. 2. The dept. of C. is the second largest in Peru, and is mainly composed of mts. and forests. Cereals are grown in small quantities, and cattle and sheep are reared. Area, 55,176 sq. m. Pop. about 486,500. See Sir C. Markham, *The Incas of Peru*, 1910; Ena Dargam, *The Road to Cuzco*, 1948; and C. Sandeman, *A Wanderer in Inca Land*, 1948.

Cuzzoni, Francesca (1700-72). It. singer, b. in Parma. She was trained and made her debut in Italy, but her first success

of interest is its power of forming metallic derivatives in which the two hydrogen atoms are replaced by an atom, or atoms, of a metal. The prin. metallo C. is calcium C. or 'Kalkstickstoff', CaNCN , which is made by heating calcium carbide to a high temp. (about 1100°C .) in a current of nitrogen: $\text{CaC}_2 + \text{N}_2 = \text{CaNCN} + \text{C}$. The crude substance is black in colour, owing to its contamination with the carbon produced at the same time. It contains about 20 per cent of nitrogen, all of which is ultimately liberated as ammonia by the action of water. This reaction explains the use of calcium C. as a fertiliser, since the bacterial soil flora is able to convert the ammonia into nitrates, which are vital to plant growth. Agric. practice has shown that calcium C. is best adapted to soils that contain plenty of lime. Calcium C. is also used to some extent in the manuf. of ammonia for chemical purposes. In this case the calcium C. is decomposed by steam. It is further employed in the industrial preparation of other chemicals, e.g. urea and sodium cyanide, though its

agric. use is by far the most important. The conversion of atmospheric nitrogen into a nitrogenous compound, such as calcium C., is known as the *fixation* of nitrogen, and since natural supplies of nitrates (e.g. Chile salt-petre) will become exhausted at no very remote date, the world's food supply will then depend upon fixation methods, as indeed it already largely does. See J. R. Partington and L. H. Passar, *The Nitrogen Industry*, 1922, and B. Waeser, *The Atmospheric Nitrogen Industry*, 1926.

Cyanææ Insulæ (Gk. Κυανæαι νῆσοι, or νῆσαι), two rocky is. situated at the entrance of the Thracian Bosphorus into the Buxine. They were called in mythology Planctæ (Πλάκται) and Symplegades (Συμπληγάδες), because they were supposed to be floating is. which wandered about and struck against ships, thus destroying them. They became stationary after the Argonauts had sailed safely past them.

Cyanic Acid (HO CN), strongly acid liquid which can hardly be prepared in a free state, since it decomposes at temps. above 0° C. Forms salts known as cyanates, the most interesting being ammonium cyanate, which gives urea on heating. The formation of urea in this manner by Wöhler in 1828 was the first formation of organic compounds from inorganic sources.

Cyanide of Potassium, see POTASSIUM.

Cyanides are salts of hydrocyanic, or 'prussic', acid, HCN. Prussic acid itself is hydrogen cyanide. It was discovered in 1782 by the Swedish chemist Scheele. Technically it is prepared indirectly from molasses, but in the laboratory the usual method adopted is the action of dilute sulphuric acid on potassium cyanide, KCN. Prussic acid is a colourless volatile liquid, boiling point 26° C., with a characteristic smell recalling that of almonds. It is excessively poisonous. Among the C., potassium cyanide and sodium cyanide are the most important. Potassium cyanide is made by the action of ammonia upon a molten mixture of potassium carbonate and carbon, while sodium cyanide is the result of fusion of a mixture of metallic sodium and sodium ferrocyanide. Both are exceedingly poisonous and must be used with the greatest possible caution. Potassium cyanide is used in entomological killing-bottles and also in chemical processes. Sodium cyanide finds application chiefly in the extraction of gold in S. Africa, etc. Complex C. are known, including potassium ferrocyanide and potassium ferricyanide (yellow and red prussiates of potash). Those important are the complex silver and gold C. used (in solution) in silver and gold electroplating as the electrolytic liquid. Prussic acid itself is extensively used, under suitable restrictions for killing pests, e.g. noxious insects, rats in ships, plague germs, etc. For this purpose it is marketed in steel or iron cylinders.

Cyanogen (C₂N₂), colourless poisonous soluble gas, with a smell like that of bitter almonds, produced by heating mercuric

or silver cyanide. It occurs as an acid radical in a series of salts called cyanides, all of which are poisonous. The best known of these are potassium cyanide and sodium cyanide, which are used in photography and metallurgy. C. combined with hydrogen forms prussic acid, which is known as a deadly poison, but which also has medicinal properties.

Cyanometer, instrument for comparing the shades of the sky, consisting of a circle of pieces of paper tinted with blue. These pieces vary in shade from the colour of solid indigo at 52° to colourless at 10°. When held so that a full light falls on the pattern, the circle can be turned until the shade in the sky is matched.

Cyanosis, lividity of complexion accompanied by a fullness of the capillaries and small veins of the face and lips especially. It is applied especially to the colour in certain cases of congenital disease or malformation of the heart. Temporarily it may be caused by extreme cold preventing circulations in the exposed parts. It is usually due, however, to some organic effect which prevents perfect oxidation of the blood. Thus in some cases, because the foramen ovale remains open, some blood can pass from the left auricle direct to the arteries without passing through the lungs, or again, a perforation may allow blood to pass from the right to the left ventricle, while it may be caused by an obstruction in the pulmonary artery or in the lungs, or by heart failure.

Cyanuric Chloride, see CHLOROCYANIC ACID.

Cyathea, the genus of ferns which gives its name to the order Cyatheaceæ, is to be found in its most highly developed state in tropical climates. The species are arborescent, the stems are often beautifully marked with the scars of fallen fronds, and the plants give a peculiar feature to the vegetation of many lands. *C. arborea*, the common tree fern, is a native of the W. Indies; *C. medullaris* and *C. dealbata* both grow in New Zealand, and contain a starchy matter used by the natives as food.

Cyaxeres (Gk. Κυζάρης) (625-585 B.C., or 634-594 B.C.), king of the Medes, grandson of Darius, the founder of the Median Empire. He organised a powerful and well-trained army, with which he waged war against the Lydians, the Assyrians, and the Scythians.

Cybele (Gk. Κυβέλη), or *Rhea Cybele*, also called *Agdistis* and *Dindymene*, goddess of anct. mythology, worshipped throughout Phrygia, and in many parts of W. Asia. Her priests were called *Corybantes*. She was the wife of Cronus, and the mother of Zeus, Poseidon, and Hades. She was, therefore, worshipped as the mother of the gods. In Asia Minor she was regarded as a nature goddess, or universal mother, and her worship was attended with wild orgies. In Greece she was identified with *Rhea*, whose worship originated in Crete. The worship of C. was introduced into Rome in 204 B.C., where she was identified with *Ops* (Plenty), the mother of Jupiter.

Cybistra, see EREGLI.

Cybium, a genus of mackerel-like fishes, is also known as *Scomberomorus*, and belongs to the family Scombridae; the tunny and mackerel are near relatives of the species. Fossil remains occur in the Eocene, Oligocene, and Miocene.

Cycadaceae, order of Gymnosperms containing about seventy-five species of living plants which have a long primary tap-root, an unbranched stem covered with leaf-scars, a crown of leathery, often spiny-tipped, leaves at the apex of the stem, and the flowers are usually arranged as cones. The species are found only in tropical and sub-tropical countries, and the chief genera are *Cycas*, *Zamia*, *Euphalaris*, and *Dioon*.

Cyclades, ls. group which form a *nomos*, or dist., of the kingdom of Greece. The name is derived from the Gk. κύκλος, a ring, because they form a rough circle round Delos, stretching S.E. from Kubon and Attica. The chief ls. are Andros, Tenos, Syros, Mykonos, Paros, Naxos, Amorgos, Keos, Kythnos, Seriphos, Melos, and Ios. Many of the ls. are of a volcanic origin, and from some marble is procured; Parian marble was very famous among the ancients. Wine, oil, gum-mastic, wax, etc., are produced and sponge fishing is carried on. Hermopolis (pop. 22,000), on Syros, is the largest tn. The ls. are a stronghold of the ant. belief in Nereids who are extremely beautiful and graceful with long golden hair and voices of more sweetness than the human. In the ls. of Sikinos they are subject to the deformity of having one or more donkey or goat hoofs in lieu of feet. The ls. comprise an area of about 959 sq. m. Pop. 147,000. See A. Dell, *Isles of Greece*, 1926.

Cyclamen, small genus of primulaceous plants, consisting of about a dozen herbs with very handsome flowers; all are to be found in Europe or on the borders of the Mediterranean. *C. europæum*, the common C., is abundant in Sicily, and is often called sowbread, from the delight it afforded the wild boar as a food. It has been found wild in Britain, but it is probably only an escape from gardens. The plant has an underground corn, and the lobes of the corolla are reflexed. After fertilisation the flower-stalks twist round until they bury the capsular fruits in the ground, where the seeds ripen and germinate, and produce other plants. *C. persicum* has a stalk which bends over instead of twisting in the burying of the fruit; *C. hederifolium* is a species the flowers of which exhale a pleasant fragrance. *C. neapolitanum* flowers in summer and autumn in Britain; *C. coum* and *C. ibericum* in autumn and winter; the ruby crimson *C. repandum* in spring, and *C. europæum* in summer. Thus C. may be seen in flower in gardens all the year round.

Cycanthaceae, family of monocotyledonous plants, palm-like in habit and found in tropical America. The chief genera are *Cycanthus* and *Carludovica*, the latter genus being of interest to Europeans from the fact that the real Panama hats are manufactured from the bleached leaves of *C. palmata*.

Cycle (Gk. κύκλος, circle), in astronomy and mathematical chronology, a period of time in which certain phenomena repeatedly occur in the same order. Cs. have been invented as a means of measuring time. The chief are the solar, that of the sun, and the lunar or metonic, that of the moon. The former consists of twenty-eight Julian years, and the latter of nineteen years. Consult the articles on the calendar and on Chronology, and the various Cs. under their specific names: Golden Number, Indiction, etc.

THE HOBBY-HORSE, 1818

Cycles and Cycling. *History and Development.*—It is hard to fix definitely the origin of an invention that has had so continuous a development as the cycle. Velocipedes and machines driven by hand, with three or four wheels, were known in England at the close of the eighteenth century. The earliest two-wheeled device in the nature of a bicycle appeared in Paris in 1898, while an improvement of the same invention was

THE 'BONESHAKER,' 1870

introduced into England in 1818 by Baron von Drais, of Mannheim, Germany, and was known as the 'draisene' and more popularly as the 'dandy-horse.' It consisted of two wheels, about 30 in. in diameter, one running in the track of the other, and connected by a wooden beam, which supported the saddle. The front of the beam sustained an arm-rest. Propulsion was obtained by the rider sitting astride over the beam, resting his arms on the arm-rest and alternately striking against the ground with his right

and left foot. This machine, however, speedily became the butt of comic writers and caricaturists, among others George Cruikshank, and succumbed to their ridicule. The dandy-horse was developed, however, by Kirkpatrick Macmillan, a blacksmith of Dumfriesshire, who affixed cranks to the axle of the rear wheel and actuated them by long levers. This invention dates from 1840 at latest, but Macmillan's claims were hardly known in his life-time, and the credit of being the originator of the first two-wheeled single-track mechanically propelled machine was given to Gavin Dalzell, a cooper of Lesmahagow in Lanark, who in 1846 produced a copy of Macmillan's machine. The next development of the cycle took place in the seventies. In 1864 a Frenchman, Pierre Lallement, fitted cranks and pedals to the front wheel of the dandy-horse. The

THE 'ORDINARY' BICYCLE, 1887

necessity of maintaining balance naturally led to the introduction of the movable head, which enabled the relative position of the front and rear wheel to be changed and equilibrium maintained. This invention culminated in the high bicycles known as the boneshaker, on account of the vibration caused by its frame being of wood and its wheels shod with iron tyres. At the same time numerous other devices, including tricycles of various types, were placed on the market under the name of velocipedes. The boneshaker attained a widespread popularity and was used extensively by the upper and middle classes of society. It had, however, little advantage over walking, and its discomfort and danger threatened to cause it to be relegated to the long list of obsolete inventions when a new direction was given to its development. Instead of a front-wheel-driven machine, a reversion was made to rear-driven C., with power transmitted by a chain. This was the origin of the modern safety bicycle, and credit for it is due to J. K. Starley, of Coventry, who produced the type in 1885.

The greatest step of all was perhaps the invention of the pneumatic tyre by Thompson in 1848 and its 're-invention' in 1888 by J. B. Dunlop, a veterinary surgeon, which secured permanently the position of the bicycle as a vehicle

for transport and pleasure. Steadily increasing in popularity, the bicycle underwent an extraordinary boom in the years 1896 and 1897, when company after company was floated. The result was, however, overcapitalisation of the industry, which seriously affected the position of affairs for many years. It would be impossible to record all the innumerable contrivances, many ingenious, many ridiculous, that have been thought of for improving the efficiency of the bicycle. The chain-driven machine was threatened by the bantam bicycle, with front-wheel drive, and by the chainless rear-driven machine. Advocates were found for exceptionally long cranks and exceptionally short cranks. Such devices made no permanent headway, but others firmly established themselves. The tangent spoke diffuses the stress throughout the wheel, and has quite ousted the old direct spoke. Plunger or tyre brakes have given way before the modern rim and hub brakes operated either by fixed rods or cables. The free-wheel has become essential wherever bicycles are used for pleasure riding, though speed riders still adhere to the fixed wheel. Of recent years the fixed gear has been more and more replaced by the variable gear. The variable gear may consist of two, three, or more ratios, changeable among themselves at the will of the rider. Usually, however, it is the three-speed gear that is favoured, the middle gear being the normal and the others being 25 per cent higher and lower respectively. Greater comfort has also been found by the introduction of spring frames, spring forks, spring saddle-pins, and inflated saddles. Front and rear lighting on recent machines is by electricity generated by a dynamo operated from the edge of the tyre or enclosed in the front or rear hub assembly. Gear-cases, enclosing the complete drive (once only found on the lady's cycle), are now universally provided on the more expensive machines. Finality in the shape of the frame itself was long in being reached. The so-called gent's diamond frame has become so familiar that one is inclined to regard it as the permanent form. Originally made with top tube sloping upwards towards the head, it has now long been made with the same tube sloping downwards, or horizontal. Numerous attempts have been made to replace it by a so-called triangulated frame, in which all tubes form the side of a triangle. The underlying principle of this kind of frame is that the triangle is mechanically a rigid figure, whereas the quadrilateral is not, and the quadrilateral frame therefore throws greater strain upon the lugs which unite the various tubes. Complete triangulation has, however, the disadvantage of producing a bicycle which is rather too rigid, and though attempts to obviate this have been made by introducing curved tubes, the expedient has never met with favour. Mention must also be made of the so-called cantilever frame, in which the principle of triangulation has been employed with good results, but this type is

not popular. The lady's machine is less satisfactory from the engineer's point of view, as the cross-bar is omitted. Women cyclists, however, now favour a rational dress. Tricycles still have their adherents, but the 'safety' bicycle is now the normal type of machine. Tandem bicycles for two persons are also seen. An attempt was made some years ago to place on the market a tricycle for two persons, called the 'sociable,' with saddles side by side, but the machine did not hold its place. The development of the motor industry has naturally led to the introduction of the motor-cycle, for which the reader is referred to the article *MOTOR-CYCLES*.

Manufacture.—Generally speaking the manuf. of C. is a home industry. At the end of last century an attempt was made to place large quantities of Amer. machines upon the Brit. market, but without lasting success, and Brit. machines have now a monopoly of the home market. The better grade Brit. bicycle is sold in considerable numbers upon the Continent. There is also a large export from England all over the world. The cycle industry in England is principally carried on at Nottingham and Birmingham.

Cycling as a Sport.—Cycle-racing, both amateur and professional, was for many years a highly popular form of sport, and many tracks were laid down all over the country. The racing is controlled in England by the National Cyclists' Union (founded in 1878), a body consisting of a number of affiliated clubs, with a small private membership of its own. This body holds the amateur championships, defines the status of the amateur, and frames rules for contests. Similar clubs exist in Scotland and Ireland, viz. the Scottish Cyclists' Union (Glasgow) and the Irish Cycling Association (Dublin). The N.C.U., owing to the decline of cycle-racing, has developed along the lines of the Cyclists' Touring Club (founded in 1878). The decline of cycle racing was to a great extent due to cycle meets being used by the manufacturing firms, aided by 'makers' amateurs' and organised pacing teams, for the purpose of advertising particular makes of C. This difficulty was obviated by the Road Racing Council, and those taking part in races promoted by the council were forbidden to use their events as advertising matter. The N.C.U. also deprecate the practice. There were further causes, however, to account for the decline of interest in cycle-racing. In long-distance events the winner owed his triumph more to possessing the best team of pacers than to his own ability, while in short-distance events the fact that the leader set the pace for the others and was almost invariably beaten in the final sprint for the post led to a series of 'loafing' contests that soon damped public interest. Attempts to meet the latter difficulty were made by introducing the lap to lap contest, where the winner was determined by finding which rider led at most of the laps. The tendency was, however, more and more in the direction of holding road competitions, in which all forms of pacing were strictly forbidden.

Professional races, in which high-power motor C. were used for pacing, are in greater favour on the Continent and in America than here, and surprising speeds have been obtained. The Fr., Belgians, Dutch, and Its. have developed racing events greatly, both on roads and circular tracks. Many of the large football grounds on the Continent have concrete tracks, heavily banked on corners. The Tour de France race is a notable ann. event in which cyclists from many countries compete, a favourite branch of the sport being the attempt to establish road records between various points. The most famous of all Brit. records is, perhaps, the Land's End to John o' Groat's House record. The distance is

The Raleigh Cycle Co. Ltd.

A MODERN CYCLE

approximately 900 m., and was accomplished by H. Green in 1908 in 2 days 19 hrs. 50 min., by H. Opperman in 1934 in 2 days 9 hrs., and by S. H. Ferris in 2 days 6 hrs. 33 min. in 1937. Such a feat could, of course, only be performed by help of elaborate arrangements for feeding and securing fresh mounts where necessary, while the rider had to follow a carefully prepared schedule of times. Another favourite form of competition is the hill climb, the best known among which in Britain is that organised by the Catford Club and held annually on Westerham Hill in Kent. Road records are: London-Brighton and back (106 m.), 4 hrs. 38 min. 27 sec., F. W. Southall, 1935. London-Bath and back (212 m.), 10 hrs. 7 min. 36 sec., R. Kemps, 1939; 10 hrs. 50 min. 53 sec., Miss M. Wilson, 1939. London-York (196½ m.), 8 hrs. 23 min., H. Earnshaw, 1939; 10 hrs. 42 min. 25 sec., women's tandem, Misses A. Calcy and M. Gallacher, 1937. London-Edinburgh (392 m.), 18 hrs. 57 min., C. Hoppieston, 1938. London-Land's End (300 m.), 17 hrs. 28 min., C. F. Davey,

1923. Land's End-London, 13 hrs. 44 min., C. Holland, 1939; 17 hrs. 9 min., Miss M. Wilson, 1939. Land's End-John o' Groats (900 m.); 2 days 22 hrs. 52 min., Miss M. Wilson, 1939. Fifty-m. road: 1 hr. 39 min. 42 sec., H. Earnshaw, 1939; 1 hr. 56 min. 33 sec., Miss M. Wilson, 1941. 100-m. road: 3 hrs. 45 min. 51 sec., H. James, 1939. 12 hrs.: 276½ m., H. Earnshaw, 1939. 24 hrs.: 467½ m., C. Heppleston; 396½ m., Miss M. Wilson, 1939; (in Australia), 489 m. 596 yds., H. Opperman, 1940. 24 hrs. N. Road: 390½ m., E. R. Wilkinson, 1938. 1000-m. (Britain): 2 days 22 hrs. 40 min., S. H. Ferris, 1937; 3 days 11 hrs. 44 min., Miss M. Wilson, 1939. (Australia): 2 days 15 hrs. 37½ m., H. Opperman, 1938. Tandem (25-m. road): 59 min. 27 sec., Joyce Dean and Eileen Jordan, 1942. Other records: 1 hr., C. Mariner (England), 26 m. 1020 yds., 1947; 1 m., A. Coulet (Australia), 1 min. 51 sec., 1912; 1320 yds., P. Lawrence (U.S.A.), 1 min. 23.6 sec., 1938; 1 kilometre, F. Ballesine (Italy), 1 min. 4.6 sec., 1938; 830 yds., A. J. Clark (Australia), 50.8 sec., 1938; 500 metres, L. Michael (Fr.), 29.8 sec., 1932; 440 yds., J. Lawson (U.S.A.), 23.8 sec., 1906.

Cycling in Warfare.—The cyclist before 1914 proved his military value rather by experience gained in manoeuvres than in actual warfare. His value may be considerable where good roads are to be found. An early type of army cycle was the quadricycle, mounted with a machine gun, but solo C. are now the general rule. The Fr. Army have a cycle with folding frame which can be carried on the back when not in use. At the commencement of the First World War in 1914 the War Office realised the value of the cycle, and what had hitherto been a section attached to an infantry unit became the Army Cyclist Corps. In the Second World War sev. armies produced folding C. for the use of their parachute troops.

See A. Davis, *The Velocipede: its History and Practical Hints how to use it*, 1869; R. J. Mcreedy and G. Stoney, *The Art and Pastime of Cycling*, 1895; H. G. Wells, *The Wheels of Chance*, 1896; S. Wright, *Everybody's Cycling Law*, 1903; W. F. Grew, *The Cycle Industry*, 1921; G. H. Stancer, *Tips for Cyclists*, 1925; W. Fitzwater Wray, *The Kuklos Papers*, 1927; J. T. Lightwood, *The Romance of the Cyclists' Touring Club*, 1928; K. Thorenfeldt, *Round the World on a Cycle*, 1929; H. W. Bartleet, *Bartleet's Bicycle Book*, 1931; N. Spencer, *The Art of Cycling*, 1948. Jours.: *The Cycling Manual* (annual); *Cyclists' Touring Club Gazette* (monthly to members), 1878; *Cycling* (weekly), 1891; and *The Cycling Record* (monthly), 1947.

Cyclitis, inflammation of the ciliary body. See EYE.

Cyclograph, also arcograph or curvograph. Instrument for drawing a curve without reference to the centre. It is usually formed of an elastic strip, which is adjustable to a given curve, and serves to transfer the latter to another plat or another place on the plat.

Cyclone. If a portion of the earth's surface becomes more heated than the surrounding parts, the air above this part will expand, rise, and spread outwards in all directions. Within this area the barometric pressure will be lessened and outside increased; so there will be a flow of air from the outside inwards, to the area of low pressure. As the inner air rises it becomes cooler and the moisture in it condenses, latent heat is liberated, and the ascending current becoming more rarefied increases the draught, moist air flows in an ever-increasing volume, and so we have the beginnings of a storm. The area of low pressure with its winds is called a C. Cs. are never stationary, but move outwards in the direction of the prevalent winds. In the tropics their course is westward towards the poles, and in the temperate zones eastwards, with the antitrade winds. The greater the difference between the pressure in the region of low pressure and the outer edge, the more violent is the storm. In the N. hemisphere the whirling motion of the C. is opposite to the direction of the hands of a watch, while in the S. hemisphere it is in the same direction. In the centre of the C. there is a comparative calm, while as it moves towards the poles the region of low pressure gradually spreads until the storm dies away. Cs. move rapidly, while anticyclones move more slowly. They bring certain weather changes with them. As they approach halos form over the sun and moon, followed by dense cloud formation. Mist is succeeded by rain, which becomes heavier as the region of low pressure passes, and this is followed usually by cool, dry, bracing winds with a bright sky. See ANTICYCLONE.

Cyclopes (Gk. κύκλωπες, round-eyed, from κύκλος, circle, and ὤψ, eye), fabulous race of classical mythology. According to Homer they were a lawless band of Sicilian shepherds, gigantic in size, who set Zeus at naught and caught and devoured human beings. Their king was Polyphemus, who had only one eye; hence the whole race were described by subsequent writers as one-eyed. According to Hesiod, they were three in number, their names being Argos, Brontes, and Steropes. They were the sons of Uranus and Gaia (or, according to Rom. mythology, Coelus and Terra), and were Titans. They were hurled into Tartarus by Chronos (Saturn), but they were delivered by Zeus, whose servants they then became, and for whom they forged thunderbolts and armour. They also fabricated a shield for Pluto and a trident for Neptune. Ultimately they were destroyed by Apollo, because they had forged the thunderbolt with which Zeus had killed Æsculapius. According to a later tradition, owing to their vicinity to certain volcanoes, they were regarded as the servants of Hephæstus (Vulcan), in whose workshops in Ætna, Lemnos, and Lipari they forged metal armour and ornaments for gods and heroes. The C. were regarded as gods, and a temple dedicated to their worship stood in Corinth. The impenetrable walls of Mycenæ and of

other Gk. tns. were called 'cyclopean' on account of their strength. According to Strabo, the C. were builders from Thrace or Lycia, who settled in Argolis.

Cyclops, genus of copepod crustaceans, represents the fresh-water family Cyclopidae. The species are very numerous and minute.

CYCLOPS

Cyclopteridae, see DISCOROLI.

Cyclostomata (Gk. *κύκλος*, circle, *στόμα*, mouth), or **Marsipobranchii**, name given to a class of vertebrate animals usually grouped with the *Pisces*, or fishes, but separated from them by various characteristic features. The species are eel-like and generally marine, with a gristly skeleton, persistent notochord, scaleless skin, jawless sucltorial mouth, straight intestine, simple tubular heart, and paired gill-sacs as the organs of respiration. The smooth skin is very slimy, and the sucltorial mouth is used as an organ of attachment when the C. fix themselves to their prey. They dwell in the depths of the sea or in rivs., and are predaceous or parasitic in habit. The two best known species are *Myxine glutinosa*, the common hag-fish, and *Petromyzon fluviatilis*, the fresh-water lamprey. They occur in temperate regions of both hemispheres, are found in fossil from Paleozoic times, and in length vary from a few in. to 2 ft.

Cyclotron, machine for producing a stream of electrically charged atoms travelling at an enormous speed. It consists of an evacuated enclosure lying between the flat, circular pole pieces of a large electromagnet, and having a pair of flat plates normal to the pole pieces and lying close to, and on either side of a diameter of the circle formed by them. An alternating electric field is set up between the plates, and charged atoms are released between them. The electric field accelerates each atom to a high speed, and after this has passed out of the region between the plates the magnetic field causes it to travel in a circular path about the axis of the pole pieces of the magnet. After it has traversed a semi-

circle the atom is again in the space between the plates, and if the electric field is now reversed the atom is not retarded, but is further accelerated. It now traverses another semicircle of larger radius, returning to the space between the plates at a time when the electric field has again been reversed, and receiving a further impetus. In this way the speed of a stream of charged atoms is gradually built up until their velocity is enormous, and they are travelling near the edge of the circular enclosure. The stream is allowed to pass out at one point near the edge, and to fall on a target of a suitable material, where it produces atoms of other elements (see **ATOM**, **ATOMIC STRUCTURE**). Many of the atoms formed by the collisions at the target are radioactive. In this way radioactive types of elements such as phosphorus can be produced. These are of value for the information they afford about processes occurring in living organisms, for if they are mixed with food the subsequent hist. of the atoms can be followed by observing their radioactivity. Concentrated radioactive materials can also be accumulated for other purposes such as the treatment of cancer, etc.

Cygnus. 1. Son of Apollo, metamorphosed into a swan. 2. Son of Poseidon, and father of Tenes and Hemitheia. C. was king of Colone in Troas. His second wife was Philonome, who fell in love with her stepson; but as he repulsed her advances, she accused him to his father, who put both his son and daughter in a chest, and threw them into the sea. But the chest was driven on the coast of the is. of Leucophrys, of which the inhab. elected Tenes king, and which he called Tenedos, after his own name. In the Trojan war C. was slain by Achilles. 3. Son of Sthenelus, king of the Ligurians, and a friend and relation of Phæthron, was metamorphosed by Apollo into a swan, and placed among the stars.

Cydnus, riv. of Cilicia, rising in Mt. Taurus and flowing past Tarsus and a broad lagoon, now clogged up by sand, into the Mediterranean Sea. Its water was famous for its coldness, and Alexander nearly lost his life through bathing in it when overheated.

Cydonia, sometimes considered as a separate genus and sometimes included in *Pyrus*, belongs to the Rosaceæ. *C. vulgaris* (or *P. Cydonia*) is the quince, a plant which bears irregularly shaped masses of fruits. These frequently adhere to one another owing to the mucus which invests them, and the seeds are used medicinally on account of the mucilage which they yield. *C. (or P.) Japonica* is another species, frequently grown as a wall-plant.

Cydwel, see **KIDWELLY**.

Cygnus ('the Swan'), constellation, comprising about 200 stars visible to the naked eye, which lies between Pegasus and Draco. The N. Cross is formed by eight of the prin. stars in C. The constellation, the brightest star of which is a Cygni (magnitude 1.6), contains many objects of interest, not the least being

the star 61 Cygni, a star of the fifth magnitude. This star was the first to have its parallax (i.e. its distance from the earth) calculated. This was done by Bessel in 1838, who announced for it a parallax of $0.32''$. This has since been reduced to $0.24''$, which corresponds to a light-year distance of $13\frac{1}{2}$.

Cylinder, surface traced out by a line moving parallel to its original direction and always passing through the circumference of a curve. The term is also applied to the solid contained by the surface and two parallel planes intersecting it, and in particular to a right circular C. which may be described by the revolution of a rectangle about one of its sides. The C. is a developable surface, i.e. it may be rolled out to form a plane surface. The section of a right C. formed by cutting the solid by a plane at right angles to the parallel surfaces is a circle, an oblique section gives an ellipse. The volume of a right C. is obtained by multiplying the area of the circular base by the height, that is, volume = $\pi r^2 h$, where $\pi = 3.1416$ (approximately), r = radius of base, and h = height. The area of the curved surface is obtained from the formula $2\pi rh$, or the circumference of the base multiplied by the height.

Cyllarus, a beautiful centaur, killed at the wedding feast of Pirithous (q.v.). The horse of Castor was likewise called C.

Cyllene: 1. The highest mt. in Peloponnesus on the frontiers of Arcadia and Achaia, sacred to Hermes, who had a temple on the summit, was said to have been b. there, and was hence called C. 2. Seaport tn. of Ellis (q.v.).

Cylon, Athenian who lived in the seventh century B.C. He was victor at the Olympic games, and after that tried to make himself tyrant of Athens, taking possession of the Acropolis during a festival. He and his followers were closely besieged, however, and finally fled to the altar of Athena for refuge. Megacles persuaded them to leave this altar, to which they are said to have attached themselves by a string. On doing so they were murdered by their enemies at the altar of Eumenides, according to tradition, on account of the breaking of the string.

CYMBALS

Cymbals (Lat. *cymba*, hollow vessel), pair of thin, round, metal plates, hollowed in the centre, with a leather strap attached by which to hold them. The sound is obtained not only by clashing them

together but by rubbing their edges. It is very loud and harsh and indefinite in pitch. In orchestras they are often used in connection with the bass drum. The original C. were probably very different in tone, with more of a bell-like sound. Their use is very ancient; they were known among the Egyptians, and were used by the Gks. in the worship of Cybele.

Cymbeline, king of ancient Britain, who appears in Shakespeare's play of the same name, in which play he is the father of Imogen. Cunobelinus, who lived during the first century A.D., seems to have been the original of C. The former is mentioned in Holinshed's *Chronicles*, and coins bearing his name are still in existence.

Cyme, botanical name given to an inflorescence in which each branch is stopped in its growth after producing a single flower, when it is forced to form lateral branches, which are themselves stopped after forming one flower.

Cymry, see under CELTS.

Cynægius, brother of the poet Æschylus, distinguished himself by his valour at the battle of Marathon (q.v.). According to Herodotus, when the Persians were endeavouring to escape by sea, C. seized one of their ships to keep it back, but fell with his right hand cut off.

Cynanchum, genus or the order Asclepiadaceæ. *C. vincetoxicum* is a native of sandy places on the Continent, and was once celebrated as an antidote for poisons. *C. monspeliacum*, or Montpellier C., contains a juice which is a drastic cathartic; *C. argel* is a native of Upper Egypt, and the whole plant acts as a powerful purgative; *C. ovalifolium* is found in Penang.

Cynara, Mediterranean genus of composite plants, contains the two well-known plants, the artichoke and the cardoon. *C. scolymus*, the artichoke, has long been cultivated as a kitchen garden plant. *C. cardunculus*, the cardoon, is eaten like celery.

Cynares, one of the subdivisions of the order Compositæ. Its type is the genus *Cynara* (q.v.), and the species are noted for the intensely bitter principle of their active properties. *Carduus nutans*, the musk thistle, is the only species possessing much odour, and, like *C. crispus*, it is a true thistle; *Carthamus tinctoria*, the safflower, and *Serratula tinctoria*, the saw-wort, yield yellow colouring matters, while from the flowers of *Centaurea cyanus*, the corn-flower, a blue pigment is obtained. *Arctium lappa*, the burdock, has hooked involucre leaves, and its tender sprouts are eaten like asparagus in N. Europe; *Cnicus tuberosus*, a thistle-like plant, has edible and starchy tubers, and its ally, *Cnicus arvensis*, the plume-thistle, contains much tannin. *Onopordon acanthium*, the Scotch or cotton-thistle, is used as an astringent in medicine; *Echinops sphærocephalus* has cathartic properties. *Carlina vulgaris* is the carline thistle.

Cynesis, or Cynetes, a people, according to Herodotus, dwelling in the extreme W. of Europe, beyond the Celts, apparently in Spain.

Cynewulf, A.-S. vernacular poet, of whom very little is known. He appears to have been a Northumbrian, but the point is not certain. Dietrich has identified him with C., bishop of Lindisfarne (737-80), though this supposition is opposed by Ten Brink. His works are attributed to the latter half of the eighth century. The only ones that can with certainty be ascribed to him are *Juliana*, *Crist*, *Elene*, and a fragment of *The Fates of the Apostles*, in each of which he has inscribed his own name in runes. He also appears to have been the writer of at least part of the *Riddles*, while the *Phoenix* is almost certainly his work. *Guthlac*, *The Dream of the Rood*, *The Descent into Hell*, and *Andreas* are also attributed to him, but their authorship is doubtful. The poet belonged to the Guild of Wandering Gleemen, and appears to have led a very varied existence knowing both trouble and triumph. His works show great mastery of language and are rich in poetic fire and religious fervour. They deal with biblical and religious subjects. See C. W. Grein and R. P. Wülker's *Bibliothek*, which contains the poems mentioned, 1881-38; R. P. Wülker, *Grundriss der Angelsächsischen Literatur*, 1883-85; Stopford Brooke, *English Literature to the Norman Conquest*, 1898, which contains trans. of the *Riddles*; F. Holthausen, *Elene*, 1905; K. Jansen, *Die Cynewulf-Forschung von ihren Anfängen bis zur Gegenwart* (Bonner Beiträge zur Anglistik), 1908; C. W. Kennedy, *The Poems of Cynewulf: Translated into English Prose*, 1910 (with bibliography); and K. Sisam, *Cynewulf and his Poetry* (Brit. Academy Lecture), 1933.

Cynics, The, sect. of Gk. philosophers, founded by Antisthenes, the disciple of Socrates, about 400 B.C. Their name is derived either from the place where they usually taught, the Cynosarges, or from the word *κύων*, 'a dog,' in derision of their morose, snarling principles, and intense scorn for all the conventions and even humanity at large, for the early Cynic virtue alone was the *summum bonum*, and therefore both learning and pleasure were things contemptible, and this doctrine led the decadent followers of Antisthenes, forgetful of the saving grace of self-control, to degrade human life to a mere brutish level. Diogenes of Sinope, Crates, and Zeno are representatives of the earlier Demetrius and Demonax of the later school.

Cynocephalus, see BABOON.

Cynodon, a small genus of Gramineæ, is found in Australia. *C. dactylon*, the dog's tooth, or Bermuda grass, is, however, world-wide in distribution, and in England grows on the shores of Devon and Cornwall. *C. linearis* is the duryagrass of the E.

Cynoglossum, genus of tropical and sub-tropical plants belonging to the Boraginaceæ. All the species are coarse plants with small flowers unworthy of cultivation. *C. montanum*, a Brit. species, grows in shady situations, by roadsides, and in hedges; *C. officinale*, the common

hound's tongue, is a native of Asia, Africa, Europe, and N. America. The whole plant has a disagreeable smell, resembling that from mice, and was formerly used medicinally as a remedy in scrofula.

Cynoidea, one of the sections of the Carnivora (*q.v.*), and consists of dog-like animals. There is a single family, the Canidæ, and the species are distributed over the whole world, with the exception of New Zealand, and many of their fossil remains have been found. The fox, wolf, dingo, prairie wolf, and all varieties of dogs, wild or domesticated, belong to this group.

Cynomorium Coccineum, the single species of its genus in the order Balanophoraceæ, is a Mediterranean plant. By old herbalists it was called *Fungus melitensis*, and was valued for its astringent properties, but it is now a rarity and an object of curiosity to botanists. The discovery of the medicinal properties of this parasitic plant dates from remote times, and in 1740 the knights of Malta set so high a value on it that they guarded the passage to the spot where it grew with the strictest jealousy.

Cynosarges, gymnasium, sacred to Hercules, outside Athens, for the use of those who were not of pure Athenian blood; here taught Antisthenes, the founder of the Cynic school. See —. Tucker, *Life in Ancient Athens*.

Cynosephalæ (dogs' heads), two hills of Thessaly in Greece, near Larissa. Here in 197 B.C. the Rom. consul, Flamininus, defeated Philip of Macedonia.

Cynossema, 'dog's Tomb,' promontory in the Thracian Chersonesus, so called because it was supposed to be the tomb of Hecuba (*q.v.*), who had been previously changed into a dog.

Cynosure (Gk. *κυνόσουρα*, a dog's tail), Gk. name for the constellation of the Little Bear, which contains the Pole Star. The Phœnician mariners steered their course by this constellation, while the Gks. steered by the Great Bear. The name has been transferred to anything attentively observed.

Cynosurus Cristatus, the crested dog's-tail grass, or gold-seed, is a well-known pasture-grass of the old world, and flourishes in Britain. The roots penetrate a great way underground and the plant thus remains green in dry weather when other grasses are burnt.

Cynthia (Gk. *Κυθία*), one of the many names of the Gk. goddess Artemis, and obtained from Mt. Cynthus. Identified by the Romans as Diana.

Cynthus, mt. of Delos, celebrated as the bp. of Apollo and Artemis, who were hence called Cynthus and Cynthia respectively.

Cyprissus, son of Telephus (*q.v.*), who having inadvertently killed his favourite stag, was seized with immoderate grief, and metamorphosed into a cypress.

Cyperaceæ, extensive natural order of glumaceous monocotyledons, having much the appearance of grasses. In England a large number of the species are called sedges, and are employed in the manufacture of 'rush' mats and bottoms for chairs.

Although allied to the grasses, they have scarcely any nutritious qualities, and are almost valueless as herbage. *Scirpus lacustris*, the bulrush, and *Cyperus papyrus*, the paper-reed, are common species.

Cyperus, genus of the order Cyperaceæ, which contains about 700 species of rush-like plants. They flourish in damp climates, need a great deal of water, and form a large proportion of the flora of cold regions. In the S. states the tubers or rhizomes are used as food for swine. *C. papyrus*, the paper-reed, furnished the writing-paper of ant. times known as papyrus.

Cyphergat, mining vil. of Cape Prov., S. Africa. It is situated S. of Moltono, and is principally engaged in coal-mining.

Cypræidea, family of gastropod molluscs which contains the cowry (*q.v.*). The species are often large and beautiful, and most of them dwell in warm seas. Besides the existing species, of which there are two or three hundred, fossil remains have been discovered from the Upper Jura.

Cy-près, term used in connection with charitable trusts or uses (*q.v.*). Where an instrument creating a trust discloses an intention to benefit charitable purposes generally, or, as it is called, a 'general intention of charity,' without mentioning any particular charity or charitable purpose; or specifies a particular charitable purpose which either cannot be carried out, as for example, where an institution intended to be benefited has ceased to exist, or which does not exhaust the whole of the trust fund, the chancery div. will itself declare the charitable purpose to which the trust fund or surplus (as the case may be) is to be devoted; and in so doing it will effectuate the settlor's intentions as nearly (*cy-près*) as possible. Where it is impossible to carry out any charitable purpose approximating to that in the mind of the settlor, the court may construe the settlor's intention by the light of other charitable trusts (if any) in the same settlement. See Strahan, *On Equity*; and Snell, *On Equity*.

Cypress, or **Cypressus**, genus of coniferous plants, of which all the twelve species are evergreen shrubs or trees, and are natives of N. America, the Mediterranean, and Asia. *C. sempervirens*, the common or upright C., is a plant of gloomy aspect but fragrant smell; it is sometimes cultivated in Britain, but the climate is too damp and cold for it to flourish. It has been identified as the C. of the Scriptures, and the cross of Christ is believed by some to have been made from this tree; but, on the other hand, the Heb. word for the C. of Scripture, *tzrah*, is derived from *taraz* connoting 'strength,' so that there is means of identifying it, and indeed the Heb. word for C. is *beroah*, often trans. cedar or fir. The variety *C. horizontalis*, the spreading C., is a more hardy plant than the common C., but its graceful spreading branches make it a beautiful object. *C. lusitanica*, the cedar of Goa, is a drooping species, and its leaves have a singularly glaucous

colour. *C. funebris* is a native of China and bears weeping branches; *C. Lawsoniana* grows in Upper California and yields good timber; *C. fragrans* is often cultivated, but occurs wild in N. America; *C. macrocarpa*, the Monterey C., is a hardy species found in California; *C. nootkalensis* (from Nootke Sound) grows in N. America, attaining a height of over 100 ft.

Cyprian (**Cyprianus**) **Thascius Cecilius** (c. A.D. 200–58), an illustrious father of the Church, was b. of heathen parentage, but in 245 was baptised as a Christian. Like St. Francis, overcome by his passionate altruism, he freely gave all his wealth to the poor, so that the 'acclamation' and 'friendly violence' of the whole city obliged him in 248 to accept the important bishopric of Carthage, yet when the Emperor Decius began his ruthless persecutions in 250 C. was exiled everywhere with pagan cries of 'Cyprianum ad leonem,' so that he sought safety in flight. On Gallus's accession he returned to Carthage in 251, and was soon engulfed in grave theological discussions, such as the question of the re-baptism of heretics and the readmission into the Church of the *lapsi*, those who had fallen away during the recent persecutions. C. was inclined to view their lack of faith with lenience, whilst Novatian wished nothing less than their entire exclusion. From C.'s letters the reader obtains a lively picture of the struggle of the Christian Church in its infancy, and the bitter animosities aroused by questions of eccles. doctrine and discipline, but also — what is surely of equal interest — an insight into the poetic feeling and tenderness of the writer, whose character has been so often misjudged. 'The pleasant aspect of the garden,' says C. on one occasion, 'harmonises with the gentle breezes of a mild autumn in soothing and cheering the senses; the neighbouring thickets insure us solitude; and the vagrant trailings of the vine branches, creeping in pendant mazes among the reeds supporting them, have made for us a leafy shelter. 'Tis with delight that here we clothe our thoughts with words.' It is clear that in C.'s day there was no recognised supremacy for the bishop of Rome, for he does not hesitate to dispute with his 'brother' Stephanus, and in 256, at a synod in Carthage, he openly declared that he recognised no judicial authority of the Rom. over the other Christian bishops, who were substantially his equals. On the proclamation of Valerian as emperor in 258, C. was obliged once more to desert his flock. In the same year he bravely and gladly suffered martyrdom. 'God be thanked!' he cried on hearing his sentence. Thus he was faithful to his fine principle that 'a priest of God . . . may be put to death but cannot be overcome,' for he proudly refused to sacrifice at the emperor's bidding. His whole life was sanctified by the ardour of his faith and the nobility of his self-denial, whilst his death for Christianity effectually atoned for any earlier taint of cowardice. His *De Catholicæ Ecclesiæ Unitate* is of peculiar interest, as herein

is first enunciated that the Christian Church is an hierarchy whose unity rests not on the episcopate of Rome but on that of the universal Church.

Cyprinidae, a very large and much subdivided family of fishes of the group Ostariophysi, is typified by the carp. The species are bony fishes with scaly bodies, naked heads, and no teeth. They are to be found in fresh water of the old world and N. America, and about 1300 have been classified. Their diet is chiefly vegetarian, but a few are animal-feeders. The carp, goldfish, minnow, dace, loach, chub, roach, tench, and fresh-water bream are a few well-known representatives of the family.

Cyprinodontidae, a family of pike-like fishes in the sub-order Haplomi, somewhat resemble carps, but have teeth in both jaws, no barbels, and the head and body are covered with scales. The most curious genus is *Anableps*, in which the iris of the eyes has two pupils; the fishes swim with the head half out of the water, and the lower pupil is adapted for sight in water, the upper for aerial vision.

Cypripedium, a genus of the Orchidaceae, contains over fifty species of graceful and beautiful plants, mostly inhab. of N. America and N. India. They include in a curious method of pollination, which is effected usually by bees. *C. Calceolus*, the lady's-slipper orchid, is found rarely in woods of N. England. It has a creeping rhizome, broad ovate leaves, and the perianth is reddish-brown in colour. The labellum, however, is yellow and slipper-like, the edges being turned inwards.

Cyprus, third largest is. of the Levant in the Mediterranean, 60 m. W. of Latakia, in Syria, and 46 m. S. of Cape Anamur in Asia Minor. Lies between N. lat. 34° 33' and 35° 41', and E. long. 32° 20' and 34° 35'. With a length of some 145 m. and an average width of 45 m., its total area is about 3572 sq. m. It is an attractive country of plain and mt. surrounded by blue seas and wide skies. The headland on the N.E., Cape St. Andreas, forms the extremity of a long and narrow peninsula. The extremely fertile plain of the Mesaoria stretches across the centre of the is. Once sheltered by dense forests, its surface presents to-day a bare and treeless appearance, broken here and there with curious rock tablelands from 100 to 200 ft. high. Of the S. and N. littoral ranges, the former, known as the Olympics, contains the higher summits. Thus Troödos attains an elevation of 6406 ft., the greatest in C. The N. system is divided into two chains, the W. and loftier, known as the Kyrenia Range, the highest peak of which is Buffavento (3140 ft.) and the E. or Karpas Range, which rarely reaches an altitude above 2000 ft. Mt. Adelphi (5305 ft.), Papoutsa (5124 ft.), and Chionia or Machaira (4674 ft.) are the other chief mts. of the S. chain, whose numerous spurs extend over a third of the is. in the S.W. There are modern summer resorts at an elevation of 6000 ft. as high as the Engadine in

Switzerland which are being developed as holiday centres for tourists and European officials in the Near E. The Pedia, which falls into the sea at Famagusta and waters the valley of Nicosia, and the Idalla both flow N. and then E. through the central plateau. In the N.W. the chief stream is the Saraklis. But unfortunately these and the other waterways of C. are little more than mt. torrents, whose beds dry up in the summertime. Even the Pedia fails at times to reach the ocean, and the marshes formed from its stagnant waters give rise to malaria. Ipecud fevers are prevalent among the natives in the low-lying

quarters. But on the whole the climate of C. which is naturally Mediterranean in character, is fairly healthy. The winter, which extends from Oct. to March, is also the wet season, the mean ann. precipitation being 19 in. Whilst the mean maximum temp. for a year is 78° and the mean minimum 57°, the average ann. temp. is about 69° F. The is. is subject to earthquakes and to the devastations of locusts, for the increase in which the excessive deforestation is largely responsible. Forests still cover 400 sq. m., but in ant. times they were one of the chief glories of C., clothing every mt. ridge and all the plains with dense masses. The Gks. found the Aleppo pine, which, with other conifers, largely predominates, excellent for shipbuilding. In the N. Eocene formations are prevalent, whilst in the plain of Mesaoria are many calcareous rocks alternating with Pliocene deposits. Archean rocks form the mass of the Olympics, which yield gypsum, red jasper, a little silver and gold, asbestos and copper. Once C., which gives the modern name to the metal, was

famous for its copper mines, but it is not found worth while to work them now. The chief metals obtained for commerce are 'terra umbra', gypsum, and salt, which is worked in the Limasol and Larnaca dists., where there are great salt lakes. But statuary marble is quarried on Buffavento, and a good building stone is quite widely distributed. Unfortunately agriculture is still backward. Ignorance and prejudice prevent the cultivators systematically adopting such improvements as rotation of crops, modern implements and machinery, etc., but great efforts have already been made to induce the peasants to adopt more modern methods. The difficulties are, however, aggravated by the fact that the majority of the cultivators are heavily indebted and usually in arrears with their payments. The Brit. administration is pursuing a policy directed to the consolidation and lightening of land mortgages—apart altogether from the help given to agriculture by improved irrigation. A good deal of the necessary irrigation is carried out by wells, but in 1899 and 1901 respectively two schemes for irrigating by means of reservoirs were carried out, the larger enabling the flood waters of the Pedia and Idalia to be temporarily held up. Cotton, carobs, wheat, barley, oats, vetches, cummin, pulse, linseed, wool, silk, tobacco, flax, madder, the poppy, olives, and the vine are grown, besides figs, oranges, citrons, and dates. The native wines are pure and strong, though not always agreeable to the taste. The practice of keeping the wines in tarred skins—a practice very injurious to their flavour—is now practically non-existent. The silk industry flourishes in the Paphos dist., and the sponge fisheries are profitable. The Cyprian breed of mules is famous in the E., and there is an indigenous wild sheep known as the moufflon.

Chief exports are animals, carobs, wheat, raisins, oranges, almonds, cheese, wine (1,600,000 gallons in 1937; 988,700 in 1946), spirits, potatoes, hides and skins, leaf tobacco, pine bark, cummin seed, artificial teeth, wool, and buttons. Mineral exports include asbestos, cupreous concentrates, pyrites, chromium ore, terra umbra, and gold ore. The chief imports are beans and peas, cereals, oils and fats, sugar, rice, petroleum, cotton yarns and piece goods, artificial silk goods, woollen piece goods, chemicals, medicines, lubricants, kerosene, chemical manure, leather, tyres, and cement. The agric. and other resources of the is. are capable of considerable expansion. Mining products exported include pyrites, copper ore, asbestos, yellow ore, and gypsum. The chief tns. are Nicosia (pop. 34,400), the cap., in the interior, and the two ports, Limassol (22,700) and Larnaca (14,700), both on the S. coast. Other tns. on the coast are Kyrenia (2900), Paphos (5800), and Famagusta (16,100) on the E. coast near which is the act. Salamis. The six administrative dists. are Famagusta, Kyrenia, Larnaca, Limassol, Nicosia, and Paphos. Lack of natural harbours, the

seaports all having open roadsteads, militates against trade, but a good harbour was constructed at Famagusta at the same time that a railway was built to connect that tn. with Nicosia, and plans have been made to extend and modernise the harbour to serve as a naval base. Larnaca Bay is also under consideration for a base for the Mediterranean fleet, the estimated cost being £8,000,000. The main roads between the various cities are good. Cable lines connect Larnaca with Alexandria in Egypt, and also with Latakia in Syria. Turkish weights and measures are current. Coinage is pounds, shillings, and C. piastres (180 C. piastres equal 20s. or £1 sterling).

A short résumé of the hist. of C. will serve to indicate the many vicissitudes through which the is. has passed. The Phœnicians colonised it about 2000 B.C. and much later the Gks. sent settlers to C. (but did not occupy it), and instituted the worship of the Paphian Venus in place of that of the Phœnician Astarte. For a short time the is. passed into the hands of Amasis of Egypt, and in the same century, in 525 B.C., Cambyses of Persia annexed it to his empire. Alexander, after his victory of Issus, affiliated the is. to his Macedonian kingdom, but on his death it was transferred to Ptolemy of Egypt. C. became a Rom. prov. in 58 B.C., and among its governors counted Cicero and Cato the younger. Paul, Barnabas, and Mark all visited the is., the Cypriots being one of the first Gentile peoples to adopt Christianity. Under the E. or Byzantine emperors C. became the seat of an archbishopric. From 644, the year of Othman's conquest, until 975, the is. was devastated by repeated Arab invasions, that of Haroun el Raschid, for a time successful, occurring in 802. From 1195 to 1487, the year when it entered the dominion of the Venetian republic, it was ruled by the family of Guy de Lusignan, who received the is. from Richard I., who conquered it on his way to the third crusade and ruled it for seven years. From 1570 to 1878 C. was subject to Turkish rule, terrible massacres and wearisome sieges marking the early days of subjugation. A convention was entered into with Turkey on June 4, 1878, whereby the is. was to be administered by Brit. rule. This held good until the outbreak of war with Turkey, when on Nov. 5, 1914, Britain completely annexed C. On May 1, 1925, C. was given the status of a colony. From 1925 until 1931 the gov. was administered by a governor, aided by an executive and a legislative council, but after the disturbances which occurred in the is. during 1931, the clauses in the letters patent of 1925 dealing with the constitution of the legislative council were revoked, power to legislate being vested in the governor. The disturbances above mentioned were the culminating events of prolonged agitation which began to grow serious in 1920. In that year the Gks. on the legislative council instituted an agitation against Brit. rule, suggesting that the only remedy for their ills would be *enosis*,

the union of C. once more to Greece, 'their mother country.' They presented a memorial to this effect to Lord Passfield, secretary of state for the colonies, who vetoed emphatically their return to Gk. rule, stating that the affairs of the is. so governed already were not efficiently enough administered for confidence to be reposed in them; he showed that for fifty years of Brit. rule there had been no internal upheavals and no external attacks; law and order had prevailed, strict and impartial justice had been administered. While the Gk. members professed that they voiced the opinion of five-sixths of the pop., there is little doubt that their agitation was organised and financed chiefly by the Church. The agric. pop. did not desire the union and the townspeople felt only a tepid enthusiasm for this movement.

In Oct. 1931 a serious revolt broke out. Rioting began in Nicosia with the destruction by the mob of Gov. House, when the governor, Sir Ronald Storrs, lost a number of valuable paintings. The revolt, however, was soon quelled with the arrival of troops from Malta and Egypt. The leaders, including the bishops of Kitium and Kyrenia, were deported.

In 1933 an advisory council, on an informal basis, was estab. to act as a channel of communication between the gov. and the people. The people of C. are, however, essentially loyal to the Brit. connection, as was shown in the Second World War, for not only was a corps of Cypriot muleteers actually the first colonial unit to reach the W. front in France, but soon afterwards a combatant corps was raised in the is. The Cypriots realised that they were in a region which at any moment might be made by an aggressive totalitarian state an arena for its territorial ambitions. They saw close at hand the fate of Rhodes, and the other is. of the Dodecanese, with a pop. like themselves, and they did not doubt that their own safety depended on the protection of the Brit. Navy ready and able to meet all adversaries. After the war the *enosis* movement was slightly compromised by the emergence of a new extreme left wing, or Communist party, demanding *aflo-kivernisia*, or self-gov. without any attachment to Greece or Britain. An attempt was made in 1946 and 1947, by means of a consultative assembly, to draft proposals for a local self-governing constitution, but owing to quarrelling between right and left it had to be dissolved, the governor declaring that no change in the is.'s sovereignty was intended. The post-war reconstruction policy of the gov. embraces the development of the natural resources, co-operative credit and agric. marketing, the improvement of living conditions, and encouragement of exports. A five-year plan of development was initiated in 1945, including a water supply for all the vills., irrigation, and anti-malaria, and other health schemes. C. needs only external peace and internal tranquillity. When the political future of C. as a member of

the Brit. Commonwealth is accepted and assured, self-governing institutions could be speedily re-estab. Then, under the direction of her own citizens, the material prosperity that C. enjoyed for a space many centuries ago might be restored and exceeded, accompanied, it may be hoped, by a higher standard of social well-being and culture than has ever been known in all its varied hist. Pop. 450,100 (of whom 18 per cent are Muslims, and the remainder mostly members of the Autocephalous Church of C., which is a branch of the Orthodox E. Church).

Cyranos de Bergerac, Savinien, see BERGERAC.

Cypselus (655-625 B.C.), tyrant of Corinth, was, on his mother's side, connected with the family of Bacchylade, who, having learnt from the oracle that this child was to bring about their downfall, sent messengers to murder him. They were unsuccessful, however, and he eventually succeeded in overcoming them and in making himself tyrant, ruling at Corinth for thirty years.

Cyrenaica, one of the two ters., Tripolitania being the other, of which Libya is formed, with an area of about 75,000 sq. m. (excluding the Cupra hinterland zone) and a habitable area of some 14,000 sq. m. Though it has no precise natural boundaries, the ter. which the Its. named C. is a natural unit. Its core is a limestone plateau welded on the S. to the Libyan desert and projecting in a wide arc into the Mediterranean. This core is the Jebel Akhdar, and constitutes the essential C. To the N., E., and the W. are transitional regions which, as they decline down to the level of the desert, gradually take on its character. Though the country is mostly desert, it is generally arable near the coast. The native inhab. are almost all Arabs and Berbers and the total pop. in 1939 was about 150,000. The inland natives, mostly pastoralists, are distinguished by their general adherence to the Senusiya order of Islam, an order not peculiar to them, though they form by far the most numerous and most compact Senussi group. Before the Second World War there were also sev. thousand Negroes, some 4000 Jews, and 12,000 Europeans, nearly all Its. Reached from across the stony waste of Marmarica to the E., or the sand dunes and salt marshes of Sirte to the W., the woodlands and gorges with perennial streams, orchards and flowers give the Jebel Akhdar a

romantic aspect. The It. themselves were greatly attracted to it; for after a provisional administration which lasted from their annexation of Libya in 1912 until 1923, they embarked on a policy of colonisation which proved so costly that its eventual success might be doubted, even if circumstances had allowed the experiment to succeed. Olives are cultivated in places, and there are date-palm oases. Great numbers of cattle, sheep, and camels are or were reared, and barley was grown and exported to Eng. maltsters. There are plenty of jackals, and foxes, porcupines, moles, and mice. C. flourished in antiquity owing to the trade with Central Africa, but that in modern times has been diverted through other channels. In 1930 80,000 Arabs with 600,000 herd of cattle were forcibly transferred from the inland dists. where they had tried to retain their independence to a stretch of ter. on the coast where they could be controlled by their It. masters. In 1931 the It. campaign against Senussi Muslims was successfully concluded with the capture of Cupra, the rebel leader, Omar el Mukhtar, being executed. The It. colonisation scheme involved the forcible displacement of the Beduin by Gen. Graziani, achieved after ruthless fighting in about 1934, by which time the native pop. had fallen from 400,000 to 200,000. The herds suffered even worse, the number of sheep being reduced between 1926 and 1933 from 800,000 to 98,000, camels from 75,000 to 2600, goats from 70,000 to 25,000. Not only did the It. take over the most fertile land of the Jebel Akhdar and coastal plains, but they closed many of the traditional grazing grounds of the Arabs. Scattered over the Jebel and the W. littoral, there sprang up thousands of It. farms, ranging from small white houses, with a few ac. of land, to estates of as much as 30,000 ac. C. has an erratic rainfall of 12 in. to 16 in., with a drought every seven years. There is some well water and catchments were constructed. The It. partly completed an ambitious pipe-line to carry water throughout the Jebel from Ain Marra, a spring, to the W. of Derna. In the Second World War C. became a battleground, first between the It. and Brit. forces and later between combined Italo-Ger. forces and the Brit. (For full details and description of the battles in Libya see AFRICA, NORTH, SECOND WORLD WAR, CAMPAIGNS IN.) When C. thus became a theatre of military operations, the It. pop. in tn. and country either fled or were removed to Tripolitania, from fear of Senussi vengeance, especially as, on Jan. 8, 1942, when replying to a question, Mr. Eden, then foreign secretary, said in the Commons that 'His Majesty's Gov. are determined that at the end of the war the Senussis in Cyrenaica will in no circumstances fall under Italian domination.' When the Brit. military administration was set up in 1943, after the famous Eighth Army (g.v.) had finally expelled the Axis forces, normal life had ceased in the colonised areas. The port tns., Tobruk, Derna, and Benghazi, which is

the cap. of C., were wrecked, and Cyrene, Barce, Jodabra, Apollonia, Bardia, and Gazala had also seen fighting. On the Jebel farms, catchments, and wells were damaged or destroyed, pumping machinery for the pipe-line and the formerly irrigated areas were once more the sport of the elements. The Brit. military administration's first care was the welfare of the natives, and this involved removal of the debris of two and a half years' battles. Millions of mines, shells, bombs, and cartridges were destroyed or collected into prohibited areas. Supplies of tea and sugar had to be organised from abroad. The next task was to salve as much as possible of the It. colonisation achievements; but it did not prove easy to induce the Beduin to follow a settled existence, though the attempt was most successful with Senussi exiles returning from Egypt, where they had shed their nomadic way of life. But in general the majority of the Cyrenaians have neither the knowledge nor the inclination to continue the work of the It. colonists. If C. is not to revert to an exclusively pastoral country expert foreign aid must be given and much foreign money spent on a long-term plan. Basically, however, the national wealth of C. will always be in its flocks and herds, where too foreign assistance is required. In time small national industries, such as oils and fats and leather manuf., could be encouraged. See R. di Lauro, *Tripolitania*, 1932; K. Holmboe, *Desert Encounter*, 1936; and G. Casserly, *Tripolitania*, 1943.

Cyrenaics, The, school of philosophers, so called because their founder, Aristippus, was a native of Cyrene, where also their peculiar tenets were developed. Their school lasted down to the beginning of the fourth century B.C. Their articles of belief were drawn up, as it were, by Aristippus the younger. They denied the excellence of virtue, and as they regarded knowledge as immediate sensation, considered all logic and physical science waste of time. The C. were hedonists, after the manner of the Cynics. It was their pessimism which deterred men from accepting their ideals. Theodorus of Athens, Hegesias, who advocated suicide, and Arete, Aristippus's wife, were adherents of this school.

Cyrene, cap. of the anct. Cyrenaica, Africa, was situated near the modern vil. of Grenna, S.E. of Cape Ras, a few miles only from the Mediterranean. The anct. ter. of C., called also Cyrenaica, included also the Gk. cities of Barce, Teuchira, Hesperis, and Apollonia, the port of C. Under the Ptolemies Hesperis became Berenice, Teuchira was called Arsinoë, and Barce was entirely eclipsed by its port, which was raised into a city under the name of Ptolemais. The country was at that time usually called Pentapolis, from the five cities of Cyrenaica—Cyrene, Apollonia, Ptolemais, Arsinoë, and Berenice. A colony of Laomedonians under Battus founded C. in 631 B.C., and ruled it for some two centuries, when it became a republic. In 96 B.C. Cyrenaica, with the

rest of N. Africa, became a Rom. prov., and the miserable party struggles of the cap. were effectually quelled. In the days of its prosperity C. numbered over 100,000 inhab., had a flourishing medical school, and was noted for its intellectual activities, and as the bp. of Callimachus, the poet, Carneades and Aristippus, the founder of the Cyrenaics, Eratosthenes, and the elegant Christian writer, Synesius. C., ruins of which remain to attest its former greatness, carried on a large trade with Egypt, Greece, and Carthage.

whom he then accompanied to Moravia. The two invented the Slavonic alphabet, and are said to have been summoned to Rome for employing the Slavonic tongue in the church services. After an understanding had been arrived at with Pope Adrian II., C. remained at Rome, but M. returned to Moravia as archbishop of the church there. He appears to have become involved in quarrels with the Ger. clergy, in consequence of which he was again summoned to Rome in 879 and 881. After the latter date nothing is heard of

CYRENAICA: CYRENE—THE EXCAVATED TEMPLE OF APOLLO

E.N.A.

Cyrenius, form, obtained through the Gk., of Publius Sulpicius Quirinius, who some time about the year A.D. 6 was made governor of Syria, and then took a census of the Jews. St. Luke's statement, however, seems to imply that this event happened earlier, and there have been sev. explanations offered to account for the difference between sacred and profane hist. on this point.

Cyreschata, or Cyropolis, city of Sogdiana, on the Jaxartes, the furthest of the colonies founded by Cyrus, and the extreme city of the Persian Empire; destroyed after many revolts, by Alexander.

Cyril (827-69) and Methodius (d. 885), two Christian apostles of Thessalonica. C. (Constantine Cypharæ), surnamed the Philosopher, and the Apostle of the Slaves, was sent to preach to the Chazars, and later to the Bulgarians. He founded a school at Buda. While in Bulgaria he was taken prisoner, but was released about 862 by the intervention of M., his brother,

him, and, in fact, the whole accounts of the lives of both C. and M. are meagre and contradictory.

Cyril, St. (315-86), was ordained bishop of Jerusalem in 351. It was the time of the Arian controversies, and as C. attempted to steer a middle course he was deposed in 358 by his metropolitan, Acacius, bishop of Caesarea, an action which was ratified two years later by the synod at Constantinople. But he was reinstated in his bishopric on the accession of Julian in 361. Expelled again by Valens in 367, he finally returned to Jerusalem in 378, and attended the second œcumenical council at Constantinople and accepted the Nicene formula there promulgated. His *Χαρίσμοις* (Instructions to Catechumens) contains a series of discourses addressed to candidates for baptism and a few to the newly baptised.

Cyril, St. (d. 444), of Alexandria, a father of the church, after some years in

the Nitrian desert, succeeded his uncle, Theophilus, as patriarch of Alexandria. Some measure of the responsibility for the atrocious murder of Hypatia has been attributed to C. by historians, though not by contemporaries. Nestorius, who refused to acknowledge the Virgin Mary as the Mother of God, was the victim of C.'s ceaseless persecutions. Anathematised in 430, he was condemned in 431 at the oecumenical council of Ephesus. C. himself was condemned by John of Antioch for his harsh treatment of Nestorius, both depositions, curiously enough, being ratified by the emperor, but C. was soon reinstated. A number of C.'s homilies are extant, besides his defence of Christianity (433). See E. Weigl, *Die Heilsschre des Cyrillus*, 1905, and H. du Manoir, *Unome et spiritualité chez St. Cyrille*, 1944.

Cyrillus Lucaris (1572-1637), Gk. ecclesiastic, was b. in Crete. He was a student at Venice and Geneva, in the latter place adopting the tenets of Calvinism. He eventually became patriarch of Constantinople, and to bring about the reform of the Gk. Church, kept up communications with the followers of Calvin in England and Holland.

Cyrrus, Gk. name of the is. of Corsica, from which is derived the adjective *Cyrrus*, used by the Lat. poets.

Cyrus the Great (d. 528 B.C.), founder of the Persian Empire, was the son of Cambyses I. and of Mandane, daughter of the Median king Astyages, and the grandson of Cyrus I., and the fourth of a line of kings over Anzan or Elam. He thus belonged to a branch of the royal house of the Achæmenides. His boyhood is shrouded in a mass of legend. A grandson, as it seems, of Astyages, king of Media, C. in 549 B.C. captured Astyages and gained possession of his cap., the anct. Ecbatana. Three years later he was face to face with a great coalition of Egypt, Lydia, Babylon, and the little Gk. state, Sparta. But although the famous King Croesus of Lydia had foretold him by invading Cappadocia, C. early inflicted a crushing defeat on Croesus, captured his cap., Sardis, made Lydia a prov. of his Persian Empire, and, according to Herodotus, was only prevented from burning the Lydian king alive by his admiration of his philosophy. C.'s next step was the subjugation of the Carians, Lycians, and Ionians of Asia Minor, who, nevertheless, offered a stubborn and gallant resistance. In 538 B.C. the great Babylonian empire crumbled to pieces before the Persian conqueror. King Nabonidus of Babylon had been wont to pass year after year in idleness at his cap., whilst his son led the army in Akkad (N. Babylonia). It was in Akkad alone that C. met any serious opposition, for Babylon, without striking one blow for freedom, helplessly opened its gates to let the victor in. Nabonidus d. almost immediately after this, and C., who was a polytheist and Zoroastrian, proudly proclaimed himself a favourite of Marduk, the chief local god of Babel. With Babylon fell also the Babylonian provs. in Syria, so that the Jews were now

under C.'s sway. In pursuance of his policy of religious conciliation he allowed the latter to return to Palestine and to rebuild their temple at Jerusalem, and for this generous act of deliverance from captivity he is referred to in the O.T. as 'the Shepherd and the Anointed of Jehovah.' It is also said that C. made successful military expeditions against the Bactrians and the Sæcæ. There was thus considerable justification for his title, king of the world, for his mighty empire extended from the confines of Egypt to the banks of the Indus and Jaxartes from the Persian Gulf to the S. of the Caucasus and Caspian on the N. C. was a splendid warrior and no mean statesman; in his humanity he far outstripped his contemporaries, for he never sacked a city, and spared alike captive, kings, and people. The Gks. honoured his memory. Xenophon chose him as the hero of a treatise, and to the Persians he was always the father of the people. His huge empire, which he had tried to organise under satraps, showed, however, no powers of cohesion the instant his dominating personality was removed. See L. Vivien de Saint Martin, *Mémoires sur l'éclipse de Thalès et sur l'époque de la prise de Sardes par Cyrus*, 1836, and P. Kleper, *Die Neue entdeckten Inschriften über Cyrus*, 1882.

Cyrus the Younger (424-401 B.C.), second son of Parysatis and Darius, king of Persia. At sixteen he became satrap of Asia Minor. In 404 he plotted against the life of his brother, Artaxerxes Mnemon, who had just succeeded his father. His plot was prematurely discovered, and C. was sentenced to death, but pardoned on his mother's intercession. Later he entered into an alliance with the Spartans, and it was largely through his help that Lysander defeated the Athenians at Cægospotami. But again he conspired against his brother, and marched from Sardis inland with a great army of 100,000 Asiatics and 13,000 Gk. mercenaries. At Cunaxa he came in conflict with his brother's army. Unfortunately C. was slain, otherwise the victory would almost certainly have been his. Xenophon in his *Anabasis* speaks highly of C., both of his prudence, generalship, and liberality, as well as of his enthusiasm for Gk. philosophy.

Cysoing, tn. 9 m. S.E. by E. of Lille, in the dept. of Nord, France. There are cotton and woollen manufactories and a brewery, but C. is famous for its buildings of historic interest, including a nineteenth-century church, once the chapel of an Augustinian abbey, and the ruins of an anct. Merovingian castle. Pop. 3100.

Cyst (Gk. κύστις, bladder), term used in various ways for bladderlike formations. In zoology it is applied to the protective covering formed by lower animals at such times as a period of drought or immediately before passing into the resting stage. The C. in which a young tapeworm usually becomes enveloped when in process of becoming a cystic or bladder-worm, is formed from the connective tissue of the animal in which it is residing.

Cystitis is the term used in medicine for inflammation of the bladder. A cystoscope is an instrument which, when passed along the urethra into the bladder, permits an examination of the latter and its lining.

Cystopteris, genus of Alpine and Arctic ferns in the family Polypodiaceae. *C. fragilis*, the brittle or bladder fern, is common on rocks and walls in limestone dists. of Great Britain; *C. montana* is found on hills of Scotland. *C. bulbifera* has buds on the petioles which break off and give rise to new plants.

Cythera, anct. name of the is. of Cerigo (q.v.).

Cytinaceae, a family of dicotyledonous plants, was estab. by Bentham and Hooker; it comprises the Rafflesiaceae together with the Hydnoraceae. All the species are leafless parasites without chlorophyll, and the flowers are either solitary or borne in a small, compact inflorescence. *Cytinus hypocistis* is a parasite found growing on the roots of certain kinds of cistus in S. France, and in Fr. pharmacy the condensed juice of the fruit is used as a styptic.

Cytisus, genus of hardy papilionaceous shrubs, natives almost exclusively of Europe and the temperate parts of Asia, bearing ternate leaves and almost always yellow flowers. *C. purpureus* is an exception to the yellow-flowered species, and has lilac-coloured flowers. *C.* (or *Sarothamnus*) *scoparius* is the broom-plant so well known and loved on our heaths for the brightness of its golden blossoms; the leaves of the plant are greatly reduced, and the fruit has an explosive mechanism. *C. laburnum* (sometimes called *Laburnum vulgare*) is a small tree which is a common ornament of our gardens, and, like *C. Alpinus*, its branches are laden in spring with bunches of pendant yellow flowers. They have a handsome, hard, olive-green wood, well adapted for the purposes of the turner. Both are natives of the Alps and are much alike, but *C. Alpinus* is the handsomer plant, and has broader and more shining leaves. The seeds of these species are dangerously poisonous, though most of the plants in this family are wholesome. The plant known as *C. Adami* is a curious example of a graft-hybrid, in which *C. purpureus* was grafted on to *C. laburnum*, and the upper part of the tree shows hybrid characters. The *C.* of Virgil was the *Medicago arborea* of botanists.

Cytology, branch of science that deals with the structure and behaviour of the minute cells that make up the bodies of all living organisms. The simplest organisms consist of one cell only and are said to be *unicellular*; such are bacteria, amoebae, and numerous aquatic plants and animals. Higher organisms consist of numerous cells and are said to be *multicellular*. The structure of a typical green plant cell is roughly as follows: Bounding the cell is a wall of *cellulose*, a substance familiar to every one as the chief constituent of paper and cotton-wool. Lining this cell wall is a layer of *protoplasm*, a colloidal (see COLLOIDS) sub-

stance and the actual seat of life. In the protoplasm are a number of bodies known as plastids, e.g. the *chloroplasts* containing the green colouring matter chlorophyll. The centre of the cell is frequently occupied by a watery liquid called the *cell sap*, and the space in which this liquid lies is a *vacuole*. Finally embedded in the general protoplasm or slung to it by protoplasmic threads is a body composed of denser protoplasm; this is the *nucleus*. Animal cells do not contain chloroplasts and do not as a rule produce cell walls, but, like plant cells, they all consist of (a) *nucleus* and (b) general protoplasm or *cytoplasm*. The cytoplasm contains granules known as *mitochondria*, while in animals small sections called *golgi bodies* also occur. Both mitochondria and golgi bodies play definite roles in cell div., but the details are too complex to be considered here; the golgi bodies are also thought to be concerned in the secretory activities of the cell. A more obvious and presumably more important part in cell div. is taken by the nucleus, which consists of a network of fine threads contained within a thin nuclear membrane. The nuclear material is readily stained by certain dyes, such as haematoxylin, a fortunate fact that enables its nature and behaviour to be more easily studied. When the cell is about to divide, certain changes take place in the nuclear material, which sorts itself out into short thick pieces known as *chromosomes*, the number of which varies from organism to organism, but is always the same for the same organism except in the germ cells which have only half the normal number. In this way the normal number is restored at fertilisation, egg and sperm each bringing half the total chromosomes. The process of div. of the nucleus is described as *mitosis*; it is roughly constant in its main stages throughout the animal and plant kingdom. When the chromosomes are ready, they each divide longitudinally into two, one half-passing towards one end of the cell and the other to the other end. Here the half-chromosomes help to form the two daughter nuclei, one at each of the opposite ends of the cell. After a time div. of the cytoplasm, that has been going on meanwhile, is also completed, and two cells are thus formed in place of the original one. The daughter cells in due course grow to adult size.

The careful div. of nuclear material and the constancy of the number of chromosomes indicate that the problem of the transmission of hereditary characters must centre in the nucleus. Modern research has indeed shown that the chromosomes appear to be the primary agents in this transmission, and there is evidence that a chromosome contains a number of independent factors or *genes* each of which is responsible for the transmission of particular characters. The investigations of Mendel (q.v.) and other biologists have conclusively shown that some such mechanical or material agency must be concerned in hereditary transmission, and breeding experiments extensively carried out by Morgan and others

have made considerable advances in our knowledge of the subject. The determination of sex in many animals, including man, has been shown to be conditioned by the behaviour of a certain pair of chromosomes, but it is probable that further factors are normally involved. In any case, the detailed study of the cell is one of the most promising fields of present-day biological research, and the behaviour of cells under the artificial conditions of the laboratory is likely to produce results of immense practical, as well as theoretical, importance. See the articles on BIOLOGY and CELL. See also L. Doncaster, *Cytology*, 1920; E. B. Wilson, *The Cell in Development and Heredity*, 1925; C. D. Darlington, *Recent Advances in Cytology*, 1932; I. W. Sharp, *Introduction to Cytology*, 1934; and R. A. R. Gresson, *Essentials of General Cytology*, 1948.

Cyturus or **Cytorum**, tn. on the coast of Paphlagonia, a commercial settlement of Sinope, stood upon the mt. of the same name, celebrated for its box-trees.

Cyzicus, see ANTIOCHUS.

Cyzicus, anct. name of a peninsula, about 9 m. in length, projecting out from the S. coast of the sea of Marmora, 70 m. S.W. of Constantinople. Once an is., it was famous in anct. times for the splendid city of C., described by Strabo, which was finally destroyed by the Arabs in 675. Originally C. was colonised from Miletus, in 756 B.C. As late as 1444 there were still standing thirty-one columns of the magnificent temple of Hadrian. The Turks call its mts. (2500 ft.) Kapudagh. Earthquakes again and again devastated C.

Czar, title of the emperor of Russia prior to the First World War, and of the king of Bulgaria, derived from the Lat. *Cæsar*. See TSAR.

Czarniecki, Stephen (1599-1665), Polish general. In 1654 Poland was invaded, and C. distinguished himself by strenuously defending Cracow, which he was compelled eventually to surrender to Gustavus Adolphus. He was victorious, however, in successive battles against the Russians and Swedes, notably at Koziencio, and finally gaining a decisive victory at Polonka, 1660. He was rewarded for these services, being placed in a position of high honour by the king, but d. very shortly afterwards while on a campaign against Russia. C. is sometimes known as the Polish du Guesclin.

Czartoryski, Adam Georg, Prince (1770-1861), Polish revolutionary leader, b. at Warsaw; spent part of his boyhood in England and studied at the univ. of Edinburgh. In 1793 he returned to Poland and enlisted under Kosciuszko. After the failure of this leader, C. was sent to Russia as a hostage, where he gained the favour of the Grand Duke Alexander and the Emperor Paul, who made him ambas. to Sardinia. In 1801, on the accession of Alexander, he became assistant to the minister of foreign affairs, and in this capacity in 1805 subscribed the treaty with Great Britain. He was curator of the univ. of Vilna for some time, and used all his powers to foster Polish

national feeling, resigning when some of the students were transported to Siberia for sedition. In 1830, at the outbreak of the revolution, he joined the Poles and devoted all his energies to the cause. He was appointed president of the provisional gov., and as such summoned to the Diet which met in Dec. 1830. In Jan. 1831 the Diet, having declared the Polish throne vacant, made C. head of the national gov. He gave liberally, both of his money and personal services, and after the defeats of Aug., served as a common soldier. He was excluded from the amnesty which was proclaimed on the Russian victory, and escaped to Paris, where he still remained a centre of Polish national life.

Czaslau, see CASLAW.

Czechoslovakia, central European republic, formerly part of the dual monarchy of Austria-Hungary, but whose independence was proclaimed in Nov. 1918. The frontiers of C., which border on Austria, Germany, Poland, Hungary, and Rumania, were fixed in 1919 by the treaty of St. Germain and the two treaties of Versailles. The constituent parts of C. are Bohemia, Moravia, and part of Silesia, formerly under Austrian rule, and Slovakia. Sub-Carpathian Ruthenia, formerly under Hungarian rule, was transferred to Russia by a treaty of July 29, 1945 (see below under History and also RUTHENIA).

Area and Population (1947).—Bohemia, 20,101 sq. m.; 5,626,600. Moravia and Silesia, 10,351 sq. m.; 3,135,700. Slovakia, 18,902 sq. m.; 3,402,300. Total area 49,355 sq. m.; total pop. 12,164,600 (8,200,000 Czechs; 2,900,000 Slovaks; 400,000 Gers.; 400,000 Hungarians; 20,000 Jews; 700,000 Poles). The pop. of the chief tns. is as follows: Prague (the cap.), 921,400; Brno (Brunn), 272,700; Ostrava, 181,100; Bratislava, 172,600; Plzeň (Pilsen), 118,100; Olomouc, 58,600; Košice, 58,000; Usti nad Labem, 56,100; Liberec, 52,700; Hradec Králové, 51,400; Zlín, 45,900; Teplice-Sanov, 45,300; Pardubice, 44,300; Kladno, 40,600; České Budějovice, 38,100; Most (Brunx), 35,300; Prostějov, 31,500; Karlovy Vary (Carlsbad), 31,100; Děčín Podrasky, 30,700; Opava, 30,100.

Religion and Education.—The majority of the people are Rom. Catholics, who are estimated to number 9,300,000; Protestants, 900,000; without confession, 820,000; Orthodox, 50,000; Jews, 20,000. In 1920 part of the Rom. Catholic clergy of C. decided to withdraw from the jurisdiction of the pope and to found a Czech Church which, by 1947 had 950,000 adherents. There are (1947) 18,700 schools in C., attended by 2,050,000 pupils. Of these 2423 are nursery, 13,511 elementary and higher elementary, and 261 secondary schools (the last with 101,700 pupils). The number of students at univs. and technical univs. is: Prague Univ., 18,840; Technical Univ. (Prague), 15,390; Brno Univ., 6640; Technical Univ. (Brno), 3240; Bratislava Univ., 3980; Technical Univ. (Bratislava), 1680; and Olomouc Univ., 960. There is

a Higher Veterinary Academy at Brno; a mining academy in Moravska-Ostrava; a Higher Agric. College at Brno; an Academy of Arts in Prague; and a Commercial High School in Bratislava.

Judicial System.—Far-reaching reforms of the judicial system enacted at the end of 1948 provide for three kinds of law courts. The dist. courts, of which there are to be one for every 50,000 inhab., will deal with all cases, civil and criminal, except proceedings under the defence law, which will go before special State courts. The regional courts, thirteen in number, will be courts of appeal, the decisions of which will be subject to the right of final appeal to the supreme court only if the regional court so decides when giving a

Mineral wealth includes soft and hard coal (Most, Chomutov, Teplice, Moravska-Ostrava, and Palknov have coalfields). Iron, graphite, garnets, silver (Bohemia), copper and lead (Slovakia). The industries (which have been nationalised) include steel works, cast-iron works, metal-working firms, precision instruments, glass huts, cellulose chemical and pharmaceutical, china-clay, loam and clays, cement, timber-dopes, gramophone records, industrial distilleries and alcohol refineries, breweries (the beer brewed at Plzeň is famous), and flour mills; also the broadcasting service and film industry. Imports for 1946 had a value of 10,239,000,000 crowns, and exports 14,345,000,000 crowns.

PRAGUE, FROM THE VLTAVA

verdict. From the decisions of State courts the right of appeal will be to the supreme court alone. Dist. courts will consist of two laymen with one professional judge, and only minor cases may be dealt with by the judge sitting alone. The legal profession is to be socialized by establishing regional associations of advocates to which all its members must apply for admission. Those admitted will receive a basic salary, and will hand all their fees to the association. Their work will be recorded, and they will be eligible for a share of the association's profits.

Production.—Agriculture is highly developed. Some 41 per cent of the total land area is arable land; forests cover 31 per cent; meadows and pastures 15 per cent. After the liberation of the country in 1945 land reform followed; and in Bohemia and Moravia 2,297,100 ac. belonging to 300,000 owners of Ger. nationality, and, in Slovakia, 345,800 ac. belonging to Magyars and Gers., were confiscated and distributed among smallholders and agric. workers. Agric. produce includes wheat, rye, barley, oats, maize, potatoes, and sugar beet. There are (1949) 105 sugar factories producing over 600,000 metric tons annually.

Communications.—Bohemia and Moravia: 9611 km. of railways; 27,993 km. of roads maintained by the state and 24,899 km. maintained in the dist. Slovakia: 3517 km. of railways; roads maintained by the state, 8127 km.; in the dist., 6506 km.

Finance.—Total revenue in 1948 (budget estimate) was 56,895,500,000 crowns; expenditure, 67,056,300,000 crowns. The monetary unit, the crown (Koruna, Kčs) is divided into 100 halers, and stabilised at the rate of 201.50 to the £ sterling. According to the 1947 budget the total home and foreign national debt amounts to 108,750,000 crowns. The internal debt amounts to 87,805,000 and the foreign debt to 20,945,000 crowns.

Defence.—Military service lasts two years, after which the soldier passes to the first reserve until he reaches forty, when he goes to the second reserve, till he reaches fifty. Armament and training are on the Soviet model, and co-ordinated by a Soviet military mission in Prague, according to the treaty of Moscow, Dec. 12, 1913.

History (1914-39).—The early hist. of C. is that of Bohemia (*q.v.* and also CZECHS), and the memory of that former political unity, the kingdom of Bohemia, was the

urge to such men as Masaryk, Beneš, Kramář, and Štefánek to found a similar political unity on the lines of a modern republic. At the outbreak of the First World War the Czechoslovaks (this joint name had been in current use since 1880) found themselves impressed into the service of Austria, while their sympathies were with the Allies, their political ideals being opposed to a pan-Ger. domination of Central Europe. Many Czech detachments in the Austrian Army went over to the side of the Serbs, and the exploits of the Czechoslovak Army in Siberia commanded the admiration of Europe. It was Thomas Masaryk (q.v.), who began the formation of Czechoslovak legions which served voluntarily with the allied armies, and this, together with Masaryk's own writings and speeches and scrupulously honest propaganda, convinced England, France, Italy, and America of the reality of the Czech claims to national independence. A Czech National Council was formed at Paris, and at the peace conference this was recognised as the responsible gov. of a belligerent nation with a right to be represented. Czechoslovak unity, however, was not a factitious result of the peace conference. The union of the two Slav races had for long been an ideal, and after the collapse of the Hapsburg monarchy it became an accomplished fact. In Jan. 1918 an all-Constituent Assembly, held in Prague, was followed in April by a congress of oppressed nationalities which met in Rome. In Oct. a bloodless revolution placed the administration of Prague in the hands of the National Council, and an Assembly, convened on Nov. 14 in Prague, elected Masaryk as president of the new republic, Karel Kramář (1860-1937) as premier, and Edouard Beneš (q.v.) as foreign minister. A provisional constitution was drawn up, and the National Assembly, formed after a general election on Feb. 29, 1920, passed this constitution and formally ratified President Masaryk's election for a period of seven years. In 1927 he was re-elected. Beneš represented C. at the peace conference and pleaded successfully for the recognition of C. as a national unity. The Slovaks, the former victims of Magyar domination, had free and equal rights under the new constitution, although they were not as advanced as the Czechs, deliberate retardation having been part of the Magyar policy. The most backward of the races formerly governed by Hungary were the Ruthenians, inhabiting sub-Carpathian Ruthenia, a part of Little Russia. In 1918 they petitioned for an autonomous union with C., and this was ratified at the peace conference. A 'Little Entente' was formed and renewed in 1929 between C., Yugoslavia, and Rumania to resist possible Magyar or Bolshevik aggression and to promote trade on the Danube. An agreement with respect to common interests was made in 1924 between France and Germany. The Ger. and Magyar minorities in C. enjoyed equal citizenship with the Czechoslovaks—though Lord Runciman,

who went out to C. as mediator in the dispute between the Sudeten Gers. and the Czechoslovak Gov. (see below) in Aug. 1938, suggested that the Sudeten Gers. had legitimate grievances.

The German Invasion and Annexation of 1939.—But conflicting ideologies in E. and W. Europe were already, in 1936, bringing about a deterioration in the political situation in Central Europe, and in Jan. 1937 Hitler, in a general review of his foreign policy, made no reference to the vital matters of Ger. relations with C. and, in particular, the absence of any friendly overture to C. gave rise to misgivings in diplomatic circles. Throughout 1937 the problem of the Sudeten-Ger. minorities in N. C. caused friction and anxiety. These minorities were mainly descendants of Ger. colonists invited by the last rulers of the Premisl dynasty in the Middle Ages. They numbered 3,232,000, or one-fifth of the whole pop. of C., and held 40 per cent of the country's industries. They were bitterly hostile to their inclusion in the new state of C. formed after the First World War by the treaty of Versailles, and their deputies consistently pursued a policy of obstruction, with the exception of the Ger. Clerical party, which joined the gov. bloc. In 1936 Konrad Henlein (q.v.), the Nazi-controlled leader of the malcontents, had succeeded the extremist Kaspar, whose adherents disagreed with the more apparently constitutional methods pursued by Henlein. Dr. Beneš, who was then President of C., admitted that the Sudeten Gers. had grievances—an admission which was later to receive some support from Lord Runciman in a Brit. Gov. White Paper—but he refused to entertain the idea of giving them national autonomy within the state of C. During Jan.-Feb. 1937 uneasiness was caused in C. by Ger. allegations that aerodromes were being placed at the disposal of Soviet Russia for possible use against Germany. An opportunity to inspect the aerodromes was given but refused. The death of ex-President Masaryk caused a temporary truce between the Czechoslovak Gov. and the Ger. coalition parties, but did not long abate Ger. press attacks on C. In 1938 the outlook for C. grew ominous by reason of the Ger. absorption of Austria, which not only left the Czechoslovak republic surrounded on three sides by Ger. ter., but further embarrassed it by the presence of a fringe of Ger. pops. within the whole length of the frontier. It was evident that the next Nazi step towards the consolidation of the Ger. race would be attempted against C., and the situation was made more menacing by the announcement that the Ger. Army manoeuvres would be held in the autumn on an unprecedented scale and in close proximity to the Czechoslovak frontiers. During the summer of 1938 the Nazi party in the Sudeten Ger. lands, vigorously supported by their kinsmen, pressed ever more aggressively for an increasing series of privileges, which in the end became incompatible with the sovereignty of the republic. This time there was a brief

respite, during which the Czech Gov. invited a Brit. statesman to study the questions at issue on the spot and endeavour to mediate. Lord Runciman, however, found himself thwarted by rising passions on both sides, the Sudeten Gers. accepting one concession only to demand another, the Czechs protesting that their national existence was threatened and invoking the treaty binding France to their support. Behind the Sudeten Gers. now loomed the might of Germany. Hitler had roused his followers to frenzy by a furious oration at a Nazi rally at Nuremberg. The League of

was only accepted by the Czech Gov. under severe pressure. At the eleventh hour, within three days of the date when he had announced his intention to invade C., Hitler accepted the negotiated settlement. By that time the Brit. Navy was mobilised—a factor by no means without influence in resolving the crisis, though, as events were to show, only for twelve months. Many averred that the cause of C. had been betrayed by a pusillanimous truckling to the dictators, through the Munich agreement of Sept. 30 concluded at a conference between the Brit. and Fr. Premiers and Hitler and Mussolini (see MUNICH PACT). President Beneš resigned and the truncated republic of C. set about the task of adapting policy and institutions to harmonise with the desires of the Reich. In March 1939 Hitler, in flat defiance of his Munich pledges, proclaimed the annexation of the remainder of C., accompanying his proclamation with such a display of military force as made resistance impossible.

History of Czechoslovakia during the Second World War and after.—Following the Ger. occupation (March 15), to which the army and people, on instructions from President Hacha's pro-Ger. Gov., offered no resistance, Hitler issued a proclamation declaring Bohemia and Moravia a protectorate of the Reich, Baron von Neurath being appointed protector. The Czechoslovak National Bank, together with its gold reserve of 2,500,000,000 crowns, was taken over by Ger. bank officials; the Czech Army was disbanded and all political parties were merged in a single party led by the puppet president. Slovakia, which, under Father Tiso, had acquired autonomous gov., was allowed to retain her nominal independence and military forces; but in fact her autonomy was useless, for the Gers., later in the year, in preparation for the invasion of Poland, sent large bodies of troops into the country and declared martial law. On the secession of Slovakia, Carpatho-Ukraine, the third component of the Czechoslovak state, also declared its independence, but the existence of this new state was short-lived, Hungarian troops having marched into the ter. even before the Gers. occupied Moravia-Ostrava by way of forestalling Polish action in that very important strategic position. The process of Germanising Bohemia-Moravia was carried on relentlessly by von Neurath and his coadjutor, the Sudeten Ger. Frank, assisted by the Gestapo. Hacha was left with the title of president, but wielded no power and, despite his pro-Ger. efforts, the people remained bitterly hostile to the Gers. Systematic sabotage led to arrests and deportations of Czechs to concentration camps, where they often suffered death and torture. A cruel blow to the Czech spirit was struck by the closing of the Czech Univ. The economic subjection of the country was completed by the setting up of a Customs and Monetary Union with the Reich, under which all diplomatic trade agreements were to be concluded by Germany, and the National Bank in

LACE-MAKING IN CZECHOSLOVAKIA

Nations was powerless, for its authority was acknowledged only by one side to the dispute. It was a supreme test of the Brit. Prime Minister's policy of appeasement. Meanwhile Lord Runciman reported that the claim of the Sudeten Gers. was substantially justified. The problem ought, therefore, to have been referred to the orthodox machinery of boundary negotiation through diplomatic channels. But Hitler claimed to dictate and seize by force of arms a frontier the Czechs contended to be ethnographically unjustified and one that must leave their country defenceless. It was at this stage that Mr. Neville Chamberlain, the Brit. Prime Minister, travelling by air, sought a direct interview with Hitler in his home at Berchtesgaden. Having thus induced Hitler to negotiate he consulted his own Cabinet and made a further flight to Germany in order to secure the acceptance of a plan agreed upon by Great Britain and France. This plan called upon C. to make heavy sacrifices in the cause of peace and

Prague ceased all international dealings. Abroad the Czech Provisional Gov., with headquarters in London, directed the efforts of some 2,000,000 Czechoslovak citizens abroad in co-operation with Great Britain and the Brit. Empire in all spheres. Both the Czech Army and air pilots rendered useful service to the Allies from 1940, both in Great Britain and the Middle E. But Slovakia, under the puppet president Tiso, continued to co-operate with Germany, and late in the year became a junior member of the Axis (q.v.).

Following the Ger. declaration of war against Russia, the armament industries and transport facilities of C. acquired an added importance for the Gers. There now occurred, through sabotage by Czech patriots, an unusual number of serious railway accidents, explosions in armament factories, and similar incidents. Production at the Skoda works fell by two-fifths. Von Neurath left, ostensibly for health reasons, and was succeeded by the notorious Gestapo chief Heydrich (q.v.), who promptly initiated a reign of terror, which only ended after some eight weeks with the realisation that it could not break the Czech spirit. Meanwhile Hacha, on the occasion of a visit of Heydrich to inspect the crown jewels in the St. Venceslas Chapel of St. Vitus's Cathedral, gave the seven keys of the treasury of the former Czech kings to Heydrich as 'a symbol of Czech fidelity to the Reich.' Slovakia's adherence to the Axis brought her no benefits; and in Oct. 1941 Tiso visited Hitler to receive an assurance that Slovakia, on condition of putting her forces at Germany's disposal, would not be asked to yield any more ter. to Hungary. In the succeeding period a number of pro-Nazis were introduced into the re-formed Czech Cabinet, with a view to speeding up the nazification of Bohemia-Moravia. In May 1942 Heydrich announced that the entire youth of the country was to be conscripted. Next day a bomb was thrown at his car, and he was fatally wounded. The outcome was a new reign of terror, the brutality of the Gers. culminating on June 10 in the stark horror of the destruction of the vil. of Lidice (q.v.), with the shooting of all the men and the sending of all the women to concentration camps. Executions continued until the end of the year.

On Aug. 5, 1941, the Brit. Gov., in order to obviate misunderstanding, pub. a White Paper confirming the undertaking given to Dr. Beneš (Nov. 11, 1940) that in the post-war settlement Britain would not be bound by any arrangements made at Munich in 1938 regarding the frontiers of C. Shortly before this the Czech legation in London was raised to the rank of an embassy, and the Brit. minister to the Czech Gov. (in London) also became an ambas. Von Neurath, having by now formally resigned after the death of Heydrich, was succeeded by Dr. Wilhelm Frick, former Ger. minister of the interior, while the Sudeten Ger. K. H. Frank was made minister of state. Despite the second reign of terror the underground

movement in the country intensified its activities, and notwithstanding the efforts of the puppet Premier, Dr. Krejci, the people were as bitterly anti-Ger. as ever, though doubtless many must have lost their lives in the allied air raid on the Skoda works in Pilsen (April 18, 1943). Up to the end of 1943 the number of Czechs executed by the Gers. was close on 3000. Early in 1943 the mobilisation for war work of all men up to sixty-five and women up to forty-five, proclaimed in Germany, was extended to Bohemia-Moravia, with the object of obtaining 500,000 persons for slave labour in Germany; but transport difficulties, aggravated by allied raids, made it impossible for the Gers. to move more than a portion of the 550,000 persons registered.

For some time Dr. Tuka, a Magyar, had been Premier of Slovakia, but in 1943 he retired from the vice-chairmanship of the totalitarian Hlinka party, having, however, secretly negotiated with Hungarian politicians for the incorporation of Slovakia into Hungary. Slovakia's part in the military operations against Russia was rendered largely negligible by the great losses which the Slovak motorised div. suffered in the Caucasus early in 1943, and by mass desertions from the Slovak Infantry brigade in the Crimea later in the same year. The corruption and unscrupulousness of the pro-Nazi Gov. of Slovakia were now, however, beginning to reap their harvest by driving ever greater numbers of Slovaks into the underground resistance movement. In May-June 1943 Dr. Beneš, President (in London) of the Czech republic, visited the U.S.A. and Canada, thereby demonstrating both to the Czech people and to the Gers. and Hungarians that the Czech Gov. of London enjoyed the full confidence and support of the U.S.A., a fact which was confirmed by the raising of the Czechoslovak legation in Washington to the status of an embassy. Dr. Beneš addressed a joint session of both Houses of Congress and, in Ottawa, he addressed members of both Houses of the Canadian Parliament. Later in the same year he went to Moscow to witness the signing of a treaty of friendship, collaboration, and mutual assistance between C. and Soviet Russia, the culmination of negotiations which had been in progress for many months. Czechoslovak infantry and artillery formations, which had participated in the Syrian and Libyan campaigns of 1940-42, were transferred to Great Britain, and merged with the Czechoslovak independent brigade into an armoured brigade. The first Czechoslovak independent brigade in Russia fought before Kharkov (March 1943), and won sev. decorations, among them the award, posthumously, of the title 'hero of the Soviet Union,' to Lt. Otakar Garos, first foreigner to receive the highest military honour bestowed by the U.S.S.R. A second Czechoslovak brigade was formed by Czechs, Slovaks, and sub-Carpathian Ruthenians, who had succeeded in deserting from Axis fighting formations or labour detachments. Dur-

ing 1944 the E. regions of the Czech republic were liberated from Ger. domination, and the gov. and state council in London devoted themselves to the task of legislating for the period between military liberation and the re-establishment of normal conditions; while members of the Czech Gov. in London took part in the International conferences, such as that of United Nations Relief and Rehabilitation Administration, held during the year preparatory to the post-war settlement.

The Czechoslovak armoured brigade in Great Britain left for the Continent in Aug. 1944, and took part in the siege of Dunkirk, while Czech fighter and bomber squadrons of the R.A.F. were among the air forces covering the landings in Normandy. There was formed in Russia a Czech air force regiment of parachutists who took part in the subsequent Slovak rising against the Axis forces. This rising was well prepared in co-operation with the gov. of Beneš during the latter's visit to Moscow. The Slovak Army was instructed to rise, and the civil authorities to restore the Czechoslovak republic on Slovak soil as soon as the Russian armies reached the Carpathian passes leading into E. Slovakia; and in preparation for the rising great quantities of munitions were stored in the mts. of central Slovakia. In Bratislava there was fighting between guerrillas and parachutists on the one hand and Ger. S.S. battalions on the other. The Ger. high command thereupon told the Slovak Gov. that they were about to occupy Slovakia by their military forces 'as provided in the Ger.-Slovak treaty of March 1939'. The Slovak National Council promptly countered this announcement by calling on the country to resist and proclaiming the puppet Slovak state to be abolished and the Czechoslovak republic restored on Slovak ter. Some regular troops and guerrillas succeeded in hampering the occupation of Slovakia by the Ger. Army, thereby leaving a flank in Germany open to allied attack from Poland and Rumania. In the central region, where most of the fighting took place, the Ger. Army and Gestapo burnt down vill. and slaughtered the people. It is estimated in Bratislava that the loss of life during and after the rising—which was premature in view of the fact that the Russian Army was nowhere near the N.E. Slovak border—at some 25,000-30,000. Hence the Czech forces withdrew from the area of Banská-Bystrica into prepared positions in the mts., where organised resistance was carried on pending the arrival of the Russians from Hungary.

During 1944 allied aircraft launched a dozen heavy raids on C., which caused damage to the Skoda works, and the great synthetic oil plants at Most, and in the Brno-Adamov dist., where a great armament combine was attacked. After the Allies had landed in Europe unrest increased in C., whereupon Frank threatened the people that Germany might change the legal position of Bohemia-Moravia by incorporating both ter. in the Reich, and steps in this direc-

tion were gradually taken. The real reason for this move was that with the loss of huge resources in the E. and in the Balkans the Gers. found themselves compelled to seize substituted economic resources wherever they might find them. Thus the coalfields of C. were ruthlessly exploited, mainly to manuf. synthetic oil. Following the conspiracy of the Ger. generals against Hitler's life total mobilisation of man power was ordered in the 'protectorate' of Bohemia-Moravia, and by the middle of 1944 some 500,000 Czechs were working outside their own country. Under the Ger. occupation the internal indebtedness of the protectorate had increased to more than 60 billion crowns, while the note circulation reached 24 billion crowns as against 7 billion in the whole of C. before the war.

Carpathian Ukraine (sub-Carpathian Ruthenia) was the first of the provs. of C. to be freed by Soviet and Czechoslovak troops. Early in Oct., following the collapse of Rumania, Russian forces were able to press their attack against the Ger.-Hungarian armies from a S. and S.E. direction and overrun all the Hungarian lines of defence. Owing to C.'s central position in Europe, it is not surprising that Prague was the last European cap. to be liberated. At the end of 1944 Marshal Koniev's armies entered C. from Hungary and Poland, but some months elapsed before they reached the cap. After being joined by the Czech Army Corps of Gen. Svoboda, the combined allied forces liberated Kosice and Presov (Jan. 20, 1945) and Poprad (Jan. 17) beneath the Tatras. But then Ger. resistance stiffened and it was not till the middle of March that Banská-Bystrica and Zvolen, in the Lower Tatras, fell to the Allies. On April 4 Bratislava, cap. of Slovakia, was occupied by Russian troops, who had fought their way along the Danube from Hungary. With the capture of Hodanin in S. Moravia (April 12) Russian troops entered Czech ter. A week later Gen. Patton's Amer. troops of the 50th Div. marched into C. at a point N.W. of Asch, and simultaneously the Czech Gov., now back on Czech soil, appealed to the populace to rise against the Gers.—an appeal which met with swift response. There ensued savage fighting in N.W. Slovakia and S. Moravia. On May 5 the people of the cap. rose against the Ger. occupying troops and a fierce battle lasting four days took place between poorly armed Czech patriots and the Gers., in which 2000 Czechs and nearly 1000 Gers. were killed. Amer. troops who entered Píseň on May 6 were only 50 m. from Prague on May 7, when they refrained from marching further in accordance with the Yalta agreement (q.v.) which delimited the zones of occupation between the Allies. On May 7 the Ger. garrison of Prague surrendered to the Czechoslovak National Council which had organised the rising, and the last remnants of Ger. resistance were wiped out by Russian troops who entered the city on May 9, the day following the final capitulation of the Ger. forces in

Germany. Ters. taken by Gers., Poles, and Hungarians were restored to Czechoslovak sovereignty between Nov. 1944 and June 1945. Sovereignty over sub-Carpathian Ruthenia was transferred to the Soviet Union by the treaty of Moscow, July 29, 1945. Dr. Benes and his associates reached Slovakia in April, where they set up a provisional gov. of the National Front of sixteen Czechs and six Slovaks pending the meeting of the Constituent National Assembly which was to consist of a single House of 300 members. The nationalisation of the means of production, in industry and agriculture and commerce and of banking and insurance, became the chief item in the gov.'s programme. Another fundamental change in the structure of the Czechoslovak republic which took place in 1945 was its change from a multinational into a Slavonic national state. Ger. and Hungarian minorities were transferred variously to Germany and Hungary and later to the Amer.-occupied zone of Germany. The Czechoslovak Gov. at length agreed to retain in C. the rest of the Ger. pop., without, however, restoring the minorities statute of the peace treaties of 1919-20. The ensuing purge resulted in retribution for the chief quislings. Thus Hacha *d.* in imprisonment, while the chief collaborator with the Gers., Col. Emanuel Moravec, committed suicide. Sudeten Ger. Nazis who had helped organise the Ger. reign of terror were handed over to the Czech authorities by the Amer. Army in the occupation zone. Henlein took his own life on being arrested by the Amers. Tiso was brought to trial in Bratislava and condemned. Von Neurath was one of the accused at the Nuremberg trial, charged with responsibility for the murder of Czech students in Prague in Nov. 1939, and for war crimes committed under his authority (*see further under NUREMBERG TRIAL*).

The first post-war election in C. took place in 1946. As in most of the liberated countries, the election was really a trial of strength between the E. and W. concepts of democracy. But whether Democrats or Communists, maintenance of the Russian alliance was axiomatic for every one, irrespective of his politics; but of course the Communists were naturally in the best position to appeal to that universal sentiment. The People's party, however, which is nationalistic or right, is mainly Catholic, and the pope's attitude towards the policy of ejecting racial minorities from their homes caused many Czechs, who were determined to eject all the Gers., to withdraw their support, although the party itself was committed to that step. The Social Democrats, whose leader was M. Fierlinger, the then Prime Minister, had acquired the reputation of being merely a less extreme version of the Communists and therefore had lost ground to the latter. In the result the left-wing parties obtained 152 seats and the right 148. The figures were: Left: Communists 114, Social Democrats 36, Slovak Labour

party 2; Right: Czech Socialists 55, People's party 47, and Slovak Democrats 46. It remained to be seen whether the left could now consider itself strong enough to change the constitution adopted after the First World War, when W. influence, and in particular the influence of the Amer. constitution on President Masaryk, was predominant; whereas the left now stood for the leadership as developed in Russia, for a single-chamber legislature, for making the judiciary an instrument of politics, and for subjecting the individual to strong party discipline. The issue was not left long in doubt, for the all-party gov. formed in 1946 was forced to give up office in Feb. 1948 to the Communist party, who demanded a gov. under their exclusive control. In Feb. 1948 the Communists, urged on by the Soviet Union, which was seeking to create a series of satellite states suitable to its own ideology, secured control of the government. A new gov. was formed in which twelve out of twenty-four ministers, including the Prime Minister, Klement Gottwald, were Communists, while most of the rest were Social Democrats. The acceptance of this ministry, which was forced on Dr. Benes, the president of C., was accompanied by a ruthless purge of the civil service and the suppression of sev. newspapers. The papers still favourable to the previous regime of Czech Socialists, People's, and Slovak-Democratic parties, could not therefore publish the text of the three-power statement by the Brit., Amer., and Fr. Govs. condemning these events as the 'establishment of a disguised dictatorship of a single party under the cloak of a Government of National Union,' and, in fact, the Czech Communist Gov. banned pub. of the statement. Gottwald declaring that his Cabinet would not accept lessons on democracy from those who were responsible for Munich (*see MUNICH PACT*). Jan Masaryk (*q.v.*), son of C.'s first president, minister of foreign affairs, committed suicide, and Benes, although he did not give up his office immediately as president, virtually retired from public affairs. He resigned on June 7, being succeeded by the Prime Minister, Gottwald, and *d.* on Aug. 2. His surrender to the Communist demands had undoubtedly as its sole motive the preservation of the Czech people, for otherwise civil war would have ensued.

Language and Literature.—The Bohemian language belongs to the Slavonic group, and was the first of that group to be scientifically cultivated. It is spoken in Bohemia and Moravia, and in a slightly modified form in Austrian Silesia, Slavonia, and a large part of Hungary. The language, in common with the other Slavonic languages, has many declensions, tenses, and participles; in this respect it surpasses modern languages, and is analogous to the old Gk. and Lat. tongues. The consciousness of Bohemian is increased by the absence of auxiliary verbs, and by the fact that in the preterite tenses the termination expresses the sex of the verb's subject. It has a great variety of words

for varying shades of meaning, and possesses also the past participle active. The small connective particles, corresponding to the Gk. *ἀλλά, μέν, γάρ, δε*, etc., are also to be found in the Bohemian. It will thus be seen that the language has much expressiveness and energy. It resembles the Gk. in its subtlety of grammatical structure; it also possesses the dual number, and is indeed exceptionally well adapted for translating the classics. A great variety of sounds can be expressed, as the alphabet has forty-two letters. Language is undoubtedly a great influence in the development of national music; Bohemian is ranked next to it, in musical value.

Ilaska, wrote clever satires. Pribik Pulkava wrote another prose chronicle, and the *Thaddecek* (the weaver), which is thought by some to be based on a Ger. production, is written in praise of a certain Adelticka; the author of the latter work is not known. The Bohemian author of the fourteenth century who is pre-eminent among his contemporaries is Thomas of Stitny (1333-1400), who wrote in excellent prose upon religious and moral questions. Among other authors may be mentioned Warnier Z. Brezowa, who wrote a hist. of the Rom. emperors and trans. *Mandeville's Travels*. By the end of this period also the complete trans. of the Bible into Bohemian had been made.

BOHEMIA: MARIÁNSKÉ LAZNE (MARIENBAD)

Bohemian literature may be divided into three main periods—the first extends from the beginning up to the time of Huss, that is, to 1409; the second period extends from the time of Huss to about 1774; and from then till the present time forms the third period. The *Chronicle*, in verse, which is generally called after Dalibail, though the real name of the author is not known, belongs to the fourteenth century. The Bohemians possess some remains of a collection of national songs, which probably date from 1290. The univ. of Prague was founded in 1348 by Charles IV., who was strongly in favour of the culture of the Bohemian language, and commanded it to be learnt by the sons of the Ger. electors. All decrees were written in Bohemian instead of in Lat. in the reign of his son, the Emperor Wenceslaus. To this period belong the *Book of the Old Lord of Rosenberg*, one of the very early specimens of Bohemian prose, and the *Exposition of the Law*, by Andrew of Duba. Smil of Pardubitz, surnamed

The prevalence of religious disputes caused the Bible to be more widely read and better understood. Huss did much to settle Bohemian orthography, and his voluminous writings had great influence. Many of his works were in Lat., but a number in Bohemian. The church service was now read in Bohemian, the Bible was re-trans., and a great number of religious and controversial works were written. One of the most influential figures of the time is Peter Chelcicky, who d. in 1460. He has been styled the Bohemian Tolstol, and his writings had much influence in the formation of the Bohemian Brethren. His chief work is *The Net of Faith*. The first regular printing press was set up at Prague in the year 1487, and the years 1500-1620 may be said to constitute the golden age of Bohemian literature. In Bohemia at this time the cultivation of learning was open to the whole people; all branches of science received attention, and were brought to a very high degree of knowledge for the time. The writers

of the period are too numerous to receive detailed mention, but the names of 'Gelenius and Veleslavin,' 1546-09; Libocan, d. 1553; Bartos, d. 1539; Sikt of Ottendorf, 1500-83; Hajek, 1495-1553; Harant, Pisecky, and Wenceslaus Vratislav may be mentioned. But in 1620 the battle of the White Mt. rendered fruitless the Bohemians' efforts to preserve their language. The whole Bohemian nation submitted to the conqueror; no literature was produced in the country, and the decline was such that by the eighteenth century Bohemian as a written language might be said to be almost extinct. John Amos Comenius, or Komensky, wrote over fifty works, dealing mostly with educational subjects, including the first illustrated book for children. But they were written from exile, Comenius dying in Holland at the age of seventy-eight, in the year 1670. Like Comenius, Wenceslas Hollar also escaped to England after the Thirty Years war. His etchings show London before the Great Fire. Bohemia was at this time culturally one of the most advanced countries of Europe. But, after the so-called counter-reformation, Jesuits and soldiers exterminated all Hussite literature, and only after the Fr. Revolution was it possible again to be a Protestant, and literary and historical societies began to organise a nationalist movement—though still forbidden to assume political forms. In the third period of Bohemian literature a revival took place. In that time a deputation of secret Bohemian Protestants induced the Emperor Joseph II. to grant religious toleration, and the Bohemian language at the same time began to flourish. The revival was still more marked from the middle of the nineteenth century. The poet Karl Hynek Masha was the leader of the so-called romantic school, by means of which the Bohemian drama again began to flourish. Most of Shakespeare's plays were trans. into Bohemian. Generally speaking, the first Czech pub., which began to appear at the time of the Fr. Revolution and the first decade or two of the nineteenth century, were trans. or imitations of literary products of other countries; but the fact of their being pub. in Czech made them precious to those who believed in the future of their country. It is therefore not surprising that this early period of modern Czech literature has a predominantly romantic character, as exemplified in Kollar's (1793-1852) *Daughter of Slava*, a cycle of 600 sonnets to Slav solidarity. Also of romantic character is Masha's *May*, a poem of hopeless love inspired by Byron. The realistic element which was, however, soon to pervade Czech literature was introduced by Havlíček, a journalist and satirical poet, whose *Tyrolean Elegies* were a forceful challenge to the absolutist regime of his time and (with other works) cost him his life. Also of the realist school are Bozena Němcová, 1820-82, a woman writer on Czech village life who collected the folklore of the country; and Neruda, also a poet and journalist, whose *Cosmic Songs* and *Friday Songs* mark the dawn

of modern Czech poetry. Three prolific writers dominate this period: Jan Vrchlický (Emil Bohus Frida), 1853, a poet, dramatist, and translator; Zeyer, b. 1841, poetic reviver of medieval legends; and Cech, a poet and author imbued with national fervour and social sentiment. Among the many noteworthy figures in literature from 1774 onward the following may also be mentioned: Joseph Dobrovsky, 1753-1829, wrote a Czech grammar and a valuable work on Old Slavonic; Jungmann, 1773-1847, compiled a dictionary; Celakovsky, 1799-1852, a poet; Palacky, 1798-1876, the author of the best national hist., and other historians since his time, Tomek and Kalousek. Schafarik, 1795-1861, was the ethnographer of the Slavonic races. Karel Harlick may be called the founder of Bohemian journalism. The best known poets of last century include also Sladek, b. 1845, and 'Eliska Krasnohorská,' the *nom-de-plume* of Henrietta Pechs. Among many later writers are Hviezdoslav, poet of the Slovak resurrection; Hruban-Vajanský, the romantic Slovak writer; Krasko, Slovak lyricist; Hermann, the Czech Dickens; the novelists Sránek (also a poet); Olbracht (Carpathan peasant life and themes of moral and social conflict); and Capek-Chod; Langer, the playwright; Bex Bezruč, the poet of oppressed miners; Wolker and Hora, lyric poets, who treat of social problems; Sovs, sensitive lyricist; and Nezval, the surrealist.

Two names of Bohemian writers are known beyond the confines of their own country. The first is that of Thomas Masaryk, the first president of the Czechoslovak republic. The other is Karel Capek (a.v.), the author, alone or in collaboration with his brother Joseph, of dramas and novels criticising contemporary life. In his early work Masaryk stood for a realism which revolted from the romanticism of the Ger.-inspired school with its cultivation of personality, and laid emphasis on social consciousness and duties. He stood for a unified concept of life, and it was this orientation which finally led him to embrace a political career. His works, apart from national propaganda, are chiefly philosophic and sociological. Karel Capek also belonged to the realist school and was a critic of life, but working in a different medium from that of Masaryk. It was his drama *R.U.R.* (1920) which first made his name known outside his country. An excellent Eng. trans. of this was made in 1923 by P. Selver, and other of Capek's works have been trans. by him. This play is a criticism of the mechanical tendencies of modern life and gave the word robot to the Eng.-speaking world. With his brother Joseph he also wrote the *Life of the Insects* (1923), a dramatic satire on mankind. His *Makropulos Affair* (1922), a novel, deals with longevity, and his second Utopian novel, *The Manufacture of the Absolute* (1927) also aroused much interest. An extraordinary literary case is that of Jaroslav Hasek (1883-1923) and his book *The Adventures of the Excellent Soldier Schweik during the*

World War (1921). The majority of the Czech literary critics dismissed it as a comparatively unimportant work, but the reading public took the four vols. to its heart and ed. after ed. was called for. In 1883 the National Theatre was founded at Prague, and this gave an impetus to drama, which provided such dramatists as those noticed above.

Architecture and Art.—Prague has a wealth of architectural beauty matching its varied hist. from the seventh century onwards, in the most varied styles—Gothic, Romanesque, Renaissance, rococo, and especially baroque. The oldest architectural remains in C. are the small circular churches or rotundas, some dating from the tenth century and many of which may be seen between Prague and Znojmo in Moravia, while a few still remain in S. Slovakia. The basilica type, of a somewhat later period, is exemplified in the St. Wenceslas Church at Stará Boleslav and in the anct. basilica of St. George, Prague. The Romanesque style reached its zenith in the twelfth century with the castles at Cheb, Zvíkov, and Orlik. The Romanesque Charles Bridge of sixteen arches and piers over the Vltava R. dates from the fourteenth century, having been built by Charles IV. in place of the older twelfth-century bridge. Among the large halls of the Hradčany Castle the Vladislav Hall is built in the late Gothic style, but the windows and portal are the oldest examples of the Renaissance style in central Europe. It is 200 ft. long by 63 ft. wide and was constructed between 1484 and 1502 by the architect Beneš of Loupy, who also designed some early Renaissance buildings, including a tn. hall in Charles Square, Prague. The earliest indications of Gothic, often mingled with the Romanesque, date from the end of the twelfth century. The monastery at Trobič, St. John's Church at Jindřichův Hradec, and St. Bartholomew's Church, Kolín, show the earlier phase. The Gothic style became firmly estab. in the reign of Ottakar II. (1253-78) and persisted into that of Charles IV. (d. 1398), though but few notable examples escaped destruction during the Middle Ages. Signs of later Gothic appeared in Bohemia in the reign of Vaclav (Waclaw) IV. (1378-1419), particularly in elaborate external decoration. Some of the best examples of this style, which is sometimes styled the Vladislav Gothic, are St. Vitus's Cathedral, Hradčany, Prague, the building of which was begun under the inspiration of Charles IV.—whose creative endeavours are also illustrated in the beautiful castle of Karlův Týn; and St. Barbara's Church at Kutná Hora (a small tn. S.E. of Prague). Four hundred years before the foundation of St. Vitus's Cathedral a Romanesque rotunda was built on the site. Like Hradčany Castle, the cathedral was almost continually enlarged, renovated, and repaired, so that each edifice really represents many styles from Gothic even to baroque. It was not until 1929 that the cathedral in its present form was completed. The transversal nave is nearly 120 ft. high and contains the altar

before which the coronation ceremony of the Czech kings took place. A special feature of the cathedral is the chapel of St. Wenceslas, which has a remarkably sumptuous appearance by reason of its walls being decorated with semi-precious stones. The exquisite Gothic cathedral of St. Barbara, which ranks next in importance to St. Vitus's, and is one of the most magnificent monuments of C.'s past, has, unlike St. Vitus's, no tower, but its striking tent-shaped roof is crowned by three spires and the building rises above a wooded valley like a rich bouquet of flying buttresses and pinnacles. The massive Praha Brána, or Powder Tower, in Prague also belongs to the same period of Gothic architecture. It, architects, artists, and artisans came to Bohemia in the sixteenth century, and such edifices as the Belvedere (1534), the star-shaped Hřesda Castle or royal summer-house (near the battlefield of the White Mt.) at Liboc (1555), the Schwarzenberg Palace (1563), and the rotunda at Jindřichův Hradec (1592) were built with it. assistance. Many prov. churches, tn. halls (e.g. Plzeň), and castles (Litomyšl) exemplify this style and are notable for their decoration with external mural paintings. The period of the counter-reformation and the advent of the Jesuits saw the introduction of the baroque style of architecture. The new churches and the palaces of the new foreign nobility were built in this style; the architect Christopher Diezenhofer, and especially his son Kilian (1689-1751), designed many of these buildings. The parapet of Charles Bridge is decorated with thirty statues of saints, which were added when the opulent baroque became the fashion. They form an effective contrast with the classically simple line of the bridge itself. Notable as an example of the baroque style is the church of St. Nicholas, Prague, with a tall steeple and bulky dome and copper roofs. Twentieth-century architecture is well represented by the Institute of Pensions, Prague, the buildings of the modern industrial tn. of Zlín, the sanatorium in the High Tatras, the new primary school buildings, with their hygienic class-rooms, domestic science rooms, and gymnasiums, the numerous Sokol gymnasiums all over the country, and the town-planning round the anct. city of Brno.

Czech art was estab. by the fourteenth century, with the embellishment of books by illuminated MSS. It was encouraged by the time of Rudolf II. but interrupted by the Thirty Years war in the seventeenth century. Noted painters prior to the nineteenth-century revival are Brandl, Reiner, and Škréta. Joseph Mánes (1820-1870) was C.'s first famous creative artist, in landscape portraiture and natural studies. An artist well known for his historical paintings is V. Brožík (1849-1913), who exhibited in Paris. Upřka, the Slovak painter, depicted typical Slovak scenes and life in a colourful impressionist style. The most important modern Czech artist is Max Svabinský, a follower of the Mánes school, which did much to foster art in C. He is also a

pioneer in Czech graphic art. In sculpture the most noted figure is J. V. Myslbek (1848-1922), whose subjects are mostly founded on Czech hist. Other sculptors are Jan Stursa (1880-1925), whose 'Wounded Man' and a figure of T. G. Masaryk are among his best known works; Gutfreund; and Benda. There are also a number of sculptors whose themes combine mysticism with realism.

The art of which the nation may be most proud is music. On the foundation of a rich folk-music a national opera was created by Bedřich Smetana (*q.v.*) (1824-1884), while Anton Dvořák (1841-1904) remains a composer of the front rank. Smetana was the creator of modern Czech music, simple folk tunes being a source of most of his inspiration. He is the composer of many tragic and comic operas, while his cycle of six symphonic poems, *My Country*, are an apotheosis of the historical past of the Czechs. The success of Dvořák, also a creator of modern Czech music, was unusual for a Czech composer. His operas are, perhaps, not so well known as his other compositions, particularly his great oratorio, *Stabat Mater*, and much of his chamber music. Besides these two great classical composers, C. has numerous others, some quite well known outside their own country: Suk, son-in-law of Dvořák, composer of orchestral works and chamber music, including *Praga* and *Israel*; Novák, who specialised in symphonic poems such as *Slovak Suite* and *In the Tatra*; Janáček (*q.v.*), opera composer; Fibich, creator of modern Czech melodrama; Foerster, writer of symphonies and operas; Martinů, a living composer who shows the influence of Stravinsky; and Weinberger, composer of the opera *Standa the Bay-piper*.

See F. H. A. Litzow, *History of Bohemian Literature*, 1899; F. Chudoba, *A Short Survey of Czech Literature*, 1924; A. Matejcek and Z. Wirth, *Modern and Contemporary Czech Art*, 1924; V. Nosek, *The Spirit of Bohemia*, 1924; T. Capek, *The Origins of the Czechoslovak State*, 1926; T. G. Masaryk, *The Making of a State*, 1927; P. Selver, *Anthology of Czechoslovak Literature*, 1929; and C. J. C. Street, *President Masaryk*, 1930.

Czechs, etc., Slavic people of whom there are now well over 8,000,000 in Czechoslovakia. Once they dwelt along the banks of the Upper Vistula in Carpathia, but about A.D. 475 they swarmed across to the country now known as Bohemia. As early as the ninth century their name was applied to the entire Slav pop. of Bohemia, as they had conquered or absorbed all the other Slavic tribes that migrated with them. C. are found also in Russia, and the U.S.A., where newspapers are printed in their language. In the nineteenth century this people, under the leadership of Joseph Dobrovsky, revived their language, which was growing extinct. This revival, which led to the foundation of Czech schools and a Czech univ., was responsible also for the institution of a national or Czech political party in 1848.

Czegled, tn. 18 m. N. by E. of Kecskemet, in Hungary, and a junction for many railways. Pop. 37,000.

Czermak, Jaroslav (1831-78), Bohemian artist, b. at Prague. He studied art in Antwerp, Brussels, and Paris, and his first pictures dealt with incidents in the hist. of Bohemia, his own country; among these pictures being 'Rudolph II.'s begging Court-Poets,' the most famous of his works dealing with such subjects. After travelling in the Near E. in 1858, he painted pictures dealing with incidents and subjects with which he had become familiar there. Among these pictures may be mentioned 'A Montenegrin Woman and Child,' 'The Turks seizing a Herzegovinian Woman.'

KARL CZERNY

Czermak, Johann Nepomuk (1828-73), Czech physiologist. Appointed prof. of physiology in Budapest (1858), in Jena (1865), and in Leipzig (1869). At his own expense he built a laboratory and auditorium adapted for demonstrations in experimental physiology. He made improvements in the laryngoscope, and did pioneer work in rhinoscopy.

Czernowitz, Cernauti, or Chernovits, city of the Chernovits region of the Ukrainian S.S.R. Overlooking the R. Pruth, it is built on a hill, varying in altitude from 520 to 950 ft., round which stretches a marshy country. Besides the fine episcopal palace (completed in 1875), C. has a Gk. orthodox cathedral (finished in 1864), controlled by an archbishop; a Rumanian, formerly Ger., univ., and an Armenian and Jesuit church. It is a clean, attractive, modern city, with considerable commerce in agric. produce, cattle, wood, and spirits, and a very cosmopolitan pop. Pop. (1938) 109,800.

Czerny Djordje (Black George), original name George Petrović (1766-1817), also known as Karageorge, founder of the Karageorgevich dynasty. A Serbian who belonged to the poorer classes of that country, he constituted himself leader of the Serbians against the Turks, owing to the cruelties practised by those people

and eventually, in 1806, succeeded in making himself master of Belgrade, having been secretly helped by the Russians. He was afterwards recognised as the ruler of Belgrade. About the year 1812, however, the Russians were unable to aid him, owing to their being involved in war themselves, and he was defeated and obliged to flee into Austria. His rival, however, during his absence, was Miloš Obrenovich, who, on C.'s return to Serbia, had him murdered, Obrenovich himself having assumed the leadership of the Serbians.

Czerny, Karl (1791-1857). Austrian pianist and composer, b. in Vienna, son of a pianoforte teacher, who trained him for that instrument to such good purpose that he began his own career as a teacher at fourteen. He came under the notice of Beethoven, whose pupil he became in the sense in which the great master had pupils. His greatest claim to distinction as a pianist is that he was chosen to be the first to play Beethoven's 'Emperor' Concerto in public. He soon became the most popular teacher of the piano in Vienna, where there were numerous competitors.

His pupils* included Liszt, Döhler, and many others who became famous. He wrote hundreds of popular pianoforte studies, and his works, which included most kinds of compositions, numbered 1000 at the time of his death, but few of them possess high merit, though he was skilful in devising variations for the piano of the display type.

Czestochowa, tn. of Poland, is situated in the dist. (formerly gov.) of Piotrkow on the R. Warta, or Warthe, close to the Silesian frontier. In 1939 it was included in the portion of Poland annexed by Germany in 1940. Reverted to Poland in 1945. The manufs. carried on here before the Second World War were chiefly those of cotton and woollen goods. This tn., which is an old one, was especially noted for its convent, in which was kept a picture of the Virgin, which was treated as a relic and visited by 200,000 pilgrims every year. Pop. about 138,000.

Czortkov, tn. 37 m. S. by E. of Tarnopol on the R. Sereth, in the Lvov region of the Ukrainian S.S.R. (formerly of Poland). There are tobacco factories and an old castle. Pop. 5200.

D

D is the fourth letter of nearly all the ant. and modern alphabets. It is the exact counterpart of the Semitic *daleth* (including modern Heb.) and the Arabic *dal*, as well as of the Gk. *della*. The Etruscans had no use for *d*, but the Romans—who borrowed their script from the former—created their alphabet before the Etruscans had time to reject this letter. The shape of **D** was slightly modified in the course of time. It was originally (in the Semitic alphabet, an irregular triangle (at a later stage, with a tail added to the right) and became a regular triangle in the Gk. character, Δ. In the Rom. alphabet, it became rounded, *D*. The minuscule was formed by lengthening a part of it, *d* from *D*. The sound of *D* is the soft dental mute, though really not a true dental in Eng., being sounded by placing the tongue against the top of the gum.

D, in Rom. notation signifies 500, being half of the symbol *DCC*, or *M* (1000), which itself was possibly taken from the Gk. *δ*.

D, in music, is the second note of the natural scale. The key of *D* major contains *F#* and *C#*, and its relative minor is *B*. The key of *D* minor has *Bb*, and is relative to the major key of *F*.

Dab, salt-water fluke, or *Limanda*, a fish which is closely allied to the plaice and flounder in the Pleuronectidae, or flat-fish family. The names of smear, lemon, or smooth dab are often given to *Solea lascaris*, the lemon sole.

Dabchick, popular name for the lesser grebe. See GREBE.

D'Abernon, Sir Edgar Vincent, first Viscount and Baron, of Esher and Stoke D. (1857-1941) Eng. diplomatist, son of Sir Frederick Vincent, eleventh baronet and rector of Slinfold, Sussex. Educated at Eton and served in Coldstream Guards for five years. In 1882, appointed president of the council of the Ottoman Public Debt and, in 1884, financial adviser to the Egyptian Gov. Knighted 1887. In 1889 he became governor of the Imperial Ottoman Bank. Speculated heavily and set the example to his staff. When the crash came he had made a fortune himself, but the bank felt morally bound to pay the gambling debts of its younger employees. Elected Conservative member for Exeter, 1899; defeated, 1906 and, again, in 1910, when he contested Colchester as a Liberal. Created a peer in 1914. From 1915-20 he was chairman of the Central Control Board (Liquor Traffic). By 1920 his speculative past had been so far forgotten that he was chosen to be the first Brit. ambas. to the Ger. republic. His appointment arose out of his experience as a financier, which, it was thought, would be valuable in view of the economic problems confronting Germany. He instigated the

conference of experts which initiated the stabilisation of the mark and helped to realise the Dawes Plan (q.v.). Another notable achievement was the Anglo-Ger. Commercial Treaty of 1924. He was the Initiator of the Locarno Pact, for it was at his instigation that Germany suggested the conference of the powers which made that agreement possible and led to Germany's admission to the League of Nations. In 1929, three years after his retirement, he headed a highly successful Brit. commercial mission to Argentina, and other S. Amer. countries. His report, with its strictures on antiquated methods of Brit. salesmanship abroad made a great stir. In 1879 he pub. *A Grammar of Modern Greek* (adopted by the univ. of Athens; later in life, he pub. *Alcohol: its Action on the Human Organism*; three vols. of memoirs, *An Ambassador of Peace: and Portraits and Appreciations* (1931).

Dabhoi, tn. of India in the state of Baroda. It contains a stone temple, rich in sculpture, and also a stone water cistern, notwithstanding the fact that there is a singular lack of stone in the dist. Pop. 16,000.

Daboecia polifolia, or *St. Daboo's Heath*, bushy evergreen shrub of small size, well fitted for planting in shrubberies and rockeries. It flourishes in Ireland and the Pyrenees.

Da Capo, or *D.C.*, in music, placed at the end of a movement as a direction to return to the beginning of the movement and finish where the word 'Fine' is placed. The term is often *Dal Segno*, i.e. repeat from the sign: *S*; only.

Dacca, tn. of E. Bengal, Pakistan, 270 m. N.E. of Calcutta. It extends for 4 m. along the N. bank of the Buribanga R. There are many important buildings; the palace of the Nawab of D., the bank, Eng. church, Baptist mission buildings, and the Rom. Catholic cathedral. A mysterious sound called the Barisal guns is said to be caused by a gun lying at the bottom of the riv. calling to its anct. mate, which stands on the Buckland Bund. The Lal Bagh fort, built in 1678, is the most picturesque monument of D., which from 1905 to 1912 was the cap. of the prov. of E. Bengal and Assam. The univ. has 1170 students. *D*. is still the largest civil station in Bengal outside Calcutta. It has the atmosphere of a romantic past and very good bazaars. Muslins are made here and silver filigree work and buttons. Pop. 213,200.

Dacca, University of, was estab. on July 1, 1921, on the lines of the later Eng. univs., but with residential facilities. No distinction of race, sex, creed, or class is observed, but special attention is given to Islamic studies and the educational

requirements of Moslems. The faculties include arts, science, and law. There are well-equipped laboratories for chemistry, physics, and psychology; more than 100 ac. of playing fields; three residential halls; five buildings; and a library of more than 50,000 books.

Dace, Dart, or Dare, popular names of the carp-like fish *Leuciscus leuciscus* of the family Cyprinidae, allied to the chub, roach, and minnow. It is a native of Europe and is found in deep, clear water in shoals. The average weight is less than 1 lb. and the length 8 in., but the fish is much sought after by anglers.

Dach, Simon (1605-59), Ger. lyric poet and hymn writer, b. at Memel. Though poor he received a good education, and graduated at Königsberg Univ. Gaining considerable reputation as a lyric poet, he was appointed prof. of poetry at Königsberg (1639). One of his best-known poems formed the original of Herder's *Annchen von Tharau*.

Dachau, tn. in Bavaria, Germany, a few m. N.W. of Munich, on the Amper, a trib. of the Isar. Notorious in the Second World War for one of the worst Ger. concentration camps (q.v.) Martin Weiss, the Ger. commandant of the camp, and his thirty-nine co-defendants to the charge of committing atrocities against the inmates were found guilty at a trial in Dec. 1945 by an Amer. military gov. court and duly sentenced. Among those convicted were five doctors, including one Klaus Schilling, a seventy-four-year-old man who killed hundreds of people in experiments with malaria, and two others who were charged with conducting pressure experiments on inmates for the benefit of the Ger. Air Force. Some of those killed were captured Amer. airmen.

T. Fall

SMOOTH-HAIRED DACHSHUND

Dachshund, badger-dog that came into England from Germany. It is not a fighter, but is a good house-dog. In sport it finds the fox or badger, but does not come to close quarters with them, merely barking incessantly until the hunters come up. The D. has a soft and silky coat, a very long body, the length from the back of the head to the root of the stern being two and a half times the height of its shoulder. Its colour varies,

but much white is not desirable. Its other points are head long and narrow, with rather small, very intelligent eyes; ears long, broad, and silky, set low and carried back and close to the head, measuring from 13 to 14 in.; jaw strong and square; chest deep and narrow, with a prominent breast bone; forelegs very short and sturdy, well crooked; hind legs smaller in bone; feet strong and well padded; skin thick, loose, and supple; coat short and strong; loin well arched and muscular; body long and low but not cloddy. Its weight is about 21 lb., a bitch about 18 lb. There are also long-haired, wire-haired, and miniature varieties of the breed.

Dacia, in ant. times the name of an extensive dist. N. of the Danube, corresponding roughly with the modern Rumania, Transylvania, and part of Hungary. Its inhab. the Dacoi, or Getae, were a warlike tribe of Thracian origin. They began to trouble the Romans in the time of Augustus, and in the reign of Domitian, under their king, Decebalus, the Dacians forced their more civilised enemies to buy them off with an ann. payment. After a war lasting from 101 to 106 A.D., the Emperor Trajan made D. a Rom. prov., but it was abandoned by Aurelian about A.D. 275.

Dacier, André (1651-1722), Fr. classical scholar, b. at Castres, Upper Languedoc. He was made librarian at the Louvre in 1694; became a member of the Academy of Inscriptions (1695), and of the Fr. Academy, being appointed in 1713 perpetual secretary to the latter. His works include ods. of Festus and Verrius Flaccus, and trans. of Horace, Aristotle's *Poetics*, Sophocles, Epictetus, etc. His wife, Anne Lefèvre (1654-1720), ed. Callimachus, Florus, Aurelius Victor, Eutropius, and the hist. which is attributed to Diotys Cretensis, all of which have been repeatedly reprinted with her notes. She pub. Fr. trans. of the *Amphitryon*, *Rudens*, and *Epidicus* of Plautus, with a good proface; of the comedies of Terence; of the *Plutus* and the *Clouds* of Aristophanes; and of Anacreon and Sappho. She also trans. the *Iliad* and the *Odyssey*, with a proface and notes.

Dacites (from Dacia, q.v.), class of volcanic rocks found in Dacia (q.v.), Greece, N. America, and elsewhere. These rocks consist largely of felspar mixed with quartz, hornblende, and augite; their structure is sometimes crystalline and sometimes vitreous. The older D. are often called porphyrites.

Dacoits (Hindustani *dakait*), members of armed gangs organised for robbery and murder. In 1887 there were reported to be over 9000 professional D. in India, and in one dist. alone (Gwallor) they murdered forty-six persons. After the war with Burma (1885), dacoity was prevalent in the country for sev. years.

Da Costa, Isaac, see COSTA.

Dacotahs, league of Amer. Indian tribes who inhabited the N. part of the Mississippi-Missouri basin, and after whom the states of Dakota are named. Their confederacy included seven 'nations,'

the prin. being the Sioux and Crows. They are believed originally to have been agriculturists until the introduction of horses, when they became rovers and hunters. In the wars of 1862 and 1876, brought on largely by the breaking of engagements by the U.S. Gov., thousands of Sioux perished, and in the latter campaign Gen. Custer and a whole brigade were annihilated.

Dacrydium, genus of Coniferae indigenous to Malay, Tasmania, and New Zealand, and sev. species are grown in Britain on account of their graceful appearance. *D. Franklinii*, the Huon pine, has more characteristics of the yew than of the pine, and grows in Tasmania; *D. cupressinum*, the commonest species in England, bears an edible fruit; *D. taxifolium*, the kakaterro-tree, is valued for its timber.

Dactyl (Gk. δάκτυλος, a finger), in Lat. and Gk. prosody, a foot consisting of one long and two short syllables; in Eng. prosody, one accented and two unaccented syllables. Dactyls, in prosody, is a name applied to metres which consist of a repetition of Ds., or of equivalent feet.

Dactylis glomerata, Cock's-foot Grass, a species of Graminae constituting a genus in itself. It is extremely common in fields and waste places of Britain during most of the summer months, and is also well known over continental Europe, the Mediterranean, and Asia. In a wild state it has a coarse bluish herbage, and is capable of enduring the drought of dry, sandy land, and forms good grass for pasture.

Dactylogy, see under DEAF AND DUMB.

Dactylopterus, genus of Cephalacanthida, or flying gurnards, remarkable for the immense, fan-like pectoral fins possessed by its species, and used by them when they spring into the air to escape voracious fishes. *D.* (or *Cephalacanthus*) *volitans* occurs in the Mediterranean; *D.* (or *C.*) *orientalis* in the seas of warmer climates.

Daddy-longlegs, see CRANE-FLY.

Dado, in classical architecture, the cube at the base of a pedestal. The name is also commonly applied to a series of mouldings, forming, as it were, a continuous pedestal, lining the lower portion of the interior walls of a building.

Dædalus, figure in Gk. mythology whose name is associated with the beginnings of sculpture and architecture. He was said to have been a descendant of Erechtheus, king of Athens, but the legends concerning him seem to be Cretan in origin. He is credited with making a wooden cow for Pasiphaë, wife of Minos, the king of Crete, and also with constructing the labyrinth for the Minotaur. Incurring the displeasure of Minos, D. made wings for himself and his son Icarus to fly from Crete. Icarus fell into what came to be known as the Icarian Sea, but D. reached Italy safely, and thence proceeded to Sicily. This story is possibly connected with the fact that D. was the reputed inventor of sails for ships. Many buildings and statues were attributed by

the later Gks. to him, and his name is representative of the time when wood was the chief material in use.

Dact, pueblo (township) in the S. of Luzon Is., Philippines. Port of call on the mouth of the D. R. Pop. 13,500.

Daffodil, see NARCISSUS.

Dafydd ab Gwilym (c. 1340-c. 1400), Welsh nature poet, b. at Bro Gynin, Cardiganshire. George Borrow, who trans. some of his poetry, wrote in *Wild Wales* that he had always considered him as 'the greatest poetical genius that has appeared in Europe since the revival of literature.'

Dagami, pueblo on the Binahaan R., S. of Tacloban, Leyte Is., Philippines. Is an important centre for traffic. Pop. 13,000.

Dagden, see DAGU.

Dagenham, urb. dist. in co. Essex, England, consisting of Chadwell Heath ward, Becontree Heath ward, and D. ward. The Becontree estate consists of a large number of houses erected by the London Co. Council. The church is ant., with a fine old tomb of Sir T. Urswyk, M.P. for London in 1461. There is a smallpox hospital. A high tide flooded 1000 ac. of land on Dec. 7, 1907. There is much marsh land. In 1921 the pop. was 9000; it is now 89,000, due partly to the inclusion of sev. dists. in one new urb. dist. and partly to the development of the Ford motor works estab. in 1929.

Dagger, short blade used for stabbing of very ant. origin. In medieval times it was called the *misericorde*, and served to penetrate the armour-joints of an overthrown adversary. It was worn attached to the sword-belt on the right side: the handle was often richly decorated. Other varieties were the poniard, dirk, and stiletto. Famous oriental Ds. are the Malay *kris* (kris) and the Indian *khutar*.

Daghestan, autonomous S.S.R. of the R.S.F.S.R., extending along the W. coast of the Caspian Sea, and inland over the N.E. spurs of the Caucasus range. The country is for the most part mountainous. The cap. is Makhachkala (the former Petrovsk) on the Kura (pop. 86,800). The inhab. include Lezgians, Tatars, Turkomans, Great Russians, and twenty-seven other nationalities; the language belongs to the Lezgian group of Caucasian languages. The traditional occupations of the inhab. are agric., but irrigation in recent years has increased production. Wheat, cotton, and soya beans are grown, and there is cattle and sheep-rearing. Oil is obtained from wells at Izerbash and there are engineering and machinery manufs. at Makhachkala. Hydro-electric power is provided by the R. Sulak. Area 22,390 sq. m. Pop. 930,500.

Dagnan-Bouveret, Pascal Adolphe Jean (1852-1929), Fr. painter, native of Paris, one of the foremost representatives of the *plein-air* school. Early in his career he was 'classical' in his subjects, but presently turned to scenes of everyday life, and his 'Wedding Party,' 'Le Pain bénit,' and, above all, his, 'Breton Pardon'

made him famous. As with Millet and Bastien-Lepage, his work became graver and deeper as years passed on, and in sympathy with the movement initiated by J. C. Cazin, he produced such masterpieces as the 'Last Supper' (1896) and 'Emmaus' (1898).

Dago (corruption of *Diego*), nickname given on Eng. and Amer. vessels to Sp., Portuguese, and It. sailors; also in the U.S.A. to It. immigrants.

Dagö, Dagden, Gioma, or Hiiumaa, largest of the Estonian is., near the gulf of Finland; separated from Oesel Is. (Livonian) by the Sõla Sound. Has rugged coasts, and is infertile except in the S. and W. The inhab. are engaged in fishing and cattle-rearing. Area 367 sq m. Pop. 17,000, of whom about 10,000 are Estonians, the remainder Swedes and Gers.

Dagoba, see **TORÉ**.

Dagobert I., Merovingian king of the Franks (628-38), son of Clovis II. He reunited the Frankish Empire, but it was divided again at his death.

Dagobert II., king of the Franks (674-679), who should have succeeded his father, Sigobert II., in Austrasia in 656. He was kept from the throne for eighteen years, and was assassinated after reigning five years.

Dagobert III., king of the Franks (711-715), succeeded his father, Childobert II., the third king of Neustria.

Dagon, Philistine and probably Canaanite deity (Judges xvi., 1 Sam. v.). It is uncertain whether his name is derived from *dag*, fish, or from *dagan*, corn; his idol, representing him as a kind of merman, favours the former hypothesis, but recent investigations seem to show that the cult was agric., and imported from Babylonia. The Philistines worshipped him as the god of both war and of harvests, and he seems to have been the male counterpart of Astoreth, or Astarte. He had temples in Gaza and Ashdod; the former was destroyed by Jonathan Maccabeus.

Daguerre, Louis Jacques Mandé (1789-1851), Fr. painter, inventor of the daguerreotype, forerunner of the present photograph, was *b.* at Cormeilles, Seine-et-Oise, and in early life was an inland revenue officer. Afterwards he became an artist, and with Pierre Prévost executed a number of panoramic views. In 1822 he estab. a pictorial exhibition called the diorama, which was so successful that he opened another one in London. But his great ambition was to produce permanent pictures by means of sunlight, and in this endeavour he was joined by J. N. Niepce, who had already been working for years at the same problem. Niepce *d.* in 1833, but D. persevered until he succeeded in producing such pictures on an iodised silver plate, called after him daguerreotypes. He wrote many works on this subject, including *Historique et description des procédés de daguerreotypie* (1839). His success was rewarded with the decoration of the Legion of Honour, and annuities for himself and Niepce's representative. See A. Mentrone, *La Découverte de la photographie en 1839, 1892*.

Daguerreotype, see **PHOTOGRAPHY**.

Dagupan, municipality and port in Luzon, Philippine Is., exports sugar, corn, copra, rice, and salt. Pop. 26,000.

Dahabiyeh, Nile passenger boat, something like a decked barge with a sharp prow, of shallow draught, and carrying one or more sails. Tourist Ds. are often propelled by steam.

A DAHABIYEH NEAR ASWÂN

Dahalac, or **Dahlak**, see **DHALAC**.

Dahl, Johann Kristen Clausen (1788-1857), Norwegian landscape painter. Particularly fond of striking effects in light and colour. One of his best pictures is an 'Eruption of Vesuvius,' another 'Dresden by Moonlight.'

Dahl, Michael (1656-1743), portrait painter, *b.* in Stockholm, who settled in London in 1688, obtained considerable patronage. He painted a portrait of Queen Anne, and also a series of portraits at Hampton Court. He was extensively employed by the nobility, but his work is not marked by any great originality.

Dahl, Vladimir Ivanovitch (1801-72), author and philologist, of Dan. family, but Russian by birth and training. After many years' service under the gov. he settled in Moscow (1858), and there, under the name of Lugansky, wrote many stories of Russian life. He also compiled a Russian dictionary, and a vol. of songs, folk-legends, and proverbs, which he had collected in various parts of Russia.

Dahlak, or **Dahalak**, is. group off the coast of Eritrea, situated in the Red Sea off the bay of, and about 30 m. E. of, the port of Massawa (Massawa). The group comprises three larger is., with numerous rocks, and was known to the Roms. for its pearl fisheries.

Dahlgren, John Adolphus Bernard (1809-70), Amer. admiral, *b.* at the Swedish consulate, Philadelphia. Serving in the U.S. Navy from 1826 to 1847, he was then transferred to the ordnance dept., and there invented the gun called by his name. When the Civil war broke out he was placed in charge of the navy yard at Washington. In 1863 he was made rear-admiral, and commanded the blockading fleet off Charleston until the end of the war.

Dahlgren, Karl Fredrik (1791-1814), Swedish humorist and poet. *Mollbergs Epistlar* (1813) displayed his skill in both capacities, and within a few years he attained a leading place in Swedish literature.

Dahlhausen, vil. of Germany, situated in the prov. of Westphalia, on the R. Ruhr, 6 m. from Essen.

Dahlia, genus of Compositæ composed of nine species of Mexican plants. In Britain sev. have been planted, but only *D. variabilis* has flourished, and given rise to very many beautiful varieties known to our gardens. In its wild state it is a bushy, herbaceous plant, 7 or 8 ft. high, with single purple or lilac flowers of no great beauty, but in cultivation it sports endless varieties in stature, leaves, and flowers, and in the double forms both ray and disk florets are ligulate. The name of the plant was given to it in honour of the Swedish botanist Dahl.

Dahlmann, Friedrich Christoph (1785-1860), Ger. historian and politician, b. at Wisnar, was one of the first to raise the Schleswig-Holstein question (1815). In 1837 he was banished from Hanover for upholding popular rights against the king; in 1848 he propounded a scheme for establishing a constitutional monarchy to include Prussia and all other Ger. states. His chief works were *Quellenkunde der deutschen Geschichte* (1830); *Politik* (1835); *Geschichte Dänemarks* (1840-43); and hist. of the Eng. and Fr. revolutions.

Dahme, tn. of Germany, situated in the prov. of Brandenburg, about 40 m. S.E. by S. of Potsdam. Pop. 5000.

Dahn, Julius Sophus Felix (1834-1912), Ger. historian and novelist, b. in Hamburg, where his father was a leading actor at the theatre. Felix D. studied law in Munich and Berlin, and became prof. successively at Munich, Würzburg, and Königsberg, and finally rector of Breslau Univ. in 1895. He wrote sev. important books on jurisprudence, but is more noted for his hist. and historical romances. The former deal with the very earliest records of Germany, his greatest work, *Die Könige der Germanen* (1861-1908), ending with the dissolution of the Carolingian Empire. His romances, *Ein Kampf um Rom* (1877), *Die Kreuzfahrer* (1844), and many others, have enjoyed great popularity in Germany. Besides these, he pub. a good many vols. of poetry, much of this also founded on early Ger. legends. A collected ed. of his stories and poems was pub. (21 vols.) at Leipzig. See life by H. Meyer, 1913.

Dahomey, colony in Fr. W. Africa with an area of 43,232 sq. m. and a pop. of 1,458,000 people. It is bounded on the E. by the Fr. mandated ter. of Togo, on the N. by the Fr. Sudan, and on the E. by the Brit. colony of Nigeria. It was conquered by the Fr. in 1892. It was formerly a Negro kingdom, for 200 years a centre of idolatry and heathen practices. The native army was famous for its detachment of 800 Amazons. The country is flat near the coast, while the interior consists of undulating plains and plateaux, with occasional stretches of forest. The

chief tns. are Porto Novo (pop. 23,500), Grand Popo, Kotonu, and Whydah on the coast, Paraku and Abomey in the higher country. The natives, Moslems or Fetish worshippers, grow maize, manioc, yams, potatoes, areca nut, and coffee. Palm oil and kernels are the chief exports. In the N. they rear cattle. They are of pure Negro stock. There are three railways. See J. Baillard, *Peuple noir*, 1935; M. J. Herskovitz, *Dahomey: an Ancient West African Kingdom*, 1938; C. Hanlin, *Occident noir*, 1947.

Dalhan, see KOREA.

Dail Eireann, Lower House of the legislature of Eire. The constitution of the Irish Free State (Saorstát Eireann), which came into force on Dec. 6, 1922, provided that the legislature (Oireachtas) should consist of the king, a Senate (Seanad Eireann), and a Chamber of Deputies (D. E.). D. E. is generally termed shortly 'the Dail'. The constitution of 1922 was repealed, but the present constitution, which came into force in Dec. 1937, contains substantially the same provisions as to the Dail. As in the case of the House of Commons of the United Kingdom, and of many another Lower House in the Brit. Commonwealth of Nations, alone D. E. among the legislative authorities of Eire has the control of the public purse, and the Gov. of Eire is chosen from the party (or parties, in the case of a coalition) having the majority in that house. D. E. is, therefore, the real power in the land, and it derives its authority from the direct vote of all citizens, without distinction of sex, of twenty-one years of age or over. Election is based on proportional representation, every citizen having only one vote, and the number of deputies is at present fixed at 138. The univs. are entitled to representation in the D. E. Unless the Oireachtas be sooner dissolved, a new Dail must be elected every five years. All members of the Dail must take an oath of allegiance to the constitution, and both the Irish and Eng. languages are official languages for the debates. The Dail is presided over by a chairman who has a deputy. The president of Eire summons and dissolves the Dail on the advice of the Prime Minister (Taoiseach). The Taoiseach is appointed by the president on the nomination of the D. E. The other members of the gov. are appointed by the president on the nomination of the Taoiseach with the previous approval of the D. E. The Taoiseach, the Tanaiste (vice-chairman), and the finance minister must be members of D. E. The other members of the gov. must also be members of D. E. or Seanad Eireann (Senate or Upper House), but not more than two may be members of the latter House.

'Daily Chronicle.' Coming into existence in London in 1855 as the *Clerkenwell News*, this paper was originally composed chiefly of small advertisements. In 1877 it was bought by Edward Lloyd and issued as a daily paper of Liberal views. It was purchased in 1918 by Mr. (later Earl) Lloyd George. In 1929 Wm. Harrison,

chairman of the Inveresk Paper Company, bought a controlling interest in the *D. C.*, together with its associate papers. With dramatic suddenness the *D. C.* closed its doors on June 1, 1930, when it was absorbed by the London Liberal paper, the *Daily News*, which appeared thenceforth as the *News-Chronicle* (q.v.).

'Daily Dispatch.' Describing itself as the 'National Newspaper of the North,' the *D. D.* is pub. daily from Manchester. Founded in 1900 by the Hultons, it was acquired by the Berry brothers in 1924, and is now one of the Allied Newspaper group. In general format the *D. D.* resembles the London popular press, and has a circulation in the neighbourhood of 1,000,000. The address of the *D. D.* is Withy Grove, Manchester.

'Daily Express.' After many years of a struggle for existence, the *D. E.* has today the largest circulation of any daily newspaper in Great Britain. It is the leading paper of the Beaverbrook group, and its present circulation is over 3,250,000 copies a day. Estab. in 1900 by Charles Pearson & Company, as a 4d. paper, but it was not until it passed into the control of Lord Beaverbrook (q.v.) in 1914 that it made any headway against the stern competition of the other popular dailies. Frank sensationalism is the main cause for the success of the *D. E.*, but it is an enterprising paper, makes a point of not suppressing news which is unwelcome and has not seldom counteracted foreign propaganda by sending its own special representatives to find out and tell the facts. It has been calculated that a circulation of 3,250,000 copies a day means that the paper is read by about 12,000,000 people. This success is due to an entertainment quality which has its appeal to a mass circulation, and although, as is the case with some of the other London popular dailies, the actual price to the purchaser is substantially less than the cost of production, this is offset by the great advertising revenue, and consequent large aggregate purchasing power of its readers. The most successful of the popular papers, it is the one with the highest rate per column inch for advertisement space. It has been the policy of the *D. E.* during the last few years to gather together a band of writers, each a specialist in his own subject, and to make their names familiar to the public. The success of this scheme has played no small part in the popularising of the paper. 'Strube,' whose 'Little Man' became a national figure, and 'Beachcomber' (J. B. Morton), the humorist, each have many thousands of devoted followers. H. V. Morton, who wrote graphic and human descriptions of travels in the Brit. Isles, had the largest public of all, but in 1931 he joined the *Daily Herald*. In politics the *D. E.* is Independent Unionist, with a strong leaning towards Imperial ideas. Lord Beaverbrook was a prime leader in the agitation for Empire Free Trade. In the Second World War the war dispatches of Alan Moorehead of the *D. E.* were especially good journalism, judged by the standards in any period and in any

country. The *D. E.* occupies a fine modern building in Fleet Street, not many yds. from its former home in Shoe Lane, Fleet Street, E.C.4. The *D. E.* is produced simultaneously in London, Manchester, and Glasgow.

'Daily Graphic,' the first illustrated morning newspaper in England, originated by Mr. W. L. Thomas in connection with the weekly *Graphic*, was estab. in Jan. 1890. Well-produced drawings and photographs were employed to illustrate the more interesting features of the day. In 1925, an agreement was entered into between the *D. G.* and Allied Newspapers Ltd., and the *D. G.* was absorbed by the *Daily Sketch* and issued with it jointly. The position has now been reversed and the two amalgamated papers are pub. as *Daily Graphic and Daily Sketch* (see DAILY SKETCH).

'Daily Herald.' In the long and curious hist. of journalism few attempts to found a journal have been more quixotic or determined than that which finally estab. the *D. H.* as Labour's first daily newspaper in England. Launched on April 15, 1912, with a capital of only £300, the paper did not even start with the blessing of the leaders of the Labour party. In these early days the paper existed as a 'small, lively but impecunious socialist newspaper that avoided death by the skin of its teeth so frequently that Northcliffe called it "the miracle of Fleet Street"' (Francis Williams). But the struggle to survive during the First World War years was almost too much, and during that period it was only found possible to publish weekly. It was in this form that George Lansbury ed. it from 1914 until 1919, when it resumed daily pub. In the days of Lansbury's editorship, the *D. H.* created controversy and kept up a high literary standard with one poet, Gerald Gould, as its assistant editor, and another, Osbert Sitwell, writing leaders—often in verse. But unable to support itself, it was (originally on the initiative of Ernest Bevin) constantly subsidised by the Trades Union Congress, although it was sufficiently independent in spirit to reject an offer of £75,000 made in 1920 by the Third International. Later, Lansbury remained manager while the editorship was given to a more-experienced newspaperman, Hamilton Fyfe, well-known war correspondent of *The Times* and the *Daily Mail*. Under Fyfe the circulation rose in four years from 130,000 to 450,000 but was not yet self-supporting owing to the lack of sufficient advertising revenue. Eventually, in 1929, the T.U.C. sanctioned a scheme for placing the paper on equal terms with its rivals. Retaining 49 per cent of its interest, with control of the paper's political policy, the *D. H.* passed into the hands of Messrs. Odhams Ltd., one of the largest firms of publishers in the country. The new paper was pub. on March 17, 1930, under the direction of J. S. Elias (later Lord Southwood), the man who had converted the *People* and *John Bull* from apparent failures into great successes. Popular newspaper

'stars' like Hannen Swaffer and H. V. Morton were secured at high salaries from other organisations, principally the *Daily Express*. H. G. Wells was asked to write on world problems and Edgar Wallace on crime, so that all tastes might be satisfied. The printing and format became at one bound equal to that of any other popular newspaper. Success came at once. The circulation jumped to well over a million in a night, and has been growing steadily ever since. Mr. Francis Williams relates that in his time as editor the circulation reached 2,000,000 copies a day and the paper had for a time the largest circulation of any daily paper in the world until it was outstripped by the *Daily Express*. But it had done so only as the result of enormous expenditure by Odhams, and in order to achieve progress more than £2,000,000 had to be sunk in the paper without immediate return; nor, despite the large sales, were any dividends paid on *D. H.* (1929) shares until well into the Second World War. Politically, the *D. H.* has considerably moderated its tone, news always being given first place. The *D. H.* is now willing to voice any subject of public interest, and not only Labour leaders, but distinguished writers from all walks of life, are regular contributors to its columns. A former editor of the *D. H.* records that he agreed to buy for £10,000 the serial rights in Sir Neville Henderson's record of events, entitled *Failure of a Mission*, despite the fact that the editor's private opinion was that much of the ex-ambas.'s judgment of events had been tragically wrong and misleading. (See Francis Williams, *Press, Parliament, and People*, 1946.) In the Second World War the dispatches of the *D. H.*'s war correspondent, A. B. Austin, were notable for their general interest and admirable journalism. The *D. H.* is pub. at 1d., simultaneously in London and Manchester, the London address being Wilson Street, Long Acre, W.C.2.

'Daily Mail.' First pub. in London on May 4, 1896, the *D. M.* not only introduced modern journalism, but is one of the most successful newspapers ever pub. Its founder, Lord Northcliffe, at that time Alfred Harmsworth, is by general consent considered the greatest journalist of all time, and the effects of his teaching can be seen in every newspaper office the world over. From the beginning, his policy with the *D. M.* was to give the public what it wanted, presenting the news of the day in such a manner that it could be taken in at a glance. The *D. M.*, when the first issue appeared, was entirely different from anything that had ever before been pub. It was brisk, and straight to the point. It was not afraid to speak its mind, and all the time it went to immense pains to provide its public with what really interested it. Over and above this it was priced at 1d. (it is now 1d.), and was willing to take up a cause or denounce an evil without a thought of the consequences. It should not be forgotten that when Lord Northcliffe started the *D. M.* with a capital of less than £100,000, and made so great a success of it that he

revolutionised the whole course of modern journalism, he did so because he was the first to appreciate that a new state-educated reading public had come into being for which existing papers hardly catered at all. It was for this public of the new elementary-school educated that he catered, and it was that public which gave him his enormous success. Whether now that a new public is coming into being a public of the secondary-school educated, a product of educational reform and extension, vast changes in intellectual standards and public taste will follow, and whether the demand for newspapers will be affected, is a moot point. Under Northcliffe's direction the circulation of

LORD NORTHCLIFFE

the *D. M.* grew until it was far larger than that of any other paper, and sev. amazing scoops during the Boer war consolidated its position as the paper for the man in the street. During the First World War the *D. M.* by unceasing propaganda urged the placing of Lloyd George in charge of munitions; and throughout the war period it played a lively part in the conduct of State affairs. Throughout this period, and until his death in 1922, Lord Northcliffe was the dominant personality behind the *D. M.* and its companion papers, the *Evening News* and *Sunday Dispatch*, as he was behind the many other pubs. he founded and ran (see NORTHCLIFFE). The *D. M.* is now owned by Associated Newspapers, Ltd., a company controlled by the late Rt. Hon. Viscount Rothermere, Lord Northcliffe's brother, and now by the latter's son, the Hon. Esmond Harmsworth, second Lord Rothermere. Politically it is Conservative in principle, but more often than not takes an independent line. The *D. M.* organises many exhibitions, one of the most successful of which is the ann. Ideal Homes Exhibition. It has also fostered

many movements, taking an especial interest in flying, and before and after the First World War doing much to assist pioneer airmen by the offer of large prizes, amounting to as much as £10,000. The advertising power of the *D. M.* is famous throughout the world. Its front page alone used to fetch £1700 for a single insertion. It was for a time the only popular daily left in London which still gave up its front page to advertising. Many famous writers have contributed at one time or another to its columns, and Tom Webster, probably the best-known sports cartoonist in the country. Published simultaneously in London and Manchester, its circulation is one of the largest in the world. On more than one occasion it has exceeded the 2,000,000 mark. Other eds. of the *D. M.* included, before 1939, a Continental one pub. from Paris; an Atlantic ed., printed and pub. on board sev. of the larger liners; and a weekly ed. The *D. M. Year Book*, founded in 1901, is popular among all classes for reference purposes on general subjects. The head office of the *D. M.* group is Northcliffe House, Tudor House, E.C.4.

'Daily Mirror.' In many ways the *D. M.* is the best example of Lord Northcliffe's genius as a journalist. Founded in London as a penny daily for women on Nov. 2, 1903, under the editorship of Mrs. Mary Howarth, it was obvious, after a few issues, that there was no public demand for such a paper, and it seemed inevitable that the paper must die. Defying defeat, Lord Northcliffe converted it in twenty-four hours into an illustrated newspaper, and in its new form it was soon firmly estab. The success of this change consolidated Northcliffe's position as the journalist who would not own defeat. In 1914 the first Lord Rothermere became chief proprietor of the *D. M.*, and a year later founded its companion paper, the *Sunday Pictorial*. The object of both papers has always been to provide the latest news in pictures, and many daring feats have been accomplished in carrying out this policy. One of the most popular features both of the *D. M.* and the *Sunday Pictorial*, was that devoted to the doings of Pip, Squeak, and Wilfred, the first two of whom were introduced to thousands of delighted children in 1919, while Wilfred appeared in 1920. It had a circulation of 2,013,943 for its King Edward Memorial number in 1910, and of 3,005,430 copies for its Princess Mary's wedding number in 1922. During the Second World War the paper was threatened with suppression for a cartoon which seemed to suggest that seamen were risking their lives in order that bigger profits might be secured by the oil companies; for a leading article which said that those who aspired to army leadership should be 'brass buttoned, boneheaded, socially prejudiced, arrogant, and fussy,' and with a tendency to heart disease and apoplexy; and for the anti-snobbery criticisms of 'Cassandra.' There were few real or imagined abuses that 'Cassandra' did not attack, and the War Office was his particular *bête noire*. After

the official warning, however, 'Cassandra's' column was dropped, he was called up and joined the army, and in due course—such being the Brit. way—was appointed editor of an army newspaper (see on this Williams, *Press, Parliament and People*, 1946). The *D. M.* is pub. from Geraldine House, Rolls Buildings, Fetter Lane, E.C.4.

'Daily News,' see 'NEWS-CHRONICLE.' 'Daily Sketch.' Founded in Manchester in 1909 by Sir Edward Hulton as a penny picture paper, the *D. S.* relied mainly upon its news pictures, aided by brightly written articles, theatrical and society features, and news served up in an easily digested form, for maintaining its circulation of 700,000 copies daily. Politically, the *D. S.* was independent, showing, as is the case with its rival, the *Daily Mirror*, little interest in politics except from a pictorial standpoint. In 1925 the *D. S.* absorbed the *Daily Graphic*, thus leaving only two picture papers in London. The *D. S.* was, later, acquired by Allied Newspapers, Ltd., and now controlled by Lord Kemsley (formerly Sir Gomer Berry). In 1946 the title was changed to *Daily Graphic* and *D. S.*, the former in much the heavier type, the publishers being now The Daily Graphic and Sunday Graphic, Ltd., of Kemsley House, 200 Grays Inn Road, London, W.C.1.

'Daily Telegraph.' The first penny newspaper pub. in London, the *D. T.* can look back upon as fine a past as most existing newspapers. Founded in a more or less casual manner by a printer in June, 1855, it passed, shortly afterwards, into the hands of the father of the second Viscount Burnham (q.v.), and remained in that family until 1927, when it was sold to Sir Wm. Berry, Bt. (q.v.) (created Baron Camrose of Long Cross in 1929), Sir Gomer Berry (later Lord Kemsley), and Sir Edward (late Lord) Hliffe. The present proprietor is Lord Camrose. In 1930 the price, which had been 2d. for many years, was reduced to 1d., and the general size and form were altered to meet modern requirements. These changes were apparently successful, for the circulation rose to well over 200,000, and is now over 650,000. The *D. T.* has always specialised in foreign news, and had many famous correspondents in all parts of the world. It was owing to the enterprise of the *D. T.* that Stanley was enabled to find the Congo, his undertaking having been originated by the paper, which also bore the expense of his search for Livingstone. In the same way, the *D. T.* assisted in the Assyrian discoveries of George Smith, and the exploration of Mt. Kilimanjaro by Sir Harry Johnston. Like the *Daily Mail* the *D. T.* was responsible for a number of scoops during the Boer war, and the rivalry between the correspondents of the two papers was intense. Politically, the *D. T.* began as a Liberal paper, but at the present time it is frankly Conservative. Many notable writers have been associated with the *D. T.*, including Edward Dicey, Frank Lawley, Clement Scott, George Augustus Sala, W. L. Courtney, for so long the

editor of the *Fortnightly Review*, who was literary editor for many years, and J. L. Garvin, later the editor of the *Observer*. The *D. T.* specialises in the issue of special supplements, many of which are of permanent value. The *D. T.* is a more serious and restrained paper than its popular rivals, deliberately quieter in its selection and display of news, deliberately more solid in its selection of feature articles, and more comprehensive in its reporting of political, industrial, economic, and international affairs; and in part its success is due to its manifest attraction to a somewhat non-committal, cautious type of middle-class reader with a serious outlook on life. The foreign correspondents of the *D. T.* are especially reliable for intelligent and balanced accounts of the ways and policy of the countries to which they may be accredited. The new *D. T.* building, erected in Fleet Street after the First World War, is the finest newspaper office in the country, and allows ample room for expansion. The *Sunday Times*, also owned by Lord Camrose, is housed in the same building. The address is 135-36 Fleet Street, London, E.C.4.

'Daily Worker,' official paper of the Communist Party of Great Britain. Founded in 1930. During the Second World War the War Office and Foreign Office were anxious to restrict the facilities given to the paper to a minimum and were adamant that it could not be allowed to have an accredited war correspondent. The Cabinet formed the view that the paper was persistently publishing material calculated to foment opposition to the war, and in Jan. 1941 the gov. invoked Section 2D of the Defence Regulations, first to warn and then to suppress the *D. W.* The Communist Party was at that time opposed to the war, which it regarded as an 'imperialist' adventure. It did not change its mind until Germany invaded Russia, after which it became a passionate advocate of victory.

Daimiel, tn. of Spain in the prov. of Ciudad Real, 20 m. E. of that city, and 60 m. S.S.E. of Toledo. There are manufs. of woollens and linens, and distillation of brandy. There is also a salt lake. Pop. 17,000.

Daimids (great names), the feudal nobles of old Japan, who within their own domains were almost absolute, paying only nominal allegiance to the Mikado; the Samurai were their military retainers. Although the Shogun (temporal ruler) and D. lost their power in the revolution of 1868, the governing classes of Japan are still mostly of Samurai descent.

Daimler, Gottlieb (1834-90), motor pioneer, b. at Schorndorf, Württemberg. After gaining experience in Germany and at Whitworth's, Manchester, he assisted Dr. Otto in the development of his gas engine (Cologne, 1870), and became director of his factory. Conceiving the idea of increasing the power of oil and gas engines by making the working parts lighter, with greater velocity of rotation, he produced the first motor bicycle in 1885, followed in 1887 by a petrol-driven

car. He founded the Daimler Motor Co. at Cannstatt in 1890. Benz of Mannheim, Panhard and Levassor of Paris, and others took up the idea, and D. engines have become universal.

Dai Nippon, see **NIPPON** and **JAPAN**.

Dairen, or **Dalny**, the customs port for Kwantung, China. At the end of 1937, when the leased ter. of Kwantung was under a Jap. governor-general, the seat of administration was at D. (or Taïrend, formerly Dalny). In 1945 the ter., including D., was restored to China. The S. Manchuria Railway connects D. with Mukou and D. is also connected by rail with Changchun (696 m.). The Chinese name is Talien-Wan. Pop. of tn. and dist., 280,000.

Dairy. The word *D.* is the same as the Middle Eng. *deirie*, which was the place where the *dey* or maldservant worked. It now denotes the place where the milk in its natural form and the cheese and butter are prepared. The milk of the cow is used all over the world for D. purposes, but in certain regions physiological conditions have led to the dependence on sheep, goats, reindeer, camels, etc., for milk. In no other dept. of agriculture has the celerity of advancement been greater than that in D. farming. In Great Britain the demand for milk and butter made by the people of industrial centres distant from the traditional dairying, or, in fact, cheese-making dists., such as Cheshire, Ayrshire, Somerset, and the vale of Glamorgan, resulted in rapid expansion of the D. business. The invention of the centrifugal separator about 1878 created a revolution, whilst smaller progressive reforms may unquestionably be traced to the persistent exertions of the Brit. D. Farmer's Association and to the D. shows held annually under its auspices since the year 1876. Moreover, this association acted as pioneer in the matter of providing technical instruction in D. farming; for it founded a D. school in the vale of Aylesbury, a school later estab. in Reading under the name of the Brit. D. Institute (now the National Institute for Research in Dairying, under the Executive Council of the Imperial Agric. Bureau), and its example was followed by many municipalities all over the country.

Improvements in Appliances.—In all modern Ds. centrifugal separators are now in use, but without such an appliance cream is separated by means of the milk-pan, skimmer, and cream crock. The first is a shallow, lipped pan made of white porcelain, enameled iron, or tinned steel; the second—a still shallower dish—serves to lift the cream from the surface of the milk in the pan into the earthenware cream crock, where it remains for one or two days before churning. By the mechanical process of cream separation, a bowl containing the fresh milk is made to rotate sev. thousand times every min.^{ts}. In this way the lighter butter fat is collected to the centre of the bowl, and thence removed through a tube, the watery and heavier portion of the milk being driven out from the outer zone

through another tube. Small machines for 10 up to 100 gallons an hour are often worked by hand still, but separators worked by horse or steam power can deal with four or five times that quantity in the same time.

Pasteurisation has made milk 'safe' despite all the vicissitudes of transit. Electricity has brought hot water and refrigeration to the remotest farm. Pasteurisers, so named after the *M^r*. scientist, Pasteur, have been designed so as to destroy the tubercle and other bacilli which may be communicated to human beings through the medium of milk. It is best to heat the milk in closed pasteurisers for about 20 min. at 140° F., for it is found that a lower temp. for a longer period is as effective as a higher temp. (180° F.) for a shorter time (10 min.). D. engineers have now devised excellent plant for the proper filtration or pasteurisation of new milk in large dairies. The new milk is allowed to flow into closed receptacles, in which it is raised to the required temp. and kept in a state of continual agitation so as to prevent the formation of the scalded layer. It is then necessary to reduce the temp. of the milk to that of water; otherwise its keeping properties are seriously impaired. This result is most easily achieved by allowing the milk to run down the outside of a metal refrigerator, corrugated so as to increase the cooling capacities of the machine and filled inside with cold water. The water is kept continually running, the refrigerator being fed by a cistern. Butyrometers are the most convenient machines for testing the amount of fat in milk. Properly graduated testing tubes are filled with the milk to be tested and fixed on a rimmed metal dish which is then made rapidly to revolve. Standard sulphuric acid and warm water are required, chemical action as well as the principle of centrifugal force being involved in the testing. Ds. in most urb. centres bottle their milk for delivery to householders.

The following are the appliances needed for cheese-making. Cheese vats are made both rectangular and round, and may be double-jacketed, the outer vat being supplied with pipes for steam. The rectangular vat, which is moved on wheels, is best made of tinned steel for the inner case, and iron for the outer. Double-tinned sheets of steel, fitted on the outside with bands, make a strong circular vat. Curd knives, for freeing the whey from the coagulated mass, should be made of fine steel with keen edges. A special machine has been devised for subjecting such hard cheeses as Cheddar to continual pressure: no pressure is applied to soft cheeses, which are simply made into the requisite size and shape in metal moulds. Cheeses should always be allowed to ripen in a room fitted with easily turned shelves. Diaphragm tub-shaped wooden churns are still used for butter-making. The butter is lifted out of the churn by wooden butter scoops. A machine, known as the 'Delaiteuse' butter drier, and worked on the centrifugal force

principle, has come into use in order to squeeze out the superfluous moisture.

Dairy Factories originated in America and thence spread to Europe. The first was a cheesery founded by Jesse Williams in 1860 in Oneida co., New York. His success in the venture led to the rapid estab. of similar factories and also of creameries, or butter factories, all over the States and Canada. Such was the mushroom growth of these factories that by 1866 there were 500 cheese factories in New York state alone. In England cheeseries were first instituted in 1870, when one was set up in Derby and another in Longford. But the enormous increase in the supply of milk from country to urb. dists. leaves a comparatively small surplus of milk for conversion into butter and cheese, a fact which accounts for the scarcity of D. F. in England relatively to the U.S.A. Moreover, foreign butter from Denmark, etc., and empire butter from Australasia, etc., are superior to the average butter produced in the United Kingdom. The cheese and butter factory system was introduced from America into Denmark, Ireland, France, etc., with surprising success. To-day one trained butter-maker can work up in a creamery the cream taken from 700 cows. His product finds a speedy market by reason of its even quality. It is packed in refrigerator cars, and within two weeks of its churning can reach a consumer many thousand miles distant. Artificial fats are frequently added to skim-milk to produce a poorer kind of butter, full-milk cheese being manufactured at the same time in the same factory. In 1855 Grimwade first made use of powdered milk in England, and in America a combination of whole milk powder and extract of malt was sold in 1883. Since that time many patented processes have placed a number of dried milks on the market. The first condensed milk plant of America was estab. by Gail Borden in 1856 at Wolcottville, Connecticut. John B. Meyenberg patented his process for supplying unsweetened evaporated milk in hermetically sealed tins in 1884. A still further product of America is the factory-made ice cream. In 1851 Fussell of Baltimore estab. a plant for making ice, and afterwards erected other factories in Washington, Boston, and New York. Ice cream which is sold commercially must contain not less than 7-14 per cent of milk fat.

Dairy Farming. Cows should be allowed plenty of pure water: epidemics of typhoid fever have been traced to cows drinking contaminated water. When the crops of grass, lt. rye-grass, vetches, or clover fall in the autumn, the cow must be given brewer's or distiller's grains or turnips. If the supply of turnips, however, is overdone, the butter and milk acquire an unpleasant flavour. Mangels and swedes are good substitutes for turnips. Milk cows should have about six pounds of concentrated food, such as oil-seed cakes, bran, and various farinaceous meals like bean meal, each day. Thirty pounds of dry food a day are a sufficient allowance

for a cow in full milk, but the food mixture should be varied as much as possible. Cleanliness is absolutely essential in the cows, their sheds, and the milkers. The cow-houses, moreover, must be well lighted, ventilated, and drained. The milking parlour is preferable to the ordinary cow-shed because it saves time in cleaning and washing down, no hay or straw comes into the building when cows are milked, and this makes clean milk production easier. Dust in the air from hay or straw is a fruitful source of dirty milk. Because the cow comes to the milker

succulent grass during the summer may lead to a full supply of milk. On the first appearance of frost cows should be sheltered at night, even though this curtails the milking period. In time all cows dry off a few months before calving again in the spring. Cows will give a good supply of milk for ten years. In this connection it may be pointed out that England has no pure dairy breed of cattle to her credit, the dairy shorthorn, our most numerous breed and the pioneer of the dairy revival at the turn of this century, still serving a dual-purpose standard

United Dairies

DAIRYING : MECHANICAL MILKING

instead of the milker going to the cow, there is a shorter journey for the milk to reach the cooler. If a milking machine is in use, there is less piping to keep sterile, and the vacuum is more easily controlled. The best-designed buildings for a dairy of about fifty cows should consist of two covered yards, separated by the milking parlour, the cooling room, and the boiler and sterilising unit. Each covered yard is divided down the centre; and the doors and gates are large enough to admit a cart or wagon to remove the dung or to carry straw. The cows are collected before milking in one yard and, after going through the parlour, go into the other. There are two bull pens, a number of calving pens, and calf pens in a third covered yard. Every cow should be examined at least twice a year by a veterinary surgeon, and the milk of any cow suspected of tuberculosis or other disease must be rejected until the animal has been inspected. For summer dairying it is arranged that the cows calve in the spring, so that abundance of

—which is justified in a European country that must rely for meat on its dairy herd. Records of performance continue to show annual improvements in yield, and the best British herds already hold their own with dairy cattle in other countries, like Denmark and Holland. Where large farms have to be supplied with milk all the year round, winter dairying is the rule. With this system cows are allowed to calve at all seasons so as not to interfere seriously with the supply at any one period. For this supplies cows are usually milked three times a day; otherwise morning and evening only. The distribution of milk was revolutionised by the growth of huge railway systems all over the country, and also by the invention of refrigerators. The former allow milk to be brought to London daily from places as distant as Derby, Gloucester, Dorset, etc., and even from Scotland, and the latter ensures the goodness of that milk by increasing its keeping qualities. Also, the bulk carriage of milk in glass-lined containers has overcome the

noise and tedium of rolling churns on railway platforms.

Practically all the milk which is brought to London comes from different parts of England; other big tnq. are similarly supplied. The estimated production of milk for human consumption in England and Wales, according to the Ministry of Agriculture, is over 1,000,000 gallons a year, and the estimated value of milk and dairy produce in England and Wales for the five years 1932-37 averaged £50,000,000 (excluding poultry and eggs, which were valued at £20,000,000). Practically all the butter and cheese made in the country is used for home consumption, and large imports of foreign milk products are made annually—butter chiefly from Denmark, New Zealand, Australia, and Ireland; cheese from New Zealand, Canada, the Netherlands, Italy, Australia, and America. The ann. review issued by the Imperial Economic Committee shows that the consumption per head of pop. in Britain of dairy products in 1936-37 averaged, for butter, 25 lb.; margarine, 8 lb.; cheese, 8 lb.; and eggs, 157. Milk and butter prices having, in recent years, fallen to an unremunerative level, the gov. set up a Milk Marketing Board in 1934 to regulate the purchase and sale of milk through a Central Distributors' Committee. This board also controls service artificial insemination from pedigree bulls, and the standard of stock for D. is being improved thereby. In 1947-48 the gov. subsidy for milk (including welfare schemes) was £65,000,000, and for milk products £37,200,000. If the subsidy had been completely removed the price of milk to the public in 1949 would have been 11½d. a quart instead of 10d., and that of butter 2s. 7½d. instead of 1s. 4d. a lb. See also MILK. See R. Wallace and J. Watson, *Farm Livestock of Great Britain*, 1923; J. Porter, *The Stock Feeder's Companion*, 1927; H. Henderson, C. Larson, and F. Putney, *Dairy Cattle Feeding and Management*, 1938; B. M. Cookson, *Dairy Cows and their Management*, 1944; F. Garner, *The Cattle of Britain*, 1944; and *British Dairying*, 1946.

Dais, genus of plants, belonging to the order Thymelaceae, or Daphnaceae. The bark of *D. malagascariensis* is made into paper.

Daisy, name given to sev. composite flowers, but is applied in particular to *Bellis perennis*, the little plant which flourishes all over Europe and is common in fields and on lawns. The Fr. call the D. 'marguerite,' from the Gk. word *margarita*, a pearl. The head is composed of yellow, tubular, and hermaphrodite florets of the disk, and white, ligulate, and pistillate florets of the ray; in wet weather and at night the surrounding involucre of bracts covers the florets. The dog D. or ox-eye D. belongs to the *Chrysanthemum* genus, and is known technically as *C. Leucanthemum*, as also are the midsummer D. and the moon D., while the Michaelmas D. is a Brit. species of *Aster*.

Dajaukku, see DETOCHES.

Dakahlieh, *Dagahlia*, or *Datahlieh*, prov. of Lower Egypt, with an area of

approximately 1020 sq. m. It is one of the most fertile provs. The chief tn. is Mansoorah. Pop. (1947 census) 1,414,284.

Dakar, cap. of Fr. W. Africa, and the only commodious port of Senegal. By a decree of 1924 D. and its surroundings, including Goree (or Goré) and Rufisque, were formed into a special ter. called *Circonscription de Dakar et Dépendances*. D. holds a commanding position on the route between W. Europe and Brazil and S. Africa, being situated on the gulf of Goree and on the E. side of Cape Verde. The tn., a fairly healthy one, possesses regular streets and sev. fine public buildings, notably the palace of the governor-general. The harbour is formed of two jetties, and there are three commercial docks with spacious quayage alongside which ships drawing 26 ft. are able to moor. D. is the only city, in the European or occidental sense, in the whole of W. Africa. The absence of any significant settlement on or near its site until the late nineteenth century heightens the paradox of its present ranking position among rivals, whether newly founded or centuries old. It was in 1857 that the Fr. authorities landed a force of marines and took formal possession. A fort was built on D. Point and, at once, many inhab. of Goree moved there to build houses under its protection. The Mesagories Impériales (later Maritimes) soon thereafter ran a monthly service between Bordeaux, D., and Rio. Yet for a quarter of a century after these beginnings D. made little progress. In the 1870s Goree felt a new wave of prosperity after the decline that had resulted from the abolition of the slave trade. The pop. of D. was then only 3000. The capacity of the harbour was greatly enlarged between 1898 and 1912. The extended city incorporated two or three African vlls., and, for some years, the thatched huts of the natives, close-clustered in irregular African fashion, continued to mingle conspicuously with the regular blocks of masonry houses put up by the Fr. Gov. for its officials or by the trading and shipping companies. During this time most of the remaining Goree merchants moved to D., and, in the first decade of the new century, port business trebled in volume; and, in 1905, a submarine cable was laid from D. to Brest. The First World War put a stop to gov. expenditure on D., and checked nearly all development. Afterwards, however, came a long series of public works in conjunction with extensive private undertakings. The marine arsenal is the largest factory in D. Both commercial and port functions greatly expanded between the two world wars. The most recent available statistics (1933-34) show that more than 1,000,000 tons of merchandise were carried on 2250 ships, the chief commodities imported being petroleum and coal; others were rice, wheat, and sugar.

D. is the 'African Gibraltar.' The improvements increased the value of the port as a naval base, particularly for submarines. In 1938 work was begun to

make a station of the first class, and so vigorously was it prosecuted that it was nearing completion when the Second World War broke out. A floating dock supplements the fixed dry dock. There are concealed tanks for petroleum storage. The most ambitious improvement effected was the construction of an outer roadstead by building a 2500-metre jetty S.-eastward from D. Point, extending into eight fathoms of water, and providing anchorage calm enough for warships and other craft up to 35,000 tons. Associated with naval expansion has been the reinforcement of the land fortifications on Goree, E. of D., on Point Bel Air and on Cape Manuel. Warplanes can land in Haume Cove, and there are large warehouses on the Peanut Plain, all supplementing the naval and land defences. Onakee, near by, contains a modern civil aerodrome, whose tracks enable heavily loaded planes to rise for the non-stop crossing from D. to Natal. At Haume there is a civil and military air-base. Before the Second World War an Air France line served the interior of the country, and by Bamako and Gao joined up with the great N.-S. airway of the line Air Africa.

The importance of D.—significantly referred to by President Roosevelt as 'the Atlantic fortress of Dakar'—for the security of the W. hemisphere became obvious in the Second World War. D. commands terrestrially and in the air the immense federation that France created in W. Africa, ters. capable of being utilised against one or other sets of belligerents as reservoirs of men and material and as departure bases of attacks and campaigns. Soon after the collapse of the Fr. forces in France in 1940 Gen. de Gaulle (q.v.), commanding the Free Fr. forces, made an attempt to take D., but had to abandon his campaign there. He had erroneously believed that a large proportion of the Fr. pop. of Senegal would support him, as they had done in Fr. Equatorial Africa. But the Vichy Gov., learning of his project, sent three cruisers from Toulon, which unaccountably were allowed to get through the Straits of Gibraltar, and eventually arrived at D. On the morning of Sept 23 (1940) de Gaulle sent emissaries to land at D., but they met with a hostile reception and were fired upon, while the batteries of the port opened fire on de Gaulle's warships and also on Brit. ships which were standing by to render assistance to de Gaulle. Fire from the Fr. battleship *Richelieu* was joined to that of the shore batteries and was returned, and the Brit. naval commander warned the Fr. authorities that submarines would be engaged if they left harbour. But in spite of this warning, three Fr. submarines attacked the Brit. ships, with the result that two of the attacking submarines were sunk. The forces of de Gaulle tried to make a landing but were not successful, and, when it became evident that only a major operation of war could secure the fall of D., it was decided on political grounds to discontinue hostilities, as it had never

been the intention of the Brit. Gov. to enter into serious warlike operations against those Frenchmen who felt it to be their duty to obey the command of the Vichy Gov. Following the allied landings in N. Africa, Adm. Darlan (q.v.) announced on the Algiers wireless on Nov. 23, 1942, that Fr. W. Africa had put itself under his orders, thus showing that it remained 'faithful to Marshal Pétain' (q.v.). This announcement appears to have been made in the name of the Dakar Gov. of M. Boisson coupled with that of Gen. Giraud. In effect the strategic significance of Boisson's adherence to Darlan, as well as to Gen. Giraud, lay more in the certainty that thenceforward D. would in no conditions become available to the Axis (q.v.) than that it would be available to the forces of the United Nations (q.v.); but, in the result, D. soon became available to the Allies with its fully developed and well-equipped port and repair base. Pop. (tn.), 45,000; (Circumscription), 75,000.

Dakiki (Daqiq), Abu Mansur (fl. 1000 A.D.), Persian poet and a native of Tus or Bokhara. He was court poet to Prince Nûb II., successor of Mansur I. on the throne of Persia (976 A.D.). He wrote many *ghazals* or odes (love-ditties, wine-songs, and religious hymns), and openly professed the Zoroastrian creed. He was charged by Nûb to turn the *Khodâ'inama* (or *Khodai-nameh*) into Persian verse. This, which in the old dialect meant 'Book of Kings', was the Parsi collection of legends and traditions of the heroic age of Iran. D.'s labours were abruptly terminated by his assassination, by which time he had written about 1000 distichs. Firdausi, whose great epic, the *Shâhnâmâ* ('Book of Kings') was the continuation and completion of D.'s work, claimed to have been inspired in dreams by D.

Dakin, Henry Drysdale (b. 1880), Eng. chemist; occupied in research work at Herter Laboratory, New York city (1905-1920). During the First World War he made a solution for the treatment of wounds which was developed, in collaboration with Alexis Carrel (q.v.), as the Carrel-Dakin treatment of wounds by regular intermittent irrigation with D.'s solution. Known for researches in biochemistry, especially on enzymes. Awarded the Davy medal of the Royal Society (1941). Co-author of *Handbook of Chemical Antiseptics* (1917).

Dakor, tn. of India, in the Bombay presidency 30 m. from Baroda. Its temple with an image is visited by pilgrims in Oct. and Nov. Pop. 10,000.

Dakota, also called *James River*, from the name Rivière de Jacques given to it by early Canadian *voyageurs*. It rises in N. D., U.S.A., and flows S. through S. D., reaching the Missouri near Yankton, after a course of 600 m. Its valley is very fertile.

Dakota, North, see **NORTH DAKOTA**.

Dakotas, see **DACOTAHS**.

Dal, riv. in Sweden, 250 m. in length. It is formed by the confluence of the Rs. Oster and Vester Dal Elf, and enters the gulf of Bothnia about 60 m. from Upsala.

Daladier, Édouard (b. 1884). Fr. statesman, son of a baker. Became a school teacher; served in the First World War as a captain, being awarded the *croix de guerre* and *légion d'honneur*. After the war was elected as a Radical-Socialist deputy. Minister of colonies in 1924, of war in 1925, of public instruction in 1926; succeeded Herriot as chairman of the Radical-Socialist party in 1927. Premier for some months in 1933, again for a short time in 1931, and from 1936 served as war minister in various Popular Front govts. He was Premier again April 1938–March 1940, remaining also in charge of the war ministry. Employed conservative methods in his efforts to restore financial and economic order in France. Was one of the signatories of the Munich Pact (*q.v.*), Sept. 1938. He was regarded as France's 'strong man,' ruling by decrees and arranging for a two-year postponement of Fr. elections in July 1939. His subsequent majorities were no longer Popular Front (Communist-Socialist-Radical), but now extended considerably to the Right. When the Chamber became critical of his personal rule and demanded a more vigorous prosecution of the war, D. resigned (March 21, 1940). He remained for a time, first the war ministry, then the foreign ministry under Reynaud, but was removed from the gov. in June 1940, and after the Fr. collapse he was detained by the Pétain Gov., and interned by the Gers. He was released in 1945. Pub. *The Defence of France* (1939).

Dalaguete, municipality in the is. of Cebu, Philippine Is. Corn, coffee, cocoa, manila hemp, etc. are produced and fish caught. Pop. 30,000.

Dalai Kuli, small is. in Lake Kosso, Kosso Gol, or Kosgol, Mongolia, 130 m. S.W. of Lake Balkal. The is. is held by the native Buddhists to be the navel of the earth, and is therefore considered holy ground. Lat. 51° N., long. 100° 30' E.

Dalai Lama. In Tibet the arch priest of Lamaism, revered as the living incarnation of deity, always present on earth in him. See LAMAISM.

Dalai Nor (Holy Sea): 1. Lake of Mongolia, near the frontier of E. Siberia and the great bend of the Argun R., in lat. 49° 10' N., long. 117° 20' E. Also called Kulun Nor. It is fed by the Kerulen R., but is now rapidly drying up, and has ceased to send any water into the Argun. 2. Small lake of Inner Mongolia in lat. 43° N., long. 116° 30' E.

Dalarna (the Dales), or **Dalecarlia**, ant. prov. of Sweden, lying N.W. of Stockholm, and stretching from the Norwegian frontier nearly to Gefle on the Baltic. The dist. is now called Kopparberg. The Dalesmen still retain their ant. costume and dialect, and have always been noted for bravery and independence. In 1434, led by a miner, Engelbrecht, they rebelled against the tyranny of Eric of Denmark, and when, in 1523, Gustavus Vasa freed Sweden from the Danes, his best helpers came from Dalecarlia. The dist. is to a great extent covered with forest, but agriculture is carried on where possible, and there are very productive iron mines,

with large works for smelting, blasting, and rolling, also saw-mills and wood-pulp factories. Copper mines at Falun, the chief tn., are almost exhausted. Pop. about 260,000.

Dalbeattie, bor. and tn. of Kirkeudbrightshire, Scotland, situated on D. Burn, 14 m. S.W. of Dumfries. There are important granite quarries in the neighbourhood; the materials for the Liverpool docks, Thames embankment, and other public erections have been taken from here. There are also granite-polishing works, dye works, and paper mills. Small vessels can approach quite close to the tn. up the mouth of the burn. John Balliol, founder of Balliol College, lived in the neighbourhood. Pop. 3000.

Dalberg, name of a noble Ger. family whose ancestors in the twelfth century were hereditary chamberlains of the bishop of Worms. In 1494 they had become so important that Maximilian I. granted them the right of claiming the first knighthood at each coronation.

Johann Dalberg (1455–1503), bishop of Worms, a great scholar; founded the first Gk. chair at Heidelberg.

Karl Theodor von Dalberg (1744–1817), archbishop of Mainz and chancellor of the empire, a friend of Goethe and Schiller, ruined his career by joining his fortunes with those of Napoleon. The D. family is extinct, but its last heiress married an Englishman, and her son was created first Baron Acton.

D'Albert, Charles Louis Napoleon (1809–1896), musical composer, b. at Nienstetten, near Hamburg; became ballet-master at Covent Garden, London. Later he left his post to take up the teaching and composition of music, settling at Newcastle. He composed many popular dances, including the *Bridal Polka*, *Sweetheart's Waltz*, *Sultan's Polka*, and *Edinburgh Quadrilles*, and was a favourite master for both music and dancing. He wrote *Ball Room Etiquette* (1835).

D'Albert, Eugène Francis Charles (1864–1932), Fr. pianist and composer, b. in Glasgow, son of the preceding. He received the foundation of his musical education under Sullivan at the National Training School of Music (the predecessor of the Royal College of Music). Studied also under Ernst Paner, Stainer, and Prout. Won the Mendelssohn scholarship at seventeen, entitling him to a period of study abroad, which he spent at Vienna, afterwards studying under Liszt. As a pianist he soon became known in all parts of the world. Was for a short time court conductor in Weimar. He wrote two piano concertos, a symphony, and piano pieces. Married seven times, among his wives being Teresa Carreño, the pianist (1892–95), and the singer Hermine Fink (1895–1910). He also composed many songs, but is better known for his operas: *The Ruby* (1893); *Hismond* (1895); *Gernot* (1897); *Die Abreise*, or *The Departure*—a one-act comedy (1898); *The Improviser* (1900); *Tiefand*, his most successful work, and part of the stock repertory of most Ger. theatres (1903); *Flauto Solo*, musical comedy (1905); *Tragödien* (1907); *Love's*

Chains (1912); *Dead Eyes* (1916); *The Bull of Oliveira* (1918); *Scirocco* (1921); and *Maretke von Nymwegen* (1923).

Dale, David (1739-1806), Scottish philanthropist and founder of the 'Old Independents,' was in early life a Lanarkshire weaver. Engaging in the importation of Fr. yarn, he gained enough to estab. cotton mills at New Lanark, and also the first Turkey-red dye works in Scotland. A kind employer, he was also deeply interested in charitable and educational work. His son-in-law was Robert Owen (q.v.).

Dale, Robert William (1829-1895), Eng. theologian and Congregational minister, b. London. Educated Spring Hill College, Birmingham—then the chief training ground for the Congregational ministry—and at London Univ., where he took the gold medal for philosophy and political economy. Took part in the political life of Birmingham as a Liberal until the introduction of Home Rule by Gladstone, when he gave up politics. Took an important part in educational affairs, becoming manager of the National Education League and a leading member of the Central Nonconformist Committee. President of the Congregational Union, 1868-1869—an honour for so young a man. In 1877 he accepted the post of Lyman Beecher Lectureship at Yale. Made honorary LL.D. of Glasgow Univ. in 1878. He was a prolific writer, his most important works being *The Atonement*, 1875, a work which gave him a high place among theological writers, and was in its time a text-book in many colleges; *The Jewish Temple and the Christian Church*; *Lectures in Preaching*; *A Manual of Congregational Principles*; and *Discourses on Christian Doctrine* (the most finished and powerful of his works). See life by A. W. V. Dale, third ed., 1899.

Dale, coast vil. of Wales, situated on Milford Haven, in the co. of Pembrokeshire, 7 m. W. of Milford. It is noted in hist. as the place where Henry VII. landed with his Fr. followers on his way to Bosworth. Pop. 300.

Dalecarlia, see DALARNE.

D'Alembert, Jean le Rond, see ALEMBERT.

Dalgarno, George (1626-87), inventor of a deaf and dumb alphabet, b. at Aberdeen, and was a schoolmaster in Guernsey and at Oxford. His *Ars Signorum* (1661) contained ingenious suggestions for a universal language, based on the hypothesis that ideas could be expressed by universal characters. His *Didascalophus*, or *The Deaf and Dumb Man's Tutor*, appeared in 1680.

Dalhousie: 1. mt. sanatorium, 7687 ft. above sea-level, in the Dhauladhar range, N.E. Punjab, close to Kashmir frontier. Pop. 7000. 2. Famous univ. in Halifax Nova Scotia. Has over 800 students in attendance at its regular sessions.

Dalhousie, Sir James Andrew Broun Ramsay, first Marquess and tenth Earl of (1812-60), governor-general of India; entered the House of Commons in 1837, and in the following year, on the death of his father, took his seat in the Upper House.

His powers of debate soon won him office, and at the early age of thirty-one Peel appointed him vice-president of the Board of Trade, and, two years later, in succession to Gladstone, president. In 1847 he went to India as governor-general. Not long after his arrival the second Sikh war broke out, and in 1849 the Punjab was annexed. While the arrangement for the future administration of the new prov. occupied much of his time, D. yet found leisure to introduce many internal reforms in India. Careful to interfere as little as possible with the religious and caste system, yet there were certain abuses that he could not but remove. Notably he legitimated the remarriage of Hindu widows, and used all the means in his power to prevent the old practice of suttee. It is to D. that India owes the introduction of the telegraph and the railway; the railways, according to the principle he had when at the Board of Trade, desired to apply to the Eng. lines, were erected and controlled by the gov. It was during his viceroyalty that the second Burmese war occurred, and that Lower Burma was added to the Brit. Empire. He returned to England in 1856, his term of office having been extended beyond the usual limits. Dying without male issue he was succeeded by Fox Maule, Lord Panmure. See life by Sir W. Lee-Warner, 1904.

Dallin, Olof von (1708-83), Swedish poet, son of the pastor of Vinberg. Entering a gov. office at Stockholm in 1726 he rose rapidly. Being fond of Eng. literature he started (1733) the *Svenska Argus*, on the model of Addison's *Spectator*, and also wrote some satires in imitation of Swift. An historical epic, *Svenska Frihelen* (1742), and a hist. of Sweden (1747-61) procured him the post of tutor to the crown prince, but becoming entangled in Queen Louise's political intrigues, he was disgraced and banished from the court (1756), and though recalled five years later his health and spirits were entirely broken.

Dalkeith, mkt. tn. 4½ m. S.E. of Edinburgh, picturesquely situated on a tongue of land between the N. and S. Esk. It has an important grain market, while iron moulding, carpet weaving, brush making, and brewing are among the industries carried on. Extensive coalfields are in the vicinity. D. Palace (rebuilt in 1700) is a seat of the duke of Buccleuch. Pop. 7500.

Dalkey, fashionable seaside resort in Co. Dublin, Ire., with a fishing vil. Pop. of urban dist. 3500.

Dallapiccola, Luigi (b. 1904), It. composer, b. at Pisis, Istria; studied at the Conservatoire of Florence. First attracted international attention at pre-1939 festivals of the International Society for Contemporary Music, a number of his works being performed in Britain in B.B.C. contemporary music concerts. His *Songs of Captivity* were prompted by the Fascist 'racial laws' of 1938 and represent the expression in music of an imprisonment which was as much mental as physical. They consist of settings of the

prayer of Mary Queen of Scots, and of passages from Boethius' *De Consolatione Philosophiae* and Savonarola's *Meditation on the Psalm 'In te Domine speravi'*; the last two being performed in London in 1946. His symphonic suite, the ballet *Marsya*, written about the same time, is on the classical legend of Marsya's contest with Apollo. His *Piccolo Concerto* for piano and orchestra of twenty-six players show his desire to get the maximum possible variety of rhythm, colour, and contrapuntal interest within limited resources. For most of his subsequent work he adopted Schönberg's twelve-note technique. The first of these (1942) were three sets of lyrics for soprano and various combinations of instruments to words from the Greek anthology—*Cinque Frammenti di Saffo*, *Sex Catmivo Alcei*, and *Due Liriche d'Anacreonte*. Three recent works are two Studies for violin and piano; *Rencesvals*, a dramatic setting for baritone and piano of fragments from the *Chanson de Roland*; and an opera, *La Torture de L'Espérance* (on the famous short story by Villiers de l'Isle Adam). D.'s influence and that of his followers is growing daily in Italy, and is a very important factor in the cultural renaissance of that country.

Dallas, Alexander James (1759–1817), Amer. statesman and financier, b. in Jamaica, W. Indies, educated at Edinburgh; studied law at the Inner Temple; practised in Jamaica, and in 1783, having taken oath of allegiance to the U.S.A., in Philadelphia. He held sev. important positions in the commonwealth of Pennsylvania, and in 1814 Madison made him secretary of the Treasury; D. also served for some months as secretary of war, and during that time reorganised the army on a peace footing. He found the gov. bankrupt, and left it with a surplus of more than \$20,000,000. Among his writings are *The Laws of Pennsylvania, 1700–1801* (1801), and *An Exposition of the Causes and Character of the War of 1812–1815* (1815). See G. M. Dallas, *Life and Writings of Alexandra James Dallas*, 1871.

Dallas, George Miffin (1792–1864), Amer. diplomatist and politician, b. in Philadelphia. He graduated at Princeton College, 1810, and was admitted to the Bar, 1813; represented Pennsylvania in the Senate, 1831–33; attorney-general of Pennsylvania, 1835. In 1837 he entered the diplomatic service, and acted as Amer. ambas. in St. Petersburg for two years. He was elected vice-president of the U.S.A., 1844–49; ambas. to Great Britain, 1856–61. He wrote *Series of Letters from London* (1869), and a life of his father, A. J. Dallas (1871).

Dallas, leading manufacturing city of Texas, U.S.A.; with a pop. of 294,700 originated in 1841 with one log hut. Nearly half the cotton gins used in the world are made at D. There are large oil-fields, petroleum refineries, the largest inland cotton market, a municipal air port, fifty parks, and the S. Methodist Univ. with 3000 students. The fair held here is the largest ann. fair in U.S.A.

There are Rom. Catholic and Protestant cathedrals.

Dallin, Cyrus Edwin (1861–1944), Amer. sculptor; b. at Springville, Utah, where he became familiar with Red Indian life. Studied at Boston and Paris. Among his statues are 'Signal for Peace' (gold medal, Chicago, 1893), 'The Medicine Man' (Fairmount Park, Philadelphia), 'Sir Isaac Newton' (Congressional Library), 'Don Quixote' (gold medal, St. Louis, 1904).

Dallinger, William Henry (1841–1909), Eng. scientist, b. at Devonport. Author of *Minute Forms of Life* (1866); *The Creator and what we may know of the Methods of Creation* (1887); and editor of Dr. Carpenter's *Microscope and its Revelations*, 1901.

Dallmeyer, Johann Hein (1830–83), Ger. optician, b. at Loxten, Westphalia; came to London in 1851, and entered the employment of Ross, a telescope manufacturer, inheriting a large part of his business in 1859. He also took up the manuf. of photographic lenses with great success.

Dalmatia, coastal region of Yugoslavia, lying along the E. side of the Adriatic from Istria to the lake of Scutari. It is bounded on the E. by Bosnia and Herzegovina, and Montenegro, and by Croatia on the N. It is at no part more than 50 m. in breadth, but has a length of 350 m. The inhab. are mainly of Serbo-Croatian origin, being descendants of the Dinaric emigrants resulting from the fourteenth-century Turkish conquest of the Balkans, but many Its. are to be found along the coast. They are for the most part engaged in seafaring occupations, and in stock rearing and fruit growing. In the time of the Rom. Empire, with addition of D. and Pannonia to that empire, a main road was constructed to link each of these provs. to the focal point at Aquileia. Military and commercial considerations motivated the lay-out of this road system, which, apart from roads of secondary importance, was dominated by the 'Frank' lines, *Via Posthumia* and *Via Gemina*. It was intended to join D. and Pannonia to Italy and it fulfilled that intention. The products include wine and olives. The religion of the people is almost entirely Rom. Catholic. The coast is much indented, peninsulas and is. alternating with gulfs and bays. The is. include Brao (Brazza), Hvar (Lesina), Vis (Lissa), Korcula (Curzola), Mljet (Melada), and Lagosta. The country is largely mountainous, and includes the Dinaric Alps and the Karst plateaux. The prin. rivs. are the Zrmanja, Cetina, Kerka, and Neretva. Dubrovnik (g.v.) or Ragusa, in S. D., is rich in architecture, and is a noted tourist centre. D. was in former times a part of Illyria. In the early centuries of the Christian era it was overrun by the Goths and the Avars, and also by the Slavs. In the Middle Ages it fluctuated between the dominance of Venice and Hungary. It was ceded to Austria in 1797, to France in 1805, and again in Austria in 1814, and after the First World War was by the treaty of

Rapallo united to Yugoslavia, except the tn. of Zara which went to Italy. It may be pointed out that D. had been promised to Italy by the treaty of London, probably because it was not linked by a single railway line to the Yugoslav interior, and because Yugoslavia was not in a position to instal the post and rail facilities which would make D. a Mediterranean outlet for its overseas trade. In the Second World War, the outcome of the 'joint delimitation' following the Axis recognition of Croatia was that Germany annexed parts of Carinthia and Styria, while Italy

and powerful; eyes set fairly wide apart, bright and intelligent, black or dark brown in the black-spotted variety, yellow or bright brown in the liver-spotted variety; ears thin, well spotted, and rather small, carried close to the head; nose black or dark brown, according to its other markings; forelegs perfectly straight; hind legs with hocks well let down; feet round and cat-like; tail well spotted, long and tapering, carried with an upward curve; coat short, thick, and glossy. The average weight of a dog is 55 lb., of a bitch 50 lb. (See illustration on p. 506.)

BUDVA, IN SOUTHERN DALMATIA

Yugoslav Embassy

acquired the larger part of D. and Slovenia. But after the Second World War D., including Zara and Lagosta, reverted to Yugoslavia. See F. H. Jackson, *Shores of the Adriatic*, 1908; and P. Digoivi, *La Dalmatie et les problèmes de l'Adriatique*, 1944. Pop. 902,000.

Dalmatian Dog, spotted carriage dog, originally kept in stables. It is active and muscular, a good runner, and a fine watch dog. Its colour should be pure white, with round black or liver-coloured spots bold and evenly distributed over its body. The average size of the spots is that of a shilling, but they vary from the size of a sixpence to the size of a florin. The puppy is b. white, and it is some days before the spots appear. The spots on the head, tail, and limbs are smaller than those on the rest of the body. Its other points are: Head long, with a flat skull, and quite free from wrinkles; muzzle long

Dalmatic, eccles. vestment worn in the W. Church by deacons and bishops at mass, and also at solemn processions and benediction except in the penitential season. It is marked with two vertical stripes from the shoulder to the foot of the garment, which is slit beneath both sleeves. At a deacon's ordination the bishop prays 'may He [the Lord] cover thee with the dalmatic of righteousness for ever.'

Dalman, city of India, in the prov. of Oudh, situated on the Ganges, 60 m. N.W. of Allahabad, and 50 m. S.E. of Cawnpur. Pop. 6000.

Dalmellington, par. and vil. of Ayrshire, Scotland, 15 m. S.E. of Ayr. Coal and iron have been worked from the eleventh century, and there are limestone and sandstone quarries. Pop. of par. 6000, vil. 1700.

Dalmeny, vil. and par. of W. Lothian,

Scotland, 1 m. S.E. of S. Queensferry. Near are D. Park, the seat of the earl of Rosebery, and Barnbougle Castle. Pop. (with Queensferry) 4500.

Dalny, *see* DAIREN.

T. Fall

DALMATIAN DOG

Dalou, Jules (1838-1902), Fr. sculptor, b. in Paris. He studied under Carpeaux and Duret. He had held office under the com. in the Louvre, 1871, and was obliged to flee to London, where he was given a professorship in the S. Kensington Museum, 1878; he returned to France in 1879. He always remained a disciple of Carpeaux, but his style is purer and his conception more vigorous. His chief works are 'Mirabeau delivering his famous Address in the States-General, 1789,' in relief, which was placed in the Chamber of Deputies; 'The Triumph of Silenus' (1897), in the Luxembourg, Paris; 'Bacchus consoling Ariadne' (1892); 'The Triumph of the Republic' (1900), in the Place de la Nation. He also executed busts of many of his contemporaries.

Dalriada: 1. The anct. name of the N. dist. of co.-Antrim, Ireland, now known as the Route. The Dalriada were, by tradition, descendants of Riada of the Long Wrist, chief of the Gaelic Scots. 2. The anct. name of part of Argyllshire, founded by the Dalriads of Ireland about 498. They were defeated at Magh Rath, co. Down, in 637, but in 843 united with the Picts, under Kenneth MacAlpin, and formed the kingdom of the Scots of Alban.

Dalruadhain, *see* CAMPBELTOWN.

Dalry: 1. Tn. of Ayrshire, Scotland, 19 m. S.W. of Glasgow, on the r. b. of the R. Garnock. The iron works were estab. in 1845. The tn. has also tweed and hosiery mills, and collieries. Pop. 5000. 2. Vil. of Kirkcudbrightshire, Scotland, 4 m. N.W. of New Galloway. Pop. 600.

Dalrymple, Sir David, Lord Hailes (1726-92), Scottish judge and historical antiquary, the great-grandson of the first Viscount Stair. He was called to the Scottish Bar in 1748, becoming judge of the Court of Session as Lord Hailes in 1766. He served with ability, if not with distinction, but he is chiefly remembered for his literary work, his friendships, and his controversies. He thought Hume's *Inquiry* atheistic, and refused to revise it

in 1753 on that ground. He was much esteemed by Dr. Johnson, who, nevertheless, adjudged him below Goldsmith as an historian, and who revised his chief work, *Annals of Scotland* (1776).

Dalrymple, Sir James, first Viscount Stair (1619-95), Scottish lawyer and politician. He was prof. of philosophy at Glasgow from 1641 to 1647, when he was admitted an advocate in Edinburgh. He was appointed secretary to the commissioners sent to Charles II. by the Scottish Parliament, 1650; lord president of the court of session, 1671. He wrote *Institutions of the Law of Scotland* (1681, 1693); and a Lat. work, *Physiologia Nova Experimentalis* (1686). He was created Viscount Stair in 1690. *See* J. M. Graham, *Annals and Correspondence of the Viscount and First and Second Earls of Stair*, 1875.

Dalrymple, Sir John, second Earl of Stair (1673-1747), Scottish general and diplomatist. He was educated at the univs. of Leyden and Edinburgh, and in 1701 joined a Scottish foot regiment and served in Marlborough's campaigns. He succeeded to the earldom in 1707, and was made commander-in-chief of the forces of Scotland. He served with high distinction at Oudenarde, Malplaquet, and Ramillies. He acted as Brit. ambas. in France, 1708, and in Holland, 1742, and in 1743 fought at the battle of Dettingen. At his seat in New Liston, Edinburgh, he devoted much time to agriculture, and was the first to plant turnips and cabbages in open fields.

Dalsersf, par. and vil. of Mid-Lanark, Scotland. It stands on the Clyde, 2½ m. from Wishaw, and 7 m. S.E. of Hamilton. A Rom. road to Ayr passed through the par., and there are Caledonian forts. Coal and iron are extensively worked, and there are orchards and dairy farms. Pop. 20,000.

Dalswinton, estate and vil. of Dumfries, Scotland. It is noted as being the place where was launched the first steamboat in Great Britain, by Patrick Miller, upon a small loch, in 1788.

Dalton, John (1766-1844), one of the greatest of Eng. chemists, b. at Eaglesfield, in Cumberland. His father was a weaver and Quaker. He himself kept a Quaker school for a time, and was afterwards partner in a school at Kendal. While at Kendal he commenced (1787) a journal of meteorological observations, the results of which appear in his *Meteorological Observations and Essays* (1793), and other works. In 1793 he became a teacher of mathematics and the physical sciences in the Manchester New College, and it was in the following year (1794) that he made known the results of his investigations of colour-blindness, sometimes called Daltonism, from which he and his brother suffered. In 1801 appeared his important essays, *The Constitution of Mixed Gases*, and *The Expansion of Gases by Heat*, and he followed up these researches by developing the atomic theory as an explanation of the facts of chemical combination in a paper read before the Manchester Philosophical

Society in 1803, *On the Absorption of Gases by Water and Other Liquids* (1805), and *A New System of Chemical Philosophy* (1808-10). He was elected president of the Manchester Philosophical Society in 1817, received the medal of the Royal Society in 1825 'for his development of the chemical theory of definite proportions,' and was made a foreign associate of the Paris Academy of Sciences in 1830. He was made D.C.L. of Oxford, and LL.D. of Edinburgh. See W. C. Henry, *Memoirs of John Dalton*, 1854; A. Harden and H. E. Roscoe, *A New View of the Origin of Dalton's Atomic Theory*, 1896; and lives by J. Neville-Palley, 1920, and W. A. Tilden (in *Famous Chemists*), 1921.

JOHN DALTON

Dalton, city of Whitfield co., Georgia, U.S.A., 114 m. N.W. of Atlanta. The surrounding country is rich in minerals, and D. has numerous foundries, mills, and factories. It is also a trade centre for exporting cotton, cattle, grain, and fruit. It was an important military centre during the Civil war. Pop. 10,400.

Dalton-in-Furness, par. and tn. of Lancashire, England, 5 m. from Ulverston. The ruins of Furness Abbey are in the neighbourhood. Iron ore abounds, and malting and brewing are carried on. Pop. 12,300.

Dalton Plan, experiment in educational reform initiated in 1920 at Dalton, Massachusetts, by Helen Parkhurst. It is similar in conception to the methods of Dr. Maria Montessori, striving to develop individuality by directing the child in self-chosen occupations and study. See Helen Parkhurst, *Education on the Dalton Plan*, 1922.

Dalton's Laws are two laws relating to the behaviour of gases. The first law is known as the law of partial pressure. It states that, in a mixture of gases, each gas exerts the same pressure as it would if it occupied the total volume; in other

words, the total pressure of the mixture is the sum of the partial pressures of each gas. D.'s second law, usually known simply as D.'s law, states that if a mixture of gases is placed in contact with water or any other solvent, then the amount of each gas dissolved and the solvent is directly proportional to the partial pressure of that gas. D.'s law is an extension of an earlier law stated by W. Henry, viz. that the amount of gas dissolved by a solvent is directly proportional to the pressure of the gas.

Daly, Sir Henry Dermot (1821-95), Brit. soldier, b. at Daly's Grove, co. Galway, Ireland. During the Indian mutiny he distinguished himself at Delhi, where he was twice wounded. At the capture of Lucknow he was in command of a regiment of Hodson's Horse, and on the death of Hodson took command of the three regiments in the Oudh campaign.

Daly, John Augustin (1838-99), Amer. theatrical manager and playwright, b. at Plymouth N., Carolina, U.S.A. He became dramatic critic to various New York papers—the *Sunday Courier*, *Express*, *Sun*, *Citizen*, etc.—from 1859 to 1869, when he opened a theatre, known as Fifth Avenue Theatre. This theatre was destroyed by fire, and in 1874 he opened another D.'s Fifth Avenue Theatre. D. had an excellent and most popular company, Miss Ada Rehan being for many years his leading lady. He toured in England and on the Continent with great success, and built D.'s Theatre (q.v.) in Leicester Square, London, in 1893. He was also a clever playwright, and wrote adaptations from Fr. and Ger. plays. His own plays include *Pique*, *The Great Unknown*, and *The Last Word*, and he was also the author of *Woffington: a Tribute to the Actress and the Woman* (1888).

Dalyell, or Dalzell, Thomas (c. 1599-1685), Scottish general, who fought on the Royalist side at Worcester (1651). During Cromwell's Commonwealth he enlisted in the Russian Army, and fought against the Turks and Tartars. On Charles II.'s accession he returned to Scotland, over which he was appointed commander-in-chief. He harshly repressed the Covenanters and defeated them at Rullion Green, in the Pentlands.

Daly's Theatre, theatre in Leicester Square, London, opened by J. A. Daly (q.v.) and his New York company with *The Taming of the Shrew* on June 27, 1893. The theatre was visited by Sarah Bernhardt in 1894, and again in 1895 in Sudermann's *Magda* and Rostand's *La Princesse lointaine*. From 1896 onwards it produced chiefly musical comedies, which included *The Geisha* (1896), *The Merry Widow* (1907), and *The Dollar Princess* (1909). It was demolished in 1934, and its site was occupied by a cinema.

Dalziel Brothers, firm of engravers, printers, and pubs., comprising George D. (1815-1902), Edward D. (1817-1905), John D. (1822-60), and Thomas Bolton D. (1823-1906), sons of Alexander D. of Northumberland, seven of whose sons became professional artists. The original partnership was constituted by George,

draughtsman and wood-engraver, and Edward, who, besides being an engraver, also painted in oils and water-colours, and who was responsible for extending the business to include publishing and printing. The authentic signature on the engravings of the D. B. is 'Dalziel sc.' only their earlier work being signed individually. Both Edward and Thomas were skilled book illustrators, particularly Thomas, whose best illustrations are to be found in early eds. of Wm. Cullen Bryant's poetical works, and Jean Ingelow's poems, and notably in the ed. of *Pilgrim's Progress* pub. by Ward, Lock in 1865, in D.'s *Arabian Nights* (1864) and D.'s *Bible Gallery* (1880). Woodcuts by George D., who developed his skill under Charles Bray, the engraver, were also executed for the above works. George, though a skilled engraver, had not the original talent of Thomas D., but he was a prolific engraver, producing alone or with his brothers numerous block engravings for many well-known pubs., such as the Abbotford ed. of Scott, Charles Knight's *Shakespeare*, and also for the periodicals *Punch* and the *Illustrated London News*, most of which blocks were made after drawings by contemporary artists of estab. reputation, such as Cruikshank, Doyle, and Leech. Later came engravings for the poems of D. G. Rossetti and of the paintings of Millais, Burne-Jones, and other Pre-Raphaelites; for Tennyson's poems (Moxon's ed.); Lear's *Book of Nonsense* (1862); and for *Alice in Wonderland* (1865) and *Through the Looking Glass* (1872)—in which latter connection it may be noted that Edward D. was a fellow student of Tenniel at a London school in early manhood. Other works for which the D. B. made well-known engravings were Staunton's *Shakespeare*, from illustrations by Sir John Gilbert; *Lalla Rookh* from illustrations by Tenniel; and Goldsmith's works, from illustrations by George John Pinwell. See C. and E. Dalziel, *The Brothers Dalziel: a Record of 1840-99*, 1901; F. Colebrook, *Dalziel and the Dalepries*, 1909.

Dalziel, par. of Scotland in N. Lanarkshire, situated on the Clyde, 12 m. S. of Glasgow. It includes part of Wishaw and Motherwell, and forms the chief centre of the Scottish Black Country. There are large iron and steel works, and the manu. of heavy iron goods is carried on. There are also sandstone quarries in the vicinity. Traces of the old Rom. Watling Street are to be found near by. Pop. 50,000.

Dam. Prin. types of Ds. are (i.) masonry or concrete; (ii.) rock-filled; (iii.) earth. (i.) The first type are the most popular for large reservoirs, and, owing to the advance in engineering knowledge during the past century, they are exceedingly stable and also built in the most economical way. They are generally triangular, in cross-section, and the width at any horizontal section of the D. is governed by the consideration of stability; this requires that the resultant of the two stresses or any portion of the D., viz. the weight of the masonry above the horizontal section and

the force due to the pressure of the water on the fraction of the D. below it under consideration, shall pass within the middle third of the horizontal section. These Ds. are made water-tight by concreting the water-face and the bottom of the D. (ii.) The second type is cheaper though inferior to the masonry D. It is concreted on its water-face and its outer face consists of masonry carefully built. The space between the two walls is filled with quarry rock of all sizes. In order to make the D. more water-tight the concrete wall is continued downwards until an impervious stratum is reached. (iii.) Earth Ds. are the cheapest Ds. if suitable material is available close at hand. They are rendered water-tight by a core of clay that is carried downward until an impervious stratum is reached. Damage to the earth D. that would be caused by the overflow of the water after heavy rains is avoided by building a concrete waterway through the D. See also RESERVOIRS. See W. F. Creager, J. Austin, and J. Hinds, *Engineering for Dams*, 1945.

Damages, in law, the pecuniary compensation recoverable for loss or injury by a person who has suffered a legal wrong at the hands of another. General D. are those regarded as naturally consequent on the breach of the right, and not requiring further proof. Special D. are D. for definite loss resulting from the act of the defendant; these must be specifically pleaded and proved. Nominal D. are given when the plaintiff proves a right but fails to prove actual loss. Substantial D. is the term used to represent fully the plaintiff's actual loss. Exemplary or vindictive D. are awarded to punish the offender, in addition to compensating the injured party, and may be given in actions for slander, libel, etc. Apart from cases of this character, the general rule is that the D. must be measured by the loss actually sustained, and that D. must be awarded on the principle that the injured party should be placed as nearly as possible in the position in which he would have been if the wrong had not been sustained. Another rule is that in a case where sev. persons are equally concerned in committing an injury, each is liable for the full amount. D. are recoverable for a breach of contract, a civil wrong, or a delict. Injury sustained through the want of ordinary skill on the part of a professional man is admissible as a cause of action.

Damage to Property, see MALICIOUS INJURIES TO PROPERTY.

Damaghan, see DAMOCHAN.

Daman, or **Damão**, Portuguese settlement on the W. coast of India, within the boundaries of the prov. of Gujarat, on the gulf of Cambay. In the dist. are the forests of Nagar Havall, which provide teak for shipbuilding. Tobacco is grown, there are fine fisheries outside the harbour, and there are large salt works. Daman was first occupied by the Portuguese in 1558, and was finally ceded by the Marathas in 1780. Area of the dist. 169 sq. m. Total pop. 68,000.

Damanhur, or **Damanhoor**, cap. of the

prov. of Beheira, Lower Egypt, on the Mahmudieh Canal, and on the railway line between Cairo and Alexandria. It has trade in cotton and woollen goods. Pop. 84,900.

Damaraland, ter. forming part of S.W. Africa. Ger. until after the First World War, when it was mandated to the Union of S. Africa, together with the rest of S.W. Africa. It extends inland from the Atlantic Ocean to the Kalahari desert, and lies between Namaqualand and Ovampoland. Part of the E. dist. is very mountainous; further inland lie well-watered prairies. The chief industry of the Damaras (or Herero), a nomadic tribe of Bantu stock, is cattle raising. Copper is found near Otavi, but the chief products of the country are leathers, skins, and ivory. Walvisch Bay is the only good harbour. The chief settlements are Windhoek, Omaruru, Ojimbingue, and Otavi. Pop. about 30,000. See also HERERO.

Damascening, or **Damaskening**, word referring to the watered lines on blades of weapons, and also to the gold and silver decorations that are incrustated on blades. The word is derived from Damascus, where the art originated and was discovered by Europeans at the time of the crusades. The watered pattern is produced by the process of forging, welding, and soldering rods of iron. The rods are twisted and then welded into one, leaving a fine watered or damascened surface. The gold and silver incrustations with which blades and hilts are ornamented are wrought in India and Persia. Gold or silver wire is laid on to a design which has previously been cut or scratched into the surface, and then the wire is hammered into position. Consult Col. T. Hendley, *Damascening on Iron and Steel, as practised in India*, 1892.

Damascenus, **Joannes**, known as **Chrysostomus** (the Golden-flowing). see **JOANNES DAMASCENUS**.

Damascenus, **Nicolaus**, philosopher and historian of the Augustan age and a friend of Herod the Great; the dates of his birth and death are unknown, and almost all our information of him is gathered from Josephus, Eusebius, and others who mention him. He wrote various works in Gk., philosophical and political in character, of which none are extant: an autobiography, of which portions have been preserved by Suidas and Josephus; and a universal hist. in 141 books, of which a few fragments remain. The best ed. of the extant portions of D. is that of J. C. Orelli (Leipzig), 1804.

Damascus, chief tn. of Syria, known among the natives as Kesh-Shām. According to Josephus, it was founded by Uz, the son of Aram and grandson of Shem. On three sides of the city rise the heights of Anti-Lebanon, whence comes the Barada R., spreading itself in seven branches over the great plain. Two of these branches are identified with the ant. Abana and Pharpar mentioned in the Bible. The plain of D., 500 sq. m. in area, is dotted with tns. and vils., and is extremely fertile. The city, with its wooded background, presents a picturesque spectacle,

for it has numerous mosques and other public buildings, many of which are of considerable interest. The Great Mosque, with its dome 120 ft. high, was originally erected in the beginning of the eighth century by the caliph Walid 'Abd-el-Melik. It took the place of a Christian church, which, in turn, had replaced a heathen temple three centuries earlier. The building has sev. times suffered from fire, notably at the hands of Tamerlane in 1401. 'The Great Mosque is immense; there is a great court, and portico of yellow marble, big as a piazza. The general effect from colours is lovely—the Imams' niches, doors, pulpit, worked in marble and mother-of-pearl, and old blue tiles outside under the columns; yet the general effect is absolutely simple' (Freya Stark, *Letters from Syria*, 1945). In the S.W. suburb of Meidan is the Gate of God, through which the hadj (*hajj*), the great pilgrimage to Mecca, sets out. The tomb of Nur ed-Din is among the relics of the city, while another place of interest is the 'street called Straight' (Acts ix. 11), which runs a mile through the city from E. to W. Here, too, is Saladin's tomb. Commercially, D. occupies an important position, being a great meeting-place for the caravans from Bagdad and the E. and the traders from the W. It is now the centre of sev. motor-routes, and air and rail communications have been developed. Electric light and other European amenities have also been introduced. The chief exports are grain, flour, inland wood, silken and cotton manufs., the apricot, and other fruits. Its industries include the production of metal work, mother-of-pearl inlaid work, gold and silver work, perfumes, attar of roses, carpets, etc. D. gives its name to damsons (Damascene plums). Pop. about 250,000, chiefly Moslems.

History.—The hist. of D. goes back to the days of Abraham. It was the scene of two great events in human destiny—the conversion of St. Paul, and, according to Moslem tradition, a great decisive moment in the life of M. Chomet, when he resolutely turned his back once for all on the pleasures of the world. D. belonged in turn to Assyria, Persia, and Rome, and from 661–750 was the cap. of the Caliphate. After being the centre of struggle between the Moslems and Tatars, D. became the cap. of Syria within the Ottoman Empire (1516). Turkish dominion continued until Oct. 1, 1918, when D. was occupied by the allied troops under Allenby and the Arab troops under the Emir Faisal. Faisal estab. an Arab national state and reigned for nearly two years. Meanwhile the Fr. had obtained the mandatory control of the Syrian seaboard with headquarters at Beirut, and friction between the Fr. and the Arabs led to the occupation of D. on July 25, 1920. Faisal fled to Bagdad. The problems confronting the Fr. administration of Syria were largely religious. The Fr. as traditional champions of the Maronite Christians of Lebanon came into conflict with the Moslems, and with the Druses, a religious sect inhabiting the mountainous

country of Jebel Druz. A Druse rebellion broke out, and the insurgents expected to find active support in D., eventually gaining an entrance into the city. D. was bombarded on Oct. 18, 1925, and about 25,000 houses were destroyed. Gen. Sarrail, the high commissioner, was recalled, but trouble continued, followed by a second bombardment of D. in May 1926. Later reconciliatory measures were introduced, and D. settled down to a period of material prosperity. D. was defended against the Allies in the Second World War, having fallen under the influence of Vichy. The operations by the

it was brought from the E. to Byzantium by the Crusaders, thence it passed to Italy, and thence to France and Flanders.

Damaskinos (Damaskinos Papandreou) (b. 1891), Gk. prelate and statesman, b. at Dorvoutsia. Bishop of Corinth, 1918. Archbishop of Athens, 1937. He became clerical leader of the Gk. resistance movement in the Second World War against Its. and Gers. Appointed regent in the absence of the king, 1944.

Damasus I., pope (366-84), was b. in Portugal about 304. He was elected pope by a large majority, but the minority resorted to violence and bloodshed in order

DAMASCUS

E.N.A.

combined Brit. and Free Fr. troops proceeded in somewhat leisurely manner, owing to the feeling that many of the garrison were de Gaulist in sentiment. D. was taken on June 21, 1941. See SYRIA.

Damask, name given to certain types of fabric with ornamental patterns. The term originated with the rich figured silks of Damascus, and was formerly applied to silk fabrics only; now the name is used also for woollen, linen, and cotton stuffs with floral or other patterns woven in the loom. Ds. are now chiefly used for tablecloths, curtains, and upholstery coverings. Table linen Ds. are manufactured at Belfast, Dunfermline, and Barnsley; cotton Ds. at Glasgow, Paisley, and in Lancashire; woollen Ds. around Bradford and Halifax; and silk Ds. near London. The industry was introduced into England in the sixteenth century by the Flemish weavers, who fled from the persecutions of the duke of Alva. Originally

to place Ursinus in the papal chair. The Emperor Valentinian I. decided in favour of D. D. defended the faith vigorously against various heresies, was instrumental in bringing about Jerome's Vulgate version of the Bible, and did much for the preservation of the catacombs.

Damasus II., elected pope on July 17, 1048, but succumbed to malaria twenty-three days later.

Dambrowa, tn. of Poland in the prov. of Kielce. It is the centre of a coal basin of some 80 sq. m. in area, which, combined with those of Cracow and Polish Silesia, form one of the largest coalfields of Europe. Output of the D. basin has reached 6,500,000 tons in a year. Pop. 40,000.

Dambul, or **Dambula**, vill. of Ceylon, situated about 40 m. N. of Kandy. It is famous for its cave temples.

Dam-Dam, see DUM-DUM.

Dames of the Order of the British Empire are either Dames Grand Cross (G.C.V.O.)

or G.B.E.) or Dames Commander (D.C.V.O. or D.B.E.), the feminine counterparts of Knights Grand Cross and Knights Commander. The orders were first given on June 4, 1917, as a reward for various war services, but later they have been conferred for important services rendered to the empire in various capacities. In 1946 there were thirty-five Dames Grand Cross and ninety-one Dames Commanders. Dames are addressed in a manner similar to that of knights, e.g. Miss A—— B——, after receiving the honour, would be addressed as Dame A., and in writing as Dame A—— B——. G. (or D.) C.V.O., or G. (or D.) B.E. Dames Grand Cross rank after wives of baronets and before wives of Knights Grand Cross. Dames Commanders rank after the wives of Knights Grand Cross and before the wives of Knights Commanders. A complete list of holders of these orders is given in Burke's *Peerage*, and a full account of the order in Debrett's *Peerage*.

Dame's Violet, or *Hesperis matronalis*, species of *Cruciferae*, found in Europe and Asia; the flowers are pale lilac in colour and have no scent until the evening. In Britain the double variety is grown in gardens as a hardy perennial.

Damghan, or **Damaghan**, vil. of Persia, in the prov. of Semnan va Damghan, 45 m. S. of Astrabad. In the vicinity are the ruins of the Parthian cap. Hekatompylos. It was of great importance in the time of Shah Abbas. Almonds and pistachios are exported. Pop. 10,000.

Damian, see COSMAS AND DAMIAN.

Damiani, Pietro, Saint (1007-72), It. ecclesiastic. In 1035 entered the hermitage of Fonte Avellano, near Gubbio, a severe and ascetic establishment, of which he became head in 1043. He soon went into political life, entering upon a correspondence with the Emperor Henry III., and in 1049 writing to Pope Leo IX., *Liber Gomorrhianus*, in which he denounced the vices of the clergy. In 1058 he became a cardinal and bishop of Ostia, and gained a signal victory for papal authority at the Council of Milan in 1059. His collected works, which are mainly directed against simony and the marriage of the clergy, appeared in 4 vols. at Rome, under the editorship of Cardinal Gaetano, in 1606-1615.

Damien, **Father** (properly **Joseph de Veuster**) (1840-89), Belgian missionary, b. near Louvain. Educated for a business career, but as a youth entered the Church, joining the Pelpus Congregation, a Fr. religious order having missions in the Pacific, and was ordained priest at Honolulu in 1864. In 1873, struck with the pitiful condition of the 600 lepers at Molokai Is.—whither the Hawaiian Gov. transported their lepers—D. volunteered to assume spiritual charge of the settlement at Molokai Is. For sev. years he worked alone, though later other resident priests assisted him for a time. In 1885 he himself contracted the disease, of which he ultimately d., though he continued with his work until his death. Some ill-conceived imputations on him by

a Presbyterian clergyman evoked a fine eulogy from R. L. Stevenson in an *Open Letter to the Rev. Dr. Hyde* (Sydney, 1889). In 1932 it was decided to beatify him. See lives by E. Clifford, 1889; F. E. Cook, 1889; Father Pamphile, 1889; and *The Lepers of Molokai*, by C. W. Stoddard, 1885.

Damiens, Robert François (1714-57), Frenchman who attempted to assassinate Louis XV. He was b. near Arras, and began life as a soldier, and later became a menial servant in Paris. On Jan. 5, 1757, as Louis was stepping into his carriage to leave Trianon, D. stabbed him with a knife. He was caught and a horrible sentence passed on him by the Parliament three months later. His hand was burnt slowly, and he was tortured by having his flesh torn off with red-hot pincers, melted oil, lead, and resin being afterwards poured into the open wounds. His body was then torn to pieces by four horses. It was alleged that the Jesuits had instigated him to perform the crime, but D. himself asserted that he had been aroused by the king's conduct towards Parliament.

Damietta, tn. and port of Lower Egypt, on the chief E. branch of the Nile, lying between the r. b. of the riv. and Lake Menzaleh. It is about 10 m. from the sea, but has been superseded as a port by Port Said and Alexandria. It still contains busy bazaars, has a considerable export trade in rice, and manufs. cotton, silk, and pottery. The old tn. was fortified by the Saracens, but was sev. times taken by the crusaders. Louis IX. captured the tn. in 1249. When it was restored to the Saracens in 1250 they razed it to the ground, and it was rebuilt on its present site. Pop. 53,600.

Damiri, **Kemal Ed-din Mohammed Ibn Musa** (1349-1405), Arabian jurist and naturalist. Spent his life in Egypt, being prof. of tradition at the Rukniyya in Cairo and at the Muslim univ. of El Azhar. Belonging to the Shafite school of law, he wrote a commentary on Nawawi's *Minhaj ul-Tatibin*, but is chiefly remembered for his literary and digressive *Hayat ul-Hayawanin* (Life of Animals).

Dammar, name given to four species of *Agathis* or *Dammara*, coniferous trees from which much res. is obtained. The *A. australis*, or Kauri pine, produces very hard wood used for paving and masts, and is found in New Zealand and Australia. *A. Dammara* produces resin and gums which are used as pitch and tar on ships and also in varnish; it has many other chemical derivatives. It is aromatic and is used in the E. as incense.

Damme, formerly the port of Bruges, but now merely a vil., in Belgium, situated in the prov. of W. Flanders, 5 m. from Bruges. It once ranked among the important European ports, the Zwyn communicating with the North Sea. The channel silted up, and the port was closed, Antwerp, on the Scheldt, taking its place. Pop. 1,200.

Damnonii, **Dumnonii**, or **Damni**: 1. Anct. Brit. tribe inhabiting the W. peninsula (modern Devon and Cornwall),

and having Isca Dumnuniorum (modern Exeter) as their cap. 2. Anct. tribe of Perthshire, inhabiting Monteth, Strathearn, and Fotherif (i.e. the W. part of Fife and Kinross), and having Alanna (Allan), Lindum (Ardoch), and Victoria (Lochore or Perth) as their chief tns.

Damnum absque Injuria (Lat., damage without wrong) denotes damage done to a person for which the law provides no remedy. The correlative legal maxim is *ubi jus ibi remedium*, i.e. where there is a right there is a remedy. In the exercise of one's ordinary rights much inconvenience and damage must often be caused to other persons without thereby incurring liability, e.g. opening a shop in competition with a neighbour in the absence of express agreement to the contrary may result in damage, but such damage would be D. a. I. Again, the interception or draining off on his own land by a landowner of water collected from underground springs in a neighbour's well would also be D. a. I.; and generally the principle applies in a number of cases where a man uses his own property to the prejudice of his neighbour.

Damocles, favourite of the elder Dionysius, tyrant of Syracuse. The story of how Dionysius, in order to illustrate what kind of happiness wealth and birth brought to princes, placed his sycophant at a luxuriously spread table over which hung a naked sword by a single horse-hair, is told by Cicero and referred to in Horace's *Odes*.

Damodar, riv. of W. Bengal, India, with a length of 350 m. It joins the Hugli close to Calcutta, the chief trib. being the Barakhar. The most important coalfield of India lies in the valley of this riv.

Damoh, tn. of India, and the cap. of the Damoh dist. in the Central Provinces. There are manufs. of pottery, and also dyeworks and a cattle market. Pop. 20,000.

Damon: 1. A Pythagorean of Syracuse, whose name is always associated with that of Pythias, properly Phintias. The latter was condemned to death for plotting against Dionysius, tyrant of Syracuse, but was allowed to go and settle his domestic affairs while D. remained, pledging his own life for the return of his friend. Phintias came back just in time to redeem D., and Dionysius was so much impressed by their love for each other that he pardoned Phintias. Their love for each other has become proverbial. 2. An Athenian musician and sophist, a teacher and close friend of Pericles. He was banished from Athens about 430 B.C.

Dampier, William (1652-1715), Eng. mariner and adventurer, b. at E. Coker, Somersetshire. He went to sea at an early age, and after voyaging to Newfoundland, Jamaica, and other places, he took part in buccaneering expeditions in Central and S. America. He was marooned on the Nicobar Is. in 1683, but managed to reach Achin (Atcheen), and returned to England in 1691. In 1699 he was sent by the Admiralty to explore around Australia and New Guinea, and he

gave his name to the D. Strait and Archipelago. On his way back he was wrecked on Ascension Is., but was rescued two months later. After an unfortunate expedition to the South Seas in 1703-7 he made his last voyage as pilot to Woodes Rogers (1708-11) in a privateering expedition. D. was associated with Alexander Selkirk (immortalised as Robinson Crusoe), who was rescued on his last voyage. *A New Voyage round the World* (1697) was D.'s chief work. D. was a very skilled navigator, and his book gives much valuable information told in the perspicuous style of the born travel writer; but it tells us very little of his doings among the Ilonguranian buccaneers. We know, however, that he must have taken part in many fights, particularly in the bay of Campeachy, and at Santa Maria and other places on the isthmus of Panama and on the Peruvian coast. He was, however, chiefly concerned, as is shown in his famous *Discourse of Winds* (1699), with natural hist., hydrography, weather, and all the phenomena one would come upon as an ocean traveller; the mere incidents of a buccaneering life did not interest him, he followed the calling chiefly as a means of acquiring navigational experience, and there seems but little doubt that his great skill as a sailor inspired fear among the Spaniards. His *New Voyage, Voyages and Descriptions* (1699), and *Voyage to New Holland* (1703, 1709), all appear in John Masefield's ed. of the *Voyages* (2 vols., 1906).

Dampier, name of certain places in the E. Indies and Australia, which have been called after Wm. Dampier (q.v.): 1. Archipelago off the N.W. coast of Australia, comprising Rosemary (12 m. from the mainland), Lewis, Depuch, Legendre, Enderby, and sev. small rocky is. 2. Is. off the N.E. coast of Papua; is volcanic. 3. Dampier's Land, a peninsula of Australia, lying between the Indian Ocean and King Sound. 4. Strait between the is. of Papua and Waigia, 70 m. long and 35 m. broad. It affords the safest passage between the Indian and Pacific oceans. 5. Strait which separates the E. coast of Papua from the archipelago of New Britain.

Dampremy, tn. of Belgium, in the prov. of Hainaut, 1 m. from Charleroi. Coal is extensively worked. Pop. 13,500.

Damrosch, Leopold (1832-86), Ger.-Amer. violinist and composer, b. in Posen, Prussia. In 1871 he went to New York, where he founded the Oratorio Society (1873), the Symphony Society (1877). He organised a season of Ger. opera, 1884-1885. He wrote sev. cantatas and pieces for the violin.

Damrosch, Walter Johannes (b. 1862) Amer. musician; b. at Breslau, Silesia; son of Leopold D., whom he succeeded as musical director of the Oratorio and Symphony Societies. Founded D. Opera Company, 1895. Since 1903 devoted himself to New York Symphony Orchestra. Founded school for military bandmasters during the First World War. Composed four operas: *The Scarlet Letter*, *Cyrano* (text by Wm. J. Henderson); performed

Metropolitan Opera House, 1913); a comic opera, *The Dove of Peace* (1912); and *The Man without a Country* (text by Guiterman) (Metropolitan Opera House, 1937); a *Mantia Te Deum* (1898); and incidental music to Euripides' *Medea* and *Iphigenia in Aulis* (1915), and to Sophocles' *Electra* (1916). Pub. *My Musical Life* (1923).

Damsel-fly, see under DRAGON-FLY.

Damson (a corruption of damascene), or *Prunus Mahaleb*, variety of *P. domestica*, the plum, which is a member of the order Rosaceae. The plant is hardy, propagating largely by suckers, the bark is fragrant, and the fruit is late and abundant. The Damascene plum, as it is often called, is eaten raw, stewed, and preserved. A species of Sinarubaceae, the *Sinaruba amara*, a native of the W. Indies, is known as the mountain or bitter damson.

Dan: 1. Israelite tribe descended from its eponymous ancestor, D., the son of Jacob and Bilhah. The tribe settled in the valleys of Sorek and Ajalon, but spread northwards to Lush, which it rebuilt as D. (see Gen. xiv. 14, xxx. 5, 6; Judges i., xviii., etc.). 2. The most N. limit of the land of Israel (cf. the phrase 'from Dan to Beersheba'), near the source of the Jordan. The site is identified with the hill Tel-el-Kadi, 3 m. W. of Banías. 3. Trib. of the R. Roanoke, N. Carolina and Virginia, U.S.A.

Dana, Charles Anderson (1819-97), one of the most famous of Amer. editors, b. Hinsdale, New Hampshire, U.S.A., Aug. 8, 1819. Studied at Harvard Univ. and then entered journalism, serving on the *New York Tribune* in 1847. In 1849 he became its managing editor, and held that position until 1863, taking a strong line against slavery. On his resignation, Secretary of War Stanton employed him on various important missions and made him an assistant secretary in 1864. In 1868 he became editor and part owner of the *New York Sun*. Of queer and fiery temperament, D. was savagely independent. He opposed the impeachment of President Johnson, he favoured Gen. Grant's election in 1868 and opposed him in 1873. He opposed Cleveland for the presidency in 1884 and supported him in 1888.

Dana, James Dwight (1813-95), celebrated Amer. naturalist, mineralogist, and geologist, b. at Utica, New York; graduated at Yale, 1833. D. went as scientific observer on the U.S.A. exploring expedition under Wilkes (1838-42), visiting the Antarctic and Pacific. With his father-in-law, Silliman, he ed. *American Journal of Science* (1840), and in 1850, on the resignation of Silliman, he was appointed Silliman prof. of natural hist. and geology at Yale. Among his works are *System of Mineralogy* (one of the most important books written on the subject, 1837); *On Zoophytes* (1846); *Manual of Mineralogy* (1848); *Reports on the Geology of the Pacific* (1849); *On Crustacea* (1852-1854); *Textbook of Geology* (1864); *Coral and the Coral Islands* (1873); and *Hawaiian Volcanoes* (1890). See life by D. Gilman, 1899.

Dana, Richard Henry (1787-1879), Amer. poet and essayist; educated at Harvard, b. at Cambridge, Massachusetts. His *Dying Raven* appeared in 1821; *The Buccaneer* in 1827, in a vol. of poems pub. that year. An ed. of his works was pub. in 1833, containing pieces which originally appeared in *The Idle Man*, a paper which he conducted for a time. His collected works were pub. in 1850, including *Thoughts on the Soul* (1829), and the novels *Paul Felton* and *Tom Thornton*, both somewhat violent and improbable tales. He was perhaps at his best as a critic, but his own works did much to elevate the literary taste of New England. See R. F. Griswold, *The Poets and Poetry of America* (1842), and *The Prose Writers of America* (1847).

Dana, Richard Henry (1815-82), Amer. author, lawyer, and politician, son of the poet. Educated at Harvard. He was especially distinguished in maritime law, but on his eyesight giving way shipped as a common sailor, and gave his experiences in his sea classic, *Two Years before the Mast* (1840). Other works were *The Seaman's Friend* (1841); *Vacation Voyage to Cuba* (1859); and an ed. of Wheaton's *Elements of International Law* (1866). See C. F. Adams, *R. H. Dana: a Biography*, 1890.

Danaë (Δανάη), in Gk. mythology, daughter of Acrisius, king of Argos, great-grandson of Danaus. An oracle having foretold that her son should slay Acrisius, the latter imprisoned D. in a brazen tower, but Zeus (Jupiter) visited her in the form of a golden shower, and by him she became the mother of Perseus. At the child's birth she was cast adrift at sea with him in a chest, but they drifted in safety to Seriphos Is., where a fisherman, Dictys, gave them shelter. They lived here till Perseus grew up, and then returned to Argos, where he accidentally killed Acrisius at Larissa. There are many famous paintings of D., including Rembrandt's, Correggio's, and two of Titian's.

Danaides (Δαναίδες), in Gk. legend, the fifty daughters of Danaus who married the fifty sons of their uncle, Egyptus. To avoid being slain by a son-in-law, as the oracle predicted, Danaus bade his daughters kill their husbands on the bridal night. All obeyed except Hypermnestra, who spared Lynceus. According to later writers, they were condemned for this crime in Hades to fill bottomless vessels or sieves with water perpetually. See Aeschylus, *Supplikes*, and *Dictionary of Classical Antiquities* (trans. from Seyffert), 1906 (Eng. ed. ed. by Nettleship and Sandys).

Danakil (singular, Dankali), name now generally used for the many nomad and fisher tribes living on the coast of N.E. Africa, from Massowa S. to Tajurrah Bay, and thence S.W. to Shoa, in the arid region between Abyssinia and Obock. They are a Hamitic tribe of the Ethiopian branch, well built and slender, with features indicating intermixture of Arab blood. They claim to be Arabs and Moslems, but are really pagans, living by

caravan- and slave-trade, and largely on the milk of their own flocks. Their native name is Afar. For language see Isenberg, *Vocabulary*, 1840. Consult also Scaramucci and Giglioli, *Notizie sui Danachiti*, 1884.

A DANAKIL SHEPHERD

Danapur, see DINAPUR.

Danastris, see DNIESTER.

Danaus, in mythology, son of Belus and grandson of Poseidon, joint-king of Egypt with his brother, Ægyptus. Jealous of the power of the latter's fifty sons, or terrified by an oracle, he fled to Argos (home of his ancestress, Io), and became king there. He gave his fifty daughters in marriage to his brother's sons, commanding them to kill their husbands on the wedding night (see DANAIDES). He was said to have reigned about fifty years, and to have first taught the people to dig wells. D. was considered the founder of Argos, and ancestor of the Danai. See Roscher, *Lexikon der Mythologie*.

Danbury: 1. Vil. of Essex, England, 4½ m. S.E. of Chelmsford. Here is D. Park, one-time palace of the bishop of Rochester. Pop. 2000. 2. Co. seat of Fairfax co., Connecticut, U.S.A., situated on the R. Still. The most important industry is the manuf. of felt hats, which has been carried on for many years. Silver-plated wares are also made. There is a State Normal School. Pop. 22,300.

Danby, Francis (1793-1861), Irish landscape and historical painter. Settled at Bristol for some years. His 'Upas Tree' (Victoria and Albert Museum) was shown at the Brit. Institution in 1820; 'Disappointed Love' in the Academy, 1821. After the 'Delivery of Israel out of Egypt' (1825), he became A.R.A. Other works are 'Golden Age' (1831); 'Sunset at Sea after a Storm' (1824); 'Embarkation of Cleopatra on the Cydnus' (1827); 'The Deluge,' 'Departure of Ulysses from

Ithaca,' and 'The Evening Gun' (1848); 'Fisherman's House, Sunset' (National Gallery) (1846).

Danby, Frank (Mrs. Julia Frankau) (1864-1916), Eng. novelist. Her best novels are *Pigs in Clover* (1903); *The Sphinx's Lawyer* (1906); *The Heart of a Child* (1908); *Let the Roof Fall In* (1910); and *Joseph in Jeopardy* (1912).

Dance, Charles (1791-1863), son of George D. the younger, Eng. dramatist, who wrote over fifty theatre pieces, among them *A Match in the Dark* (1836); *The Bengal Tiger* (1843); and *Marriage a Lottery* (1858).

Dance, George, the Elder (1700-68), architect to the city of London; designed the Mansion House (1739), the old exchequer office in Broad Street, and sev. London churches.

Dance, George, the Younger (1741-1825), succeeded his father as architect to the city of London; rebuilt Newgate Prison (1770-83), and was prof. of architecture at the Royal Academy (1798-1805). His last years were devoted to portraiture.

Dance, Sir Nathaniel (1748-1827), Eng. sailor, son of James D. (d. 1774), grandson of George D. the elder (d. 1768). He entered the E. India Company's service, 1759, commanding a ship, 1787. While commanding the E. India Company's homeward bound fleet (1804) he defeated a strong Fr. squadron of men-of-war off Pulo Aor. and reached St. Helena safely. See Sir A. Markham, *Sea Fathers*, 1832; W. James, *Naval History of Great Britain*, iii., 1860; and F. Marryat, *Newton Forster*, 1865.

Dance-Holland, Sir Nathaniel (1734-1811), Eng. painter, son of George Dance the elder. Learned painting under Hayman, the genre-historical painter. Took up residence in Italy, where he came into contact with Angelica Kauffmann, of whom he was a devoted admirer. From Italy he sent home a number of historical 'quasi-classic' paintings, such as 'Dido and Æneas' (1763), and later in his career continued to produce similar paintings, such as 'Paris and Helen' (1771), 'Orpheus lamenting Eurydice' (1774), and 'Death of Mark Antony' (1776), none of which has survived. He settled in London in 1768 and his name figures among the founders of the Royal Academy. In Greenwich Hospital is his portrait of Capt. Cook and, at Up Park, Sussex, a full-length portrait of George III. Having made a large fortune he abandoned painting, became M.P. for E. Grinstead and, having been created baronet (1880), changed his name to D.-H.

Dance of Death, name of a dramatic or pictorial allegorical representation of the universal power and supremacy of death over mankind, first presented as a church play (see MIRACLES PLAY and MORALITY), dating from about the fourteenth century. It came to be most frequently represented with music and dancing, and all the adjuncts of a festival, to point the contrast all the more sharply. It is supposed that the seven brothers of the Book of Macabees (ii. 7) played an important part in a representation of the kind, or else the first

representation, which took place at the monastery of the Innocents, Paris, fell upon their festival. Hence the origin of the name Chorea Machabæorum, or Danse Macabre, by which it is frequently known. The dramatic form consisted of short dialogues between Death and about twenty-four followers, representing all ranks of mankind. In Spain it appeared as 'La Danza General de los Muertos.' The drama lasted on till about the fifteenth century. In Germany the subject was treated most often. The representations on the cloister walls of the Klingenthal (Basle Convent) date from 1312. There is an example in one of the chapels of the Marienkirche at Lubeck, much resembling one at La Chaise-Dieu in Auvergne of fourteenth-century date. In 1425 a series of pictures was painted on the walls of the monastery of the Innocents. A 'Triumph of Death' (wrongly ascribed to Andrea Orcagna) is in the Pisan Camp Sinto, dating from the fifteenth century. Similar frescoes were executed in London after 1430. In Henry VI.'s reign there was one round the cloisters of Old St. Paul's. The Tower of London, Croydon Archbishop's Palace, Hungerford Chapel (Salisbury), Wortley Hall (Gloucestershire), and Hexham (Northumberland) also had examples. Holbein's fifty-two sketches for engravings are especially famous and original in design—the 'Imagines Mortis' (originals at Leningrad). The first series was engraved by Lützelburger, 1520; the larger was pub. at Lyons (1538) in book form. A modern representation is that of A. Rethel (1848) (q.v.). The subject has been treated in music by Saint-Saëns. Rowlandson's *English Dance of Death* (1815-16) is a modern adaptation. See De Méhel, *Eures de J. Holbein*, i. 1780; E. G. Polignot, *Recherches sur les danses des morts*, 1826; H. F. Massmann, *Die Basler Todtentanz*, 1847; F. Douce, *Holbein's Dance of Death*, 1833; W. Seelmann, *Die Todtentanz des Mittelalters*, 1893; A. Blackwood, *The Dance of Death*, *Tales*, 1927; and P. Rous, *The Modern Dance of Death*, 1929.

Dancetté (from Lat. *dens*, tooth), one of the lines of partition in heraldry, differing from indented only in the greater width and depth of the indentations or notches. The fesse dancetté has only three indentations. They are arranged like the zigzag or chevron moulding, a common ornamentation in Saxon and early Norman architecture.

Dancing, see **FOLK DANCING**.

Dancing, which is patently the expression of a universal instinct for rhythmical movement, is variously practised as an exercise, a pastime, and an art. In its earliest forms it was an expression of strong emotion, and hence came to be associated with religious or patriotic feeling. In the latter class may be placed the many national dances which still survive, not a few of which have been developed and perfected in that nursery of modern D., the Fr. capital. We still have the national dances of the Bohemian, Hungarian, It., Sp., and Polish peasantry, the

Basque mutchilko, the Scottish reel, the Highland fling, the Irish jig, and the hornpipe of the Eng. sailors. Inspiration for battle has often been sought among civilised races by means of the dance. War-dances have flourished among the Amer. Indians, the Maoris, and other races, while Ceylon has had its devil dancers, and Muslim countries their whirling dervishes. The religious dance was known among the Israelites; it found a place in the processions to the Egyptian temples, and it was cultivated by the Gks. D. has never found any permanent place in Christian rites, but has often been known in Christian ceremonies. Carol dances were practised by the early Christians. Until 1737 *la bergette* was danced at Besançon at Easter. At Seville Cathedral, during the Corpus Christi Octave, a ballet is still danced every evening before the high altar, and a religious dance also survives at Alarc in the Balearic Isles. The ballet of the modern theatre, in which posturing and mimetic action are combined and D., had its beginning in the fifteenth century, though it may be said to have been foreshadowed to some extent by the pantomimes of the Romans, and in the religious and dramatic representations of the Gks. In 1489, on the occasion of marriage festivities, a ballet dance was given before the duke of Galeazzo of Milan at Tortona. This appears to be the first record of ballet on any considerable scale. The fame of the performance spread far and wide, and thereafter the ballet became a favourite entertainment on great occasions and celebrations. The dance, which had passed from the Romans to the national theatre of the Its., passed thence to France, where it flourished as it has done nowhere else. The ballet was introduced into France by Catherine de' Medici. Louis XIII. and Louis XIV. were fond of the ballet to excess, and it was in the reign of the latter, himself an enthusiastic dancer, that D. reached the height of its popularity in France. In the middle of the eighteenth century, Noverre did much for the ballet, and introduced the *ballet d'action*.

Among the oldest of the Eng. dances is the morris dance, which was much in vogue in medieval Europe, and was introduced into England in the time of Edward III. The name may refer to a Moorish origin. 'Sir Roger de Coverley' is another old Eng. dance that has survived to the present day. The waltz became popular in the days of Napoleon; it came to England from Germany, but was probably Provencal in origin. The polka is a Bohemian national dance, and was much in vogue half a century ago, but, with country dances and quadrilles, it has declined in popularity. The cotillon has been revived and developed from the old Fr. dance of that name. The lancers was brought to England in 1850 from Paris, where it had originated about fifteen years before. The pavane, the coranto, and the minuet have had their day, though the last named, which at one time was brought to great perfection in France, died hardly.

Some of the old homely dances of Queen Elizabeth's time have left traces in children's games, such as 'kiss in the ring' and 'hunt the slipper.' In the early years of the twentieth century barn dance and variations of the waltz, with more or less intricate sequences of steps led, before the First World War, to ballroom D., which, if more lively in spirit, was much less grateful in form. Various dances were introduced from America having their origin in the uncouth dances of the negroes: such were the turkey-trot, the bunny-hug, and the fox-trot. The two-step came also from America, but was not negroid in origin. Of these only the foxtrot has retained its popularity, but in two different and more graceful forms: the slow foxtrot and the quickstep. The waltz, originally danced quickly, has now a more leisurely tempo. The tango, in 2-4 time, slightly faster than the Sp. *habanera*, came from S. America, but was greatly modified before it could be introduced into European society. The rumba is a Cuban dance, but of African negro origin, in quick 2-1 time.

Stage D. has undergone many changes in popularity. Isadora Duncan, from San Francisco, derived her inspiration from the anct. forms of Greece, and her wonderful rhythmic posturings evoked much admiration. Adeline Genée, a Dan. dancer, was the perfection of lightness and grace in her exquisite ballet dances. Lolo Fuller, an Amer. dancer, was the pioneer of the Serpentine dance; Ruth St. Denis gave representations of nautch and other Oriental dances; Maud Allan raised much controversy by her astounding 'Vision of Salome.' The Russian ballet in 1910 took London by storm with its fairylike nature and graceful freedom of movement: Mordkin and Nijinsky, Karsavina, Lopokova, and Pavlova were the leading exponents of their art. Modern stage D. reveals variants or tap-D. routines added to the eccentricities of individual exponents. Some of the leading modern stage dancers are Jack Buchanan, Jack Hulbert, and Fred Astaire. Women excel especially in acrobatic and *adagio* D. The modern dance orchestra may vary in number from three to twenty or more players. In an average-sized combination of seven performers the instruments are piano, string bass, percussion, violin, saxophone, trumpet, and guitar. Most competent players can perform on two or more instruments (known as doubling), thus giving the orchestra a wider variety of effects. See further under BALLET, COUNTRY-DANCE, JAZZ; MORRIS-DANCE, and RAGTIME. See Nellie Chaplin, *Ancient Dances and Music*, 1909; W. Hobson, *American Jazz Music*, 1940; J. Martin, *The Dance*, 1947; V. Silvestre, *The Magic Way to Ballroom Dancing*, 1947; K. Burchill, *Step Dancing*, 1948; Katharina Breuer and others, *National Dances of Europe*, 1948.

Dancourt, Florent Carton (1661-1725), Fr. actor and dramatist, b. at Fontainebleau of good family. He was educated for the legal profession, but when he appeared at the Théâtre Français in 1685

his gift for comedy at once brought him success as an actor. One of his greatest successes was as Alceste in Molière's *Misanthrope*. He wrote over forty plays, many of which display his genius for depicting peasant characters. Among the best of his plays are *Le Chevalier à la mode* (1687); *Les Bourgeoises de qualité* (1700); and *Le Galant Jardinier* (1704). In his later years D. retired to his château in the country, and devoted himself to writings of a religious character.

Dandelion, or *Taraxacum officinale*, cosmopolitan species of Compositae which differs from such plants as the daisy (*q.v.*) in having all the florets of the head both ligulate and hermaphrodite. It has a tapering, perennial root containing latex, and is sometimes used in the adulteration of coffee. The name is derived from the Fr. *dent de lion*, or lion's tooth, on account of its jagged appearance.

Dandie Dinmont Terrier, called after the character in Scott's *Guy Mannering*, who was founded on a Border farmer, Mr. Davidson of Hindlee, Teviotdale, who had helped to introduce the breed. There are two varieties, peppers and mustards, the former being slate-blue in colour, and the latter yellow. It is a strong muscular dog, a fearless fighter, and somewhat unmanageable. It has in it some bulldog blood. The muzzle is deep and the jaws very strong. The coat is moderately long, and the ears feathered to a point. Weight about 20 lb.

DANDIE DINMONT TERRIER

Dändler, Karl (1840-1910), Swiss historian, b. at Elsau. Among his works are *Geschichte der Schweiz mit besonderer Rücksicht auf die Entwicklung des Verfassungs- und Kultur-lebens* (1883-88); *Kleine Geschichte der Schweiz* (1889). With J. Müller, he wrote *Lehrbuch der allgemeinen Geschichte* (1891); and *Geschichte der Stadt und des Kantons Zurich* (1908-12).

Dandolo, Enrico (c. 1120-1205), doge of Venice from 1192 to 1205. He belonged to an illustrious Venetian family, and was the most distinguished member of any of the name. He is the 'blind old Dandolo' of Byron's *Childe Harold*, his blindness being variously attributed to torture at the hands of Manuel, emperor of Constantinople, to whom he had been accredited as ambassador, and to wounds

in battle. Though about seventy-two when he was elected doge, he proved a vigorous and brave ruler. In two naval battles he successfully ended the war with Pisa; marched at the head of the Crusaders in 1201, and took Constantinople by storm in 1204. Constantinople was plundered, and booty to a vast quantity divided among the Venetians and Fr. It is said that D. might have been crowned emperor of Constantinople instead of Baldwin of Flanders but for the fact that the Venetian Republic would not permit a Venetian citizen to become an emperor (see Gibbon's *Decline and Fall*). Enrico's eldest son, Fantino, was patriarch of Constantinople; and the second son, Rainieri, was procurator of S. Marco, and was killed in Candia (1213). There were two other doges of the D. family: Francisco, elected 1318 (*d.* 1339); and Andrea, elected in 1342 at the early age of thirty-six, author of a chronicle of Venice pub. in the *Itarum Italicarum Scriptores* of Muratori and a close friend of Petrarch, some of whose letters to him are extant.

Dandurand, Raoul (1861-1942), Canadian barrister; b. at Montreal; son of Edouard D. Educated Montreal College, Laval Univ. (LL.B., 1882; LL.D., 1909), and McGill Univ. Called to Quebec Bar, 1883; K.C., 1898. Assistant attorney-general for Quebec Prov. Called to Senate by Lord Aberdeen, 1898. Speaker of Senate, 1905-9. P.C., 1909. Leader of Senate in govts. of Mr. MacKenzie King of 1921 and 1928. President of Assembly of League of Nations, 1925. Wrote *Traité théorique et pratique de droit* (1890).

Dandy Fever, see DENGUE.

Dandy-horse, see under CYCLES AND CYCLING.

Danebrog (*brog*, bunting) is the Dan. national flag, red with a white cross. According to the legend it descended from heaven during a battle in Estonia in 1219, and inspired the downhearted Danes to victory. The royal and the naval ensign is split at the end, while the army flies the ordinary rectangular flag.

Danegeld, land-tax, originally levied by Ethelred the Unready for the purpose of buying off the Danes. It was thus levied in 991, 994, 1007, and 1012. It was also used as a method of taxation by Canute, and, after being abolished by Edward the Confessor, was revived by William the Conqueror, and finally abolished under Henry II.

Danelaw, **Danelagh**, or **Danelagu** (A.-S. *Dena lagu*, law of the Danes), an ancient name for the ter. in England to which Alfred the Great confined the Danes by his wars. It was ceded to King Guthrum after the battle of Ethandun in A.D. 878, and its inhab. were governed by modified Dan. law. It was reduced by Edward the Elder (901-25), revolted in Eldred's reign, but was forced to submit in 954. Deira and Lindsey were the most Dan. parts, and Dan. place-endings—*thorpe*, *ly*, *cæster*—are still common. The D. corresponded to about fifteen of the modern coos. in the N. and E. of England (Yorkshire, Derbyshire, Leicestershire, Norfolk, Suffolk, Essex, Cambridgeshire, Bucking-

hamshire, Bedfordshire, and others), Watling Street being roughly the dividing line.

Danes, name given to Scandinavian tribes, especially to the inhab. of Denmark. In the fifth century A.D. they replaced the Angles and Jutes. They are usually described as a yellow-haired, blue-eyed people of medium height. Tradition points to Zealand as the home of the D.; at a later stage the name D. was applied to all inhab. of Jutland and the is. The old Dan. language occurs in runic inscriptions, 700-1050, the Viking period. Three marked periods in their hist. are the Viking period up to Canute (*d.* 1035), time of Valdemar I. and II. (1157-1227), and the fourteenth century. See also DENMARK. See J. A. Danstrup, *History of Denmark* 1948; and S. M. Toyne, *Scandinavians in History*, 1949.

Danes' Dyke, see FLAMBOROUGH HEAD. **Danevirke**, or **Dannevirke** (Dane's Work), ancient line of earthworks in Slesvig, built originally by the Danes under King Godfred in the time of Charlemagne (A.D. 808), N. of the Elbe, extending for 10 m. from the Sli to the Trone. It was erected as a boundary wall and protection against the Saxons, Franks, and other invaders. The original line was from Slesvig to Hollingsted, but it was enlarged by Queen Thyra in the tenth century.

Dangerfield, Thomas (c. 1650-85), Eng. conspirator, son of a farmer, of Essex. Having robbed his father early in life, he became later a false coiner and a perjurer. He pretended to have discovered a Catholic plot against Charles II., the so-called Meal tub Plot, 1679. Among numerous pamphlets he pub. *Dangerfield's Narrative*. For this he was tried for libel, and sentenced to be pilloried and whipped (1685). He *d.* from a blow shortly afterwards.

Dangerous Trades. This term is used in a somewhat technical sense, not including all D. T., but especially those in which some form of poison or disease is incidental to the trade itself, as now carried on. The designation is reserved not so much for trades in which sudden injury or death may result from machinery as for those in which the causes of danger and injury are slower acting. It cannot be applied to the poor sanitation and ventilation incidental to many trades. The Factory and Workshops Act, 1883, was the first real attempt to deal with the question. The Act of 1891 gave the home secretary power to make regulations for any industry (not domestic) certified to be dangerous to health. By 1898 the inspectors won forty-nine out of fifty-six cases, and these trades were henceforward classed as dangerous. They include, among various others, manufs. of china, earthenware, white lead, lucifer matches, paint, arsenic, dry cleaning, furrier's work, tanneries, use of grindstones, electrics, generating works, quarries, bottling, spinning, weaving, and working in compressed air, i.e. at a pressure higher than that of the atmosphere. Of industrial poisons lead and lead compounds

are the most dangerous, and they concern about 130 trades, including smelting, painting, plumbing, printing, and the manu. of earthenware. All chemical workers are liable to various affections, especially of the skin. Ulcers are common to those working in pitch and tar, and anthrax is known as the wool-sorters' disease. The coal-miner is subject to numerous accidents and the possibilities of danger, especially from gas-poisoning. Miners, stone-masons, and textile workers are subject to dust diseases of the lungs. Cotton is best operated in a humid atmosphere, and the temp. is apt to become dangerously high. Coughs and asthma, accompanied by fever, are sometimes caused by a mould fungus adhering to raw cotton. The Home Office have in Horseferry Road, Westminster, a museum (open free to the public) devoted to the subject of D. T. In 1917 the U.S.A. made an inquiry into the cotton industry, finding the rate of disability for males was 37 per 1000 in May and June and for females 34.4, while in Nov. and Dec. the figures were 18.9 and 17.9 respectively. See E. Collis and Major Greenwood, *The Health of the Industrial Worker*, 1921; T. Oliver, *The Health of the Worker*, 1925; Industrial Welfare Society, *Welfare in Industry*, and *Health Service in Industry*, 1942; Dept. of Health, Scotland, *Health and Industrial Efficiency*, 1913.

Dangs, The, tract of land in the presidency of Bombay, India. It includes fifteen petty states, the Bhils being the chief tribe. The dist. is very thickly wooded, teak and other timber being largely exported.

Daniel, Book of, book of the Bible composed during the reign of Antiochus IV. (about 165 B.C.) by some Jewish author who wished to give his countrymen some consolation in the persecution they were then undergoing, for Antiochus was making a determined effort to substitute the Gk. religion for the worship of Jehovah. Before the days of biblical criticism the book was held to have been contemporary with the period it describes, that of Nebuchadnezzar, king of Babylon, and the following kings. The book falls into two subject divs.: (1) chaps. i.-vi., which tell the hist. of Daniel at the Babylonian court, where he rises to high rank through his power of interpreting dreams; (2) chaps. vii.-xii., containing four prophetic visions. Chaps. i. and ii. (to v. 4) are written in Hebrew, chaps. iii. (v. 4) to vii. in Aramaic, and the rest in Hebrew. No conclusive explanations have yet been given of this change of language. The most probable theory is that the original work, in Hebrew, was trans. into the vernacular Aramaic, and that the trans. was used to supply missing parts in the original. The events described in the prophetic visions clearly refer to the events of the reign of Antiochus Epiphanes, and the historical errors are so palpable that it cannot be earlier than the date now assigned to it. It is generally held to be the work of one author. See commentaries of A. A. Bevan, 1892; Behrman, 1894; J. D. Prince, 1899; and Haupt, *Sacred Books*

of the Old Testament; J. Davis, *Old Testament and Semitic Studies*, 1898. Consult also eds. by R. H. Charles and S. R. Driver, 1921.

Daniel, le Père Gabriel (1649-1728), Fr. author and theologian; entered the Jesuit order in 1667. Louis XIV. gave him a pension and the title of historiographer of France. He wrote *Histoire de France* (1713), of which many eds. and abridgements appeared (see Griffet's, 1750-60). Voltaire criticised it harshly. His *Entretiens de Cléandre et d'Eudore* (1694), was an attempt to refute Pascal's *Provincial Letters*. His *Histoire de la milice française* is well known (1721). D. attacked Descartes's views and doctrines. See C. Sommervogel, *Bibliothèque des écrivains de la compagnie de Jésus*, iii., 1869; P. L. Joly, *Éloges de quelques auteurs français*, 1742.

Daniel, Samuel (1562-1619), Eng. poet, son of a music master, b. near Taunton, Somersetshire. He entered Magdalen Hall, Oxford, in 1579. Leaving the univ. without a degree, he served as tutor in sev. noble families, his patrons including the earl of Pembroke and Lord Mountjoy. He came into favour at court, wrote masques for court festivities, and in 1607 was appointed one of the queen's groom of the privy chamber. Though most successful as a sonneteer, he was persuaded by Spenser to attempt tragedy, and in 1615 he became concerned in a theatrical company at Bristol. His earliest poems, *Delia* (sonnets, 1592), are among his best. His most ambitious work was a lengthy poetical *History of the Civil Wars between York and Lancaster* (1595-1609). His dramatic works include *Cleopatra* (1594); *Philotas* (1601); *The Vision of the Twelve Goddesses* (1604); *The Queen's Arcadia* (1606); and *Hymens Triumph* (1615). Among his poems may also be mentioned the *Compliment of Rosamund* (1592); and the 'Royal Maske,' *Tethys Festival* (1610). His prose works include a *Defence of Ryme* (1603), in which he opposed Campion's opinion that the Eng. language was not suitable for rhyme; and a *History of England* (1612, 1621). Ben Jonson said he was 'a good honest man . . . but no poet,' but he was praised by Drummond of Hawthornden, and in later times by Coleridge and Hazlitt. He bore the title of the well-languaged, but lacks energy and fire, and is thus apt to become tedious. His *Epistles* are generally considered his best work, and his sonnets have had some modern admirers, especially those to *Delia*. His complete works in verse and prose were ed. (1885-1896) by A. B. Grosart. See T. Fuller, *History of the Worthies of England*, 1662; W. Oldys, *Life of Daniel*, 1737; and J. G. Scott, *Les Sonnets elisabéthiens*, 1929.

Daniell, John Frederic (1790-1845), scientist, b. in London. He invented the D. constant battery, a hygrometer in 1820, and a pyrometer in 1830. He was a fellow of the Royal Society (1813), Copley medallist (1836), and was prof. of chem. in King's College, London

(1831-45). His writings include *Meteorological Essays* (1823); and *Introduction to Chemical Philosophy* (1839).

Daniell, Thomas (1749-1840), Eng. painter and illustrator, b. at Chertsey, son of an innkeeper there. Apprenticed to an heraldic painter, a dying trade from which his love of the romantic in architecture and nature would inevitably have driven him sooner or later. A leaning towards archaeology and botany revealed itself in paintings of topographical subjects and flower studies. Spent ten years in India, publishing, on his return to England, his chief work, *Oriental Scenery* (6 vols., 1795-1808). Executed many studies of oriental subjects, including temples and jungle scenes. His other illustrated works, executed in aquatint, include *Views of Calcutta*, *Views in Egypt*, and *Picturesque Voyage to China*. R.A. 1799, and fellow of the Royal Society about the same time.

Daniell, William (1769-1837), Eng. landscape-painter and engraver, nephew of Thomas D. to whose versatility he owed much. D. entered the R.A. schools in 1799, becoming R.A. in 1822. He pub. *A Picturesque Voyage to India* (1801-14); he engraved many of George Dance's portraits. His great work, *Voyage round Great Britain*, was completed between 1814 and 1825. Though his subjects were novel and interesting, his artistic merits were not exceptional. See Redgrave; Sanby, i. 314.

Daniels, Josephus (1862-1948), Amer. democrat, politician, and diplomat; b. at Washington, N. Carolina. Educated Wilson (N. Carolina) Collegiate Institute. Ed. small newspaper *Advance* in Wilson, at eighteen. Admitted to Bar, 1885, but never practised. State printer, 1887-93. Chief clerk Dept. of Interior, 1893-95. Ed. *Raleigh State Chronicle* (1884-94) and *News and Observer* (Raleigh, 1894-1933), the latter, of which he was owner, being an amalgamation of both. Entered the Cabinet as the nominee of W. J. Bryan, his close friend, whose election publicity campaign he had directed—as he did for Woodrow Wilson in 1912. Like Bryan, his outlook was narrowed by his strict views on religion, liquor, and pacifism. It was therefore somewhat anomalous that he was destined to put the Amer. Navy—he was secretary of the navy under Wilson, 1913-21—on an equal footing with that of Britain as the largest in the world. His problem was to find the men, for Amer. sailors' wages, though large, compared ill with those earned on shore; but he made the service more attractive by introducing a system by which the recruit was not only trained in naval matters, but received general educational training and a training in professional and technical subjects. Member Democratic National Executive, 1896-1916. When the Democratic party returned to power in 1933 under Franklin Roosevelt, his former assistant at the Navy dept., D. was appointed ambas. to Mexico, holding that post during Roosevelt's second term. In 1924 he wrote a life of Woodrow Wilson, a sympathetic tribute that revealed little that was unknown. Also wrote on the

navy: *The Navy and the Nation* (1919); and *Our Navy at War* (1922). Other pub.: *Life of Woodrow Wilson* (1924); *Editor in Politics* (1940); and *The Wilson Era* (1945).

Danielson, Mrs. J. S., see HURST, FANNIE.

Daniilo, Petrović Njegoš (1677-1735), ancestor of the dynasty of Petrović-Njegoš, first hereditary prince-bishop (*vladika*) of Montenegro (1697-1735). He caused the massacre of all Montenegrins who were Moslems or partisans of the Porte (1702), and carried on constant fierce wars with the Turks. D. gained the support of the Russians (1711), and entered into amicable relations with them.

Daniilo I., Petrović Njegoš (1826-60), prince of Montenegro (1851-60), with Russian support, succeeding his uncle (Vladika Peter II.), and belonged to the family from which the prince-bishops of Montenegro had been chosen since 1697. D. was educated at Vienna. He declared the line of hereditary prince-bishops at an end on his accession, and began ruling as a secular prince. Fierce war was waged with the Turks from 1852 until, after their defeat at Grahovo (1858), D. obtained the nomination of a European commission to mark a definite boundary between Turkey and the principality. He did much to improve the laws and social condition of his people, issuing the Code Daniilo (1855), which resulted in the disappearance of the customary institutions of theft and the vendetta.

Dankara, dist. of Upper Guinea, W. Africa, situated on the Gold Coast, with considerable gold mines.

Dannat, William T. (1853-1929), Amer. artist, b. in New York. He studied at the Royal Academy, Munich, and was later a pupil of Munkacsy at Paris; especially noted as a figure- and portrait-painter. His 'Castanet Dance, a Quartette' (1884) is now in the Metropolitan Museum, New York. Other works are 'Bavarian Peasant' (1878); 'Aragonese Contrabandist' (1883); and a portrait of Vicar-Gen. Thomas Preston.

Dannebrog, Order of. Second of the Dan. orders of knighthood, founded by Valdemar II., 1219, in honour of the banner of Denmark, which was supposed to have fallen from heaven to inspire the army at the siege of Reval. In 1500 the order was suppressed, but revived by Christian V. in 1671. In 1808 Frederick VI. made it an order of merit for all the Dan. people, whether for military or civil services. It has four degrees, and in addition a class of Dannebrogsmænd, who are not strictly members of the order. In 1842 a special class (grand commanders) was created for persons of royal blood. The decoration is a white enamelled gold cross, suspended by a white ribbon with a red border. The inscription reads: 'God and the King,' and it carries the figures 1219, 1671, and 1808.

Dannecker, Johann Heinrich von (1758-1841), Ger. sculptor, who became prof. of sculpture at Stuttgart. He executed busts of Schiller, Gluck, Lavater, Motternich, and other notable personalities.

His 'Ariadne on the Panther' and his 'Christ' at Leningrad are among his finest work.

Dannemora, tn. of Sweden in the prov. of Upsala. It is the centre of the most important iron field of the country, and the best iron in Sweden is obtained here. Pop. 1700.

D'Annunzio, Gabriele (1863-1938), prince of Montenevoso, It. poet, novelist, and dramatist, b. March 12, 1863, at Pescara, on the coast of the wild region of the Abruzzi, educated at the college of Prato, Tuscany, and at the univ. of Rome. He was the son of the Duchessa Maria Gallese di Roma, of Dalmatian extraction. His first pub., *Primo vere* (verse), 1879, won him notice, and he was welcomed at Rome by the Cronaca Bizantina group. The *Terra Vergine* (1882) was a continuation in prose. *Canto Nuovo* appeared the same year. As a journalist on the staff of the *Tribuna* at Rome he wrote under the name of Duca Minimo. Other earlier works are *Intermezzo di Rime* (1883); *San Pantelone* (collection of short stories, 1886); *Il libro d'Isotta* (1886); *Odi Navali*, and *Poema Paradisiaco* (1893); *Chimera* (1895); *La Canzone di Garibaldi* (1901); *Laudi* (1909); *Elegie romane* (1905); *L'Orazione e la Canzone in morte di Giosue Carducci* (1907). Chief among his novels, which contain vivid descriptions, and show much beauty of style and psychological insight, may be mentioned *Il Piaceere* (1889; trans. into Eng. as *The Child of Pleasure*, 1898); *L'Innocente* (1891); *Il Trionfo della morte* (1896); *La Vergine delle Rocce* (1897; Eng. trans., 1899); *Il Fuoco* (1899). Among his tragedies are *La Gioconda* (1899); *La Gloria* (1899); *La Città morta* (written for Sarah Bernhardt) (1898); *Francesca da Rimini* (1901); *Poi che l'amore* (1906); *Le Martyre de Saint Sébastien* (in Fr.) (1911). A miscellany entitled *La Leda senza cigno* appeared in 1913. In 1914 he produced a play in Fr., *La Pisanella ou la mort morte parfumée*; also *Parisina*, for which Massenet composed music. Many of his shorter stories were obviously suggested by the works of other writers, e.g. *The End of Candia* was clearly founded on Maupassant's *A Piece of String*; *San Pantelone* reminds us of Verga's tale of the rival saints; and *Maestro Peppino's Magic* is a variation of a well-worn comic theme of old It. novelists. Similarly, with many of his long novels, the theme, treatment, and even the phraseology may be at times traced to anterior writers. Where he is original is in his rhetoric; he employs words as a musician employs sounds, and expresses his individuality in swift vital language shot through with colour.

He was in France at the time the First World War broke out, and instantly made it his business to urge Italy to side with the Allies. *Per la più grande Italia*, addresses concerning the war, appeared in 1915. *Contro uno e contro tutti* (1919) was an invective against the Wilson peace policy. D'A. had surprised many by his performances on active service,

the extreme sensuality of his literary work having led people to believe him a weakling. He had been in the artillery, and had lost an eye when practising aviation; but his most remarkable exploit came after the armistice of 1918. The tn. of Fiume on the Croatian coast had been industriously Italianised by Hungary in order to checkmate the Slav pop. The treaty of London (1915) had provided for its annexation to Italy; but, on the emergence of a Yugoslav state, the gov. of Italy in 1918 agreed with it upon a modification of the treaty. Immediately, however, the new imperialism of Italy rose in protest. Contrary to engagement, on April 17, 1918, It. troops occupied the tn., which came to be governed by a self-appointed It. council. It was visited by Mussolini, then a journalist, in May; and during the summer there was fatal rioting, to inquire into which an international commission arrived in July. On its findings becoming known in Aug. the It. pop. rose in revolt; and on Sept. 12, 1919, D'A. entered the place at the head of 1000 men. On the plea of security, the other allied garrisons were persuaded by the It. garrison's commander to embark—thus enabling D'A. to become dictator. He proclaimed It. annexation, and held out against all protests and threats until near the end of Dec. 1920; when, refusing to negotiate with the It. Gov., he surrendered his powers to the Fiume tn. council. He then departed from Fiume, which had begun a short-lived career of independence, Jan. 18, 1921, and retired to Gardone. He pub. in 1921, *Nocturno*, dealing with the blindness he suffered after the aeroplane accident. In 1924 he was made prince of Monte Nevoso, and there appeared the first vol. of *Le faville del Maglio*. In the spring of 1925 he was visited by Mussolini, who had become dictator of Italy. In 1927 the It. Gov. commenced the pub. of his works in 48 vols.; the issue was completed in 1938, the year of D'A.'s death. See C. Bennerhasset, *G. D'Annunzio*, 1901; J. N. Macdonald, *A Political Escapade: the Story of Fiume and D'Annunzio*, 1921; and G. Griffin, *Gabriele D'Annunzio*, 1935.

Dansville, vil. of Livingston co., New York, U.S.A., 48 m. S. of Rochester on the Canaseraga Creek. It is the seat of Jackson Health Resort, a large sanatorium. It has printing and paper works. It was named in honour of Daniel P. Faulkner; it was settled in 1800 and incorporated in 1845. It has large nurseries and vineyards. Pop. 4900.

Dante Alighieri (1265-1321). It. poet, b. at Florence, probably in the latter part of May 1265, some nine months before the battle of Benevento. His father, Messer Alighiero di Bellincione di Alighiero, came of an anc. and honourable family of that section of the city named from the Porta San Piero. In *Inferno*, x. 46-50, D. tells us that his family were strenuous adherents of the Guelph cause, and since the Guelphs were almost all in exile until 1266, it is rather difficult to account for his having been b. at Florence. Probably, however, his father, who seems to have

been a notary, was of too little importance to be molested. Some few references to his relations are found in the *Divina Commedia*, and these may be briefly mentioned. In the heaven of Mars, among the warriors of the cross, D. meets his great-great-grandfather, Cacciaguida, whom other sources tell us to have been b. about 1090, to have married Aldighiera degli Aldighieri, to have been knighted by Conrad III., and to have d. in battle against the infidel. His son, the first to bear the name of Aldighiero or Alighiero, is said by Cacciaguida to be still in the purgatorial terrace of the proud (*Paradiso*, xv. 91-96). The only other member of the family mentioned is Geri del Bello, a grandson of the elder Alighiero and cousin of D.'s father, a sower of discord and a murderer (*Inferno*, xxix. 13-36), whose violent and well-deserved death had not yet been avenged. D.'s mother, Donna Bella, d. soon after his birth, so a certain loneliness marked his life from the beginning. His father married again, Lapa di Chiarissimo Cialuffi, the daughter of a prominent Guelph citizen, and by this second marriage he had a son Francesco, and two daughters, one of unknown name, the other Tana. He himself d. while D. was still in childhood. There is a possible reference to one of D.'s step-sisters in the sonnet, 'A very pitiful lady, very young,' in the *Vita Nuova*. The most salient feature of the poet's youth and early manhood is certainly the story of his love of the mystic Beatrice. The whole story is told in the *Vita Nuova* in an allegorical and poetical manner, and to this work reference must be made. Beatrice has generally been identified with Beatrice, the daughter of Folco Portinari, a wealthy Florentine who d. in 1289. This Beatrice Portinari married Simone del Bardi, a rich and noble banker. There are still some, however, who hold that Beatrice was no real woman, but a mystically exalted ideal of womanhood. In the *Vita Nuova* D. tells us that already at the age of eighteen he had learnt 'the art of saying words in rhyme,' but the first sonnet that has come down to us is in connection with his love ('To every heart which the sweet pain doth move'). He was immediately recognised (1283) as a new poet, and received many answers to this sonnet, including one from the most famous lt. lyricist of the day, Guido Cavalcanti, henceforth to be the first of his friends. Boccaccio tells us that from 1238 to 1289 D. was engaged in study, but there is nothing to mark the outward course of his life. The lyrics of the *Vita Nuova* bear witness to his growing maturity in art, while the prose narrative shows his acquaintance with the Lat. writers. Boccaccio and Benvenuto da Imola also speak of a visit of D. to the univs. of Bologna and Padua, which can hardly have been so early. He was more certainly engaged in the military campaigns of 1288 and 1289, for Leonardo Bruni tells us that he took a prominent part in the battle of Campaldino (June 11). This was the crowning triumph of Florentine arms, and the city was given up to great rejoicing. But on June 9 or 19

Beatrice d. and D. lifts up his voice with the prophet in direct lamentation. It is not easy to get a definite idea of D.'s life during the ten years which followed this event. He seems to have taken refuge in philosophic studies. The poignant reproaches which Beatrice addresses to him when he meets her on Lethe's banks seem to tell us of a serious falling away at this period. Some moral aberration and sensual passion must have called him for a while from the light of reason and the beauty of righteousness. *Tanto giù cadde*, 'so low he fell' (*Purgatorio*, xxx. 136). He became friendly with Corso di Simone Conati, a turbulent and ambitious citizen, and with his brother Forese, a sensual man of pleasure. In sev. sonnets Guido

DANTE ALIGHIERI

Engraving from a painting by Tofanelli.

Cavalcanti rebukes his friend for his altered mode of life, while sev. of D.'s own sonnets seem to show that sev. women crossed his life. Some time before 1297 D. married Gemma di Manetto Donati, a distant kinswoman of Corso and Forese, and the marriage does not seem to have been entirely happy. Gemma bore him four children: Jacopo, Pietro, Antonia, and Beatrice, but she did not share his exile, and was still living in 1332. Upon the abdication of Celestine V. in 1294 Boniface VIII. was made pope, an event ominous for Florence. In 1295, the first year of Boniface's pontificate, D. entered the troublous seas of political life. On Jan. 23, 1296, the pope inaugurated his aggressive policy towards the Florentine republic by a bull denouncing Giano della Bella, a great leader of the popular party, overthrown in 1295, and extolling the prudence of the Florentines in expelling him. Now, although D.'s influence on the policy of the republic has been exaggerated by many, there can be no doubt that from the outset he took a decided attitude in direct opposition to all lawlessness, such as the riot which had overthrown Giano della Bella, and that he opposed any

external interference in Florentine matters whether from Rome, Naples, or France. In 1300 a new div. devastated Florence, originating in the feud between the two distinguished families of the Donati and the Chierchi. The partisans of the former house, consisting mostly of aristocrats and admired by the populace, are known as the Black Guefts or Nerl, while the Chierchi, all-powerful among the burghers, headed the White Guefts or Bianchi. On May 1, 1300, the two parties came to blows, and the whole city was divided. From June 15 to Aug. 15, D. was one of the six elected priors, and from this period he dates all his woes. The leaders of both parties were at first banished, but the Bianchi, who submitted quietly, were soon recalled. The exiled Corso Donati sought the pope, whose aggressions had still continued, and that pontiff summoned Charles of Valois to his support. On Nov. 1, after giving solemn pledges to the Signoria, Charles entered Florence with 1200 horsemen, receiving no opposition. His first act was to recall Corso Donati and his allies, and the Bianchi made no attempt to hold their own. Plunder, massacre, and proscription was the order of the day. In Jan. 1302 D. and four other prominent men were accused of a variety of crimes, all of which the poet denies, and were exiled, their property being confiscated. All his early biographers support his denial. The terms of this decree of exile seem to imply that D. had fled from the city some time before its pub. He himself in the *Convivio* thus sums up the earlier portion of his exile: 'Since it was the pleasure of the citizens of the most beautiful and most famous daughter of Rome, Florence, to cast me forth from her most sweet bosom (in which I was born and nourished up to the summit of my life, and in which, with her goodwill, I desire with all my heart to rest my weary soul and to end the time given me), I have gone through almost all the parts to which this language extends, a pilgrim, almost a beggar, showing against my will the wound of fortune, which is wont unjustly to be oftentimes reputed to the wounded.' We do not know exactly where he went. It may have been either Bologna, Siena, or Verona. In 1303 he was certainly at the latter tn., where he found his first refuge at the house of Bartolomeo della Scala. Meanwhile, after sev. attempts to regain the supremacy, often in alliance with the Ghibellines, the Bianchi party were utterly defeated at Lastra (July 1304). About this time D., who had taken no active steps in the attack on Florence, went to the Studio at Bologna, and between 1307 and 1309 went on to Paris, where he achieved much repute in the schools. Here he probably remained until 1310, when tremendous events put an end to his studies and imperatively summoned him back to Italy. In 1309, after the death of Albert of Austria, who had totally neglected Italy, Henry of Luxemburg was elected emperor with the approval of the pope. He immediately asserted his position as true king of the

Roms. and successor of Cæsar, and moved S. to join all Italy together under a united church and empire. D., before the end of March 1311, had paid his homage to the new emperor, and had already written the first of a series of letters to the Ita. and Florontines in which he calls on them to submit to the absolute authority of Henry. But Florence was the most perverse of the great cities. She supported all who were opposing the emperor, treated his messengers with contumely, and formed a Gueft alliance against him with King Robert of Naples as her chief ally. D. urged the emperor against Florence (the sick sheep that infects all the flock of the Lord with her contagion), and the probable result of this and other letters was that a new condemnation was pronounced against him in Sept. 1311, making his exile perpetual. For a while Henry besieged Florence, but he had to retreat before the end of 1311, and two years later he died when about to renew the attack. And all hope being gone, the poet remained silent. From the spring of 1311 till the end of his days at Ravenna, which may be termed the last period of his exile, D.'s movements are hardly known at all, except by more or less certain conjecture. He had now given up all hope of returning to Florence, and wandered about in great poverty, under the protection of various lords, in different parts of Lombardy, Tuscany, and Romagna. There is a tradition, founded on *Paradiso*, xxi. 106-120, that he retired to the convent of Santa Croce di Fonte Avellana in the Apennines, engaged on the great *Commedia*. He seems at one time to have visited Lucca, and in 1316 an amnesty was offered to him with many other exiles, but on conditions too degrading for him to accept. Towards the end of 1316 he went to Verona to renew his friendship with Can Grande, son of Bartolomeo della Scala, and in 1317 he finally settled at Ravenna. Here ensued a quiet period, for he was treated with honour and surrounded by congenial companions. Then in 1321 he was sent on an embassy to Venice to settle a quarrel which had arisen between the two cities. He returned sick with fever, and passed away on Sept. 14, the Feast of the Exaltation of the Holy Cross, 1321.

Dante's Works.—Before dealing in detail with the more important of the works, it will be as well to give a general account of his entire production. His works fall into three distinct periods. The first is the period of the new life, the epoch of the worship of the real Beatrice, in which the youthful poet beheld many things by his intellect, 'as it were dreaming.' This period includes the *Vita Nuova* with its lyrics, and closes with the promise to write yet more concerning her than has before been written of any woman. The second period is that of passion, political turmoil, and philosophical research, and marks a great advance in almost every direction. It includes the greater part of the *Canzoniere* collection, the two unfinished prose treatises—the *Convivio* and

the *De Vulgari Eloquentia*, and the political letters connected with Henry VII. The Lat. treatise, *De Monarchia*, may also belong here. It may be observed here that the ideals of the empire of the Ger. Caesars, the papacy, Venice, Spain, and Bourbon France (that is, those empires which preceded the modern Brit. Empire) are completely enshrined in the *De Monarchia*, a work which knits itself closely to Caesarian and to consular Rome. Connecting the second and third periods comes the letter to the It. cardinals on the death of Clement V. (1314). The last period is that of the *Divina Commedia*, the return to Beatrice, but now the allegorical Beatrice, as well as the two eclogues and the letters to the Florentine friend and to Can Grande, if these are authentic. Among apocryphal works may be mentioned the *Questio de Aqua et Terra*, in Lat. prose, and the *Seven Penitential Psalms* and the *Profession of Faith* in It. verse. Sev. of his smaller poems, to which he incidentally makes reference in other works, are now lost.

D. acknowledges Guido Guinicelli as his master in poetic art and the founder of the new school of It. poetry (*Purgatorio*, xxvi. 97), whose doctrine of love expounded in the 'Canzone of the Gentle Heart' is the most fitting introduction to the *Vita Nuova* and the *Canzoniere*. The *Vita Nuova* may be considered as a preparation for the *Commedia*, inasmuch as it tells us how the divine singer became a poet, and how she crossed his path who was to be his spiritual pilot over that mighty ocean. It is the most spiritual and ethereal romance of love that exists, but its purity is such that it comes, not from innocent simplicity of soul, but from self-repression. It tells the whole story of D.'s love for Beatrice from his first sight of her in their ninth year to a vision which is the anticipation of her final apotheosis. Under the heading of the *Canzoniere* are included all D.'s lyrical poems, together with a few that are more doubtfully attributed to him. They fall into four groups: the first of the *Vita Nuova* period; the second in which allegory is beginning to supplant the real Beatrice; the third expressing passionate love of other real women; the fourth, canzoni on Rectitude, Nobility, and Galantry. Just as, after the death of Beatrice, D. collected all his early lyrics in a prose narrative, so in the *Convivium*, or Banquet, he attempts to collect fourteen of his later canzoni, with a prose commentary to the glory of his mystical lady, Philosophy. The work, however, was left incomplete. The first of the Lat. works is the *De Monarchia*, an attempt to solve the burning medieval question of the relations of Church and State, of spiritual and temporal authority. It is divided into three books, and has been described as 'the most purely ideal of political works ever written.' The *De Vulgari Eloquentia* is incomplete, only two out of the four books having been written, the second remaining unfinished. It deals first with the search for the highest form of the vernacular, and secondly, with the appli-

cation of the vulgar tongue to poetry. Ten Lat. letters are also extant and ascribed to the divine poet, but only that to Henry VII., emperor of Germany, is universally accepted as genuine. One of them, that to Can Grande, is a miniature philosophic treatise in epistolary form, at the same time being a dedication of the *Paradiso* to the young lord of Verona. It is probably authentic, and its date would be about 1319. The eclogues, two delightful pastoral poems in Lat. hexameters, belong to the closing period of D.'s life, when he was engaged on the *Paradiso*. In spite of the testimony of Boccaccio and Leonardo Bruni, their authenticity has been questioned.

Though the *Divina Commedia* must be regarded as the work of his closing years, it is poetically placed in the spring of 1300, before D.'s election to the priorate, and the poet puts himself in the position of a man relating a vision which he had seen twenty years before. Hence all events subsequent to April 1300, such as the faction fight of May in that year, are spoken of prophetically as future events. Approximately, the completion of the *Inferno* and *Purgatorio* may be placed between 1314 and 1319, that of the *Paradiso* between 1316 and the day of his death. The poem is a vision of the world beyond the grave, and also an allegory, based upon that vision, of the life and destiny of man, his need of light and guidance, his duties to the temporal and spiritual powers, to the empire and to the Church. In the epistle to Can Grande, the poet tells us that the allegorical meaning is 'Man as by freedom of will, meriting and demeriting, he is subject to justice rewarding or punishing.' The *Inferno* represents the state of ignorance and vice; the *Purgatorio* is the life of converted sinners, obeying Caesar and reconciled to Caesar, doing penance and striving Godwards, after the state of innocence has been regained in the earthly paradise; the *Paradiso* represents the ideal life of action and contemplation, closing in an earthly foretaste of the Beatific Vision. This may be applied to the moral or spiritual Hell, Purgatory, Paradise of men still united to their bodies in this life, as well as to the essential Hell, Purgatory, Paradise of disembodied spirits. The end of the poem, as the epistle to Can Grande shows, is to remove those living in this life from the state of misery and lead them to the state of felicity. In the individual, this object is attained in the manner described above, in the universality it can only be effected by the restoration of the empire and the purification of the Church. To aid in the attainment of this end, D. has two guides: Virgil, representing Reason or Human Wisdom, and Beatrice, representing Revelation or Divine Wisdom. At times Virgil seems invested with the power of the empire, and Beatrice with the authority of the Church. The personal meaning, too, must not be forgotten. The allegory is partly dropped when Virgil leaves Dante in the Earthly Paradise to return to his own sad place in Limbo, and entirely when Beatrice is last seen

enthroned in glory beneath Madonna's throne. The metrical structure is complicated. Each of the three *Canticas* is divided into cantos, the *Inferno* into thirty-four, the *Purgatorio* into thirty-three, the *Paradiso* into thirty-three, thus making up a hundred cantos, the square of the perfect number. Each canto is composed of from thirty-eight to fifty-three *terzine* or *terzette*, written in *terza rima*, thus ABA, BCB, CDC, . . . with an extreme line or *tornello* rhyming with the second line of the last *terzina* to close the canto thus . . . XYZ, YZYX. The *Divine Comedy* is issued in the Temple Classics in 3 vols. with It. and Eng. on opposite sides. Rossetti's trans. of the *Vita Nuova*, with the sonnets of D. and his contemporaries, is to be found in Everyman's Library. The best ed. of the works is the Oxford *Dante* (1894, 1924), ed. by E. Moore. See P. Toynbee, *Dante Alighieri, his Life and Works*, 1893; F. X. Kraus, *Dante, sein Leben und seine Werke*, 1897; E. Moore, *Studies in Dante*, 1896-1917; R. T. Holbrook, *Portraits of Dante*, 1911; E. Gardner, *Dante* (Temple Primers), and *Dante and the Mystics*, 1912; P. Wicksteed, *Dante and Aquinas*, 1913; B. Croce, *La Poesia di Dante*, 1921; E. Gilson, *Dante the Philosopher*, 1948; J. H. Whitfield, *Dante and Virgil*, 1949; lives by H. Hauvette, 1930; N. Zingarelli, 1931; and M. Barbi, 1933.

Dante da Majano, It. lyrical poet of the early fourteenth century, b. at the end of the thirteenth, contemporary of Dante Alighieri. He was a slavish imitator of the troubadours, two poems being in Provençal, but had a considerable reputation. His reply to Dante's first sonnet (*A ciascun' alma presa*) was very coarse. A collection of his works, entitled *Sonetti e Canzoni di diversi antichi autori toscani*, appeared 1727. A later ed. is that of Bertacchi (1896). Novati (1883) refuted Borgognoni's arguments (1882) against the existence of such a poet.

Danton, Georges Jacques (1759-94), 'the Titan of the Fr. Revolution,' b. at Arcis-sur-Aube, of well-to-do parents. He received a good education, and in 1780 went to Paris, where he practised as an advocate until the outbreak of the Revolution. He took no prominent part in the earlier stages of the Revolution. He first came to notice as founder and president of the Cordeliers' Club, which, though local in origin, soon began to attract the more extreme revolutionists. D. does not appear to have taken any prominent part in the great events of 1789, the fall of the Bastille and the forcible removal of the court from Versailles to the Tuilleries. In the following year one finds him urging action to prevent the arrest of Marat, and in the autumn he appears to have been made commander of the battalion of the National Guard in his dist. In 1791 the death of Mirabeau (who fully appreciated D.'s powers) hastened the downfall of the monarchy. From a minor administrative office, D. was, in 1792, made minister of justice. This appointment, following the march on the Tuilleries, has been adduced as a proof that he was con-

cerned in that affair, but that he was so is not at all clear. Henceforward until his death his personality looms large in the story of the Revolution. He himself had no part in the infamous Sept. massacres, but he sought to justify them as inevitable excesses. It was his eloquence that inspired his countrymen to drive back the Prussians when they sought to restore the monarchy. 'We must dare,' he said, in words that became proverbial, 'and again dare, and for ever dare.' He voted for the death of the king in Jan. 1793. He was one of the original members of the Committee of Public Safety, and was frequently sent on special missions. In the convention he became leader of the Mountain, a party so named from the high

GEORGES JACQUES DANTON

benches on which its members sat. Under his leadership they overcame the more moderate Girondins, or country party, but D. then found that he could not control the party he had led to victory. His enemies won over Robespierre to support their intrigues, and D., either careless or disdainful of his enemies, was arrested without difficulty. On April 2, 1794, he was brought before the revolutionary tribunal which he had created a year before, and when his eloquence made a great impression on the people he was sentenced to death without further hearing. He was executed on April 5, 1794, with fourteen others, including Camille Desmoulins, his comrade from the early days of the Cordeliers' Club. See A. Bougeart, *Danton, documents authentiques*, 1861; and lives by A. H. Beesly, 1899; H. Belloc, 1899; and L. Modelin, 1914 (trans. 1921).

Dantzg, or Dantsic, see DANZIG.

Danube, second largest riv. of Europe, its length of 1740 m. being only exceeded by that of the Volga. It has its origin in the Brigsach and the Brege, two int. streams that rise in Swabia in the Black Forest. They unite at Donaueschingen, and the D. flows thence first S.E. to Gutmadingen, and then N.E. as far as Regensburg. Here it turns S.E., having reached its most N. point at Regensburg, and

continues to flow in that direction as far as Vác (Waitzen), 20 m. N. of Budapest. In this part of its course the riv. passes through wild and romantic scenery, and the crystalline rocks of the Bohemian forest are found along the banks as far as Aschach. It leaves Austria by means of what is known as the Carpathian Gate, a narrow opening between the mts. and forms the boundary between Czechoslovakia and Hungary. Before reaching Vác the stream divides in one or two places, and the is. thus formed include the Great Schutt and St. Andreas is. Farther down its course are found Csepel, Margitta, and other is. Near Vác the riv. turns sharply to the S., and continues to flow due S. over the Hungarian plain, where it is continually making fresh channels, for about 230 m. It turns S.E. once more in Yugoslavia and E. of Belgrade forms the boundary between Yugoslavia and Rumania. A series of rapids occurs on this stretch of the riv., the most important being at the Iron Gates, below Orsova. Proceeding in an E. direction, the D. drains the country lying between the Transylvanian Alps and the Balkans. It gradually turns from S.E. to N.E., from Silistra, skirting the Dobrudja, it runs N. as far as Galatz, and then turns E. at a right angle, and goes into the Black Sea. The delta of the D. begins a few miles after Galatz and a few miles W. of Tuldja. The extreme mouths are 60 m. apart, and the expanse lying between these extreme branches, comprising about 1000 sq. m., is little more than a wilderness of rushes. The prin. arms of the riv. are the Sulina, Killa, and St. George. The area drained by the riv. in the whole of its course is estimated at over 315,000 sq. m. The D. is distinctive among important European rivers in that it flows from W. to E. It has, roughly, about 400 tribes, about one in four of which are navigable. In its upper course it receives the Lár and the Lech from the right. Passing through Austria and Hungary it receives the March, Waag, Gran, and Theiss from the left, and the Enns, Raab, Dravo, Save, and Morava from the right. Lower down it is joined by the Seret and Prut. The prin. mts. on the D. are Ulm, Passau, and Regensburg in Germany; Vienna and Linz in Austria; Bratislava (Pressburg) in Slovakia; Budapest in Hungary; Belgrade in Yugoslavia; Lom-Palanka, Vidin, and Ruschuk (Russe) in Bulgaria; Orsova (Iron Gates); Turnu Severin (where a bridge is projected to link Rumania with Yugoslavia); Braila; Galatz (confluence of the Sereth), and Sulina, the Black Sea port, in Rumania. The width of the riv. varies considerably, and at some points the opposite shore is hardly discernible. It is first navigable at Ulm, and, thanks to various improvements, is now navigable continuously from that point to its mouth. Engineering work to this end was undertaken at Vienna, Budapest, and the Iron Gates.

The European commission of the Danube, appointed in 1856, controls the lower portion of the riv., and has done much to improve navigation at the delta.

The commission has also made great progress in the deepening of the riv.-bed, so that at Sulina, for example, the depth has been increased from 9 to 24 ft. It has also linked up various parts of the riv. by canals, so that the route for navigation has been shortened, and the mileage reduced from 45½ to 33½ nautical m. The D. is connected with the Rhine and the Elbe by canal, and the famous Ludwigs-kanal has united the D. with the Main since 1844. A new and deeper canal is under construction to permit the passage of larger craft than at present, thus linking up the whole Rhine and D. systems across Europe from the North Sea to the Black Sea. The tonnage clearing from the D. ports in 1923 was 825,524 tons. Before the Second World War Rumania estab. a naval base at Sulina, and the force on the D. consisted of seven monitors, seven vedettes, and some small vessels; the naval school was situated at Galatz. Bulgaria was prohibited from maintaining any warships on the D., but was permitted to retain for the protection of its trade and fishery a small number of unarmed torpedo and motor-boats. Sea-going vessels of 600 tons can now go nearly as far as the Iron Gates, while vessels of 2500 tons can go above Galatz.

Danubian International Regulation.—A European commission of the D., with headquarters at Galatz, was appointed by the treaty of Paris, 1856, after the Crimean war. Its function was to control the navigation of the riv. from Braila to Sulina (at the mouth). Up to the First World War the whole riv. was under its control, and it was kept in power by various later agreements, 1871, 1878, and 1883, and from 1904, by tacit prolongation for successive terms of three years until the war conditions of 1914–19 suspended the validity of agreements between European nations. The later International D. Commission, with headquarters in Belgrade, was created by the treaty of Versailles by a convention instituting the definitive status of the D. signed in Paris (July 20, 1921), by all the chief nations of Europe with riparian rights or commercial interests, the convention coming into force on Oct. 1, 1922; and in the following year a second convention was signed (May 27) by riparian powers approving arrangements regarding a permanent technical commission for the D. The convention of 1921 provided that the navigation of the D. should be equally free to all nations from the Black Sea to Ulm and instituted schemes for the improvement of the waterway; it decided that no passenger or goods traffic should receive any preferential treatment in any state. Ships were to be taxed according to their tonnage, for the purpose of providing revenue. The headquarters, which were at Bratislava, were to be maintained for five years, and afterwards transferred to other mts. on the D. for periods of five years when these were deemed especially suitable. A pilotage and riv.-improvement service was maintained by this commission at the Iron Gates (headquarters at Orsova), the expenses being

met by shipping dues. Receipts of this commission in 1937 totalled 3,500,000 gold francs, and expenses 2,200,000. Much hist. therefore lies behind current discussion of the control of the D., particularly following the emergence of Russia as a leading European power. Russia is traditionally hostile to international control of the riv., which, as shown above, originated after her defeat in the Crimean war. For Russia the delta of the D. has always entered into the question of the Black Sea and the Straits. More recently Russia has been concerned, not only with the delta and oversea trade, but also with the upper reaches and trade up and down the riv. These distinct aspects of

invasion of Russia in 1941 the whole D. was controlled by Germany for the next three years. The Brit. Gov., for its part, protested in 1940 about the Russo-Ger. negotiations, reserved its rights under existing agreements, and refused to recognise any new arrangements which Germany and Russia might make between them. At the Paris conference of foreign ministers in 1946 Mr. Bevin, representing Britain, said he would accept Mr. Byrnes's (U.S.A.) proposal that a clause in the treaties should stipulate that navigation should be free and on equal terms for all states, 'providing it was also agreed that a Danubian conference could be called within a fixed period after the conclusion

THE RIVER DANUBE AT BELGRADE

Yugoslav Embassy

Danubian trade are, respectively, reflected in the sphere and function of the two controlling commissions, which, according to the Brit. view, are juridically and technically, both still in being, though neither can (1949) now function. Russia was not a riparian owner from 1856 to 1878, nor again from 1917 to 1940, but none the less has always been jealous of any rival in the delta. Germany up to 1918 was content to allow her ally Austria to deal with Danubian problems, but two decades later, with Ger. military penetration of the Balkans, she came into conflict with Russia (1940). The war in 1939 suspended the work of both commissions, but in 1940 Germany summoned a conference at Vienna to estab. a provisional administration for the upper D., Russia not being invited. Russia protested, averring her interest thenceforth in all Danubian problems, maritime and fluvial, and indeed claiming that the provisional regime for the maritime D. should be left exclusively to herself and Rumania. In Dec. 1940 the conference adjourned *sine die*, and following the Ger.

of the treaties,' thereby following the precedent of the previous world war when an inter-allied D. commission under Adm. Sir E. Troubridge, which had replaced the D. command, was itself superseded in 1920 by the International Commission. This conference was held in Aug. 1948 at Belgrade, and resulted in the adoption by the conference of a new Soviet-sponsored convention which, while reaffirming the principles of freedom and equality of access for all nations, would limit the membership of the new commission to riparian states (among them the R.S.F.S.R. and Ukraine), conditions of traffic to be controlled by the Soviet-Danubian naval companies. The delegates of the W. powers maintained, however, that the whole new statute was *ultra vires* as the acquired rights of France and Britain could not be abrogated without their consent. For battles on the D. in the Second World War see under EASTERN FRONT, or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR, and also under BUDAPEST, VIENNA, etc. See F. Heiderich, *Die Donau als*

Macartney, *Problems of the Danube Basin*, 1942; A. Basch, *The Danube Basin and the German Economic Sphere*, 1944; and F. Hertz, *The Economic Problems of the Danubian States*, 1947.

Danum, see DONCASTER.

Danubian Principalities (Provinces), name formerly given to the principalities of Moldavia and Wallachia. In political discussions it was also sometimes used for Serbia and Bulgaria.

Danvers, tn. of Massachusetts, U.S.A., in Essex co., 20 m. from Boston, of which it is a residential suburb. There are extensive boot and shoe factories, brickfields, etc., also manufs. of electric lamps and fixtures. Among the institutions are a state lunatic asylum, a Catholic college library, and museum. Pop. 14,100.

Danville: 1. Cap. of Vermilion co., Illinois, U.S.A., 46 m. from Terre Haute, 120 m. from Chicago, on Vermilion R., and various railways. It is a farming and coal-mining centre and important manufacturing tn., and has flour, lumber, and woollen industries, glass and iron works. A branch of the National Soldiers' Home is here. Pop. 26,900. 2. Cap. of Boyle co., Kentucky, U.S.A., on the Queen and Crescent route, 68 m. from Louisville. It is an important market for horses, cattle, hogs, and sheep, and contains Centre College (Presbyterian), founded in 1819, state asylum for deaf-mutes, and D. Theological Seminary. Pop. about 6,700. 3. Cap. of Montour co., Pennsylvania, U.S.A., on N. branch of Susquehanna R., and various railways, 56 m. from Harrisburg. The first estab. for manufacturing railroad iron was here, and it has a steel plant and blast furnaces. Anthracite coal, iron ore, and limestone are found near. There is a state insane asylum. Pop. 7,100. 4. City of Virginia, U.S.A., on Dan R., 115 m. from Richmond on various railways. It has numerous colleges and institutions. It is in the yellow-tobacco region, and has much tobacco trade and cotton mills. Pop. 32,700.

D'Anville, Jean Baptiste Bourguignon (1697-1782), famous Fr. geographer and map-maker of Paris. He may almost be said to have created the science of geography, and in 1719 was appointed geographer to the king. He occupied the chair of geography in the Academy of Sciences, 1773. D'A. pub. 211 maps, the chief collections being *Atlas Général* (1737-80); *Atlas Antiquus Major*; *Orbis Romanus*; *Orbis Felicibus notus*; *Géographie ancienne abrégée* (3 vols., 1769); and *États formés en Europe* (1771). See Condorcet, *Éloge de D'Anville*, 1782.

Danzig, or Gdansk, until 1939 a free state under the protection of the League of Nations, and now a tn. of Poland; it includes the city of D., the municipality of Zoppot, and sev. smaller communities. The city of D. stands on the l. b. of the Vistula, about 3 m. from the mouth of the Baltic. From 1303 to 1454 it be-

longed to the Teutonic knights. When we first hear of D. in the tenth century it was inhabited by Slavs. It remained a Slav city until 1308, when the Teutonic knights, fighting as the allies of King Władysław the Short of Poland against the rulers of Brandenburg, captured the city and massacred the inhab. It joined the Hanseatic League in the fourteenth century, and in the fifteenth century its prosperity led to its being called the Venice of the N. Owing to its strategic importance D. was subjected to sev. sieges, and fell in turn into the hands of Denmark, Sweden, Poland, and Brandenburg. In 1834 D. was captured by the Prussians and, rapidly prospering, became the cap. of W. Prussia. On Nov. 15, 1920, by the treaty of Versailles D. received the status of a free city, this being a concession to the Polish demand for a commercial port on the Baltic despite the fact that 96 per cent of the people were Ger. The League of Nations was represented by a resident high commissioner, who had power to arbitrate between Poland and the free state of D. The affairs of the harbour were governed by a committee, consisting of five Polish and five Ger. citizens of D., with a chairman of Swiss nationality. Poland retained the right of free access to the sea for commercial purposes. The foreign and diplomatic relations of D. were also in the hands of Poland. D. possessed a currency peculiar to itself. The gulden, valued about 10d., was divided into 100 pfennigs. Ger. was the official language. In Aug. 1939 Forster, Nazi leader in D., proclaimed the reunion of D. with the Ger. Reich. The D. senate, overawed by the Nazi element, passed a law cancelling the constitution of the free city of D., and asked Hitler to ratify it, which Hitler did, ordering Burkhart, the League of Nations high commissioner, to leave the ter. at once. The political situation in D. grew acute in 1939. Germany complained that D. was systematically neglected by Poland in favour of Gdynia, the new port on Polish ter. Hitler's cry that D. was a Ger. cit., and must return to the Reich, was answered by Poland with the retort that 'the Danzig problem did not exist except in the imagination of the Nazis.' Poland asked for no more than the maintenance of the *status quo* in D., and would, in 1939, have been willing even to agree to certain modifications in Germany's favour. But Hitler wished to use the incorporation of the free city in the Reich as a preliminary step towards the recovery of the Polish prov. of Pomorze (the Corridor), and to the subsequent extension of Ger. domination over the rest of Poland. The city of D. is a busy commercial port, having extensive docks and shipbuilding yards. There is in normal times considerable traffic, both passenger and cargo, between D. and the Baltic ports, Hull, London, and the U.S. After the treaty of Versailles the trade on the Lower Vistula declined, but there was still a large export trade from D. by means of the R. Motława, a trib. of the Vistula. Exports include

timber, grain from the fertile Vistula valley, cement, iron, and steel. The industries of D. include the production of sugar, tobacco, flour, hardware, and jewelry. The public buildings include the church of St. Mary (1343-1503), one of the finest churches on that side of the Baltic; a Gothic tn. hall (fourteenth and sixteenth centuries); and a Franciscan monastery. Marshal Rokossovsky's troops advanced to the gulf of D. on Jan. 26, 1945, and the port was taken soon afterwards. The tn. and dist. was handed over to Poland in the same year, and later the Ger. inhab. were moved out. The pop. of D. city (1938) was 231,000; total pop. of D. 416,000. Area 791 sq. m. See also EASTERN FRONT, OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Daphne (Δάφνη), in classic mythology, a nymph beloved of Apollo, daughter of one of the Gk. riv.-gods. She fled from Apollo's pursuit, and was changed into a laurel or bay-tree, which was ever after sacred to Phoebus Apollo. See Ovid, *Metam.* i. 425-567. For the legend of her pursuit by another lover, Leucippus, see Pausanias, viii, 20; Parthenius, *Erotica*, 15.

Daphne, famous grove and sanctuary of Apollo, about 5 m. S.W. of Antioch, Syria, on R. Orontes. It was founded by Seleucus Nicator (c. 321 B.C.). The temple contained a statue of Apollo by Bryaxis, and was in the midst of a grove of cypress and bay trees, with beautiful gardens, baths, and porticoes surrounding it. The temple was burnt (c. A.D. 363). The probable site is now called Bâet-el-Mâ.

DAPHNE LAUREOLA: SPURGE LAUREL

Daphne, genus of the order Thymelaeaceae. The commonest of the species is the mezereon of our gardens, which is found wild in mountainous woods of Middle and S. Europe. The spurge laurel (*D. laureola*) is another Brit. species found wild in woods and hedges; the Garou bush

yields a yellow dye; *D. lagetta*, or *Lagetta tintaria*, the lace-bark tree of Jamaica, contains strong bast fibres and the inner bark is sometimes made into a kind of lace.

Daphnin ($C_{12}H_{16}O_4$), in chem. a bitter glucoside obtained from the bark of *Daphne mezereum* and *Daphne alpina*, found by Vauquelin (see Vauquelin, *A. Ch.*, 84, 173). Also a dark green resin, regarded as the essential principle of the mezereon. It can be easily decomposed into sugar and a substance called daphnetin, whose composition is represented by the molecular formula $C_8H_8O_4$. It may be prepared artificially.

Daphnis (Δάφνις), in mythology, a shepherd and hero of Sicily, said to be a son of Mercury and a Sicilian nymph. He was the reputed inventor of pastoral poetry, and figures largely in the bucolic poetry of the ancients (from the early third century B.C.), as also in the more modern imitations, where he becomes merely a conventional figure. He was under Diana's protection, and taught music by Pan. According to legend, D. was beloved by a Naiad, who punished him with blindness for his infidelity to her. See Theocritus, *Idylls*, i.; Virgil, *Eclogues*, v.; W. Prescott, "A Study of the Daphnis Myth" (in *Harvard Studies in Classical Philology*, x., 1899).

Daphnis and Chloe, see LONGUS.

Dapitan, tn. situated on the N. coast of Mindanao, an ls. of the Philippine archipelago. It is a trading port, and a trade in rice, cocoa, sugar, fruit, and vegetables is carried on. A little gold is also found. Pop. 5000.

Da Ponte, Lorenzo (real name Emanuele Cornigliano) (1749-1838), Austrian librettist, of Jewish descent, but was converted to the Rom. Catholic faith by Lorenzo da P., bishop of Ceneda, whose name he adopted according to the custom of the time. About 1780 he was officially appointed by the Austrian Gov. to be Poet to the Italian Theatre. He wrote librettos for Mozart's *Le Nozze di Figaro* (1786), *Don Giovanni*, and *Così fan Tutte*—the second of these, however, is but mediocre work, and the sustained popularity of the Don Juan legend was due to Mozart's incomparable setting to da P.'s pale version of *El Burlado de Sevilla*. In London from 1793 to 1805, where he wrote for Drury Lane Theatre *La Capricciosa Correto*, *L'Isola del Piacer*, and *La Scuola de Mariati*. In the U.S.A. (1805) he was appointed prof. of lt. literature, Columbia, from 1825.

Dapsang, mt. of Central Asia, which forms the culminating point of the Karakorum range, and rises to a height of over 25,000 ft.

Daqahliya, see DAKAHLIEH.

Daquin, or d'Aquin, Louis Claude (1694-1772). Fr. organist, harpsichordist, and composer, b. in Paris. At the age of six he played the harpsichord before Louis XIV. and at twelve performed the organist's duties at the Sainte-Chapelle. Held various posts as organist, including that of the Chapel Royal. His music is still heard at recitals, particularly *The Cuckoo*, a composition from the first book

of his harpsichord pieces, and a great favourite with both recitalists and amateurs.

Darabgherd, **Darab**, or **Darabjird**, city of Persia in the prov. of Farsistan. It is situated at the base of high hills on a small stream, and is surrounded by orange and lemon groves, date palms, etc. Relics of great antiquity have been discovered in the vicinity. Pop. about 15,000.

Daraga, tn. situated on the is. of Luzon, belonging to the Philippine Archipelago. The chief industry is the distilling of flower essences and alcohol. Pop. 22,000.

Daraiyeh, or **Derayeh**, ruined tn. of central Arabia. It was at one time the cap. of the Wahabis, in Nejd, being composed of five separately fortified quarters. It was destroyed in 1818, after withstanding a siege which lasted about seven months.

Darbhanga, chief tn. of the dist. of that name, in Bihar prov., India. It is situated on the l. b. of the Little Bagmati R., 78 m. N.E. of Patna, and is the residence of the maharaja of D., one of the largest landowners in Bengal. The palace is a very fine building and the tn. contains a number of very large tanks. It possesses a large market-place, many bazaars, and a medical school. There is a trade in salt timber, grains, and oil seeds. Pop. 70,000; dist., 3,000,000.

D'Arblay, **Madame**, see BURNES, FRANCES.

Darboy, **Georges** (1813-71), Fr. prelate, archbishop of Paris, 1863. He upheld the theory of episcopal independence, but, though vehemently opposing the doctrine of papal infallibility, submitted on the adoption of this dogma. At the siege of Paris, while ministering to the wounded, he was seized by the Communists, and shot in La Roquette prison, 1871. He trans. *Dionysius* (St. Denis) the *Areopagitae*, and wrote *Saint Thomas Becket, sa vie et ses lettres* (1860); *Les Femmes de la Bible* (1876, 8th ed.); *Les Saintes Femmes* (1877). See life by J. A. Foulon, 1869.

Darby, **Mary**, see ROBINSON.

Dardanelles, or **Strait of Gallipoli**, ant. Hellespont, a narrow channel connecting the sea of Marmora with the Aegean Sea, and thus separating Europe from Asia. It is about 40 m. in length, and varies in width from 1 to 5 m. One of the narrowest parts is between Abydos and Sestos, where, according to the classic story, Leander swam across nightly to visit Hero. This exploit was repeated by Lord Byron in 1810. It was also about this spot that Xerxes crossed into Europe with his army (by two bridges of boats) in 480 B.C., and Alexander the Great crossed to Asia in 334 B.C. Both sides of the strait are strongly fortified, as it is the key to Istanbul. By a treaty of 1841 it was agreed that none but a Turkish warship should pass through the D. without the consent of Turkey. This understanding was reaffirmed in 1871 and 1878. In 1904, during the Russo-Jap. war, two Russian volunteer fleet cruisers passed through as merchant ships. Sev. castles are situated on the shores of the strait, including two bearing the name

of the D. on the sites of Abydos and Sestos. The chief coast tns. include Gallipoli, Lapsaki, Galata, Kild, Bahr, and the fortified seaport of Sultanieh-Kalehsi. The D. take their name from the ant. Dardanus, a Gk. city on the Troad. They were closed to merchant shipping in April 1912 during the Turco-It. war, but were reopened a month later in response to representations from Great Britain and other European powers. The Gallipoli peninsula was the scene of fighting during the second half of the Balkan war, 1913.

Attack on the Dardanelles, 1915.—Shortly after the outbreak of the First World War the Turkish Gov., under Ger. pressure, closed the D. to commerce, as a reply to the allied protest regarding the Ger. cruisers *Goeben* and *Breslau* (see 'GOEBEN' AND 'BRESLAU'), which, having taken refuge in Constantinople harbour, were dominating that city with the connivance of the pro-Ger. party under Enver Pasha. Thus Russian grain exports were effectually sealed up in the Russian ports, and a few days later Turkey was openly ranged with the central empires against the Allies. The Allies, realising how great would be the moral and practical effect of taking Constantinople, prepared to force the D. The political and military importance of the straits at this time was almost incalculable: the capture of Constantinople, which would have been the corollary to success, would not only have opened the way to the Russian grain cargoes, but would have thwarted Ger. control of the Bagdad railway, enormously enhanced allied prestige throughout the Muslim world, probably kept Bulgaria out of the war, and, further, by releasing the Russian armies in the Caucasus, have tended to shorten the war. It was, however, recognised that the operation of forcing the D. was hazardous, especially as Ger. experts had superintended the mounting of powerful 14-in. Krupp guns on the shores so as to command all approaches. From Feb. 19 to Mar. 15, a squadron of obsolescent Fr. and Brit. battleships, supported by the *Queen Elizabeth*, *Agamemnon*, and *Inflexible*, and commanded by Vice-Adm. De Robeck, intermittently bombarded the forts Sedd-el-Bahr and Kum Kale at the entrance of the straits. On March 18 an attempt was begun to reduce all the inner forts, commencing with Kild Bahr, within a few weeks. The hope was that once the forts were reduced the minefields would be cleared and the way open for the fleet to proceed up to Constantinople, destroy the *Goeben* and *Breslau*, and take the cap. This ambitious plan seems to have been open to many objections (consult *Dardanelles Report*), especially strategic, and it is not surprising in all the circumstances that it failed. The guns of the forts at the entrance were silenced, but the real defences were in the Narrows, less than a mile in width, and commanded by the forts of Kild Bahr on the W. side and those of Chanak on the E. or Asiatic side. The 15-in. guns of the *Queen Elizabeth*

having carried out a bombardment from the gulf of Saros against the Chanak forts, the allied ships, comprising fifteen Brit. and four Fr. vessels, moved towards the Narrows and concentrated their attack on Kilid Bahr, the impression of the commander being that the Chanak guns had been put out of action. The result was disastrous, for the Fr. ship *Bouret* was shelled and sank with all on board, the *Irresistible* and *Ocean* were sunk (probably torpedoed) on March 18, and both the *Infleible* and the *Gaulois* were severely damaged. The Brit. loss in personnel was 2000. The rest of the fleet steamed out again on the same day, and no further attempt was made to destroy the forts by a naval attack alone. Later, when the fleet co-operated with the landing force, three more Brit. battleships were lost, the *Goliath*, torpedoed off Gallipoli, May 12, and the *Triumph* and *Majestic*, both torpedoed on May 26. (For the land attack which was launched in the same year see under GALLIPOLI CAMPAIGN.)

Naval Operations subsequent to March 1918.—The Brit. submarine E. 15 was wrecked, and the crew captured on April 17. Crews of the *Majestic* and *Triumph* went out and destroyed the hull of the submarine. On April 27 E. 14 went through the straits and sank three Turkish men of war. On May 12 the Turks torpedoed the old Brit. warship *Goliath*. On May 26 and 27 Ger. submarines torpedoed and sank the *Triumph* and *Majestic*. On Aug. 9 a Brit. submarine sank the *Barbarossa* and later the Ger. torpedoed and sank the Brit. transport *Royal Edward*, 1000 Brit. lives being lost.

Among the famous fourteen points set forth by President Woodrow Wilson in Congress on Jan. 8, 1918, was that (No. 12) which insisted on the D. being permanently free to all ships. After the war the internationalisation of the straits became an accomplished fact under the treaty of Lausanne, 1923. A special convention demilitarised zones on both sides of the Bosphorus and sea of Marmora, and prescribed rules for preserving the freedom of the Narrows in peace and war which were applied by a mixed commission of the League of Nations. In 1936 Turkey applied for permission to re-fortify the zone, and this was granted by a new convention signed at Montreux. Turkish troops occupied the area on July 21, 1936. Under this convention belligerent warships may not pass through the straits to the Black Sea. After the Second World War Russia reopened the question of the passage of Russian warships through the D. A Russian note (Sept. 24, 1946) carried still farther the diplomatic exchanges which began on Aug. 22, when the Soviet Gov. proposed to Turkey a revision of the regime of the straits which would substitute for the existing loose but internationally sponsored Turkish control a regional defence arrangement between Turkey and the other Black Sea powers. The W. democracies (America, Britain, and France), expressing substantially similar views, replied that the regime of the

straits was a matter of concern, not only to the Black Sea powers, but also to other powers, including the U.S.A. The Turkish reply rejected the Russian suggestions, while agreeing that the time might be ripe for a revision of the Montreux convention, but only by consultation between its signatories, with whom would be included the U.S.A. See T. Bridges, *On Land and Sea at the Dardanelles*, 1916; E. Delage, *The Tragedy of the Dardanelles*, 1932; A. Kearsley, *Notes and Comments on the Dardanelles Campaign*, 1934; and E. Chatterton, *Dardanelles Dilemma*, 1935.

Dardania was in anct. geography a kingdom in Mysia, Asia Minor, of which the size and boundaries were uncertain. It is mentioned in the *Iliad*, and was, according to Gk. mythology, founded by Dardanus, who swam on an inflated skin from Samothrace to the Troad. The inhab. of D. were the Dardani.

Dardanus (*Δαρδανός*), son of Zeus and Electra, daughter of Atlas. He was the mythical ancestor of the Trojans, called after him Dardanide. Homer reckons five generations between D. and Priam.

Dardanus, **Dardanum**, or **Dardanum**, was in anct. geography a city situated on the Hellespont in Mysia, Asia Minor, about 10 m. S.W. of Abydos. It was built by Dardanus, who was, in Gk. mythology, the founder of Troy.

Dardistan (country of the Dards), name of a mountainous dist. on the N.W. of Kashmir, India, where the R. Indus bends S.; extended as a geographical name for numerous tribes between Kashmir and Afghanistan, on the S. slopes of the Karakoram and Hindu-Kush Mts. It comprises the frontier dists. of Chitral, Swat, and Kafiristan, recently brought under Brit. control. The Dards are an Indo-European people, once Buddhists, now mostly Shiite Moslems. They are also called Kanjur. See J. Biddulph, *Tribes of the Hindoo Koosh*, 1880; and G. Leitner, *Hunza and Nagar Handbook*, 1893.

Dare (fish), see DACE.

Dar-el-Beida, see CASABLANCA.

Dares (*Δαρης*), priest of Hephestus (Vulcan), mentioned in Homer's *Iliad*, v. 9, and praised for his wisdom. He was said to have been present at the siege of Troy, and an older story of Troy's destruction, written on palm leaves, was attributed to him. There is an extant prose narrative (forty-four chapters) ascribed to Dares Phrygius, written in very bad Lat., *De Excidio Troie Historia*, purporting to be a trans. from the Gk. by Cornelius Nepos, but apparently belonging to the fifth century A.D. Guido delle Colonne's *Historia Troiana*, a romance based on the Lat. version in the thirteenth century, closely resembles Benoit de Sainte-Maure's *Roman de Troie*. It was often printed with the works of Dictys Cretensis (by Dacier, 1680; by Meister, 1873).

Dar-es-Salaam (Arabic, house of peace), seat of gov. of the Tanganyika ter., formerly cap. of Ger. E. Africa. Has about 63,300 inhab., with quays and floating

dock, and a railway to the interior which made it the commercial centre of Ger. E. Africa, good hospitals and schools, museum, two churches, electric light, European and native quarters. Terminus of the Central railway to Kigoma (775 m.). D. is a port of call for the empire mail service. Its harbour is accessible to ocean-going vessels. It was bombarded by the Brit. in 1914 and evacuated by the Gers. in 1916. The dist. of the same name has 183,000 inhab.

Darfield, par. and tn. of W. Riding, Yorkshire, England, on the Dearne, 5 m. from Barnsley. Coal is worked in the neighbourhood. Pop. 5600.

Dar-Fur, prov. in the Anglo-Egyptian Sudan, formerly a centre of the slave trade. It was an independent kingdom until 1874, when it was nominally annexed to Egypt. Subsequently, however, it suffered from the domination of the Mahdi, and his successor, the Khalifa, until the defeat of the latter in 1898. It is inhabited chiefly by Arabs and a negro tribe, the Fur; the cap. is El Fasher. The country is an undulating plateau, with flat sandy desert in the N. It produces grain, tobacco, gum arabic, tamarind's dates, white melons, ivory, some copper and iron, and cattle, camels, and game are plentiful. Area 170,000 sq. m. Pop. variously estimated at 1,000,000-1,500,000.

Dargal, hill-range near the Khola Pass, 50 m. from Peshawar, N.W. Frontier prov., Pakistan. During the Tirah campaign the Brit., under Yeatman Biggs, stormed the fortified heights held by Afridis and Orakzais, 1897. The honours were carried off by the Gordon Highlanders, assisted by the 2nd Ghurkas and the 3rd Sikhs.

D'Argenlieu, George Thierry (b. 1889), Fr. vice-admiral and member of the Carmelite order. Called up as a naval reserve officer in Sept. 1939 and rendered distinguished service. He joined Gen. de Gaulle in London as commander in June 1940. Went with the latter's Dakar (q.v.) expedition (Sept. 1940) and was wounded after landing there. Promoted to rear-admiral and sent as Fr. high commissioner to the Pacific. Returned in 1943 to take over the command of the Fr. naval forces stationed in Britain. Promoted vice-admiral (1943). In 1945 he was appointed Fr. high commissioner in Indo-China, being recalled in 1947. Decorated at the Brit. Embassy, Paris in Nov. 1947. Demobilised in 1948 and returned to his monastery as Father Louis de la Trinité of the Carmelite order.

Dargomyzhski, Aleksandr Sergeevich (1813-69), Russian composer, b. in the gov. of Tula, of good family and brought up on a country estate. His parents, however, had fled from their own home near Smolensk during the Napoleonic invasion of 1812. D. early showed musical talent and between six and eight years of age was taught to play the piano and violin, while at eleven he had made some attempt at composition. Entered the civil service in St. Petersburg and, moving in fashionable circles, became

well known as an amateur pianist and as a composer of dilettante drawing-room songs. It was his chance meeting with his older contemporary Glinka which gave his talents a more serious bias, and the two composers may be said together to have symbolised the pretensions of Russian musical genius at this period; but whereas Glinka's music was idealistic and lyrical, D.'s was realistic and dramatic. D. is a figure of some importance in the hist. of Russian opera: his first opera was *Esmeralda* (1839), the Fr. libretto of which was taken from Victor Hugo's *Nôtre-Dame de Paris*; but it was not accepted for the Imperial Opera until 1847. This was followed by a cantata on *The Triumph of Bacchus*, a dramatic poem by Pushkin, which D. later converted into a ballet-opera. Then came the opera *The Hussar* (1856) or *The Watersprite*, for the libretto of which D. again turned to Pushkin. The opera, though superior to *Esmeralda*, did not prove successful and D. wrote no further operas for some time. Meanwhile he produced *Knight Errant* and *The Old Corporal*, dramatic ballads which have been compared with the ballads of Schubert. Later D.'s association with Balakirev and his school gave him a leading part in the formation of a national and progressive school of Russian music, breaking with stale conventions and outmoded traditions. The influence of these principles is shown in his last opera, *The Stone Guest*, founded on the story of Don Juan as told by Pushkin. The opera was left unfinished at D.'s death, but was completed, on D.'s directions, by Rimsky-Korsakov (1872). D.'s own views on opera resembled those of Gluck and Wagner in the adaptation of the music to the dramatic import of the text. See monograph by A. N. Drosow (Moscow), 1929.

Darial, famous gorge and chief pass in the Caucasus Mts., situated in the central part of the range. It has been fortified from very remote times, and the present Russian fortress is at the N. extremity, over 1000 ft. in altitude. A military road crosses it, leads from Tiflis to Vladikavkaz.

Daria Shah, see URUMIA.

Darien, Gulf of, forms part of the Caribbean Sea, situated in lat. 9° N. and long. 77° W. On the W. is the Isthmus of Darien, known as Panama. In the S. is the bay of Choco, which receives the R. Atrato.

Darien, Isthmus of, otherwise Panama, the narrow neck of land joining central and S. America.

Darien Scheme, project started by a Scotsman, Wm. Paterson, in 1695, to form a settlement on the isthmus of Darien for controlling trade between the E. and W. Paterson, the founder of the Bank of England, was a bold and enterprising man. His ostensible purpose was to estab. an E. India trade in Scotland; this first developed into the plan of forming an emporium on each side of the isthmus of Panama to estab. trade between the opposite continents, and to wrest the keys of the world from Spain. William III. was opposed to his scheme, but national

enthusiasm carried it through, though it was unable to avert the disastrous fate of the settlement. In 1698 1200 Scottish colonists sailed from Leith to Panama (Puerto Esceces), to lay the foundations of New Caledonia. They made Acta their headquarters, with the name of New Edinburgh, and built a fort, New St. Andrews. The Spaniards proved hostile, and the colonists unfitted to endure the climate and hardships of war and disease. The survivors returned home in 1699, and though two more companies had already been sent out to America, a like fate drove them back in 1700. For the full story consult Sir J. Dalrymple, *Memoirs of Great Britain and Ireland*, 1790; Sir W. Scott, *Tales of a Grandfather*, 1828; J. Burton, *History of Scotland*, viii., and *Darien Papers*, 1849; E. Warburton, *Darien* (novel), 1852; R. Story, *William Carstares*, 1874; H. Bancroft, *History of Central America*, ii., 1883; and J. Barbour, *W. Paterson and the Darien Company*, 1907.

Dario, Rubén (1867-1916), one of the most notable writers of Sp. poetry of his time. Born at Metapa in Nicaragua, he soon made himself the leader of Hispano-Amér. poetry. His first book, *Azul* (1888), was an immediate success. In 1896 he was living in Buenos Aires, where he pub. *Prosas profanas* (1899). In 1900 he came to Paris, where he was to settle down until 1914, when he departed on account of the war to die at León after a short time in a hospital in New York. His best work appeared during his life in Paris: *Songs of Life and Hope* (1905); *The Wandering Song* (1907); *Poems of Autumn* (1910). Since his death he has become a modern Sp. classic. See life by A. Torres-Rioseco, 1931.

Darius I. (521-485 B.C.), first and greatest of the Persian kings bearing that name, b. in 548 B.C. He obtained the throne after the death of Cambyses, but for some time had to contend with rebellion, especially from Babylon under Nidinta-Bel. After obtaining peace within the empire, he proved himself in many ways a wise and enlightened ruler; he divided the empire into twenty satrapies for the purposes of government, systematised the taxation, and improved the roads. His conquests extended from India to Thrace and Scythia. In his expedition of 515 B.C., he transported 700,000 men across the Bosphorus on a bridge of boats. He conquered Thrace and his general, Megabyzus, subdued Macedonia, after which he pursued the Scythians as far as the Volga, but returned with a depleted army. In 499 B.C. the Ionians revolted and were helped by the Athenians. After subduing the revolt D. sent two expeditions against the Athenians. The first ended in the wreck of his fleet in 492 B.C. The second ended in the defeat of the Persian army at the famous battle of Marathon, 490 B.C. He d. while preparing for a third expedition.

Darius II. of Persia (424-405 B.C.), illegitimate son of Artaxerxes I., who succeeded Xerxes II. after murdering his own brother, Sogdianus. His reign was

only notable for insurrection and misrule. He helped the Spartans in the Peloponnesian war.

Darius III. (336-331 B.C.), last of the Persian kings of the Achaemenian dynasty; most of his short reign was occupied by defending the empire against Alexander the Great, who proved victorious. D. was treacherously slain by one of his satraps.

Darjeeling, or Darjiling: 1. Dist. of W. Bengal, India, bounded by Nepal (W.) and Sikkim (N.). It is the N. portion of Rajshahi div., and has two distinct parts, one traversed by the Lower Himalayas, the other by terai, formerly all jungle, but now cleared for tillage and tea-gardens.

Indian Railways

A FRUIT SELLER OF DARJEELING

It produces grain, tea, india-rubber, and cotton. 2. Cap. of above dist., 300 m. from Calcutta, connected with it by the N. Bengal state, and the Darjeeling and Himalaya railways. There are sev. churches, Queen's High School for girls, and other schools and a museum. The bazaar is thronged by folk from all parts, Lepchas, Limbus, Bhutias, Tibetans, Nepalese, Palariás, Bengalis, Kashmiris, and Marwaris. The chief industry is the cultivation of tea, 21,000,000 pounds a year. The Eden sanatorium (nearly 8000 ft. above sea level) is here, formerly for the sick and convalescent members of the Indian army. Magnificent mt. views can be obtained, Everest and Kangchenjunga being visible. It is a favourite summer resort, and is the hot-weather cap. of the prov. Pop. (tn.) 22,000; dist. 283,000.

Dark Ages, name given to the early period of the Middle Ages between the fall of the Rom. Empire, A.D. 475, and the revival of learning on the discovery of

the Pandects at Amalfi, 1137—roughly a period about 700 years. The D. A. seemed to last longer in the N. than in the S., as the revival occurred in Italy sooner than in N. Europe.

Darkhiker, see **NEW**.

Darlan, Jean François (1881–1942), Fr. admiral, b. at Nérac, Lot-et-Garonne, son of the deputy-mayor of that tn. who, later, became minister of justice in Méline's Cabinet. Entered the Fr. naval school, 1899. As a naval cadet he spent much time on the China station, where he acquired the first rudiments of diplomacy as well as naval and military experience. It was, however, not until 1912 that he was promoted a lieutenant. After that he was for a time instructor aboard the training cruiser *Jeanne d'Arc*. The First World War brought a complete change to his career. He obtained transfer to the army as an expert gunner, fought at the Meuse, Alsace, Salonika, and in the battle of Verdun. After the armistice he went to the Rhineland and, later, went back to the navy. It was only in 1928 at the age of forty-five, and with the rank of *capitaine de vaisseau*, that he suddenly achieved a position of great influence. Georges Leygues, minister of marine, appointed him assistant *chef de cabinet* on the military side, and, but for a short interruption, he remained there until 1934. Then for two years he was commander-in-chief of the Atlantic fleet, returning to the ministry as chief of the general staff in 1936. Throughout the period 1926–39 his authority came to him rapidly. In 1929 he was made *chef de cabinet* and a rear-admiral. Three years later he became a vice-admiral and a grand officer of the Legion of Honour.

In 1939 he was promoted admiral. This made him head of the Admiralty as well as commander-in-chief of all the naval and military forces in France, without regard to the seniority of other vice-admirals and high ranks. It invested him with unprecedented power. On the capitulation of France in 1940 he became minister of marine in the Pétain Gov. Later he became vice-premier, foreign minister, and minister of the interior, as well as minister of marine. He was now the real power in France, keeping in close touch with Ger. leaders, and expressing gratitude to Hitler for not 'obliterating France from the map of the world.' In April 1942 he began to lose favour with the Gers., and Laval (*q.v.*) took his place as Prime Minister. D., however, retained command of the armed forces, and, when the Brit. forces took over Madagascar (*q.v.*), he called on the garrison to resist to the utmost. In Nov. 1942, after the Allies landed in Morocco and Algeria, he ordered cease fire, and himself assumed the role of chief representative of Fr. N. Africa in the name of Pétain. By arrangement with the Amer. commander-in-chief, Gen. Eisenhower, he was allowed temporary political status, which he himself enhanced into that of chief of state in Fr. Africa, with a Fr. Council under him. His status provoked bitter criticism, notably among the adherents of Gen. de

Gaulle (*q.v.*), and among many members of the Brit. House of Commons, who had by no means forgotten his former markedly anti-Brit. sentiments. The Vichy Cabinet, however, disapproved of his apparent change of alliance and deprived him of Fr. nationality. Soon afterwards he was assassinated by a young Frenchman at Algiers (Dec. 24, 1942), and the Fr. Imperial Council unanimously chose Gen. Giraud to succeed him as high commissioner for Fr. Africa.

Darlaston, tn. of Staffordshire, England. Gunlocks and nails are extensively manufactured, and there are coal-mines, iron-works, and blast furnaces. Pop. 20,000.

Darley, Felix Octavius Carr (1822–88), Amer. artist and engraver; son of an actor of Eng. birth. He went to New York in 1848, engraving outline illustrations of Irving's works (*Sketch Book*, *Rip van Winkle*, *Legend of Sleepy Hollow*) for the Amer. Art Union (1850). He also illustrated Judd's *Marysart* (1856) which won high praise. D. became a member of the Academy of Design in 1852, and also of the Amer. Society of Painters in Water-colours. He illustrated some of Lossing's many hist. of the U.S.A., Hawthorne's *Scarlet Letter* (1879); and novels of Cooper, Dickens, and Simms. After visiting Europe he pub. *Sketches Abroad in Pen and Pencil* (1868). Among his larger works are 'Cavalry Charge at Fredericksburg, Virginia' (1867); 'Street Scene, Rome' (water-colour) (1876); 'Washington's Entry into New York' and 'Emigrants attacked by Indians'.

Darley, George (1795–1846), Irish poet and mathematician, b. at Dublin, began writing with articles for various magazines. He joined the staff of the *Athenaeum*, and became famous for his sarcastic reviews in it, an example being his attack on Talfourd's *Ion*. He pub. *The Errors of Ecstasy* (1822), a dialogue in blank verse, *Lilian of the Vale*, a story containing the well-known song, 'I've been roaming,' appeared in 1826. Between 1826 and 1828 he pub. manuals of geometry, algebra, and trigonometry, and *The Geometrical Companion*. Carlyle praised these treatises. *Labourers of Idleness* (1829) contain 4 other stories of his. His best lyrical drama was *Sybil*, or *the May Queen* (1827), praised by Lamb. He was much influenced by the Elizabethans, and ed. an ed. of Beaumont and Fletcher (1840). *Nepenthe* and *The Lammeryer*, two of his poems, were pub. privately. *It is not Beauty I Demand* (anonymous, in Palgrave's *Golden Treasury*) is really his. See E. Stedman, *Victorian Anthology*, 1895; and C. C. Abbott, *The Life and Letters of George Darley*, Poet and Critic, 1928.

Darling, Sir Charles John, first Baron (1849–1936), Eng. judge, eldest child of Charles D., estate manager. A delicate child, passed his boyhood principally at home—first at St. John's Abbey (Abbey House), Colchester, where he was b.; and then at Langham Hall. Articled to a solicitor in Birmingham, but did not serve out his time. Called to Bar in the

Inner Temple in 1874, practised journalism, and went the Oxford circuit. As a Conservative contested Exeter (1884) and S. Huxley (against Sir Charles Russell, 1885); returned for Deptford, 1888. Remained its representative until elevated to the Bench. Appointed judge of the high court and knighted, autumn of 1897—his appointment creating indignation in the Liberal party and consternation in the Temple (see Lord Birkenhead's *Contemporary Personalities*, 1921). Became known as the judicial humorist. Member of the royal commission on king's bench, 1912; sworn of the Privy Council Jan. 12, 1917. Presided over the ludicrous 'Black Book' (Pemberton Billing) trial, May-June 1918; and over the committee on courts martial, 1919. Retired from the Bench in Nov. 1923; but temporarily returned, 1924. He returned to the Bench again in 1931. Among the trials in which he was judge were the murder cases of Stine Morrison (1911) and Herbert Rowse Armstrong (1922). Pubs.: *Meditations in the Tea-Room*; *Scintillae Juris* (1877); *Seria Ludo* (1903); *On the Oxford Circuit and other Verses* (1909); *Crime and Insanity, Murder and its Punishment, Musings on Murder* (1925); *A Pensioner's Garden* (1926); *Reconsidered Times* (1930); and *Autumnal Leaves* (1933).

Darling, Grace Horsley (1815-42). Eng. heroine, b. in Northumberland; daughter of Wm. D. (1795-1860), lighthouse-keeper on Longstone, one of the Farne Is. At the risk of their lives and at her earnest entreaty, she and her father rescued nine people from the *Forfarshire*, sailing from Hull to Dundee, and wrecked near Longstone lighthouse in 1838. Their heroism was warmly appreciated and rewarded, but she d. of consumption soon afterwards. See *Grace Darling, her True Story*, 1880; E. Hope, *Grace Darling*, 1876; and *Journal of William Darling*, 1886.

Darling, Sir Ralph (1775-1859). Eng. soldier and general. As ensign in the 45th Foot, he helped to suppress the Negro insurrection under Féder in 1793 in Grenada. In 1796 he was made military secretary, served in the W. Indies, and was deputy adjutant-general in the Walcheren expedition. Was governor of New S. Wales, 1825-31. Accused of excessive severity he was recalled and tried, but acquitted and knighted by William IV. in 1835; he became general in 1841. Many places (riv., mts., downs, etc.) were named after him in this period of geographical discovery in Australia. See T. Brahma, *History of New South Wales*, i., 1846.

Darling: 1. Australian riv., 1160 m. long, rising as the Macintyre in the Dividing Range between New S. Wales and Queensland. For some way it forms the boundary between the two, and enters S.E. Queensland. It is a trib. of R. Murray, joining it at Wentworth. Other names are the Calowatta and Barwon. It is navigable as far as Bourke at some times of the year, at others being merely a series of shallow lakes. Among its

tribs. are Its. Dumaresque, Colgoa, Warrego, Gwydyn, Macquarie, Bogan, and Namoi. 2. Dist. of New S. Wales, 50,000 sq. m. in area, in S.W. 3. Range of mts. in W. Australia, running N. to S., parallel with the coast, 20 to 70 m. inland. Sandalwood and timber abound. 4. Squatting and rich grazing dist. of S.E. Queensland, between R. D. and Condamine, W. of Moreton Bay.

Darling Point, tn. of New S. Wales, Australia, forming a suburb of Sydney.

Darlington, municipal and par. bor. in the S. of the co. of Durham, 18 m. S. of Durham and 33 m. from Newcastle, on the Skerne, near its junction with the Tees. It is on the N.E. region of Brit. Railways and on the main north road from London to Edinburgh, and a network of railway lines branching in or near D. gave access to all parts of the kingdom. Industrially it is close to the coal and iron mining dists. The prosperity of D. began with the opening in 1825 of the Stockton and D. railway, the first railway on which a steam locomotive was used for passenger traffic. The first locomotive so used, built by George Stephenson, now stands on a pedestal at Bank Top station on the former L.N.E.R. D., however, has a long record as an industrial tn.; in the days of Bishop Pudsey, more than 700 years ago, dyeing was a flourishing industry in the tn. In the beginnings of the Industrial Revolution the tn. was still principally concerned with the textile industry. Carpet weaving was another prominent local industry. To-day, however, the only branch of the textile industry is a large worsted mill, and the manuf. of railway engines and other plant and equipment takes pride of place, including rolling stock, signals, signal wire pulleys, rails, and sleepers. Steel and iron forgings and steel castings are made for ships, as well as propeller shafts, rudders, guns, and massive stern frames. There is a great bridge-building industry, and among the bridges which were made at D. are the Blue Nile bridge at Khartum; the White Nile bridge at Goz Sbu (Gouma) (1911); the Lower Zambesi bridge (1935); and the Victoria Falls bridge; and, in Britain, the King Edward VII. bridge, Newcastle; Chiswick bridge; Tees transporter bridge; and Newport bridge over the Esk. Other industries are agric. implements and tools; are welding; boiler making and heating engineering; bricks and tiles of all sizes and types; constructional engineering; electrical equipment; furnaces; insulating material; wiremanuf. of all kinds, including extra high strain wire for ropes and hawsers.

D. is a clean and well-paved tn., and, as is often the case in our older tns., the par. church is the most outstanding feature. The present church was founded by Hugh Pudsey, bishop palatine of Durham and nephew of King Stephen, on the site of an earlier Saxon building (begun 1180), and was restored by Sir Gilbert Scott, R.A., during the nineteenth century. The great bells were recast in 1633, and others date from 1755 to 1866. Among its monuments is a carved figure

said to represent Berengaria, wife of Richard I.—though why the memory of a queen who never visited England should be perpetuated in D. is an unexplained mystery. The tn. hall (1863), apart from its handsome tower, hardly does justice to D. Haughton-le-Skene church, dedicated to St. Andrew, is also an architectural feature of the bor. Memorials in the tn. include those to Joseph Pease, son of Edward Pease, the Quaker pioneer of public railways and the first Quaker M.P. to sustain in Parliament his right to affirm instead of taking the oath; John Fowler, inventor of the steam plough; Dr. R. Taylor Manson, geologist and botanist; and John Fothergill, the first teetotal doctor. The First World War memorial takes the form of a hospital founded 1926. The public library, opened in 1885, was endowed by Edward Pease and modernised in 1933.

For over 400 years D. was ruled by the bishops palatine. No charter has been found, but it is believed to have become a bor. by prescriptive right in the time of Hugh Pudsey. In 1270 John of D., who assisted in preparing an ed. of the *Concordances* of Hugh of Saint-Cher, issued his *The Greater English Concordance*, probably the first ever issued. He was confessor to Henry III. and became archbishop of Dublin. During the Pilgrimage of Grace a number of the men of D. joined in the rising led by Earls Neville and Percy, and suffered execution. In his eccles. survey of the dist. Leland describes D. as 'the best market town in the Bishoprick after Durham.' After the rising the king deprived the bishops palatine of much of their temporal power, though it was not until 1863 that D. was represented in Parliament. James II. created his 'friend,' Catherine Sedley, baroness of D. in 1685; the title was revived in 1722 for George I.'s 'friend,' Madame Kilmansegge; and in 1754 the tn.'s name was properly incorporated in the peerage when Harry Vane was created Earl D.—a title now extinct. In 1875, on the occasion of the jubilee of public railways, the statue to Joseph Pease was unveiled by the duke of Connaught. Pop. 72,000.

Darlingtonia californica, single species of its genus in the order Sarraceniales, is a pitcher-plant of the state of N. America which gives it the specific name. The flowers are pale green and white, and the plant requires a warm temp. to favour its growth. See also **PITCHER PLANT**.

Darmesteter, Arsène (1846-88), Fr. scholar and philologist, of Jewish descent. He was a pupil of Gaston Paris (1867), entering the Ecole des Hautes Etudes (1869). He was tutor there (1872), then went to the Faculté de Paris as prof. of the medieval Fr. language and literature. His works are full of creative imagination and valuable, original suggestions. They include *Glosses et glossaires hébreux-français* (1878); and *La Vie des mots étudiée dans leurs significations* (1887). With Hatzfeld he wrote *Le XVI^e Siècle en France*. D. began with him also *Dictionnaire général de la langue française*,

finished by Hatzfeld and Thomas (1895-1900). The *Cours de grammaire historique de la langue française* was ed. by E. Muret and L. Sudre (1891-95).

Darmesteter, James (1849-94), Fr. orientalist, brother of Arsène D.; studied under Bréal and Bergaigne; graduated from Lycée Bonaparte, Paris, 1867. He was tutor at the Ecole des Hautes Etudes, 1877; after Renan's death, secretary of the Asiatic Society, 1881; prof. of Iranian language and literature at the Collège de France, 1885. Among his most famous works are *Haurvatat et Ameretait, essai sur la mythologie de l'Avesta* (1875); *Ormazd et Ahriman, leurs origines et leur histoire* (1877); *Études iraniennes* (1883); *Le Mahdi (The Mahdi, Past and Present)*, trans. 1885). D. visited India (1886), becoming fellow of Bombay Univ. *Chants populaires des Afghans* (1888-90) resulted from this visit. He also wrote *Essais orientaux* (1883); *Les Origines de la poésie persane* (1888); *Essais de littérature anglaise: Les Prophètes d'Israël* (1892); and trans. of selected poems by his wife, Agnes Mary F. Robinson, afterwards Mme Duclaux (q.v.). He trans. the *Zend-Avesta* in *Annales du musée Guimet* (1892-93); and ed. it for M. Muller's *Sacred Books of the East* (1892-93). He ed. the *Revue de Paris* for a time. See *éloge* in *Journal asiatique*, iv., 1894; H. Cordier in *Royal Asiatic Society's Journal*, Jan. 1895; Gaston Paris, 'J. Darmesteter,' in *Penseurs et poètes*, 1896.

Darmstadt, tn. of Germany, in Hessen, is situated at the foot of the Odenwald, 16 m. S. of Frankfurt-on-Main, having broad streets and tasteful gardens. It was not until the last quarter of the nineteenth century that its iron foundries, boiler factories, and machine shops and chemical and pharmaceutical works made it a great industrial centre, while the activity of its architects, sculptors, and artists added applied art. The former grand ducal palace was converted into a museum and state library of 700,000 vols. There are also the Landesmuseum, with a picture gallery, a technical academy, and the Rathaus of 1596. Princess Alice, daughter of Queen Victoria, is buried in the grand ducal mausoleum. Liebig, the chemist, b. 1805, was a native of D. The tn. suffered considerable damage from frequent allied air raids in the Second World War. In the allied advance to the Rhine in 1945 the 5th Div. of the 12th Corps of Gen. Patton's Third Army crossed the Rhine near Oppenheim, S. of Mainz, on March 22-23. The rest of the 12th Corps crossed the riv., and seized D. on the 25th, and then swept on to capture intact the Main bridges at Aschaffenburg. Pop. 111,000.

Darnetal, tn. of France in the dept. of Seine-Inférieure. It is situated on the R. Roble and Aubette, 2 m. E. of Rouen. There are manufs. of heavy woollen goods, blankets, etc., also factories for calico-printing and cotton-spinning. Pop. 7700.

Darnley, Lord, see **LENNOX**.

Darnley, anct. Scottish barony of Renfrewshire, 4 m. from Paisley, 2 m. from Barrhead. From it Sir John Stewart

took the title baron (c. 1461). He later became earl of Lennox, and was grandson of Sir J. Stewart of D. (d. 1429). Henry, Lord D. (1545-67), was a descendant.

Dartlipons, see GODMANCHESTER.

Darrang, dist. of India in the prov. of Assam, situated between the Brahmaputra and the Bhutan and the Dalpa Hills. The headquarters of the administration are at Tezpur. The prin. crop is rice. Pop. 337,000.

Dart, riv. of England, which rises near Cramere Pool, in the centre of Dartmoor. It is 36 m. long, 10 m. being tidal. At Totnes it widens into a broad estuary, and is navigable to and from Dartmouth.

Co. Mental Hospital has accommodation for 2161 patients, and 2000 beds are available in the hospitals of the Metropolitan Asylums Board. Pop. 28,800.

Dartmoor, plateau in the S.W. of Devonshire, England. Its length is about 23 m. and width 20 m. The mean altitude is 1500 ft. The higher parts are bleak, wild, and rugged, composed of masses of granite, the higher points of which are called tors, Yes Tor, 2028 ft., and High Willhays, 2039 ft., being the most lofty. The lowlands are well wooded and form a beautiful contrast with the bleak moorlands. In the centre of the moor lie the pools and morasses

Dart (fish), see DACE.

D'Artagnan (hero in *The Three Musketeers*), see ARTAGNAN.

Dartford, mkt. tn. and par. of W. Kent, England. It is situated on the Darent, about 2 m. from its entrance into the Thames, and 16 m. E. of London. In 1355 Edward III. founded an Augustinian nunnery there, and in 1381 Wat Tyler's rebellion took place. The manufs. are machinery, gunpowder, and paper. In 1590 the process of rolling and slitting iron was first estab. in England here by a native of Brabant, and in the same reign paper-making was introduced by Sir John Spelman. Richard Trevethick, the inventor of the locomotive steam engine, d. and was buried here in 1833. The foundation stone of the Livingstone Hospital was laid by Sir H. M. Stanley, the African explorer, in 1894. There is a memorial in the central park to the martyrs burnt here in 1555. The London

which form the headwaters of the chief Devonshire streams. Of the royal forest which occupied the centre of D. before the Conquest, small oaks and undergrowth in rough tracts alone remain. The moor abounds in interesting prehistoric antiquities, such as avenues of large standing stone, sacred or sepulchral circles, dolmens, etc. Near Chagford may be found a fine example of a primitive vil. of rude granite blocks. Much of the scenery is exceedingly wild and beautiful, Lydford Gorge being famous. The great convict prison at Princetown was originally built for Fr. prisoners in 1809, and has been utilised for its present purpose since 1855. A good picture of the scenery, atmosphere, and life of D. may be obtained from many of Eden Phillpotts's novels. See S. Baring-Gould, *A Book of Dartmoor*, 1900.

Dartmouth, George Legge, Baron (1847-1891), Eng. admiral, the eldest son of Wm. Legge, earl of Dartmouth &c. 1609-

1670); he served in the navy during the Dutch war, 1665-67, and held many offices and commands in the navy and army. Entrusted by James II. with the prevention of the landing of William of Orange, he did nothing, the disaffection of the fleet being marked. He took the oath of allegiance, but was in 1691 arrested for treason and d. in the Tower before trial.

Dartmouth, seaport and municipal bor. in S. Devon, England, 8 m. S.W. of Torquay, and 30 m. S.W. of Exeter. The tn. is picturesquely situated on the terraces of a craggy hill, near the mouth of the Dart. Many of the streets are narrow, and include some well-preserved timbered houses. The castle, at the entrance to the harbour, dates from the reign of Henry VII., though the original castle was built in the time of Edward IV. D. is an important coaling station, and its spacious, land-locked harbour has made it a favourite resort of yachtsmen. It formerly had a considerable trade in Newfoundland fisheries, but its present trade is chiefly of a coasting character. The R.N. College (see NAVAL EDUCATION) is situated here. At D. Richard I. embarked with his crusaders for the Holy Land in 1190. Pop. 8000.

Dartmouth, tn. of Nova Scotia, Canada, with a mental hospital, sugar refinery, oil works, etc. It is a splendid drive thither from Halifax by the lakes. Pop. 8000.

Dartmouth College, institution for the higher education of men, founded, 1769, in Hanover, New Hampshire, U.S.A. It now contains a yearly average number of over 3000 students, the majority working for the regular college B.A. degree. There are also facilities for studying medicine. In 1928 the building of the Fisher Ames Baker Memorial Library, donated by George F. Baker of New York, was completed at a cost of over \$1,000,000; in 1929 the Carpenter Art Building, a natural science laboratory, was also added. Admission to the college is by selection, special consideration being given to set character and qualities of leadership as well as scholarship.

Darton, par. and tn. in W. Riding, Yorkshire, England. It is situated on the Derne, 2½ m. N.W. of Barnsley. It has coal-mines; manufs. screws and nails. Pop. 13,400.

Daru, Pierre Antoine Noël Bruno, Count (1767-1829), Fr. statesman and soldier, b. at Montpellier; educated at the military school at Tournon; was commissary to the revolutionary army, 1793; was imprisoned on the charge of friendliness to the royalists, but was released on the death of Robespierre. He then rose rapidly in the service, and won great repute for his organising powers. In 1799 he was employed as chief commissary to the army in Italy by Napoleon, and continued in that service, being one of the most capable administrators in the army. He drafted the treaty of Pressburg after the battle of Austerlitz. He was made secretary of state, 1811, and retired from public life on Napoleon's abdication in 1814. After 1815 he was made a member of the chamber of peers.

Darvel, burgh and tn. of Ayrshire, Scotland, situated on the Irvine, 10 m. from Kilmarnock. Carpets and lace are manufactured. Pop. 4000.

Darwen, municipal bor. of Lancashire, England, 20 m. N.W. of Manchester by rail, situated on the D. There are collieries and stone quarries; the tn. is a centre of the cotton trade, and has blast furnaces, paper mills, and fire-clay works. Pop. 32,200.

Darwin, Charles Robert (1809-82), naturalist, grandson of Erasmus D. (q.v.), and son of Robert Waring D. and Susannah, daughter of Josiah Wedgwood of pottery fame, was b. at Shrewsbury and d. at Down; buried at Westminster Abbey. He early evinced a passion for collecting, and a taste for chem. After leaving Shrewsbury School he went to Edinburgh, and later to Cambridge, Univ. His studies appear to have been comprehensive, but they in no way inclined him, as was intended, to follow his father's profession of medicine. The subjects that fascinated him were zoology and botany, and his active mind and abundant energy manifested itself in a love of sport and the collecting of beetles. The seal of his future career was set on the invitation, through the influence of his close friend Henslow, botany prof. of Cambridge, to join H.M.S. *Beagle* as naturalist on her celebrated voyage in 1831 to S. America and the Pacific. The immediate results of his assiduity on this scientific mission are to be found in his first pub. work, *Journal of Researches into the Natural History and Geology of the Countries visited during the Voyage of H.M.S. 'Beagle'* (1839). From the time of his return, in 1836, he settled down in England for the rest of his life, marrying his cousin, Emma Wedgwood, in 1839. With the aid of his collections from the voyage and a Treasury grant, he then worked on his second book, *The Zoology of the Voyage of H.M.S. 'Beagle'* (1839-42). From this point the preparation of his great constructive theories begins. The industry he displayed in spite of poor health was remarkable. In 1859 his epoch-making *On the Origin of Species by means of Natural Selection, or the Preservation of Favoured Races in the Struggle for Life* was pub., expounding the doctrine now known as Darwinism (q.v.). His later scientific speculations are in the main extensions of this theory. A curious feature in connection with the *Origin of Species* is the fact that its thesis was in its essentials formulated independently by his great friend, Prof. Alfred Russel Wallace (q.v.), while abroad, and who submitted his paper on the subject to D. The total absence of jealousy on the part of the two naturalists, and the harmony in which they severally conducted their researches, forms one of the romances of Eng. scientific progress. In 1871 he pub. *The Descent of Man, and Selection in Relation to Sex*, which in some respects excited still more attention than the earlier and greater work, by reason of its searching inquiry into the ancestry of man. In this connection it is curious to note that

the prejudice excited in the vulgar mind by D.'s speculations was due in great measure to the error of supposing that he advanced the theory of man's descent from the ape (see under DARWINISM). The theory of sexual selection as a process in the evolution of man, briefly adumbrated in the *Origin of Species*, was elaborated in *The Descent of Man*, but at the present day it has been very generally discredited. As a man D. possessed a strong frame, was thin and tall, and walked with a slight stoop, but in constitution he was far from robust, ultimately succumbing to some affection of the heart. In character he appears to

N.P.G.

CHARLES DARWIN

The painting by the Hon. John Collier.

have been a man of no pretensions and of considerable personal charm and warm sympathetic geniality. A full list of his works is to be found in the works of his son, Sir Francis D. His botanical works include *On the Various Contrivances by which British and Foreign Orchids are fertilised by Insects* (1862); *Insectivorous Plants* (1875); *The Effects of Cross and Self-fertilisation in the Vegetable Kingdom* (1876); *The Different Forms of Flowers or Plants of the Same Species* (1877); and *The Power of Movement in Plants* (1880), which was a corollary of his *The Movements and Habits of Climbing Plants* (1865). Among his zoological works are, besides the works on the voyage of the *Beagle* (the most popular of which is *A Naturalist's Voyage*, pub. in 1889), *A Monograph on the Cirripedia* (1851-53); *Fossil-Balanidae and Verrucidae* (1854); and *The Formation of Vegetable Mould through the Action of Worms* (1881). His works on geology were numerous, and include *The Structure and Distribution of*

Coral Reefs (1842); *Geological Observations on the Volcanic Islands visited during the Voyage of H.M.S. 'Beagle'* (1844); and *Geological Observations in South America* (1846), all of them included in the general work entitled *Geology of the Voyage of the 'Beagle.'* Miscellaneous works include *The Variation of Plants and Animals under Domestication* (1868) and *The Expression of the Emotions in Man and Animals* (1872). See Sir F. Darwin (ed.), *Life and Letters of Charles Darwin, including an Autobiographical Chapter*, 1887, and *Autobiography of Charles Darwin*, 1929; G. A. Adler, *Charles Darwin*, 1909; A. C. Seward, *Darwin and Modern Science*, 1909; and L. Huxley, *Charles Darwin*, 1921.

Darwin, Erasmus (1731-1802), Eng. scientific writer, poet, and physician, b. at Elton, near Newark, Dec. 12. Educated at St. John's College, Cambridge, and at Edinburgh Univ., where he took his degree in medicine. He settled as a doctor at Lichfield, and won a high professional reputation, so much so that he was offered, but declined, the appointment of physician to George III. He is said to have been an athletic man and of temperate habits, the advantage of which he seems to have omitted no opportunity of pointing out to those over whom his influence extended, and in this respect he rendered good service to the poor of Lichfield. His writings were varied, yet essentially those of a man of scientific mind, which bias robs his verse of the true poetic quality, full though its subject matter may be of sylphs, nereids of the grot, and gnomes, and dignified with the Spenserian formula of personification. Posterity has largely forgotten his work, yet his *Zoonomia or the Laws of Organic Life* (1794-96), a pathological work, together with a treatise on generation, is significant in that, according to his far more famous grandson, Charles D., he anticipated the views of Lamarck. But his literary reputation rests mainly on his poem *The Botanic Garden* (1789, 1791), a long poem in decasyllabic rhymed couplets, instinct with scientific interest in nature, but, if polished, artificial, stilted, and pompous. In the second part, entitled *The Loves of the Plants*, he follows the system of Linnaeus by personifying each plant; and he appends botanical comments in which the praise of scientific men recurs. In 1800 appeared his *Phytologia; or the Philosophy of Agriculture and Gardening*, a lengthy work in one vol. All his works excited considerable attention, and by some were extravagantly praised, by others as unreasonably disparaged, but at the present day they are but little read or consulted, though they scarcely deserve to sink into complete oblivion; for they reveal a writer of a highly original turn of mind, well versed in physics, with a rare aptitude for seizing and illustrating natural analogies. But he was over-fond of tracing false analogies, and showed the faults of a credulous collector and of a fanciful reasoner. As a poet he lacked inspiration. He was a free-thinker and, as implied above, an enthusiastic botanist, possessing an eight-

acre botanical garden. Some of his ideas on evolution foreshadow the work of his grandson (see DARWINISM). His first wife d.; and to please his second he removed to Derby. By his first wife he was the grandfather of Charles D., by his second of Francis Galton. He d. suddenly of heart disease at Beardsall Priory. See S. Butler, *Evolution Old and New*, 1879; C. Darwin, *Life of Erasmus Darwin*, 1887; J. Huxley, *Darwin*, 1921, 1948; H. Pearson, *Doctor Darwin*, 1930; and J. V. Logan, *The Poetry and Aesthetics of Erasmus Darwin*, 1938.

Darwin, Sir Francis (1848-1925), Eng. botanist, b. at Down, Kent, the third son of Charles D. He was in intimate association with his father's work till the latter's death; was editor of his father's biography. In 1884 appointed univ. lecturer and reader in botany to the univ. of Cambridge; president of the Brit. Association, 1908, at Dublin. Pub. *Practical Physiology of Plants* (with E. H. Acton, 1894) and *The Elements of Botany* (1895). His admirable *Life and Letters of Charles Darwin* (1887) was followed by *More Letters* (1903). In 1917 appeared *Diversions of a Scientist*; in 1920 *Stray Papers of a Scientist*. He is chiefly remembered by botanical students at the present day for the type of potometer devised by him to measure rate of water intake by plants. He was also a musician and played the bassoon at the Cambridge Musical Club.

Darwin, Sir George Howard (1845-1912), Eng. physicist and mathematician, b. at Down, Kent, the second son of Charles D. After a distinguished career at Cambridge Univ. he went to the Bar, but returned to Cambridge as Plumian prof. of astronomy and experimental philosophy, 1883. He was probably the greatest worker in applied mathematics since Lord Kelvin. His chief work was concerned with the mathematical problem of three bodies—with the attraction of rotating fluid bodies, with the theory of the tides and the estimate of their effects during the separation of the moon from the earth, and the pressure of loose earth. In what may be termed the historical dept. of astronomy, D. was chiefly concerned with the genesis of the moon from the earth. He was president of the Brit. Association in 1905 in S. Africa, Copley medallist, 1911. His pub. work is mainly to be found in *Scientific Papers* (Cambridge, 1898). He pub. a popular summary of his work on the tides, *The Tides and Kindred Phenomena of the Solar System* (1898).

Darwin, Mount, situated near the S. coast of S. Is., Tierra del Fuego, and attains a height of about 7000 ft. D. Sound is on the S.W. of King Charles S. Land, Tierra del Fuego.

Darwin, Port, seaport of N. Ter., Australia, with a fine safe harbour and pearl fisheries. It is also an airport. Pop. 1100.

Darwinism, or the **Darwinian Theory**, theory popularly but erroneously identified with the dawn of the method of evolution, especially as applied to the genesis of the human species. The D. T.

as expounded in Charles Darwin's *Origin of Species*, accepting the preconceived notion of evolution as such, proceeded, by a brilliant extension of the Lamarckian opinion that all species, including man, are descended from other species, to enunciate by the light of a mass of biological facts the law of natural selection, and indirectly to refute the traditional belief in the immutability of species and the expression of that belief in the current theological conception of a special or separate creation by direct divine interposition. D., or more popularly, the doctrine of the survival of the fittest through a process of natural selection, is primarily concerned with the fact of the existence of variations in species, as explanatory of the hitherto incomprehensible and marvellous co-adaptation in nature of organic beings. Briefly D. or the D. T. is this: There is no independent creation of organic beings from an archetype, their embryological relations, mutual affinities, and geographical distribution being opposed to any such hypothesis; an investigation of plants and animals shows that man, by a process of artificial selection, conscious or unconscious, has been able to produce for his own ends numerous variations of species; applying this principle of artificial selection of species under domestication to organic beings in a state of nature, the old distinctions between species and varieties break down; in nature dominant or flourishing species produced the greatest number of varieties, and the slight variations of all parts of an organism furnished in nature itself the material for selection. Those organic beings that vary, however slightly, in a manner profitable to themselves have the best chance of surviving, and therefore of being naturally selected. Natural selection inevitably causes much extinction of the less improved forms of life, and from a consideration of the high geometrical ratio of increase of organic beings to the means of subsistence a struggle for existence must follow, and that struggle is most severe between varieties and individuals of the same species. Hence the process of natural selection leads to the survival of the fittest, or the preservation of favourable individual differences and variations, and the corresponding destruction of those which are injurious.

The Origin of Species also briefly outlines the process of sexual selection, or 'the struggle between the individuals of one sex, generally the males, for the possession of the other sex.' The hypothesis of sexual selection is used by Darwin to explain peculiarities appearing in one sex and becoming hereditarily attached to that sex whether those peculiarities appear under domestication or in nature. *The Descent of Man, and Selection in Relation to Sex* is really an application of the principles expounded in *The Origin of Species* to the human species. In this work Darwin collects evidence to show the descent of man from some lower form, and from the evidence provided by homologous structures and embryological

development infers that man and anthropomorphous apes had a common ancestor. The theory of sexual selection has been very generally abandoned at the present day; according to this theory differences in the secondary sexual characters of male and female (e.g. in the plumage of birds) can be explained in terms of selection value during breeding: those male birds with the most brilliant colouring would be selected by the females, so that the colours would be perpetuated and would become more extensive in succeeding generations. Darwin accepted the theory of evolution apart from the existence of its motive cause. But the proof of the existence in nature of the material for variations of species is believed by many to supply a motive cause in itself. There can be no doubt of the almost universal acceptance of D., notwithstanding the prejudice roused at its promulgation, chiefly in religious quarters. The value of the theory in relation to evolution is shown by its application to sociology, psychology, and the growth of political institutions. In the subsequent application of the method of evolution to other sciences, the theory of natural selection not infrequently found less favour than that of Lamarck, who early laid emphasis on the effect of use and disuse or habit in species formation and its hereditary transmission. D. taught that habit, though it played a considerable part in some cases in the modification of the constitution and structure of species, has been in its effects largely combined with and overmastered by the natural selection of innate variations, and the interpretation of D. as establishing the *creation* of new species from the accumulative power of natural selection has since the controversy over hereditary transmission found very general acceptance. One of the subtlest criticisms of D. was that of T. H. Huxley, who, while championing the theory against dogmatism, himself advanced the objection that man, by artificial selection, could not induce varieties of a domesticated animal which were unable to breed with one another, and that until he could do so, variations were not satisfactorily accounted for by natural selection. The difficulty offered by the existence of unity of type, or the constant fundamental agreement in structure in organic beings of the same class, is met by Darwin himself, who thinks the explanation of the unity lies in the fact of unity of descent. In the field of philosophical speculation, D. would seem to be inconsistent with any teleological conception of the universe, or the theory of a world created out of chaos by the intervention of a Divine Being proceeding on the lines of a coherent and beneficial plan. It substitutes a purely mechanical conception of organic development based on the mere instinct of self-preservation, which is complete of itself except in so far as the spontaneity of the variations and mutual affinities of species is assumed so as to lead to the inference of some innate organising principle. D. is not avowedly concerned with the absolute origin of life

or, as was the teaching of Buffon, with the evolution of the primordial germ. Wallace, who worked out the theory of natural selection independently of Darwin, sees in it no necessary inconsistency with teleology, and the existence throughout evolution of an upward guiding principle from without. It may not be impossible, too, to agree with some German philosophers who regard D. as inculcating a new determinism (q.v.), based on the relativity of all moral ideas in harmony with successive stages of social progress.

Nietzsche, too, criticises D. through a denial of the primary importance of the instinct of self-preservation, saying that 'psychologists should bethink themselves before putting down the instinct of self-preservation as the cardinal instinct of an organic being. A living thing seeks above all to discharge its strength—life itself is Will to Power; self-preservation is only one of the indirect and most frequent results thereof.' Huxley, however, acutely criticises the whole theory of evolution by pointing out that all the laws of physical evolution can never aid us in comprehending the origin of mind. Schaefer has put forward a materialistic theory, not entirely original, that life has originated by a process of evolution from non-living elements, and that we may eventually succeed in building up living protoplasm in the chemical laboratory. But he was careful to distinguish 'life' from 'soul,' and the genesis of the latter is as much as over in the region of the transcendental. It may be conceded, and from the most optimistic standpoint, that D. favours a love of the law of nature, not dissimilar from the Stoic conceptions, and replaces current religious emotions by a love of the æsthetic in nature, and a pantheistic conception founded on the belief of the essential identity of man and the external world. It is an axiom that Darwin's work brought about a revolution in human thought, so that, as Osborn says, 'Before and after Darwin' will always be the *ante et post urbem conditam* of biological hist., even though the evolutionary idea is so much older—for this idea goes back to the Greek philosophers, and Darwin himself, in the *The Origin of Species*, dealt quite fully with the views of his predecessors. Arising out of D. is the recognition of 'emergence' in organic evolution, or, in other words, the recognition of creativity in many of the steps in such evolution. Modern biologists, while accepting D. as a whole, concur in the view that there is no irrefutable evidence of the transmissibility of 'definite variations,' or changes in living creatures induced by peculiarities in environment. They accept Weismann's theory that these variations have a germinal origin and not an origin from without. Weismann asserts that the germplasm is continuous, that all reproductive cells are produced directly by other reproductive cells, and are not in any true sense the product of the complex organism which carries them, nourishes them, and allows them to multiply. Botanists, however, are not very enthusiastic about Weis-

mann's 'germplasm' theory; and while Darwin himself was prepared to take an ecological view of the evolutionary problem, the neo-Darwinians for the most part are not.

It does not appear that Darwin knew the work of Mendel (pub. in 1865); at all events he took no notice of it, and it was not taken up until the beginning of the present century, when it was more or less simultaneously rediscovered by De Vries, Correns, and Tschermak. Briefly the result of Mendel's work on the problem of inheritance in plants was to show that inherited characters are dependent on unit factors derived from both parents, which maintain their identity throughout the life of the plant, and separate only when the sex cells (gametes) are formed. Mendel brought to light facts which have been developed by the mutationist school—a mutation being a discontinuous variation, a more or less wide salutation or sport, which differs from the parent form in one or more well-marked characters. Darwin made many observations on such sports or mutations, but he objected to such 'sudden and considerable deviations of structure,' as material for evolution, because he was of the opinion that they would be swamped by inter-crossing; but the Mendelian discoveries have shown that this is not necessarily the case. See also BIOLOGY; EVOLUTION; MAN.

Das, Chitta Ranjan (1870–1925), Indian Swarajist leader, b. in Calcutta, son of Bhubon Mohan D., a solicitor. Called to the Bar at the Middle Temple, 1892. Returned to India, 1893, and practised at the Calcutta Bar until 1921. He first entered the Indian Congress in 1906, and was elected its president in 1921; but, before the Congress met at Ahmedabad, he was arrested for unlawfully issuing an appeal for 'volunteers,' and he served a sentence of six months in prison. He was president next year, at Gaya, and in Dec. 1923 he entered Bengal Legislative Council. In 1924 he was elected first mayor of Calcutta.

Dash, Comtesse de, the pseudonym of Gabrielle Anne de Cisternes de Courtières, Marquise de Polignac de Saint-Mars (1804–1872), Fr. novelist, b. at Poitiers. She was a woman in fashionable society and her numerous novels deal principally with love and intrigue. She is said to have written five or six vols. in a single year,

and the list of her novels is accordingly long. *Les Galanteries de la cour de Louis XV.*, *Le Salon du diable*, *Les Bals masqués* (1882), and *Le jeu de la reine* may be mentioned.

Dashkov, or Dashkova, Caterina Romanovna Vorontsov, Princess (1744–1810), Russian authoress, b. at St. Petersburg, daughter of Count Roman Vorontsov, married at fifteen to Prince Mikhail D. Her elder sister Elizabeth was mistress of the Emperor Peter III., and in 1762 the princess took a leading part in placing Catherine II. on the throne. Her scientific and literary abilities gained her an entrance to all the learned societies of Europe. In 1782 she was made director of the St. Petersburg Academy of Arts and Sciences, and in 1784 first president of the Russian Academy. In 1796 the Emperor Paul deprived her of her offices, and she retired to her estates near Moscow. See her *Autobiography*, 1810, and G. Schlegel-berger, *Die Fürstin Dashkova*, 1935.

Dashkova, tn. of White Russia, on the Dnieper. The Fr. were defeated here in 1812 by the Russians.

Dashwood, Sir Francis, Bart., fifteenth Baron Le Despencer (1708–81), chancellor of the exchequer, at a very early age became notorious for riotous living in an age when much liberty of action was allowed to a 'buck.' After making the grand tour, during the course of which he indulged in many mad pranks, he was given a minor appointment in the household of Frederick, Prince of Wales. He presently became president of the Dilettante Society, and later founded the infamous brotherhood of the Monks of Medmenham, among the members of which were Bute, Sandwich, Wilkes, Thomas Potter, and Paul Whitehead. Entering Parliament in 1741 as an opponent of Wilkes, he was twenty-one years later appointed by Bute chancellor of the exchequer, but his general incompetence and his ignorance of financial affairs were so great that his tenure of office did not survive Bute's fall in the spring of 1763. In that year the abeyance into which the barony of Le Despencer had fallen was terminated in his favour, and he became premier baron of England. In the House of Lords he, on one occasion, unconsciously created much merriment by the sincerity with which he, the most dissolute of men, denounced Wilkes for printing the *Essay on Women*. In spite of his incapacity as a statesman, Chatham made him joint postmaster-general in 1766, which office he held until his death.

Dass, Petter (1647–1708), Norwegian poet, b. at Nord Herø, Norway. He was the son of a Scottish merchant, Peter Dundas, and was ordained priest in 1672, and after being for some years chaplain at Nesne, was presented with the living of Alstahoug. His wonderful power of description in verse has led him to be styled the father of modern Norwegian poetry and his most famous poem, *Nordlands Trompet*, is still often quoted by the priests and peasants in the N. of Norway. The collected writings of D. were ed. by Dr. A. E. Eriksen (1875–77).

Dasyurus, genus of carnivorous marsupials placed near to the bandicoot and opossum genera; the species are called dasyures or native cats. They inhabit the Australian region, are nocturnal in habit, and extremely ferocious. The body of the *D.* is viverrine in form, dark brown and white in colour, and a hallux is sometimes present.

Dattahieh, see DAKAHLEH.

Datames, distinguished Persian general, a Carian by birth, was satrap of Cilicia under Artaxerxes II. (Mnemon), but revolted against the king. He defeated the generals who were sent against him, but was at length assassinated, 362 B.C. Cornelius Nepos, who wrote his life, calls him the bravest and most able of all barbarian generals, except Hamulcar and Hannibal.

Date. The *D.* palm, or *Phoenix dactylifera*, is a tree of the natural order Palmæ, cultivated chiefly in warm countries for its fruit. The stem is generally 20 to 30 ft. high, and is crowned at the top by leaves which often split and become pinnate. The inflorescence is enveloped in a large spathe when young. The dioecious flowers are in clusters. The fruit contains a stone which cases the embryo in a mass of hard endosperm. The male and female flowers are borne on separate trees, and as it is impossible to distinguish them before the flowers appear they have to be artificially fertilised. No difficulty is found in the cultivation of the *D.* palm, plenty of sun, light, and sandy rather than rich soil, and a certain amount of water, are the only conditions required. They commence to bear fruit at eight years old, and continue to do so for more than a century. The *D.* is a very important article of food in Arabia, where other foods are hard to obtain. It is eaten raw, roasted, or ground and pressed into cakes. The leaves are used for matting, and the wood for any kind of carpentry in which a light species only is required; the stem-fibre is made into ropes. It is largely exported. It is mentioned in the earliest records of the Assyrians and Gks., and the Jews also used it as a symbol of victory.

Date Plum, name given to sev. species of *Diospyros* in the order Ebenaceæ. *D. lotus*, the common *D. P.*, or European lotus, has long shining leaves, white flowers tinged with pink, and fruit almost like a cherry. It is really a tropical tree, but has been naturalised and is cultivated in the S. of England, where the fruit is used for preserves. *D. Kaki* is the Chinese *D. P.*, or persimmon.

Datia, **Ditteah**, or **Datiya**, native state of Bundelkhand, central India. The tn. of *D.* is 15 m. N.W. of Jhansi, and 125 m. S.E. of Agra. It is almost entirely built of stone, and is surrounded by walls. Pop. of state 180,000, tn. 25,000.

Datis, Indian general who, with Artaphernes, commanded the army of Darius in the expedition he sent against Athens, 490 B.C. He succeeded in capturing Eretria, but was defeated by the Athenians under Miltiades at the famous battle of Marathon, and had to abandon any further attempt against Greece.

Datolite, mineral composed of basic calcium and boron orthosilicate, $\text{Ca}(\text{BOH})\text{SiO}_3$. It is generally found as glassy crystals, or as masses with a granular to compact texture. It is colourless or with a slight tinge of green and may be transparent or opaque. Hardness, 5-5½; sp. gr., 3.0. It is found in Norway, Scotland, the U.S.A., and Tasmania.

Datum, or **Datus**, anct. Thracian tn., on the Strymonic gulf, subject to Macedonia, with gold mines in Mt. Pangæus, in the neighbourhood, whence the old Gk. proverb, a 'Datum of good things.'

Datura (Arab *talorah*), genus of Solanaceæ. *D. Stramonium* is the horn apple. The plant is found on dunghills and in waste places. It is a violent narcotic and is employed in convulsions and tic douloureux. When smoked it palliates the symptoms in asthma. *D. Tabula* and *Metel* are similarly used. From the species *D. sanguinea* the Peruvians make an intoxicant.

Daubenton, Louis Jean Marie (1716-99), Fr. naturalist. After assisting Buffon at the Jardin du Roi, he became curator and demonstrator in the Cabinet of Natural History, and helped to compile the *Histoire Naturelle*. During the revolution he held the chairs of natural hist. and mineralogy. Elected to the Senate, he was seized with apoplexy at his first attendance, and *d.* shortly after.

Daubeny, Charles Giles Bridle (1795-1867), Eng. chemist, botanist, and geologist. He was prof. of chem., Oxford, 1822; of botany, 1833, and represented the univs. at the first meeting of the Brit. Association, 1831. He travelled largely and made important studies of volcanic action. His numerous works include *Active and Extinct Volcanoes* (1848); *Introduction to the Atomic Theory* (1831); and *Trees and Shrubs of the Ancients* (1865).

D'Aubignac, François Hédelin, Abbé, see AUBIGNAC.

D'Aubigné Française, see MAINTENON, MARQUISE DE.

D'Aubigné, Jean Henri Merle and Théodore Agrippa, see AUBIGNÉ.

Daubigny, Charles François (1817-78), Fr. painter. After two years' study in Italy he returned to Paris, and his landscapes of the Barbizon school were recognised as masterly. His 'Look at Optovoz' was bought by the state, 1855, and he was made a chevalier of the Legion of Honour, 1859. His finest landscapes, usually of riv. scenes, were painted between 1864 and 1874. His 'Spring-time' is in the Louvre. With other painters of his school his works fetch very high prices in art sales at the present day.

D'Aubonne, Baron, see TAVERNIER, JEAN BAPTISTE.

D'Aubusson, Pierre, see AUBUSSON.

Daucus, a genus of Umbelliferae, is cosmopolitan but for Australia, and in Britain is represented by *D. carota*, the carrot. In its wild state the root of the plant is hard, wiry, and juiceless, but when cultivated it becomes succulent and nutritious.

Daudet, Alphonse (1840-97), Fr. novelist, b. at Nîmes. His father, Vincent D., was a silk manufacturer. The family suffered many misfortunes, and D.'s early years were not happy owing to the poverty following on the failure of his father's business. In 1856 he went to Alais as an usher to a boys' school, but the life was impossible, and in 1857 he went to Paris to live with his brother Ernest, who was a journalist. He was some time throwing off the depression of his misery as an usher, and the memory of his wretched experiences haunted him, as it has many who, like him, were made for finer things. In 1858 he pub. his first volume of verse, *Les Amoureuses*, and at once obtained employment on *Le Figaro*. Through this post he was made secretary to de Morny,

ALPHONSE DAUDET

with whom he remained till the latter's death in 1865. During 1866 he pub. *Lettres de mon Moulin*, and in 1868 *Le Petit Chose*, which contained memories of his early life. He collaborated with others for the stage, and wrote *L'Arlesienne* (1872). In the same year he pub. the first of the immortal *Tartarin*, *Les Aventures prodigieuses de Tartarin de Tarascon*, in which he satirised, or rather burlesqued, his fellow Provençals. It is still read in nearly every language of Europe. In 1874 he wrote his most masterly work, *Fromont Jeune et Risler aîné*, which struck a new note in Fr. literature, the two successive works showing that he could move to tears and laughter. The story of an illegitimate child, *Jack*, followed in 1876. His power of making his characters live is clearly shown in this. He has been charged with being an imitator of Dickens, but he was in himself a master of the new naturalist school of fiction, and always went to real life for his characters and situations. In fact, the more justifiable criticism is that he was prone to make his characters transcripts of real personages too easily identified. *Le Nabab* (1877), *Les Rois en Exil* (1879), and *Numa Roumestan* (1880)

are notorious examples; in the last Gambetta is obviously portrayed. *L'Immortel* (1888) contained a savage satire on the Fr. Academy, to which he was never elected. His other novels include *Sapho* (1884) and the conclusions of *Tartarin sur les Alpes* and *Tartarin Voyageur* (1885). His *Trente ans de Paris* (1887) and *Souvenirs d'un homme de lettres* (1888) gave a vivid picture of his literary and social life. He wrote some charming children's stories, the best known being *La belle Nivernaise* (1886). He was a member of the literary circle of Zola, Flaubert, and the De Goncourts, Edmond de Goncourt dying in his house. His wife, Julia Allard (see below), shared his literary labours, and their marriage was extremely happy. See F. L. M. Daudet, *Mon frère et moi*, 1882; R. H. Sherard, *Alphonse Daudet*, 1894; L. Daudet, *Alphonse Daudet*, 1898. *Quand vivait mon père*, 1940, and (ed.) *Lettres familiales*, 1944; F. Delattre, 'Daudet et l'Angleterre' in *Dickens et la France*, 1927; and Y. Martinet, *Alphonse Daudet: sa vie et son œuvre*, 1940. See also A. Symons, *Studies in Prose and Verse*, 1904.

Daudet, Ernest Louis Marie (1837-1921), Fr. author, b. at Nîmes; an elder brother of Alphonse D. Well known as a writer of novels and as a political journalist. He is the author of *La Terreur blanche* (1878) and *Souvenirs de la Présidence du Maréchal MacMahon* (1880), historical works of considerable interest, and he wrote a biography of the Princess Lievin (the Princesse de Cadignan of Balzac), entitled *Vie d'une ambassadrice* (1903); also *Soixante années du règne des Romanoff* (1919).

Daudet, Julie Rosalie, née Allard, Madame Alphonse (b. 1847), Fr. authoress, wife of Alphonse D., the novelist. She wrote, under the pseudonym Karl Steen, sev. literary sketches and studies, and in her own name *Impressions de nature et d'art* (1879), *L'Enfance d'une Parisienne* (1888), and *Journal de famille et de guerre* (1920).

Daudet, Léon (1868-1942), Fr. author, the son of Alphonse D. He wrote sev. satires, notably one upon doctors, entitled *Les Moricotes* (1894), and another upon republican politicians, entitled *Les Parlementaires* (1901). His works also include *L'Astre noir* (1893); *Le Voyage de Shakespeare* (1896); *Les Idées en Marche* (1896); *Suzanne* (1897); *Sebastian Gouvé* (1899); *Les Deux Etranges* (1900); *Souvenirs des milieux littéraires, politiques, artistiques, et médicaux* (1914-21); *Le Stupide XIX^e Siècle* (1922); *Panorama de la III^e république* (1936); and sev. books about his father, Alphonse D. (q.v.).

Daudin, François Marie (1774-1804), Fr. naturalist, b. at Paris. He wrote many books on zoology, the best known being a work entitled *Histoire naturelle générale et particulière des reptiles* (1802-3), a book of considerable value to herpetologists, as it describes many generic and specific forms for the first time.

Daudnagar, tn of Bihar, India, situated on the Son, in the dist. of Gaya, 90 m. S.W. of Patna. There are manufs. of

cotton and woollen goods, and a considerable riv. trade is carried on. Pop. 10,000.

Daugavpils, formerly **Dvinsk** (anc. **Dunaburg**), tn. of Latvia, cap. of the prov. of Latgala, on the **Dvina**, with trade in flax, hemp, and wood. There was much fighting here between the Gers. and Russians in Sept. 1915. Pop. 41,000.

Dauglish, John (1824-66), Eng. chemist (M.D. 1855), b. in London. He invented a process for the manuf. of aerated bread, which was brought into operation in Great Britain in 1859. Carbonic acid gas was evolved in a generating vessel by the action of sulphuric acid on chalk, and after being purified was forced at high pressure into water which was then used with the flour to make the dough. The great object was to lessen the risks incurred during the ordinary process of fermentation by a variable temp., and to ensure certain and uniform results.

Dauin, small tn. situated on the is. of Negros, in the Philippine Archipelago. It was formerly called **Buglas Is.** Pop. 8000.

Daulatabad, **Dowletabad**, or **Deogire**, fort. tn. of India, in Hyderabad, 10 m. N.W. of Aurangabad. The fortress is placed 300 ft. high upon a perpendicular rock, and is apparently inaccessible, the means of reaching the top being through a subterranean passage in the rock. In spite of its position the fort has been captured many times. In the vicinity are cave temples.

Daulis, or **Daulia**, anc. tn. in Phocis, situated on a lofty hill, celebrated in mythology as the residence of the Thracian king Tereus, and as the scene of the tragic story of Philomela and Procne. Hence **Daulias** is the surname both of Procne and Philomela.

D'Aulnoy, Marie Catherine Baronne, see **AULNOY**.

D'Aumale, Counts and Dukes, see **AUMALE**.

Daumat, Jean, see **DOMAT**.

Daumier, Honoré (1808-79), Fr. caricaturist and painter, b. at Marseilles. He joined the staff of *La Caricature*, where his scathing caricatures attracted attention; one of the king, Louis Philippe, led to his imprisonment (1833). He then drew for *Charivari*, his social caricatures making artist and paper famous. He was also a serious painter of high rank, whose pictures are only now attracting the attention they deserve. He became totally blind. See lives by Arsène Alexandre, 1888, and E. Klossowski, 1908; and L. Deltail, *Honoré Daumier, Description de l'œuvre graphique*, 1926-31.

Daun, Leopold Josef Maria, Count von, Prince of Thiano (1705-66), Austrian field marshal, b. in Vienna. He was made a colonel during the war of the Polish Succession (1734-35), general in the war against the Turks (1737-39), and field marshal in the war of the Austrian Succession. His cautious and sometimes over-prudent generalship was frequently criticised.

Daunii, anc. name for the inhab. of Daunia, which was a co. of Italy in the N. of Apulia. The name is derived from

Daunus, an Illyrian chief who conquered it. It now forms a part of the Neapolitan prov. of Terra di Bari.

Dauphin, title formerly borne by the eldest son of the king of France, abolished after the revolution of 1830. The childless Comte de Vienne Dauphiné first gave the property and title to Philip VI's grandson.

Dauphiné, one of the old provs. of France, on the S.E. frontier between Provence and Savoy, and now comprising the depts. of Drôme, Hautes-Alpes, and Isère. Its cap. was Grenoble. We first hear of it in the possession of the Allobroges, Catuiges, and various Celtic tribes, and then it was taken into the Rom. Empire. Later it became part of the kingdom of Burgundy, and thence passed into the possession of the Franks. The Carolingian empire was split up and redistributed, and D. was taken into the second Burgundian empire of Arles. From the ninth to the twelfth centuries it changed its entity, being divided into various principalities. The Burgundian succession failed, and it was willed to the Ger. emperor, in whose possession it remained till 1343, when it was given back to France. In support of political freedom a convocation was held at Vizelle in 1778 to protest against the dissolution of the prov. Parliament. The D. Alps form the N. part of the W. Alpine system of Europe, the highest summits being Les Ecrins (13,462 ft.) in the dept. of Hautes-Alpes, and the Aiguille du Midi (13,075 ft.) in Isère.

Dauphinite, see **ANATASE**.

Daurat, Jean (1508-88), Fr. poet and scholar, b. at Limoges. His original name was Dinemandy. From working as a page in the household of Francis I., he became a learned classical scholar and director of the Collège de Croqueret. Here he founded the famous society of young poets, the *Picéade*, so called after the group of seven Gk. poets of Alexandria. The group consisted of Balf, Belleau, Pontus de Tyard, and the more famous Ronsard and Joachim du Bellay. Etienne Jodelle was attached later. In 1556 D. became prof. of Gk. at the Collège Royal.

Dauria, see **TRANSBAIKALIA**.

Davanziati, Chiaro (c. 1230-78), It. lyrical poet, b. at Florence. He commenced by writing lyrics in the style of the Provençals and Sicilians, but later he became a follower of Guittone of Arezzo. D'Ancon's *Antiche Rime* (1875-88) includes all his best work.

Davao, prov. in S.E. Mindanao, Philippine Is., containing the best hemp land in the Is. Of the 105,000 inhab. more than half are pagans. Their women weave excellent cloth, and the men make metal articles. The cap. is **Davao**. Pop. 103,100.

Davenant, or **D'Avenant**, Charles (1656-1714), Eng. writer on political economy, eldest son of Sir Wm. D., the poet. He practised as a lawyer at doctor's commons, was commissioner of excise, 1683-89, and inspector-general of customs, 1705-14. He was secretary to the commission which settled the union

with Scotland. As an economist he at first showed some free-trade tendencies, but later adopted the orthodox mercantile theory. A complete ed. of his numerous pamphlets and works was pub. in 1771, ed. by Sir C. Whitworth.

Abbey. See J. Maidment and W. H. Logan (ed.), *The Dramatic Works of Sir William D'Avenant, with Prefatory Memoir and Notes*, 1872-74.

Davenport, Charles Benedict (1866-1944), Amer. biologist at Harvard Univ.

B.B.C.

DAVENTRY TRANSMITTING STATION

Davenant, or D'Avenant, Sir William (1606-66), Eng. poet and dramatist, b. at Oxford, son of the proprietor of the Crown Inn. The story that Shakespeare was his real father was fostered by D. himself, but there is no certainty about it. At first attached as page to various noble households, the murder of his patron, Lord Brooke, in 1628, left him without means, and he turned to the stage. He wrote the words for some masques of Inigo Jones, such as the *Temple of Love* (1634); his earlier plays were *The Tragedy of Albovine*, *King of the Lombards* (1629) and *The Cruell Brother* (1630). His best play, a comedy, *The Wills*, was produced in 1636. In 1637 he succeeded Ben Jonson as poet laureate. He was an ardent royalist, and was knighted for bravery at the siege of Gloucester, 1643. He was captured on a mission to Virginia to establish a colony, 1650, and imprisoned, but was released through the good offices of Milton, whose life, it is said, he saved after the Restoration. In the reign of Charles II. he took a prominent part in the development of the theatre, especially in the matter of elaborate scenery and stage effects, at his theatre the Duke's in Lincoln's Inn Fields. His numerous plays and adaptations were worthless, and his great epic, *Gondibert* (1651), is dull, except for some brilliant and quotable passages. His shorter lyrical poems, with the title *Madagascar* (1638), contain some verses that still live. In 1656 he produced the first opera in England with Mrs. Coleman, the first actress introduced on to the Eng. stage. He was buried in Westminster

He held the position of instructor of zoology from 1893 to 1899, and was subsequently assistant prof. of zoology at Chicago Univ. In 1904 he became director of the station for experimental evolution of the Carnegie Institution, and from 1898 to 1921 he was director of the Marine Biological Laboratory of the Brooklyn Institute. He made valuable contributions to the study of heredity in man and in animals. His chief publs. are *Experimental Morphology* (1897-99); *Eugenics* (1910); *Heredity in Relation to Eugenics* (1911); *Heredity of Skin Color in Negro-White Crosses* (1913); *The Feebly Inhibited—Nomadism and Temperament* (1915); *Naval Officers—their Development and Heredity* (1919); *Body Build and its Inheritance* (1923). He collaborated with A. G. Love in exhaustive inquiries into the physical fitness of men drafted for the First World War, and pub. in this connection his *Defects Found in Drafted Men* (1920).

Davenport, John (1597-1670), Puritan divine, b. at Coventry, England, educated at Oxford. Was for fourteen years a minister in London, and then fled to Holland under Laud's persecution. Went to America, and was one of the founders of the New Haven Colony, Connecticut, his co-leader being Theophilus Eaton, who became first governor of the colony. D. became pastor of the New Haven Church. He opposed the Half-way Covenant, and pub. many theological works.

Davenport, tn., co. seat of Scott co., Iowa, U.S.A., situated on the Mississippi,

opposite Rock Is., with which it is joined by two bridges; it is connected by rail to the Chicago and N.W. railway. It was founded in 1835 by Col. George Daventry. Pop. 86,000. D. is sec of a Rom. Catholic and a Protestant episcopal bishopric, and is an important centre by riv. and rail for coal and grain. The Rock Is. arsenal is the largest munitions plant in the U.S.A. The first bridge across the Mississippi was built at this point in 1853.

Davertry, municipal bor. and tn. of Northamptonshire, England. It is situated near the sources of the Nene and Avon, 12 m. W. of Northampton. The manuf. of boots and shoes is carried on. It is noted in hist. for the fact that in 1645 Charles I. stayed there a week, prior to the battle of Naseby. There is an important broadcasting transmitter, erected in 1925, on Borough Hill. Pop. 3700. (See illustration on p. 545.)

David (Heb. friend or beloved), the second of the kings of Israel, was the son of Jesse the Bethlehemite. He was the youngest of Jesse's sons, and his business was the guardianship of his father's flocks. Of D.'s introduction to the court two accounts are given, but it seems more reasonable to credit that which traces it to his skill on the harp (1 Sam. xvi. 14 ff.). The account of his conflict with Goliath is difficult to reconcile with other parts of the historical books. Be this as it may, D. quickly rose to a responsible position under the king, though at the same time his prowess raised the royal jealousy. Saul gave him his daughter Michal to wife, but his attitude then became so threatening that it was only by the help of Jonathan and his wife that D. escaped with his life. D. hastened southward, and after a short stay at Nob, finally settled in the cave (i.e. hill-fortress) of Adullam. Here he gathered round him a small band of outlaws, numbering in all some 400 men. D. now became leader of this band, but steadfastly refused to take part in any designs on the 'Lord's anointed.' He subsisted on contributions levied on borderers, in return for the protection he afforded them against the Philistines, Amalekites, and other foes of Israel. Saul, however, pressed him hard, and it was no longer possible for him to continue the one-sided conflict. His following now numbered 600 men, and with these he placed himself at the service of Achish, king of Gath. From him he obtained the lordship of the frontier tn. of Ziklag. Meanwhile both Saul and Jonathan had fallen at Gilboa, and Israel was in a chaotic state. D. moved to Hebron and was soon acknowledged as king by the men of Judah, while the rest of the country remained in the hands of Ishbaal (Ish-bosheth) and the powerful Abner. To this period may well belong the conquest of the Jebusite stronghold (Jerusalem), ascribed in the narrative to the later period when all the country was in his hands. This came to pass on the death of Ishbaal. The Philistines, whose vassal he had hitherto been, now opened war upon him, and many victories are ascribed to him by the chroniclers. Then

followed a succession of wars with Moab, Ammon, and Edom, and D.'s success 'united all the tribes from Dan to Beersheba.' During these campaigns occurred the grievous sin, to the results of which must be ascribed so many of the woes of the latter part of D.'s reign. Absalom, his favourite son, raised a revolution which resulted in his death, and this was followed by still another revolt, that of Adonijah, who was jealous of D.'s design of leaving the crown to Solomon. In spite of the stains which soil D.'s character, and which are, indeed, those of his time, not the most destructive criticism of Bayle, Voltaire, and the rest has been able to do away with eulogistic tradition of the ages. Though recent criticism has demonstrated the impossibility of the Psalter being to any extent his own composition, yet he is universally regarded as the originator of the poetic school. But his great claim to honour is as a legislator. He 'executed judgment and righteousness unto all his people,' and, as Robertson Smith says, his administration 'was never stained by selfish consideration or motives of personal rancour.' See V. Zappeler, *David und Saul*, 1921; Mildred Duff and N. Hope, *David the Shepherd who became King*, 1926; and F. Meyer, *David, Shepherd, Psalmist, King*, 1935.

David I. (1084-1153), king of Scotland, the youngest son of Malcolm Canmore and Saint Margaret, sister of Edgar Ætheling. He married Matilda, daughter of Walthoef, earl of Northumbria, and through her became possessed of the earldom of Huntingdon. On the death of his brother, Edgar of Scotland, in 1107, he received the S. dist. with the title of earl of Cumbria; in 1124 his brother, Alexander I., d., and D. gained the whole kingdom. As an Eng. baron he swore fealty to Matilda, daughter of Henry I., and invaded England on her behalf against Stephen. He was defeated near Northallerton at the battle of the Standard in 1138. After this he returned to Scotland, and devoted himself to the political and eccles. reform of his kingdom. He founded five bishoprics and sev. monasteries: Melrose Abbey, Newbattle Abbey, and Holyrood were endowed out of the crown lands. He consolidated his realm, and built up the feudal kingdom of Scotland. The country prospered under his rule; he encouraged agriculture, and his charters to landowners took the place of unwritten customs of Celtic tenure. The first idea of a real Parliament in Scotland was that of D., tribal authority was swept away, and offences against the king's peace were judged by sheriffs, judges, and other officials specially appointed. Schools were founded for par. churches and burghs, in addition to monastic schools, and during his reign the country became orderly and peaceful.

David II. (1324-71), king of Scotland, b. at Dunfermline, 5th son of King Robert Bruce and Elizabeth de Burgh. He succeeded to the throne in 1329, and was crowned at Scone in 1331. He had been married in 1328 to Joanna, daughter of Edward II. of England. The victory

of Edward III. and Edward Balliol, the pretender to the Scottish throne, at Halidon Hill in 1333, drove D. and his queen to flee to France. He returned in 1341, and in the interests of France invaded England in the absence of the army in France, but was defeated and taken prisoner at Neville's Cross. He remained a prisoner in England for eleven years. By the treaty of Berwick the Scots undertook to pay 100,000 marks as ransom, but the country was too poor to pay the sum, and the king was allowed to return. He secretly offered to treat with Edward III. on the basis of making him or his son successor to the Scottish crown. The nomination of the duke of Clarence was refused by the Scottish Parliament, but D. continued secretly making arrangements with Edward. He d. in Edinburgh in 1371, and was succeeded by his nephew, Robert II.

David, St., bishop of Menevia and patron saint of Wales. The tenth-century *Annales Cambrie* record him as having d. c. 601. There is also record of his having presided at two Welsh synods. These meagre historical facts have formed the basis of a wealth of legend. St. D.'s Day is March 1.

David, Ferdinand (1810-73). Ger. violinist and composer. b. at Hamburg. He was a pupil of Spohr, and from 1836 to 1873 was the leader of the band at the Gewandhaus, Leipzig. He taught at the Leipzig conservatorium, and Joachim and Wilhelm were among his pupils. His compositions include concertos, and he wrote arrangements for the violin, and an excellent violin instruction book.

David, Gerard (c. 1450-1532). Flemish painter, the last great painter of the Bruges school. Among his many famous and beautiful pictures are the great altarpieces, of which a fine example, 'The Marriage of St. Catherine,' is in the National Gallery, London, and the triptych of the 'Madonna Enthroned,' Brignole-Sale collection, Genoa. The 'Transfiguration' is one of the few still remaining in Bruges. See life by J. Weale, 1895.

David, Jacques Louis (1748-1825). Fr. painter, b. at Paris, son of a well-to-do Parisian merchant, who was killed in a duel when J. L. was only nine. His earliest instruction was obtained from his uncle, Boucher; afterwards he studied under Vien. His first ambition was to obtain the Prix de Rome, but it was not till after he had made sev. attempts that he was successful, gaining it in 1774. Then he followed his master, Vien, to Rome, where he spent six years, chiefly in copying the antique and studying the old masters. When he returned to France his 'Belshazzar' (1780) secured his admission to the academy. Between 1775 and 1785, inspired by Rome and guided by Vien, he evolved the strikingly neo-classic idiom for which he is famous. He did not invent the neo-classic style but he was its greatest exponent. With his 'Andromache grieving over the dead Hector' he was admitted a full Académicien. His fame was greatly enhanced with 'The Oath

of the Horatii' (1785)—a picture in which he was deliberately rousing in the masses a civic and patriotic sense. At the time of the revolution he became an enthusiastic representative for Paris in the convention and he was also made a member of the committee of public safety. After Robespierre's death he was twice imprisoned and in danger of his life. In 1804 Napoleon appointed him court painter, and made him commander of the Legion of Honour, but when the Bourbons were reinstated he was banished as a regicide to Brussels, where he remained till his death. D. was in his time both the leader of the Fr. school and the most famous artist in Europe. There are twenty-four of his pictures in the Louvre, his best known being 'Napoleon on Mount St. Bernard,' 'The Coronation of Napoleon,' 'Oath of the Horatii,' 'Cupid and Psyche.' See lives by T. Thoré, 1843, and R. Cantinelli, 1930.

David, Pierre Jean (1789-1856), Fr. sculptor, known as David d'Angers, b. at Angers, of extremely poor parents. Overcoming family opposition, he went to Paris, and by hard work gained a prize at the École des Beaux Arts and, in 1811, the Prix de Rome; he stayed five years in Rome, studying Canova. He became famous for his busts and medallions. His chief works are a monument to the Gk. liberator, Botzaris, the pediment of the Panthéon in Paris, and the statue of 'Philopœmen,' now in the Louvre.

David, city and cap. of the Chiriqui dist. in Panama. It is situated on the Rio D. in a fertile valley, 8 m. from the entrance of the riv. into the Pacific. Tobacco is largely cultivated, and stock raising is an important industry. Pop. 7000.

David, Thomas William Rhys (1843-1922). Eng. oriental scholar. He was the prin. Eng. authority on Buddhism and Buddhist literature. Among his works are *Buddhist Suttas* (1881); *Buddhism* (1889); *Sacred Books of the Buddhist* (1889); and *Buddhist India* (1903).

Davidson, Andrew Bruce (1831-1902), Scottish divine and theologian, b. at Kirkhill. In the Free Church the advanced critics or theologians who filled the college chairs, owed their inspiration to D., who went to the Heb. chair in New College, Edinburgh, in 1863. In 1865 he was made prof. of oriental languages, and was one of the O.T. revisers of the A.V. of the Bible. He pub. various works on Heb. grammar, syntax, etc.

Davidson, George (1825-1911), astronomer, b. at Nottingham. When still a boy he went to America, and in 1845 joined the U.S. coast survey. He also engaged in surveying work from Maine to Texas, and on the Pacific coast. He was given the command of sev. astronomical expeditions, and his name is connected with the invention of many astronomical instruments.

Davidson, John (1857-1909), Scottish poet, dramatist, and writer, b. at Barrhead, Renfrewshire, Scotland; was a master in Scottish schools, was also in business, and in 1890 came to London.

His early poetical plays, *Bruce* (1886), *Smith: a Tragedy* (1888), and *Scaramouch in Nazos* (1889), attracted no attention, nor did the strange example of his original genius, the romance *Perjuria* (1890). His first success was in *Fleet Street Eclogues* (1893, 2nd series, 1896), followed by *Ballads and Songs* (1894). His novels of this period include *Baptist Lake* (1894) and *A Full and True Account of the Wonderful Mission of Earl Lavender* (1895). He adapted Coppée's *Pour la couronne* for Forbes Robertson (as he then was) and Mrs. Patrick Campbell in 1896, and wrote other literary, poetic plays, such as *Godfrida* (1898) and *The Theatrical* (1905). His satiric and didactic works include *The Testament of a Visivector* and *The Testament of a Man Forbid* (1901), and *The Testament of an Empire Builder* (1902). His last book of poems, *Fleet Street and other Poems*, was pub. in 1909, and a dramatic work *God and Mammon* in 1907. He was drowned near Penzance under mysterious circumstances pointing to suicide. See H. Jackson, *The Eighteen Nineties*, 1913; H. Fineman, *John Davidson: a Study of the Relation of his Ideas to his Poetry*, 1916; and P. Thouless, *Modern Poetic Drama*, 1934.

Davidson, Randall Thomas, Lord (1848-1930), ninety-sixth archbishop of Canterbury, b. at Edinburgh; educated at Harrow and Trinity College, Oxford; ordained 1874, and was domestic chaplain to Archbishop Tait, whose daughter Edith he married in 1878. In 1882 he was made dean of Windsor and domestic chaplain to Queen Victoria. He was bishop of Rochester 1891, of Winchester 1895, and succeeded Archbishop Temple of Canterbury, 1903. He was president of the Pan-Anglican Congress, 1908, and of the subsequent Lambeth conference, and crowned George V., 1911. He will be remembered for his practical conception of the great opportunity offered to the Anglican communion in the empire. His W. Canada Fund had a marked effect on the religious life of the prairie provs. In the First World War he supported the national cause from a belief in its justice, but he was never betrayed into any wild approval of war as such. Rather did he occupy himself with the promotion of that spiritual renewal which the strain of the times seemed to demand. He estab. important committees to deal with intellectual problems, with worship, with social questions, and with church organisations. As a result of these and similar activities, the 'Life and Liberty' movement came into existence as a focus for the younger men of all schools of thought, and, with this movement, came the Enabling and Constitution Act, which he piloted through the House of Lords, and under which the church assembly and its subordinate councils were set up. The creation of the assembly provided him, in his later years, with a function and opportunity exactly suited to his temperament and gifts; and under his guidance legislation embodying sound practical reforms was presented to Parlia-

ment. As regards Rome, he regarded any real rapprochement between Canterbury and the Vatican as outside practical politics. The Lambeth conference of 1920 encouraged inquiry into the possibilities of religious reunion, and it was argued by some that reunion must begin with a movement towards reunion with the Rom. Church; but in the ensuing conversations at Malines with Cardinal Mercier he adroitly denied to the discussions the character of negotiations and the essential obstacles to such reunion remained unassailed. Yet, if these conversations achieved no practical result, D.'s vigilant interest in all that concerned the Orthodox churches not only drew those churches closer to the Anglican

'The Times'

LORD DAVIDSON

communion, but also brought them into contact with other forms of European Christianity. D. was recognised as the champion of E. Christians, whether the oppressor was Bolshevik or Turk. His view of the relation of Christianity to world affairs was never narrowly eccles. as was shown by his preaching at Geneva on the eve of the third assembly of the League of Nations. It was perhaps as a legislator and as a parliamentarian that the Church missed him most, and in the House of Lords he found the calm and judicial atmosphere in which he liked to discuss grave questions. His last years brought severe disappointments; his efforts of many years to solve, by settlement, the difficult religious problem in elementary education were at length nullified by eccles. factions hotly opposed to what they conceived to be the surrender of church schools. A still greater disappointment came with the rejection by the House of Commons of the 1927 and 1928 Prayer Book measures; for the hopes he had reposed in the authorisation of an alternative Prayer Book had increased with the labour he had bestowed on its

preparation; but it would seem probable that, like Cramer, he had excessive faith in a new Prayer Book as a means of composing differences and restoring discipline within the Church. Soon after the second defeat of the Prayer Book measure in 1928 he resigned, his retirement being, however, prompted solely by his sense of duty to the Church. The king bestowed a barony upon him, an honour almost without precedent in the instance of one who had been a spiritual peer. He wrote the *Life of Archbishop Taft* with Canon W. Benham, 1891, and ed. the *History of the Lambeth Conferences* (1889). See life by G. K. A. Bell, bishop of Chichester, 1935.

Davidson, Samuel (1807-98), Irish biblical scholar. He accepted the chair of biblical criticism and oriental languages at Independent College, Manchester. The advanced views of his *Interpretation of the Bible*, an introduction to the text of the O.T., caused his resignation in 1857. His works dealing with biblical criticism include introductions to the N.T. (1851) and to the O.T. (1862); *The Canon of the Bible* (1877). He trans. Fürst's ed. of Buxtorf's great *Hebrew Lexicon*. He was one of the O.T. revisers of the A.V. of the Bible.

Davidson, Thomas (1838-70), Scottish poet, b. near Jedburgh. He was known as the Scottish Probationer, and though a licensed preacher of the United Presbyterian Church he never held a living. He was a poet and author of the popular students' song, *Yang-tsi-Kiang*; he also wrote *The Auld Ashie Tree* and *Myspie's Den*. See J. Brown, *Life of a Scottish Probationer*, 1877.

Davies, Arthur B. (1862-1928), Amer. modernist painter, trained under Dwight Williams and at the Art Institute, Chicago. His 'Spring's Renewal' and 'The Breath of Life' were first shown in New York, and stamped him as a notable adherent of the romantic school. 'The Circle of Ares,' which was bought by the Metropolitan Museum of Arts, was first exhibited in Philadelphia; and thereafter other notable pictures were 'Visions of the Sea' and 'Children of Yesterday,' the latter of which is now in the Brooklyn Museum. In 1916 D. was awarded the first W. A. Clark prize and the Corcoran medal. The chief of his modernist paintings is 'The Great Mother.'

Davies, Ben (1858-1943), Welsh tenor, b. at Pontardawe, near Swansea. He started life in trade, then went to London to study at the Royal Academy of Music. Began by singing in Balfe's *The Bohemian Girl*, and took part in the operas of Goring Thomas, Mackenzie, and Stanford. He sang in the long run of Cellier's *Dorothy* in London, and then in Sullivan's *Ivanhoe* at D'Oyly Carte's Eng. opera house. For some years he was a member of the Carl Rosa company. He sang in both Eng. and It. operas. Leaving the stage he took to oratorio and concert singing, and for many years was the leading Brit. tenor. Those who were present at the celebration of his eightieth birthday will remember the perfect ease of style with which he sang *Onaway! Awake, Beloved!*

Davies, Mrs. David, see KENNEDY, MARGARET.

Davies, Fanny (1861-1934), Eng. pianist, b. in Guernsey. She went to Leipzig to study music, and became a pupil of Reinecke and also of Oscar Paul. While staying at Frankfurt she studied with Clara Schumann. Played at all the great European festivals, accompanied Joachim, and after her first appearance in 1885 was for many years one of London's popular favourites.

Davies, Sir Henry Walford (1869-1941), Brit. organist, b. at Oswestry; choir boy at St. George's Chapel, Windsor, under Sir Walter Parratt. Assistant organist to the latter, 1885-90. Studied at Royal College of Music, 1890-94; pupil of Parry, Rockstro, and Stanford. Organist, St. Anne's, Soho, 1891-98; at Temple Church, 1898-1919, with which church his work as organist and choirmaster is specially associated; and at St. George's Chapel, Windsor, 1927. Appointed prof. of music at the univ. of Wales, Aberystwyth, 1919, and chairman of the National Council of Music in connection with that univ. He succeeded Elgar in 1934 as Master of the King's Musick, and in 1935 organised a great choral concert at the Albert Hall to mark George V.'s jubilee. A prolific composer, especially for chorus and orchestra. In the first of these categories his best known work is his *Everyman*, produced at Leeds, 1904, and the *Song of St. Francis*, performed in Birmingham, 1912. Among his songs are *When Childey Play* and *I Love the jocund Dance*. Probably his best known composition is the *Solemn Melody* for organ and orchestra, which is frequently and widely played. His most important contribution to the musical life of his time was, however, less in composition than as teacher, adjudicator, and lecturer.

Davies, Hubert Henry (1876-1917), Eng. playwright; b. at Woodley, Cheshire. Educated at private schools. Went, 1893, to San Francisco, became journalist and writer of sketches. Returned to England, 1901; produced plays in London: *Mrs. Goring's Necklace* (1903); *Cousin Kate* (1903); *Amelia* (1904); *Captain Drew on Leave* (1905); *The Mollusc* (1907); *Lady Epping's Lawsuit* (1908); *Bevis* (1909); *A Single Man* (1910); *Doormats* (1912); and *Outcast* (1914). Work as hospital orderly in France broke his health. He was recuperating at Robin Hood's Bay, where his overcoat and stick were found near the cliff edge, Aug. 17, 1917. He was never seen again.

Davies, or Davis, Sir John (1569-1628), Eng. poet and lawyer, b. at Tisbury, Wiltshire. He was educated at Oxford (1585), and called to the Bar in 1595. He seems to have enjoyed a reputation for wit, and wrote many epigrams as well as poems. James I. took him into favour, and made him solicitor-general of Ireland in 1603, and three years later attorney-general; when he was created serjeant-at-arms. His energy and zeal for the Protestant religion accomplished some good work. He was appointed lord chief justice shortly before his sudden death.

In conjunction with Sir Robert Cotton he founded the Society of Antiquaries. His best known works are the philosophic poems *Orchestra*, in which the world is exhibited as a dance (1596), and *Nosce Teipsum*, a poem on human learning and immortality (1599). His works were ed. by Dr. A. B. Grosart (1869-76). He must not be confused with John Davies (q.v.) of Hereford (c. 1565-1618), the poet, whose works were also collected by Dr. Grosart (1873).

Davies, John (1679-1732), Eng. classical scholar and critic, *b.* in London. His father was a merchant of Cambridge, his mother being a daughter of Sir John Turton, a judge of the king's bench. He was educated at Charterhouse School and at Queens' College, Cambridge, and subsequently became president of the college. Collated to the rectory of Fen Ditton and to a prebend in the church of Ely. His editorial labours were great: thus he pub. the following correct eds. of (Gk. and Lat. authors: *Trisulcanæ disputationes* (1709); *De natura deorum* (1718); *De divinatione* and *De fato* (1725); *Academica* (1725); *De legibus* (1727); and *De finibus bonorum et malorum* (1728, 1741).

Davies, John of Hereford (c. 1565-1618), Eng. poet, *b.* at Hereford, where he was a writing master. His poems, which are not without merit, are somewhat prolix and tedious and devoid of delicacy and taste. They are recalled mainly for their accidental interest of reference. His chief work, *Microcosmos* (1603) is shaped on Joshua Sylvester's trans. of the *Semaines* of du Bartas. His *Scourge of Folly* (c. 1611) has verses addressed to numerous contemporaries, and, among them, Shakespeare. Other works: *Willes Pilgrimage* (1610); *The Muses Sacrifice* (1612); and *A Select Second Husband for Sir Thomas Overbury's Wife* (1616). His poems were collected by A. B. Grosart (2 vols.), 1873.

Davies, Sir Louis Henry (1845-1924), Canadian jurist and Liberal statesman, *b.* in Prince Edward Is., son of Hon. Benjamin D. He was called to the Bar in 1867, solicitor-general, 1869, 1871-72. Leader of opposition in Legislative Assembly, 1873. Premier and attorney-general, Prince Edward Is., 1876-79. Elected to dominion Parliament, 1882. Minister of marine and fisheries, 1896-1901. On commission at Quebec, 1898-1899, to settle questions with U.S.A. In London on Behring Sea business, 1899 and 1900. Judge, Canadian supreme court, 1901; chief justice, 1918. Privy Councillor, 1919.

Davies, Mary (1855-1930), Eng. soprano, *b.* in London. Of Welsh parentage, she was trained as a public singer, and in 1880 created the part of Margaret in the Eng. version of Berlioz's *Faust*. Took part in most of the Eng. musical festivals, and for many years sang at the London ballad concerts as their leading soprano.

Davies, Sarah Emily (1830-1921), Eng. feminist pioneer; *b.* at Southampton, daughter of Rev. J. Davies, D.D. Educated at home. Secretary of committee (1864) for obtaining opening of Cambridge

local examinations to girls, a demand which was successfully accomplished in the following year. Agitated for London Univ. degrees for women, and likewise succeeded in 1874. Honorary secretary of movement (1867) inaugurating Hitchin College, rehoused at Girton, 1873, D. being a mistress for two years. Member of London School Board, 1870-73.

Davies, Thomas Wlton (1851-1923), Eng. Heb. scholar, educated at Univ. College, London, where he won the first prize in logic and philosophy, and also in Heb. In 1897 he was appointed lecturer in Arabic and Syriac at Univ. College, Nottingham; and in 1899 prof. of Heb. and O.T. literature at the Baptist College, Bangor; prof. of Semitic languages in N. Wales Univ. till 1921. Amongst his numerous puba. are *Oriental Studies in Great Britain* (1892); *The Scriptures of the Old Testament* (1900); *Welsh Political and Educational Leaders* (1907); and *Outstanding Literary and Human Factors in Life* (1911).

Davies, W. D., generally known as Karri Davies, *b.* at Karriale, Australia. He went to S. Africa and came into public notice during the agitation of the Uitlanders in the Transvaal against the Kruger regime, and was a member of the Transvaal Reform Committee; he was arrested with other members at the failure of the Jameson Raid in 1897. Sentenced to two years' imprisonment and a heavy fine, he with Woods-Sampson alone refused to appeal from the sentences and was retained on the liberation of the other prisoners. He fought in the S. African war (1899-1902), was wounded at Elands-laagte, and was present at the relief of Mafeking.

Davies, William Henry (1871-1940), Brit. poet; *b.* at Newport, Monmouthshire, of Welsh parentage. Served apprenticeship to picture-frame making. Went to America and for six years lived chiefly as a tramp, visiting England in cattle-boats. Peddled lace, pins, etc., on return to England. Poetry began with *The Soul's Destroyer* (1907). Collected eds., 1916 and 1924. Prose includes *Autobiography of a Super-Tramp* (1908); *A Weak Woman* (novel) (1911); *Adventures of Johnny Walker, Tramp* (1926); and *Dancing Mad* (1927). The *Autobiography* (to which George Bernard Shaw wrote a preface) records the queer story of his early life in America, where he lost his right foot while 'jumping' a railway train in Canada. On his return he lived in a public lodging-house in London, where he wrote a blank-verse tragedy, *The Robber*, which was rejected by two publishers, a long narrative poem, and a hundred sonnets. He managed to collect £20, and at his own risk pub. some poems and posted two brief press notices of them to various prominent people. He eventually became a notable figure in twentieth-century poetry. He is not a poet of the first magnitude, but is at his best when, as in *The Loneliest Mountain*, poetic feeling finds expression in words of unlaboured fitness. The artless simplicity of his later work has been the butt of parodists, yet these poems show a

distinctive and pleasing quality. To produce poetry of any quality was an achievement in circumstances such as he describes in *The Lodging-house Fire*, a verse transcript of experiences related in the *Autobiography*. Like Herrick he is a poet of extreme accomplishment and sophistication, 'wrapped in a deceptive aura of simplicity.' His place is with Collins, Clare, and Wm. Barnes. Poems like *Go Lovely Rose* will live long after much original and deeper poetry is forgotten; while in such poems as *The Heap of Rags*, *The Bird of Paradise*, and *The Sleepers* he touched a note of poignant tragedy even more intense and individual in expression. His collected poems were pub. in 1940.

Davila, Enrico Caterino (1576-1631), It. statesman, b. near Padua; his father, a distinguished Cypriot, had fled to France when the Turks conquered Cyprus. From being a page at the Fr. court he rose to the position of one of the leading men of Venice, as governor of Dalmatia and Candia. He wrote a famous hist. of the Civil wars of France. He was assassinated on his way to Crema.

Da Vinci, see LEONARDO DA VINCI.

Davis Cup, presented by Dwight F. Davis of St. Louis in 1900 as a sort of international challenge cup. Conditions for D. C. were submitted by United States N.L.T.A. to the Lawn Tennis Association in London, on Jan. 16, 1900. The regulations have since been revised and the competition is now called The International Lawn Tennis Championship. It is a knock-out men's tennis tournament between nations. Singles and doubles are played, ties are drawn for, and the challenge tie is played in the country of the champion nation. America has held the cup thirteen times, Great Britain seven times, Australia six times, and France six times during the years 1905-1948. During the Second World War Australia retained the D. C., being unchallenged after their victory in 1939.

Davis, Cushman Kellogg (1838-1900), Amer. political leader and lawyer, served during Civil war in the Federal Volunteers; became prominent in state politics as a Republican; from 1874 to 1876 he was governor of Minnesota; from 1887 U.S. senator. Had great influence on Amer. foreign policy, and signed the treaty of Paris after the Sp.-Amer. war.

Davis, Elmer Holmes (b. 1890), Amer. writer and radio news commentator, b. at Aurora, Indiana, U.S.A. Rhodes scholar, New College, Oxford, 1912-14. On editorial staff of *Adventure*, 1913-14, and *New York Times*, 1914-24. News commentator, Columbia Broadcasting System, 1939-42; director, Office of War Information, U.S. Gov. 1942-45. President of council of the Authors' League of America 1939-41. Pub.: *Times have changed* (1923); *Friends of Mr. Sweeney* (1925); *Strange Woman* (1927); *Giant Killer* (1928); *Morals for Moderns* (short stories) (1930); *Love Among the Ruins* (short stories) (1935); and *Not to mention the War* (1940).

Davis, Henry William Carless (1874-1928), Eng. historian. Educated at Wey-

mouth College, and went to Balliol College, Oxford, as Brackenbury hist. scholar; won Jenkyns exhibition in his fourth year. Deputy prof., Univ. College, N. Wales, 1896-97. Lecturer New College, 1897-99; Balliol, from 1899. An enthusiast for medieval times. Contributed to the *English Historical Review* and *Cambridge Modern History*. Pub. *Balliol College* (hist.) (1899); *Charlemagne* (1900); *England under the Normans and Angevins* (1905); and *Medieval Europe* (1911). Became regius prof. of modern hist., Oxford, 1925; was editor of the *Twentieth Century Dictionary of National Biography*.

Davis, Henry Winter (1817-65), Amer. political leader, b. at Annapolis, Indiana. Served in the National House of Representatives as a Know Nothing, 1855-56. After Lincoln's election he became a Republican, and opposed Lincoln's plan for the reconstruction of the S. states, and issued with Benjamin Wade of Ohio the 'Wade-Davis manifesto,' which denounced Lincoln. In 1861 declined nomination to the vice-presidency. Chairman of committee of foreign affairs, 1863-65. Pub. *The War of Ormuzd and Ahriman in the Nineteenth Century* (1853) against the slave-holders.

Davis, Jefferson (1808-89), only president of the confederate states during the Amer. Civil war, b. at Fairview, Kentucky. D.'s father Samuel was of Welsh extraction. After attending schools in Kentucky and Mississippi, he graduated from old Transylvania College in his native state in 1824, and then attended the U.S. Military Academy, from which he graduated in 1828. He remained in the U.S. Army for seven years, and distinguished himself as a young officer in the Black Hawk Indian war of 1833. Marrying a daughter of Col. afterwards Gen. and President, Zachary Taylor, he bought a cotton plantation in Mississippi, where he made a comfortable fortune. He lost his first wife of fever after three months, and afterwards married Varina Howell of Mississippi. For a long time thereafter he devoted himself to his books and his plantation. As he treated his own slaves kindly and gave them a large measure of self-government, he became a convinced supporter of African slavery, really believing that all slave-holders treat their human property in as benevolent a manner as he did. He was elected to the National House of Representatives in 1845, but on the outbreak of the war with Mexico resigned this post and went to battle as colonel of the First Mississippi Infantry in the army led by his father-in-law. He served with distinction at the battle of Monterey, and on Feb. 22, 1847, became something like a national hero because he saved the day at the battle of Buena Vista. In the same year he was elected to the U.S. Senate, and was made chairman of its committee on military affairs. He ran for governor of Mississippi in 1851, but was defeated. President Franklin Pierce made him secretary for war in his Cabinet in 1853. D. energetically improved the army, and pushed the construction of coast defences

and the survey of the far W. for future railway lines. Once more elected to the Senate in 1857, he became the leader of the S. democrats. The election of Lincoln as president in the fateful campaign in 1860 caused D. to burn his bridges. In the Senate he passionately asserted the right of the S. slave-holding states to secede from the union and form a separate nation. When Mississippi formally seceded and joined the confederacy, D. fondly hoped to lead Mississippi troops in the coming armed conflict, but to his dismay the S. congress on Feb. 9, 1861, chose him as provisional president of the confederacy. In a later election by the people he was again chosen president, Feb. 22, 1862. In the war D. blundered by retaining the services of generals who had been shown to be unfit for their task. Press and public began to turn against him, and Gen. Lee might have been able to seize supreme power if loyalty to the gov. had not been his first and his last word. When Richmond, the cap., fell into Union hands, D. moved first to Danville, Virginia, thence to Greensboro, N. Carolina, and was finally captured near Irwinsville, Georgia, May 10, 1865. Manacled and harshly treated, he was confined in Fortress Monroe, Virginia. Sev. efforts were made to connect him with the assassination of Lincoln and with the harsh treatment of prisoners at Andersonville, but without success. Two indictments for treason were found against him and for some years he was refused trial or bail. This cruelty aroused the sympathy of the people of the S., who looked upon D. as a martyr to their cause, and in large measure reinstated him in the esteem he had lost on account of his blunders. Finally (1867) he was admitted to bail; many of his former political opponents stood as sureties, while Charles O'Connor, a leader of the New York Bar, volunteered to defend him. O'Connor moved to quash the indictment on which D. was brought to trial, but the court of two judges was divided. The matter was then certified to the Supreme Court, and no decision of which there is record was ever announced by that tribunal, and meanwhile the administration dismissed the prosecution and discharged D. who went to Canada. He benefited from the general amnesty of 1868 and returned to Belvoir, Mississippi, where he spent the rest of his life quietly, refusing to take any part in politics. He d. suddenly in New Orleans, Dec. 6, 1889. He wrote sev. books, one of which was *The Rise and Fall of the Confederate Government* (1881). See also UNITED STATES, *History*. See Mrs. Varina Howell Davis, *Jefferson Davis, a Memoir*, 1890; lives by F. H. Alfriend, 1868, E. A. Pollard, 1869; and W. E. Dodd, 1907; also W. E. Dodd, *Statesmen of the Old South*, 1929.

Davis, John (1550-1605), celebrated Eng. navigator, considered the father of Arctic discovery. Was b. in Stoke Gabriel, near Dartmouth, Devon. In his early days he made various expeditions around Greenland, and after suffering many reverses of fortune succeeded in pushing through the

strait which bears his name to Baffin Bay. His next voyages were in the S. Seas. In 1597 he took a Dutch vessel to the E. Indies, and had trouble in Madagascar. He then undertook a short expedition as major of the fleet. He wrote *The Seaman's Secrets* (1594) and *The World's Hydrographical Description* (1595). See life by C. R. Markham, 1889.

Davis, Sir John, see DAVIES.

Davis, Mortimer Barnett (1866-1928), Canadian financier. President of the Imperial Tobacco Company of Canada and chairman of the Canadian Industrial Alcohol Company, besides being a director of the Royal Bank of Canada and a member of sev. other great commercial concerns in the dominion. Was often styled "the tobacco king of Canada." Gave munificent amounts to philanthropic concerns.

Davis, Richard Harding (1864-1916), Amer. novelist and journalist; b. in Philadelphia, son of L. Clarke D., editor of the *Public Ledger*, and his wife was Rebecca Harding D., novelist. Throughout the Sp.-Amer. war he acted as war correspondent. He served in the same capacity during the Boer war in S. Africa. He wrote sev. books relating to these campaigns, as well as a large number of novels; also a play entitled *Dictator*, produced at the Comedy Theatre, London, May 1905. In 1914 he was in Mexico as war correspondent of the New York *Tribune*. Later he went to Belgium. He wrote *With the Allies and Somewhere in France* (1915).

Davis, Thomas Osborne (1814-45), Irish poet and journalist. He attached himself to the party of Daniel O'Connell, and worked on the committee of the Repeal Association, 1841. In conjunction with J. B. Dillon and Charles Gavan Duffy he started the weekly paper *The Nation*, and his best work appeared in this, comprising some fine lyrics such as the *Lament for Owen Roe O'Neill*; *The Battle of Fontenoy*, etc., and historical sketches. Trouble arose between O'Connell and the Young Ireland party, as they were called, and D. was attacked on the plea that he was anti-Catholic, but he retained a strong influence on his party until his early death from scarlet fever. See Sir C. Gavan Duffy, *Thomas Davis*, 1896.

Davis, William Morris (1850-1934), Amer. geographer and geologist, son of Edward Morris, b. in Philadelphia. Educated at Harvard Univ., he taught geology and geography there in 1876 and 1878 respectively. His prin. pubs. are *Elementary Meteorology* (1894); *Physical Geography* (1899); *Elementary Physical Geography* (1902); *The Triassic Formation of Connecticut and Geographical Essays* (1909); *A Handbook on Northern France* (1918); and numerous articles in scientific journals.

Davison, William (1541-1608), secretary to Queen Elizabeth. Of Scottish birth, and a friend of Robert Dudley, he was employed on various diplomatic missions by the queen. He became a member of Parliament, a Privy Councillor, and in 1588 assistant to the queen's secretary,

Walsingham. He brought the warrant for the execution of Mary Queen of Scots for Elizabeth's signature and bore the brunt of the queen's displeasure when it was carried out, being heavily fined and imprisoned. In 1589 he was released, but not restored to favour, and he retired to Stepney, where he d.

Davissou, Clinton Joseph (b. 1881), Amer. physicist, b. at Bloomington. Educated at univ. of Chicago and Princeton Univ. (1908-11). Instructor in physics, Carnegie Institute of Technology, Pittsburgh (1911-17). Member of technical staff of the Bell telephone laboratories, New York city, 1917-46. Known for researches in electricity, magnetism, and radiant energy. Discovered (with L. H. Germer) the diffraction of electrons by crystals (1937). Comstock prize, 1928; Elliott-Cresson medal, 1931; Hughes medal of the Royal Society, 1935. Shared Nobel Prize for physics with George Paget Thompson (1937). Member of the National Research Council, 1928-31, and 1933-36. Pub. papers on thermionics, radiation, electron diffraction, and electron lenses in scientific journals.

Davis Strait separates N. America and Greenland, joining Baffin Bay with the Atlantic Ocean. The name is derived from John Davis, who was the first to explore it. It is from 160 to 180 m. across at the narrowest point, and the greatest depth is about 950 fathoms.

Davitt, Michael (1846-1906), Irish Nationalist politician, b. in co. Mayo. His father having been evicted in 1851, the boy started life in a Lancashire cotton mill, but in 1857 a machinery accident resulted in the loss of his right arm. In 1865 he joined the Fenians, and five years later was arrested on the charge of importing fire-arms into Ireland, and was sentenced to fifteen years' penal servitude. Released after seven years he returned to Ireland in 1879, and helped Parnell to start the Land League, with the result that he was re-arrested, but released on ticket-of-leave again in 1882, when he was elected to Parliament as Nationalist member for Meath, but as a convict was not allowed to sit. He was one of the respondents before the Parnell Commission (1888-90), and spoke for five days in his defence. He was elected to Parliament on three subsequent occasions, but never sat for any length of time. He wrote a good deal, and was bitterly anti-Eng. and anti-clerical.

Davos, mt. valley in the canton of the Grisons, Switzerland. Its two prin. vils. are Davos-Platz and Davos-Dorf (with 9200, mainly Protestant, inhab.), which are 5015 ft. above sea level. They are situated 40 m. E. of Coire and 18 m. from Sûs in the Lower Engadine. The valley is sheltered from the cold winds and enjoys brilliant sunshine, and these facts being noted by Dr. Spengler in 1865, he advocated the place for consumptive patients, and the valley has since become a famous winter resort for those suffering from the disease. There are many hotels and sanatoria, and the winter sports attract many visitors.

Davout, Louis Nicolas, Duke of Auerstädt and Prince of Eckmühl (also Davoust and Davoust) (1770-1823), marshal of France, and one of the most brilliant of Napoleon's generals; b. at Annoux. He went through the Rhine campaigns of 1794-95 and on the expedition to Egypt with Bonaparte. After the Marengo campaign he became general of div., and when Napoleon became emperor was created a marshal of France, was in command of the 3rd Corps of the Grande Armée at Austerlitz, and with a single corps won the victory of Auerstädt against the main Prussian Army. He was made duke of Auerstädt in 1808. After being governor of Poland he took part in the war with Austria (1809), and was made prince of Eckmühl. He organised the army for the Russian campaign, through-out which he commanded the 1st Corps, and in 1813 he sustained the siege of Hamburg. He retired on the first restoration, joining Napoleon on his return from Elba, when he became minister of war, and was left in command of Paris after Waterloo. His stern discipline made the troops he commanded the most trustworthy in Napoleon's armies, and his severity and extortion in conquered ters. were in execution of the emperor's orders. At the second restoration he was deprived of all his titles, but in 1817 they were restored to him.

SIR HUMPHRY DAVY

An engraving after a painting by Sir Thomas Lawrence.

Davy, Sir Humphry (1778-1829), Eng. chemist, b. at Penzance, Cornwall. His father was a woodcarver. He was educated at Truro, studied medicine and set up as a doctor, devoting his leisure to chemical research. The results of his experiments were pub. by Dr. Beddoes, who made him superintendent of the Pneumatic Institute. This led to his appointment to the post of assistant lecturer of chem. to the Royal Institution,

London, where his brilliant scientific success, his versatility, and originality brought him recognition and fame, which spread abroad. In 1807 he delivered a remarkable Bakerian lecture on 'some Chemical Agencies of Electricity,' embodying the results of experiments he had been making for some time. It revolutionised the scientific world, and France bestowed on him the Napoleon prize of 3000 francs. In these experiments he discovered sodium and potassium. He planned the ventilation of the House of Lords, and in 1812 was knighted by the prince regent, the same year marrying Mrs. Apreece, heiress and daughter of Charles Kerr of Kelso. With Faraday he visited the Continent, where he met contemporary leading scientists: Ampère, Cuvier, Chevreul, and Humboldt. On his return to England his investigations into the causes of fire damp resulted in his invention of the miners' safety lamp. Numerous honours followed. He was made baronet and president of the Royal Society. Failing health necessitated his leaving England, and he d. at Geneva. His collected works were ed. by his brother, John D. (1839-41). See lives by J. A. Paris, 1831; J. Davy, 1836; Sir T. E. Thorpe, 1896; and P. A. Guye, 1907.

Davy, John (1763-1824), Eng. musician, b. near Exeter, and d. in London. He wrote many songs, the best known of which is *The Boy of Biscay*.

Davy, Jones, sailor's name for the evil spirit of the sea, the sailor's devil, whose locker is the ocean, the grave of those who die at sea.

Davy Lamp, form of safety lamp, used especially in mines, which will allow an illuminant to be burnt in it without danger of explosion from the explosive gases often generated in the passages of the mine. The principle of these lamps is that sufficient air should be allowed to enter to allow the light to burn, while at the same time the flame or gases of combustion should not escape at a temp. which would cause ignition of the explosive gases in the mine. Sir Humphry D. in 1816 invented the lamp which has since then borne his name. It consists of a cylindrical lamp, to which air is admitted at the bottom and covered by a cage of iron wire gauze, the mesh of which was at that time of 789 apertures to the sq. in. This standard has been reduced. The lamp is in two parts, locked together so that once lighted the gauze cannot be removed. Many improved lamps have been made on this system, especially to prevent the inflammable gases, travelling at high velocities, being forced back into the lamp.

Dawes, Charles Gates (b. 1863), Amer. brigadier-general of engineers and financial expert; b. at Marietta, Ohio, son of Gen. Rufus R. D. Comptroller of the currency, 1897-1902. In First World War major of engineers in France from 1917, became member of Allied Purchasing Board, in 1918 brigadier-general. Appointed by Reparations Commission to preside over committee for examining Germany's capacity for reparation pay-

ments, which sat in Paris Jan.-April 1924, and whose report of April 19 submitted so-called Dawes Plan (q.v.). In 1924 elected vice-president U.S.A., for term 1925-29. Received the Nobel peace prize in 1925. Ambass. to the court of St. James, 1929. Pub. *A Journal of the Great War* (1930), a record of his activities as president of the Purchasing Board of the Amer. expeditionary force in France; also *A Journal of Reparations* (1939) and *Journal as Ambassador to Great Britain* (1939).

Dawes, William Rutter (1799-1868), Eng. astronomer, who made a name by his observations and measurements of the double stars; he made an early observation of the dusky ring of Saturn, 1850, and in 1855 won the gold medal of the Astronomical Society. He effected notable improvements in the micrometer. He was a clergyman and worked at his private observatories at Ormskirk, Cranbrook, Wateringbury, near Maidenhead, and Haddenham.

Dawes Plan. This was the name given to the scheme evolved by the committee of experts which was set up to investigate the financial conditions in Germany and to settle the amount of money which Germany could pay as reparation for war damage—such amount to be without prejudice to the balancing of the Ger. budget and the stabilising of Ger. currency. On Oct. 24, 1923, the Ger. Gov., forced by severe economic pressure, applied to the Reparations Commission under Act 234 of the treaty of Versailles for an investigation of Ger. economic resources and her capacity to pay. This application was followed on Nov. 2 by a notification to the effect that for the time being Germany was unable to pay for deliveries in kind. The application was granted and the Reparations Commission decided on Nov. 30 to appoint two committees: (1) the Dawes Committee to investigate and report as above; (2) the McKenna Committee to inquire into, and report upon, the flight of Ger. capital abroad since the armistice. The Dawes Committee was presided over by C. G. Dawes, U.S.A., and the other members were O. D. Young, U.S.A.; R. M. Kindersley and J. C. Stamp, Great Britain; J. Parmentier and E. Allix, France; A. Pirelli and F. Flora, Italy; E. Francqui and M. Houtard, Belgium. The gist of the committee's report (which became the basis for the eventual settlement) may be given in these words: 'Beyond the fixed annuities which shall be normally 2½ milliard gold marks there will be no longer any other liabilities arising out of the treaty of Versailles or the world war.' The normal annuity of 2½ milliard gold marks was to be obtained from the following sources:

1,250,000,000 from customs duties and consumption taxes.
660,000,000 from the railways.
290,000,000 from the transport tax.
300,000,000 from industry.
2,500,000,000

And the normal annuity was to be reached in the fifth year. The actual payments made were:

	gold marks
1924-25	1,000,000,000
1925-26	1,220,000,000
1926-27	1,500,000,000
1927-28	1,750,000,000
1928-29	2,500,000,000

The standard figure was reached on Sept. 1, 1928, and an additional payment became liable after the close of the year 1928-29 calculated on an index of prosperity, based on certain trade returns, budget receipts, and expenditure, etc. In 1930 the D. P. gave way to the Young Plan (q.v.), but in 1934 Germany's financial position so deteriorated that the Ger. Gov. declared a moratorium on both loans. Thereupon the Brit. Gov. announced that it would be necessary to initiate an exchange clearing arrangement by which holders of the loans might be paid with interest and an exchange agreement was eventually concluded. See C. Bergmann, *The History of Reparations*, 1927.

Dawkins, Sir William Boyd (1838-1929), Welsh geologist and archaeologist. In 1862 he joined the Geological Survey of Great Britain. In 1874 he became prof. of geology and palæontology at Owens College, Manchester. His researches in connection with the cave-dwellers of prehistoric times won him a name in anthropology, and he pub. the following works: *Cave-hunting* (1874); *Early Man in Britain* (1880); and *British Pleistocene Mammalia* (1866-87). He was also connected with surveys for the proposed channel tunnel and for the discovery of coal in Kent.

Dawley, urb. dist. of England, in Shropshire, situated on Shropshire Union Canal, and in the Wellington div., 4 m. S.E. of that place. Coal and iron are worked. Pop. 7400.

Dawlish, tn. and watering-place in Devon, England, 11 m. from Exeter; a stream called Dawlish water runs through its centre. D. is a great resort for seabathers and invalids throughout the year. Pop. 4500.

Dawn, morning twilight, the period of half-light, when the sky is illuminated by the reflection of the rays of the rising sun on the clouds and dust, etc., suspended in the atmosphere before it rises above the horizon. The maximum vertical depression of the sun was early calculated by astronomers to be 18°. The time the D. light lasts is measured by the time the sun takes to pass through an arc of 18°, and varies with the lat. of the observer and declination of the sun, it being at its minimum at the equator and increasing according to the distance from that point, and being longer in summer than in winter. The colours of the sunrise at D. are not so warm as those of sunset, since the air is clear and there is less diffusion of light rays. The order of D. colours is deep red, then orange, gold, and clear bright yellow, the reverse order of

the sunset colours. The duration of D. is shorter than of twilight.

Dawson, Charles (1886-1938), Eng. antiquary. As a young man became a fellow of the Society of Antiquaries. Collected fossils of dinosaurs in the Wealden quarries round Hastings, his collection being accepted by the Brit. Museum. Continued to obtain for the museum similar specimens from Sussex for the rest of his years. His name will be remembered for his discovery, between the years 1911 and 1913, of what anthropologists know as the Piltdown man. D. found portions of the fossil skull, and in doing so discovered the remains of the earliest Englishmen known. In July 1938 Sir Arthur Keith unveiled a monolith memorial to D. in the grounds of Barkham Manor, Piltdown, to mark the place of discovery. These bones gave us the entrance to a long-past world of humanity, such as never had been dreamt of, and afforded evidence that carried the hist. of man in Sussex back to a period to which geologists assigned a duration of from 500,000 to 1,000,000 years, though since the Piltdown man was unlike any known fossil the remains set students of man's evolution the most difficult and important task that had confronted them. D. was an amateur geologist, and, by profession, a solicitor.

Dawson, Christopher (b. 1889), Eng. philosopher, educated at Trinity College, Oxford. Lecturer in the hist. of culture, Univ. College, Exeter, 1930-36; Forwood lecturer in the philosophy of religion, Liverpool, 1934; Gifford lecturer (Edinburgh) 1947 and 1948. Pubs.: *The Age of the Gods; The Making of Europe; Progress and Religion; The Spirit of the Oxford Movement; Medieval Religion; Christianity and the New Age; Religion and the Modern State; The Judgment of the Nations; and Religion and Culture*.

Dawson, George (1821-76), Eng. non-conformist divine, b. in London. He entered the ministry as a Baptist, and in 1843 went to Rickmansworth, removing a year later to Mount Zion, Birmingham. His unorthodox views led him to resign, and his followers built the church of the Saviour for him. Here he worked for nearly thirty years attracting a large number of people by his eloquence and freedom of thought. Carlyle and Emerson were numbered among his friends, and contributed to his popularity. He pub. one or two books of lectures and sermons.

Dawson, George Mercer (1849-1901), Canadian geologist, b. at Pictou, Nova Scotia, son of Sir John Wm. D. He held the post of geologist and naturalist to the N. Amer. boundary commission (1873), served on the staff of the Geological Survey of Canada, becoming director in 1895. He had charge of the Yukon expedition in 1887, and Dawson City is named after him. He was one of the Behring Sea commissioners (1891), and went to Paris on the Arbitration Board. He wrote *The British Colonies in America* (1892), and many scientific papers and reports.

Dawson, Henry (1811-78), Eng. painter, b. at Hull. With the meagre artistic

education of a dozen lessons from Pyne in 1838. D. succeeded in winning a place among Eng. artists by his wonderful skill in painting sky and clouds. In style he was an ardent follower of Constable.

Dawson, Sir John William (1820-89), Canadian geologist, b. at Plottou, Nova Scotia. He studied at Edinburgh Univ., and on settling down to educational work in Nova Scotia undertook a geological survey of the country, publishing his results in *Acadian Geology* (1855). The same year he became prof. of geology and principal of McGill College and Univ., Montreal, and in 1862 was elected F.R.S., becoming the first president of the Royal Society of Canada. In 1884 he was knighted, and in 1893 was nominated emeritus principal, prof., and honorary curator of the Redpath Museum. D. did great service to geology and education. He took a leading part in the movement for the improvement of women's education, and brought the whole school system of the prov. to a higher level of efficiency. Among his numerous works are *Archæa* (1858); *Story of the Earth and Man* (1872); *Origin of the World* (1877); *Fossil Men* (1878); *Egypt and Syria* (1885); *The Meeting-place of Geology and History* (1894); and *Relics of Primeval Life* (1897).

Dawson of Penn., Sir Bertrand Edward Dawson, first Baron Viscount (1864-1945). Court physician, son of Henry D., F.R.I.B.A., of Purley, Surrey. Educated at Univ. College and the London Hospital. B.Sc., 1888; M.B., London, 1890; M.R.C.S., 1890; M.D., London, 1893; F.R.C.P., 1903. Physician-extraordinary to King Edward VII., 1907-10; to King George V., 1910-14. Early became known as an authority on gastric affections—wrote *The Diagnosis and Operative Treatment of Diseases of the Stomach* (1908). During First World War he was captain R.A.M.C. (T.F.), commandant 2nd London General Hospital and consulting physician in France. Colonel A.M.S. and honorary member Army Medical Advisory Board, 1918, and chairman of the special committee of the Medical Research Council on Tuberculosis in Wartime. Raised to peerage, 1920; Privy Councillor, 1929. President of the Royal College of Physicians, 1931. Created a viscount, 1936.

Dawson City, cap. of the Canadian Yukon dist. and centre of the Klondyke goldfields. The tn. was founded in 1896 at the time of the first gold rush, and though partially destroyed by fire in 1899, became a well-estab. mining city, boasting sev. fine opera houses and hotels. It enjoys the services of a fleet of riv. steamers and telegraphic communication connecting it with the upper and lower Yukon. In spite of the climate, which tends to extremes, wheat, barley, and oats have been successfully cultivated there. The pop., which has been extremely fluctuating, dwindled from 30,000 in 1898 to 1000 in 1941 owing to the exhaustion of the Klondyke goldfields.

Day, tn. and arron. in the dept. of Landes, France, on the Adour. The tn.

has manufs. of pottery and liqueurs, and trades in wine, timber, and agrio. produce. There are fine medicinal springs, which have maintained a reputation for the cure of rheumatism since the time of the Romans. The name is a corruption of *Acqua*. It contains Rom. remains, castle, and cathedral. Pop. (tn.) 12,600; (arron.) 133,200.

Day, Francis (1829-89), Eng. ichthyologist, b. at Marcsfield, Sussex, who wrote some standard works on the piscatorial life of India and Great Britain. He became interested in this study while surgeon at Madras. His chief works are *The Fishes of Malabar* (1865); *Fishes of India* (1875-88); and *The Fishes of Great Britain and Ireland* (1880-84).

Day, John (c. 1574-c. 1640), Eng. dramatist, was a native of Norfolk and sizar of Calus College, Cambridge, whence he was expelled for theft. He collaborated successfully with Dekker, Haughton, and other writers of the period. His best known work is an allegorical masque, *The Parliament of Bees* (1641), in which all the characters are bees. He also wrote a pleasing comedy, *Humour out of breath* (1608). His complete works were ed. by A. H. Bullen (1881). See A. C. Swinburne, *Contemporaries of Shakespeare*, 1919.

Day, Thomas (1748-89), author of *Sandford and Merton*, b. in London, inheriting in early infancy £900 a year, the greater part of his father's estate. He was educated at Charterhouse and Oxford, and was called to the Bar, but did not practise. He was eccentric, and educated two girls with the idea of making one his wife, but the experiment failed. With his friend Richard Lovell Edgeworth he made the acquaintance of Jean Jacques Rousseau in Paris. Literature, architecture, politics, and agriculture in turn had his attention. He married Esther Milnes, an heiress. In support of the abolition of the slave trade he wrote *The Dying Negro* (1773). He was killed whilst taming a colt near Wargrave. His *Sandford and Merton* (1783-89) is a technical example of the pedagogic novel. D., like Rousseau, advocated more enlightened methods in education, and offered models of stories and improving talks with children, which were intended to make them realize the value and entertainment of science and virtue. D. is of interest for his influence on Maria Edgeworth, the daughter of R. L. Edgeworth. Her stories for children really belong to the class of didactic novels.

Day (O.E., *daeg*. Ger. *Tag*); usually means the time during which the sun is above the horizon, the period of light as opposed to darkness. In astronomy it is one rotation of the earth. The sidereal D. is the time between two culminations of a star, consistently equal. The solar D., which is measured by the sun, varies slightly, and is longer than the sidereal D., which does not alter. There is a difference of about four minutes, for by the time the sun has made one complete rotation and the earth has come back to the same place relatively, the sun has moved eastwards nearly one degree,

which necessitates four minutes' longer travelling by the earth. Only four times a year do the sundial and the clock agree, the astronomers' imaginary sun, moving uniformly, regulating the mean time (watch time), the real sun on the meridian giving the apparent time. D. varies with lat. and seasons, to the N. of the equator increasing in summer and decreasing in winter, and vice versa to the S. The apparent solar D., i.e. the interval between two successive passages, of the real sun across the meridian varies in length owing to the varying velocity of the earth in its orbit and of the inclination of the ecliptic to the equator. The difference, mean solar time minus apparent solar time, is called the *equation of time*. It is a variable quantity, and may be as high as seventeen minutes. The mean solar D. is equal in length to the average apparent solar D. throughout the year. At the equator D. and night are nearly equal, for owing to the inclination of the earth's axis to the plane of its orbit the parallel of lat. in which the sun appears to move is continually changing, at the equator alone being bisected. The Gks. counted D. from sunset, the Romans from midnight, the Babylonians from sunrise, and the Umbrians from midday.

Dayaks, see DYAKS.

Day and Night Breezes, relate to the varying direction and velocity of the wind during the different periods of the twenty-four hours. The heat of the sun reflected from the earth reacts on the surface layer of the atmosphere, the interchange causing surface winds and up-currents. These fluctuations are not so marked over water where the conditions are more uniform. Certain surface winds die down towards sunset owing to the cooling ground which lessens the tendency of the air to rise. The mean direction of the wind does not vary much throughout the twenty-four hours. Most breezes usually tend to veer slightly to the observer's right through the morning and turn back again after sunset. Small pilot balloons are used by meteorological stations to determine the direction and velocity of the wind at different altitudes.

Dayfly, or Mayfly, see EPHEMERA.

Daylesford, bor. and tn. of Australia, situated in Victoria, 26 m. N.E. of Ballarat. Gold is extensively worked in the neighbourhood. Pop. 3500.

Daylight Saving. To Wm. Willett (1856-1915), a Chelsea builder, belongs the credit for the introduction of the D. S. scheme into England, although his suggestions put forth in 1907 were held up to ridicule. The idea of summertime was first mooted in America by Benjamin Franklin, though its practice is purely an outcome of the First World War. In 1916 Germany instituted a D.-S. scheme for purposes of light and fuel economy, and this led to the Summertime Act of Britain being passed on May 17, 1916. On Sunday, May 31, the clocks throughout the country were for the first time put on an hour in advance of Greenwich time for the whole of the summer months. Other countries throughout Europe fol-

lowed suit, and America put the scheme to trial in 1917.

Although originally a war measure, D. S. was considered to have so many advantages that by a series of Acts of Parliament it was continued in England, Col. Lambert Ward being its earnest champion in the House. The royal assent was given to the Summertime Act, making it a permanent measure, on Aug. 7, 1925.

Officially summertime begins at 2 a.m. on the day following the third Saturday in April, unless that is Easter Day, when it becomes the day following the second Saturday of April. It terminates at 3 a.m. (or 2 a.m. Greenwich time) on the day following the first Saturday in Oct. During the Second World War the necessity for economising fuel and light, coupled with the inconvenience of the black-out against air raids, led to the beginning of Brit. summertime in 1940 from Feb. 25, and in 1941-44 from Jan. 1 to Dec. 31; in 1945 the period was reduced to nine months. Double summertime (i.e. 2 hrs. in advance) was in force during the summer months of 1941-45 and again in 1947.

The number of minutes that clocks are moved forward varies from 20 min. in Sarawak and the Gold Coast to 60 min. in Great Britain, Eire, France, and most other countries. The actual date on which clocks are moved forward is not standard for all countries that have adopted the expedient of D. S.

European countries have used the scheme, abandoned and revived it from time to time, and in June 1930 the Soviet Union introduced it into Russia. In America some of the states favour it, while others refuse to entertain it. The opposition to the scheme comes from agriculturists mainly, who find it inconvenient to begin milking, harvesting, and other work an hour earlier; by educationists and those with the care of young children, who find their charges cannot sleep when put to bed during the bright daylight of the summer months, and so waken unrefreshed and disorganised in the morning; by miners, hospital nurses, and others. Wm. Willett d. the year before his idea was put into operation.

Day Lily, popular name for the lilaceous genus *Heremacallis*, common to Europe and Asia. *H. flava* is a yellow-flowered species cultivated in Britain for its sweet scent, and *H. fulva* is a species from S. Europe which is given to cattle for fodder.

Day of Atonement (Yôm Hakkippûrim, or Day of Coverings) is the holiest day in the Jewish year, and is observed with complete rest from all labour, abstinence from all food and drink, in self-examination and penitence. The Yôm Kippur is always the tenth day of the seventh month (Tishri), and the fast begins at sunset on the ninth day, lasting until the evening of the tenth.

Days of Grace, see BILL OF EXCHANGE.

Dayton: 1. Cap. Montgomery co., Ohio, U.S.A., situated in the Miami valley at the mouth of the Mad R., 50 m. N. by E.

of Cincinnati. It is a leading centre of aviation research, is the home of the National Cash Register Company, and produces electric lighting plant for home use, refrigerators, aeroplane parts, etc. There is a state hospital for the insane and a branch of the National Home for Disabled Soldiers. In 1913 D. was covered with mud by a great flood and then protected by dams. The first house built there, a log cabin, is preserved as an historical museum. The city covers 17 sq. m. Pop. 217,000. 2. A city in Campbell co., Kentucky, U.S.A., on the Ohio, opposite Cincinnati, of which it is a suburb. Pop. 210,700. 3. A city of Tennessee, co. seat of Rhea co. Pop. 1700. In 1925 a teacher of science in the high school was found guilty of having violated a state law prohibiting the teaching in schools supported by the state of any theories that man is descended from the lower animals. Wm. Jennings Bryan, who was briefed by the state of Tennessee for the prosecution, d. at D. a few days after the trial.

Daytona Beach, popular holiday resort of Florida, U.S.A., on the Atlantic coast, with a motor-racing track on the sands. Pop. 22,600.

D'Azara, Felix, see AZARA, DON FELIX DE.

D'Azeglio, see AZEGLIO.

Dazimon, see TOKAT.

De Aar, tn. of Cape Prov., S. Africa, one of the prin. railway junctions of S. Africa, centre of large live-stock fairs, with a healthy climate. It is rapidly expanding. Pop. 2000, of whom 1500 are white.

Deacon (Lat. *diaconus*, Gk. *διάκονος*, an attendant, minister), eccles. officer in the Christian Church, whose offices and duties have varied greatly in different places and at different times. Their origin is connected by tradition with the appointment of the Seven (Acts vi.), but doubt is thrown on this theory by the fact that the Seven are never called Ds. in the N.T., and do not seem to have been thought of as such until the end of the second century. Allusions to the diaconate occur in sev. of the pastoral epistles, and with the development of the bishopric the office of D. became peculiarly attached to that. The chief functions of the D., as we may gather from the story of St. Laurence, archdeacon of Rome in the third century, were the care of the poor, with the collection and distribution of alms, and personal attendance on the bishop. In time these functions were lost or absorbed by the minor orders, and the D. was left merely a particular part in the church service. In the Rom. and Anglican churches the diaconate is rarely a permanent office, but is considered a step to the priesthood, whereas in the E. it retains more of its old character. Among certain Protestant bodies, such as the Presbyterians, the D. is a layman who has charge of finances, etc.

Deaconess, one of an order of women set apart for special service in the Christian Church. In Rom. xvi. 1, and 1 Tim. v. 9 *et seq.*, we find traces of the first begin-

nings of this order, and at the time of the *Apostolic Constitutions* it already formed a distinct part of the Church's organisation, and as such is mentioned in the canons of Nicea and Chalcedon. Though Ds. were ordained in much the same way as deacons, there is no trace in their duties of any sacerdotal function. In the W. Church the order was condemned at sev. councils from the fifth century onward, and fell entirely into abeyance during the Middle Ages. It has recently been revived in sev. of the reformed churches, e.g. the Anglican and Presbyterian.

Deacon of a Trade, temporary president of certain incorporated bodies in Scotland. These presidents represented their different trades or crafts in the various tn. councils before the Burgh Reform Act of 1834. This Act deposed them from their position as official members, but still permitted them to regulate the business affairs of the crafts when appointed by election. See also DEAN of GUILD.

Dead, Book of the, collection of texts, both religious and magical, written by the anc. Egyptians for the safe guidance of the soul through Amenti (the Egyptian lower world). This papyrus, or parts of it, was always buried with the mummy in his tomb. The later MSS. were very imperfect, but a pure ed. was pub. by Edouard Naville in Berlin, 1886. Excellent Eng. trans. by Le Page Rénouf, 1890, and E. A. W. Budge, 1895 and 1901.

Deadly Nightshade, see NIGHTSHADE.

Deadman's Handle, device attached to the control gear of an electric train (or lift) which ensures that the train is automatically brought to a standstill if the driver releases his grip through sudden illness. The device is in the form of a knob, which switches off the power and applies the brakes should the handle be released when on a running notch.

Dead-nettle, popular name of sev. species of plants, of the genus *Lamium* and order Labiatae, in appearance the plant greatly resembling the stinging-nettles of the genus *Urtica*. Sev. of these herbs grow in Britain as wayside weeds, the chief being white, or *L. album*; purple, *L. purpureum*; and yellow archangel, *L. galicobdolon*.

Dead Sea (Lat. *Lacus Asphaltites*, Arabic, *Bahr Lūt*, Sea of Lot), scripturally called Salt Sea, Sea of the Plains, Sea of the Arabah, is a lake near the S. extremity of Palestine, lying between that country and Transjordan. Its length is 46 m. and its greatest breadth 9½ (average 8½) m. The long oval of the lake is unequally divided by the E. Lisan peninsula, of loose calcareous formation. N. of the peninsula the greatest depth is 1278 ft., S. of that it is only 3 to 12 ft. It receives the Jordan and six other rivs., but has no outlet, the surplus water being carried off by evaporation. The water is intensely salt, with a specific gravity one-sixth greater than water. Fish cannot live in the lake, but it has a therapeutic reputation for lepers, and the inhab. on the banks are quite healthy. It is surrounded by steep cliffs of bare lime-stone, rising to a height of 6000 ft., and masses of sulphur

exposed by periodically occurring earthquakes lie on its borders. There is a considerable business in the exploitation of its salt deposits, and potash, bromine, magnesium, etc.

E.N.A.

THE DEAD SEA

In the background are the mountains of Judæa.

Dead Sea Apple, see APPLE OF SODOM.

Dead's Part, Scots law, the remaining portion of the movable estate which alone may be bequeathed by will. Where the deceased leaves a widow and no children the widow takes one-half as her *jus relictæ*, and the other half is D. P. If he leaves a child or children and no widow, half goes to the issue as their *legitim* and half is D. P. If he leaves widow and children, one-third is D. P., the residue going equally to the widow and children. If he dies childless and unmarried every part of the estate is D. P. The same principles apply in the case of a wife leaving movable estate. The D. P., if undisposed of, devolves on the next of kin.

Deadwood, co. seat of Lawrence co., S. Dakota, U.S.A., in the extreme W. of that state. It is the trading centre for the gold, silver, lead, and tin mines of the Black Hills. Was founded in 1876, and owns some buildings of architectural interest. Pop. 2800.

Deaf and Dumb, or Deaf-mute. Deaf-mutism or deaf-dumbness in the sense in which it is used in this article denotes (1) the congenital deafness which arises from some original malformation of the ear and which is always accompanied with dumbness; (2) deaf-dumbness attributable to post-natal causes. Acquired deaf-dumbness, which for the most part follows on some febrile disease in very early life, is of importance from the dactylogological standpoint, but in cases where deaf-mutism has occurred later in life it is obvious that the subject may well have learnt the arts of speech and writing before his affliction, and for that reason does not present the same problem to educators as the congenital deaf-mute. Complete deafness is by no means essential as a cause of com-

plete dumbness; a small amount of deafness may well eventuate in dumbness. Etiologically inheritance is a potent cause of deaf-mutism; the intermarriage of deaf-mutes and consanguineous marriages are mainly responsible for its production. The prin. causes of non-congenital deafness are those which produce some inflammatory affection of the middle ear. The most prolific sources are scarlet fever, and, in a less degree, meningitis, measles, fevers, catarrhs, abscesses, small-pox, and erysipelas. It frequently happens that mental disorder is in some way connected with deafness, and the importance of an efficient means of education is apparent from the fact that D. and D. children, if uneducated, have perforce to be classed among imbeciles. It appears to be a psychological fact that without special education some form of mental disease will assuredly follow. A morbid condition of the mind must almost certainly eventuate where the deaf-mute, to however great an extent he may be susceptible to external impressions, is utterly unable to formulate coherent ideas from never having had his intellectual faculties developed by communication with other and unaffected human beings.

In 1840 the proportion in Europe of deaf-mutes to the pop. was 1 to 1537; in England 1 in about 1600. But happily it is demonstrable that the proportion is becoming less every year, a result due to the more scientific treatment of the various causes. In the decennial periods from 1851 to 1891 the proportions for the United Kingdom were respectively 1 in 1550; 1 in 1430; 1 in 1642; 1 in 1694; 1 in 1814; 1 in 1879. It is higher in Ireland than in the rest of Great Britain, and higher in Scotland than in England and Wales. The statistics, however, are not altogether conclusive, because many persons refrain from disclosing their affliction to the census authorities. The schedules did not require the 'deaf only' to state that fact, while on the other hand many were included in the category who properly belonged to the feeble-minded or aphasic dumb-classes. It was estimated in 1934 (according to the conference of the Brit. Medical Association) that 40,000 persons in Great Britain were totally deaf, and a further 2,500,000 partially deaf, either from acquired deafness or defective hearing in one or both ears. (In 1936 out of about 58,000 applications for enlistment in the Brit. Army 411 per 1000 were rejected for various physical and medical defects, and of these about 56 per 1000 candidates on account of diseases of the ear.) At the present day there are 50 schools for the D. and D. in England and Wales, and 10 in Scotland. Education is compulsory among the deaf in England from the ages of 5-15, in Scotland it is *permissive* from 3-18. In Eire it is not compulsory for the deaf to attend school. There are schools in almost every other country in the world, although in some cases, notably China, Japan, India, and countries in S. America, the provision made is altogether inadequate. In regard to the instruction of

British Deaf Times

TWO-HANDED ALPHABET

the D. and D., it is to be noted that those instructed include for the most part persons whose vocal organs are perfect, but who from deafness are ignorant of the way to articulate the sounds of speech. Again the pupils comprise many who are not completely deaf. Deafness occurs in every degree and in some cases amounts only to an insensibility to the sharper notes of sound. This fact is carefully borne in mind by teachers when considering

individual cases. But, of course, dactylogy or the manual communication of ideas is a science invented mainly in the interests of the more or less completely deaf, who, from never having heard a word spoken, are for that reason unable to use their vocal organs for speech. To such a person any language is a foreign language, and this has always been strongly impressed on all teachers of the D. and D.

Many of the early systems of teaching were faulty from the very ignorance of this important fact, e.g. the celebrated Abbé de l'Épée estab. through dactylogy and articulation some connection in the mind of the pupil between certain methodical signs and the language of their country, but it was by no means estab. that he effected a subjective connection between those signs and the ideas which they were intended to represent. Nevertheless he attained considerable success, and his principles were carried further by his successor, the Abbé Sicard, and the basis of his teaching in signs is that of the chief modern systems. Signs are the natural language of the D. and D., but the attainment through signs of abstract thinking and conceptions is impossible unless a clear distinction is kept in mind between explaining a language and expressing it. The thoughts must first be awakened, and generally by signs as the most or only natural method; and when awakened those thoughts must be shaped in language by some manual alphabet or form of writing. Down to the sixteenth century there was next to no serious effort in the direction of instructing the D. and D. It was the common assumption that instruction by means of language was limited to those who could hear. Nay more, it was generally believed that deaf-mutes were naturally more debased than other men, both in intellect and morals. Even Whately, the logician, was capable of asserting that a deaf-mute, before being taught a language, was as incapable of carrying on a train of reasoning as a brute. Doubtless many of the D. and D. are intellectually and morally inferior, and remain habitually credulous, childish, of shallow sentiments, and scarcely susceptible to the emotions of pity or gratitude. But as indicated above, this is not necessarily so; some pupils have even attained to celebrity, notably Massieu, the pupil of Sicard. In England shortly before the pub. of Dalgarno of his treatise, the art of instruction of the D. and D. was advanced by John Bulwer and Dr. Wallis. Contemporaneously with those D. and D. philologists, Montans, van Helmont, and Anman were occupied with its study in Holland; and in Germany, though later, Kerker, Arnoldi, and Heinicke were devoting attention to the subject. It was in France, however, that the greatest strides were made, as indeed was the case in the instruction of the blind (see BLIND), and the work of de l'Épée and Sicard, however incomplete, cannot be over-estimated. In England, after Dalgarno's time, the art slumbered for many years. It was revived by Henry Baker, the naturalist, and in the middle of the

eighteenth century Thomas Braidwood opened an academy in Edinburgh. Braidwood's success was remarkable. He opened another school in Hackney in 1783, and his sons opened other schools in Edinburgh in 1810 and Birmingham in 1825. The first public school for free instruction of the D. and D. was opened in Bermondsey in 1792, and of this school Dr. Watson, nephew of Thomas Braidwood, was head instructor for thirty-seven years. With the development of a more enlightened social system the days have long since passed when the duty of instructing the D. and D. was left to individual effort alone. The Elementary Education Acts, 1870 to 1891, make provision for the compulsory elementary education of defective children, including in that term the deaf. The London County Council makes special provision for deaf children, having six day schools for the wholly deaf, five for the hard of hearing, and three residential schools. There are also centres where evening classes in lip-reading are held. The total number of deaf children in attendance at schools throughout England and Wales is not much more than 4000, in Scotland about 700.

Societies and institutions in England for the welfare of deaf-mutes include the Royal Society for D. and D. Children, Margate, and the Royal Association in aid of the D. and D., 413 Oxford Street, London. There is a national college of teachers of the deaf (blind and deaf school) at Stoke-upon-Trent.

The close of the First World War brought serious hardship to many officers and men who had lost their sense of hearing by war service, 33,791 being discharged on account of deafness (the numbers were fewer in the Second World War). On their behalf the Deafened Ex-Service Men's Fund was founded in 1919, with headquarters at 23 Queen Anne's Gate, S.W.1.

Methods of Instruction.—Where there is sufficient hearing the instruction may be auricular, but experience does not point to any great success in this method. Where the afflicted are completely deaf the methods must be such as appeal to the eye alone. The obvious ways of so appealing are by a sign language, representation by writing, printing, and pictures, lip-reading, and the manual alphabet. Generally speaking the two prin. methods are the manual and the oral, which utilise the above means of appealing to the eye in varying degrees. The manual and the oral may also be combined, but the combined systems have not been productive of such success as the purely manual; and the oral, which is admittedly unpopular with the deaf themselves, produces a much lower percentage of successes than the manual. In the manual method, signs are first used to stimulate thoughts, and the thoughts are given vernacular expression to in the mind of the pupil by finger-spelling and writing. In Great Britain the two-handed, in Europe and America, for the most part, the one-handed, manual alphabet is in vogue. That this method is successful may be inferred from the fact that so many

British Deaf Times

ONE-HANDED ALPHABET

pupils can acquire an average shorthand speed of communication of 130 words a minute. Perhaps the first manual alphabet pub. in England was that of Dalgarno in 1680.

So far as the single letters are concerned the system was simplicity itself. The rules were: (1) Touch the places of the vowels (see diagram) with a cross-touch with any finger of the right hand; (2) point to the consonants with the thumb

of the right hand. The present two-handed alphabet appears to have been derived from Dalgarno's finger-alphabet. The one-handed alphabet was invented in Spain, and was probably first pub. in the works of Bonet.

A dactylogogy of syllables has occasionally been employed in the instruction of the D. and D., and a system of alphabetic and syllabic dactylogogy was pub. by Dr. Deleau the younger in 1830. The application of finger-language to designate numbers is attributed to Mr. Stanbury, superintendent in a New York institution for the D. and D. Only one hand, the left, is used, the right being left free to record calculations.

The cipher is represented by the closed hand. To indicate this, the position of the hand is changed from perpendicular to horizontal; the thumb is pointed forwards for 10, the thumb and forefinger for 20, and so on to 90. Hundreds are pointed downwards; thus the thumb, forefinger, and middle finger pointed downwards represent 300. If 572 be the number to be designated, three positions are required; the five fingers are pointed downwards for 500, the little finger and ring-finger forwards for 70, and the thumb and forefinger held upright for 2. To represent thousands, the left hand is placed across the body towards the right shoulder, and the signs which were used in front for units in this position represent thousands. Variations of position with the same signs are adopted for tens of thousands and higher numbers. Though complex in description, the whole is easy and comprehensive in operation. In the oral method, although reading and writing may be utilised as in the manual, the prin. means employed are articulation and lip-reading. The sounds of letters as opposed to the names are taught through the medium of lip-formation; but, of course, the names must be taught where different pronunciations of the same letter are to be conveyed. Articulation, which in this connection denotes the teaching of deaf-mutes to speak and to comprehend speech by merely watching the motion of the vocal organs, seems to be as old as the time of Bede. Not one pupil in thirty attains any appreciable degree of proficiency by this method, and in all probability it requires in the pupil a higher degree of intelligence. Much patience and kindness on the part of the teacher are absolutely essential. The speech, such as it is, of the deaf-mute (who must, of course, be of that class who are not completely dumb) is artificial, constrained, and laborious, and generally too loud and discordant from the obvious fact that he cannot hear himself speak and has never heard any one else speak. The system has never been a really serious rival to the art of dactylogogy, although opinion has differed on the question whether articulation is indispensable to the acquisition of thought. Ger. teachers think it is, Eng. teachers for the most part are of the opposite opinion. The Amers. seem to hold a middle view.

Occupations of Deaf-mutes.—These are

necessarily wider than in the case of the blind (*q.v.*). Indeed only those in which speech and hearing are indispensable are closed to them. As an indication of the strides made in their education it may be instructive to note the following diversity of occupation: bookbinders, carpenters, cigar-makers, cutlers, gilders, hatters, jewellers, law-writers, optical and philosophical instrument makers, and printers of all kinds. Some have attained distinction in the highest branches of oil and water-colour painting, while one, at least, became a sculptor of great ability, and another a conveyancing barrister. Two Amer. women, Laura Bridgeman (1829-89) and Dr. Helen Keller (*b.* 1880) (*q.v.*) are noted for their triumph over their disabilities. The census returns, of course, show that the highest proportion are engaged either in non-productive and indefinite, or in industrial occupations; but none the less many have found employment in commercial and professional circles.

Mechanical Aids to Hearing.—Numerous devices, known as deaf-aids, have been invented, and have reached a high degree of efficiency. A deaf-aid incorporating the results of all the latest research was commissioned by the Brit. Gov. in 1947 for manuf. and distribution under the National Health scheme. The U.S. Bell Telephone laboratories have developed a system of visible speech transmitted from a microphone to a television screen, each inflection or sound being pictorially reproduced in the form of spurts or splashes. The users can quickly learn to identify the shapes of the spectrograms as words, for each sound has its own striking and divergent form. See also GALLAUDET, THOMAS HOPKINS. See KERR LOVE, *Deaf-Mutism*, 1896; G. S. Haycock, *Education of the Deaf in America*, 1926; M. Clark and G. Crowden, *The Employment of the Deaf in the United Kingdom*, 1937-38; and National Institute for the Deaf, *All about the Deaf*, 1939.

Deafness, see EAR.

Deák, Ferencz (1803-76), famous Hungarian politician, an eloquent speaker, and devoted patriot. Elected to the National Diet (1832), he soon, as leader of the Liberal opposition, promoted measures for the amelioration of the peasant's lot, and the reversal of the law exempting the nobility from taxation. He was appointed minister of justice in Count Batthyány's Cabinet (1848), but resigned his portfolio when a committee was formed under Kossuth. Returned to the Diet by Pesth (1861) he became leader of the Moderate party, and drew up the famous address to the Emperor Francis Joseph, demanding the restoration of the constitution of 1848 and an independent Hungarian ministry. The pre-1918 dual system of monarchy estab. between Austria and Hungary, after Austria's defeat in the war of 1866, was the result of his tactful policy.

Deakin, Alfred (1856-1919), Australian statesman and orator, *b.* at Fitzroy, Melbourne; son of Wm. D., a native of Towcester, Northamptonshire, accountant to

a firm of coach proprietors. Educated at Melbourne Univ. Admitted to the Bar, Sept. 1877. Contributed non-political articles to the *Age* and the *Leader*. He represented Victoria in the Imperial Conference at London in 1887, and took a leading part in the cause of Australian federation as a member of the National Australian Federal Convention (1897), and of the Federal Council of Australia. He visited England a second time in 1900, as one of the Australian representatives in connection with amendment of the Commonwealth Bill. He succeeded Sir Edmund Barton as Premier of Australia, and held office three times between 1903 and 1910. Was appointed to represent the Commonwealth in the Imperial Conference, 1907. His works include *Irrigation in India* (1892); *Irrigation in Australia* (1893); and *Temple and Tomb in India* (1894). He was a Protectionist-Liberal-Imperialist: it is claimed for him that he was an imperialist before Rudyard Kipling began to boom imperialism; and for many years he preached the now settled dogma, 'White Australia.' Retired 1912, and in his last years suffered from loss of memory.

Deal (the valley, a form of Dale), seaport and watering-place in Kent. It is one of the Cinque Ports, and Walmer Castle, 1 m. to the S., is the official residence of the lord warden. The justices of the Cinque Ports still sit here. Henry VIII. built three castles in the neighbourhood: Walmer, Sandown, and D. Sandown Castle, at which Col. Hutchinson, governor of Nottingham Castle and tn. for the parliamentarians (see HUTCHINSON, JOHN), d., had to be destroyed as dangerous owing to the incursion of the sea. The N. portion is now groyned by the case system. D. was never a commercial port. It came into being when Sandwich harbour silted up in late mediæval times, and which for the same reason succeeded that of the Rom. Richborough. D. has no natural harbour, but lies along a steeply shelving bank up which could be hauled the small vessels ('hobbies') serving it. D. flourished as the landing and embarking point for the downs (with fishing as a side-line for its pop. of boatmen), and consequently grew up along the foreshore on the sites and lines occupied by mediæval seamen's huts. Its prosperity was coeval with sail and reached its peak in late Georgian times. The inhab. to-day are employed in boat-building, sail-making, and piloting, and are proverbially courageous. The par. church was not built till 1726, and is a square early Georgian building of simple merit, previous to which the very picturesque church of Old or Upper D. served the par. Old D. proper lies about a mile inland. There is a newer D., formerly known as Victoria Town, adjoining it to the S. in the vicinity of the castle built by Henry VIII. The intermediate area, formed by Middle Street, Coppin Street, Griffin Street, Dolphin Street, etc., is the historical D. It is proposed to redevelop the area extending from the sea front to the E. side of Middle Street, and along

the front from Brewer Street in the N. to Broad Street in the S., including the seaward ends of King Street and Broad Street. A part of this area was severely damaged by Ger. bombers in the Second World War. Pop. 14,000.

Dealfish, genus of deep-sea fish, of the sub-order Acanthopteri. Seven or eight species are known in European waters. The *vaagmaer* from Norway and Iceland is found sometimes round the coasts of Scotland. It is about 4½ ft. in length, and silvery in colour.

Deal (Wood), div. of a piece of timber, generally by sawing. It is a term usually applied to fir planks. It is obtained from *Pinus*, a genus of coniferous trees, several species of which yield valuable timber. From Scotch fir we get Russian D.; from *Pinus Strobus* white pine or D. from the U.S.A.; and there is also a species of yellow pine, which is exported from Russia, Norway and Sweden, and N. America, and is extensively used in house carpentry and shipbuilding. The planks are as a rule 7 in. wide, and in length varying over 6 ft.; less than 6 in. wide they are called battens. Under 6 ft. long they are D ends; 1½ in. thick, whole D.

De Amicis, Edmondo, see AMICIS.

Dean (Lat. *decanus*, from Gk. δέκα, ten), title of various eccles. functionaries. The title was originally derived from a Rom. civil officer of whom we find mention under Theodosius and Justinian. Its first use is found in the monasteries, where the *decanus* had the supervision of ten monks. When the canonical life was introduced among the clergy in residence at the cathedrals, the same title was often applied to the head of the chapter. Mention of an archipresbyter, a somewhat similar officer attached to a bishop's staff, occurs in the time of St. Jerome, who uses the term in his fourth epistle to Rusticus. The D. of a cathedral has entire charge of the fabric of the building, the arrangement of the services, and the management of property. There are also certain *Ds. of peculiars*, who have charge of particular churches not under episcopal supervision, such as the church of Battle in Sussex and the chapel royal. *Rural Ds.* have held office in the Eng. Church from very early times. Their duty is to attend to the concerns of parts of a diocese and report thereon to the bishop. The bishop of London is D. of the prov. of Canterbury. In the Rom. Church the D. of the Sacred College is the cardinal who has held rank longest. The office is generally held by the bishop of Ostia and Velletri.

Dean, East and West, pars. of W. Gloucestershire, England, forming part of the Forest of D. Much coal and iron ore abound, also clay, building stone, and ochre. Pop. of E. D. 15,000, and W. D. 12,000.

Dean, Forest of, tract of land and national park in W. Gloucestershire, England, situated in the Severn and Wye valley. It was a royal forest, and much of the timber was cut down by order of Charles I., but it was reafforested by order of Parliament after the Restoration. A

great portion of its timber was formerly utilised for the navy. It is divided into six walks of oak, beech, elm, etc. Much coal and iron abound throughout the forest. An account of the F. of D. has been pub. by H.M.S.O. as a national park guide.

Dean of Guild, in former days head of the numerous trade guilds in Scottish burghs. His function was to act as arbiter in all mercantile and maritime affairs within the burgh. His present powers consist mainly in regulating the erection of suitable buildings and condemning those unfit for habitation. See also DEACON OF A TRADE.

Deane, Richard (1610-53), Brit. admiral and general at sea. In 1644 he fought with the parl. army in Cornwall, and was also present at the battles of Naseby, Preston, and Worcester. He was appointed joint commander with Blake and Monck in 1653, and lost his life at the first battle off the N. Foreland.

Deane, large par. of Lancashire, partly in the bor. of Bolton. It is situated on the Lancashire coalfield, and there are cotton mills and bleaching works.

Deat, Marcel (1894-1945), Fr. politician, b. at Guérigny in Nièvre. Deputy in 1928, and minister for air in 1936, he accepted office under the Vichy Gov. in 1940, and founded the so-called 'unity' party, the Rassemblement National Populaire. He was executed for treason after the liberation of France.

Death. Under BIOLOGY it is pointed out that there is a continual change proceeding in every cell of any organism, waste matter being carried off and new deposited. Thus the cells of any organism are continually dying, and D. in this molecular sense is an essential to life. But it inevitably follows that, because of this process of metabolism, D. in the larger sense, i.e. the D. of the entire organism, must ensue. Thus D. would occur *naturally* by the gradual decay of the organism as in old age, but most organisms do not die in this way. The majority of Ds. are *accidental*, being caused by disease or violence. And D. thus caused must begin, as Bichat said, at the heart, the head, or the lungs. But these three *vital* organs, the heart, brain, and lungs, are mutually dependent, and while D. may be immediately caused by the failure of one of them, yet that one may have failed through an impairment in the functioning of another. D. from failure of the heart may be sudden, as in *syncope*, or gradual, as in the action of some poisons. Or, again, it may occur because the blood is insufficient in amount to excite the heart, as in the case of *anæmia*. D. from failure of respiration, or *asphyxia*, again, is chiefly due to violence, although certain poisons and *letanus* may cause it. D. which begins at the brain, or D. by *coma*, is caused either by violence, or by the action of poisons, or by the formation of clots of blood in the vessels.

The signs of approaching D. are sometimes well marked, as in natural D. from old age, by a vacancy in the intellect, and an atrophy of the senses and sentiments.

Again, delirium and even dementia, or imbecility, are often precedents of D. Similarly, the muscles relax, and are incapacitated, the voice becomes low, and the heart either begins to fail gradually, the pulse becoming faster but weaker, or it may beat irregularly though not weaker, or it may suddenly contract violently and stop. The respiration again may be hurried and panting, or slow and laborious, while the 'death rattle,' as it is commonly termed, is caused through the passage of air from the lungs through the fluid (mucus) which has collected in the air passages. The signs of actual D. are: (1) *The extinction of the vital functions*. The cessation of circulation and respiration may not always signify D., for they may, as in drowning and in newly born infants, be entirely suspended for a while and then restored, or they may even be reduced so low that while they have not ceased they may yet be incapable of detection. Loss of heat is a tolerably certain sign, although in exceptional cases the temp. may rise after D. Certain signs of D., however, are the loss of contractility of the muscles on application of a galvanic current. (2) *Changes in the tissues*. The most important of these is, of course, the *rigor mortis*, which, commencing in the neck and trunk, proceeds through the upper and then the lower extremities, finally passing away in the same order after from twenty-four to thirty-six hours, is a sure sign of D. (3) *Changes in appearance*. These are well marked, but the chief are the lividity of various parts of the body, and the appearance of a green tint on the skin of the abdomen, accompanied by a separation of the epidermis.

For conceptions of D. held by primitive and civilized races, see BURIAL CUSTOMS; IMMORTALITY; PHILOSOPHY; RESURRECTION; TRANSMIGRATION, etc.

Death Duties. These include, since the passing of the Finance Act, 1894, and the Finance (1909-10) Act, 1910, estate duty, legacy duty, succession duty, and increment value duty. Where the deceased d. on or before Aug. 1, 1894, his estate was liable, in addition to legacy and succession duties, to probate duty, account duty, and an additional duty imposed by the Customs and Inland Revenue Act, 1889. In extension of both estate and succession duties. The effect of the Act of 1894 was to supersede probate duty and account duty by estate duty, and to fix a date for the expiration of the additional duties imposed by the Customs and Inland Revenue Act, 1889.

Estate Duty is a comparatively new duty imposed by the Finance Act, 1894, as amended by subsequent Acts. It supersedes probate duty, account duty, additional succession duty, the temporary estate duty imposed in 1889, and 1 per cent legacy or succession duty. Although it is a substitute for probate duty, it taxes property which escaped the latter duty altogether. It is payable whenever property changes hands on death without regard to its ultimate destination, and the amount of the duty is unaffected by any

testamentary disposition. It is also leviable on personal property situate abroad where the deceased was domiciled in the United Kingdom. It is calculated on the principal value (i.e. for all practical purposes the market value at the date of the death of deceased) of all property, real or personal, settled or not settled, which passes on death. It is not imposed on estates which do not exceed £2000, and the rate of duty payable is shown below: In the case of every person dying after April 10, 1946, where the principal value of all property, real or personal, settled or not settled, passing on the death of such person,

exceeds:	per cent	exceeds:	per cent
£ 100	1	£ 75,000	23.4
500	2	85,000	24.7
1000	3	100,000	26
5000	4	120,000	28.6
10,000	6	150,000	31.2
12,500	7.2	200,000	33.8
15,000	8.4	250,000	36.4
18,000	9.6	300,000	39
21,000	10.8	400,000	41.6
25,000	12.0	500,000	44.2
30,000	13.2	600,000	46.8
35,000	14.4	800,000	49.4
40,000	15.6	1,000,000	52
45,000	16.8	1,250,000	54.6
50,000	19.5	1,500,000	58.5
55,000	20.8	2,000,000	65
65,000	22.1		

Estate Duty in respect of agric. property is to be charged in part on agric. value at the rates set out in the Finance Act, 1919, in lieu of the above rates. (Small estates up to £300 and £500 gross are charged, at the option of the accounting parties, either by the above scale, or with fixed duties of 30s. and 50s., and are exempt from all other D. D.).

Liability to the duty depends on whether the property passes or can be deemed to pass on death, the duty being leviable, not by reason of some person *succeeding* to it on the death, but on account of a *change of possession* consequent on the termination of an interest by reason of the death. Property passing on the death of the deceased embraces property of which the deceased was competent to dispose at his death and property over which he had no power of disposition. The latter category relates principally to settled property in which the deceased or any other person had a limited interest ceasing at the death of the deceased, and the duty is aimed not at that limited interest, but at the property out of which it was carved, and the quantum of property taxable depends on the extent to which a benefit accrues by the cesser of such limited interest. Property in which the deceased or other person was only interested as holder of an office or as trustee, or recipient of the benefits of a charity, or as a corporation sole (see CORPORATION), are excluded from the operation of this principle and are exempt from the duty. Gifts made by the deceased during his lifetime for public or

charitable purposes are charged unless they were made more than twelve months before death; other gifts are charged, unless made more than three years before death; gifts made in consideration of marriage, or as part of deceased's reasonable normal expenditure, are excepted. Gifts not exceeding £100 in the aggregate in value or amount are also excepted.

Before the Finance Act, 1896, the duty was leviable on the cesser of an interest created by the settlor himself where the property reverted back to him; that Act, however, excludes property reverting to a settlor on the determination of a life or other limited interest created by him; property of which the settlor acquires the immediate reversion by reason of the determination of an intervening life-estate created by him in succession to a prior settlement on himself for life, and rents of real or leasehold property to which the deceased was entitled in right of his wife and which pass to his widow. The Finance Acts, 1894, 1896, and 1910, create a number of exemptions in addition to those indicated above; among which are included property of common seamen or soldiers dying in service, works of art given to the nation, and pensions or annuities payable by the Indian Gov. to the widow or child of a deceased officer of such gov. Property given absolutely before the death of the donor for the use of his majesty is exempt. Under the Finance Act, 1937, land given to the National Trust is also exempted—subject to a number of highly technical conditions set out in the Act. Reference should also be made to the provisions in the Finance Act, 1938, governing estate duty on cesser by death of a limited interest in unascertained residue. The legal personal representative of the deceased is responsible for the duty on the property of which the deceased was competent to dispose, and he must pay it out of the residuary personality. The duty on property over which the deceased had a general power of appointment is only payable out of the residue when the power has been exercised and an executor appointed; if not, it is payable ultimately by the person to whom the property passed in default of appointment, and may be recovered from such person by the executor. In all other cases estate duty is payable by the persons to whom the particular property eventually goes, whether it be paid in the first instance by the executor or other personal representative or not. For the purpose of ascertaining the *rate* of the duty on each part of the property, the principal values of the different parts, subject to certain exceptions, are aggregated. The exceptions are property in which the deceased had no interest; real and personal property the combined value of which does not exceed £1000 exclusive of property settled otherwise than by his will, and objects of scientific or historic interest settled on different persons so as to be enjoyed by them in kind successively. In computing the principal value, a deduction may be made for funeral expenses.

debts, and incumbrances. The duty on real estate may be paid by eight yearly or sixteen half-yearly instalments, and that on certain annuities may at option be paid in four yearly instalments, 2 per cent interest being charged on all unpaid portions of duty starting twelve months after death, and part of the land liable to estate duty may be accepted by the Treasury in lieu of the duty. There are many refinements on the law of estate duties in the Finance Act, 1940, and reference should be made to that Act, Part IV., inasmuch as the provisions are of a highly technical character. Under that Act, where a life interest has been disposed of or determined (otherwise than by the expiration of a fixed period at the expiration of which the interest was limited to cease) such interest will be regarded as included in the property passing on the death; but where the disposition or determination was bona fide effected or suffered (as the case may be) three years before the death (or, if it was effected or suffered for public or charitable purposes, one year before the death) then the interest will not be included in the estate of the deceased. There is another important series of provisions in the Act affecting shares in companies. Where a person, dying after the commencement of the Act (June 27, 1940), has made to a company a transfer of any property (other than an interest limited to cease on his death or property which he transferred in a fiduciary character), and any benefits accruing to him in the three years ending with his death, the assets of the company will, for the purposes of estate duty, be regarded as included in the property passing on his death, or, in other words, will be a charge on the company's assets, to an extent calculated by reference to the proportion that the aggregate amount of the benefits accruing to the deceased from the company bore to the net income of the company. There are a number of sections in the Act (and some amendments in the Finance Act, 1944) governing the mode of valuation for estate duty of shares and debentures of companies whose assets fall within the scope of Part IV. of the Act. The following are the sums which have been paid into the national exchequer under estate duty in the given year ended March 31: 1935, £71,590,996; 1936, £78,136,523; 1937, £79,980,756; 1938, £78,541,472; 1939, £82,659,843; 1940, £89,045,451; 1941, £99,769,090; 1942, £108,559,893; 1943, £135,925,929; 1944, £156,622,912.

Legacy duty is a tax on the interest of the individual and beneficiary in personal property devolving under a will or on intestacy. The personality liable to legacy duty excludes leaseholds and moneys to arise from a sale of real estate (see CONVERSION), but includes all other personality and real property regarded in equity as already converted into money. Where the value of the whole personal estate is under £100 no duty is payable. Specific legacies under the value of £20 are not liable, and there are a few other

exemptions. Where a legacy is expressly given free of duty, the duty is payable out of the residuary personality. In all other cases it is deducted by the executor, or other personal representative, from the amount of the legacy or share accruing to the legatee or next of kin. The duty is a percentage on the value of the legacy calculated according to the degree of the relationship between the testator and the legatee as follows: husband or wife and lineal ancestors or descendants, 1 per cent; brothers and sisters or their descendants, 5 per cent; all other legatees, including strangers, 10 per cent. Under the Finance Act, 1910, the husband or wife of the testator, or intestate, is exempt where the estate does not exceed £15,000 in value whatever may be the value of the legacy given to the surviving spouse. No duty is payable by the surviving spouse on a legacy under £1000 in value whatever the value of the whole estate, nor by the widow of the deceased, or a child under twenty-one on a legacy under £2000.

Succession duty is also a tax imposed on the interest of the beneficiary. It is chargeable on every succession to real or personal property, except as to personality liable to legacy duty. Leaseholds are liable to succession but not to legacy duty. Succession duty, like legacy duty, is payable only on property coming under the jurisdiction of the courts of the United Kingdom. For the purposes of succession duty, the date of the instrument conferring the succession is immaterial. The duty is not payable, in the case of real estate, devolving to heirs or devisees, until the beneficiary becomes entitled in possession. No duty is payable where the principal value of all the successions is under £100. The rates, which are calculated according to relationship, as in the case of legacy duty, vary according to the date of the death of deceased. If the deceased *d.* before July 1, 1888, the rates are the same as those for estate duty, provided the property in question be also liable to estate duty. If not liable to estate duty, and the deceased *d.* after July 1, 1888, the property is liable to the additional rates imposed by the Customs and Inland Revenue Act, 1888. The rates would then be: 1½ per cent in the case of husband or wife, lineal ascendants and descendants, 4½ per cent brothers and sisters and their descendants; 6½ per cent uncles and aunts and their descendants; 7½ per cent great-uncles and great-aunts and their descendants; and 11½ per cent in other cases. Where the deceased *d.* between June 1, 1889, and June 1, 1890, and the value of the succession is over £10,000, an additional duty, imposed temporarily by the Customs and Inland Revenue Act, 1889, at the rate of 1 per cent, is payable. Leaseholds passing under a will or on intestacy and property liable to account duty are exempt from both the additional rates imposed by the Act of 1888 and the 1 per cent temporary estate duty, provided, in the latter case, the temporary estate duty has actually been paid. Where an illegitimate child (or the spouse

or issue of an illegitimate child) takes any interest in real or personal property under the intestacy of the mother of the child or under a disposition made by her; or where the mother of an illegitimate child takes an interest in real or personal property under his intestacy or under a disposition made by him (or his issue); then, any succession or legacy duty which (after 1944) becomes leviable in respect of the taking of the interest, will be payable at the same rate as if the child had been born legitimate.

The method of valuing successions to realty before the Finance Act of 1894 was to capitalise the beneficiary's interest as if it were in the nature of an annuity equal to the ann. value of the property; this was done, although the beneficiary was entitled to more than a life estate, on the principle that whatever the quantum of his estate, he could not enjoy the succession for a longer period than his own life. Since 1894, i.e. where the succession arises on a death occurring after Aug. 1, 1894, and the beneficiary is competent to dispose of the property, the duty is charged on the principal value after deducting the amount of estate duty. The duty in either case is payable by eight equal half-yearly instalments, the first being due at the end of twelve months from the date of the beneficiary entering into possession. As in the case of estate duty, the person liable may agree with the Treasury to pay the whole or part of the duty in the form of real or leasehold property. In the case of a succession to personality, the beneficiary of an interest limited to him for life only pays duty on the principal value of the ann. income. If entitled absolutely, he pays on the principal value, and the duty becomes payable immediately. The incidence of the succession duty has been particularly severe in the case of large landed estates, and where a number of deaths occur in the same family within a relatively short term of years the amounts paid by each successor are enough sometimes to cripple the estate for years. To avoid this heavy incidence there has been during the past decade or two a tendency to turn large estates into limited liability companies divided into so many shares which are usually held by members of the family, who are beneficiaries under the will. By this means large sums are saved in succession duties, but legislation has been recently passed to restrain what was really tantamount to a palpable evasion of the duty. The fact remains, however, that the severe taxation to which large landed estates have been subjected in late years has led to a breaking up of these estates, and a phase of social life which has lasted for sev. centuries in England is slowly but surely passing. The following are the sums which have been paid into the national exchequer as legacy and succession duties in the given years ended March 31: 1935, £9,593,152; 1936, £9,813,765; 1937, £10,800,726; 1938, £10,521,065; 1943, £10,586,686; 1944, £10,931,544; 1945, £11,200,900; 1946, £9,708,629; 1947, £11,483,716; 1948, £12,552,344.

In the 1949 budget it was proposed to consolidate the existing estate duty, legacy duty, and succession duty into a single duty by abolishing the legacy and succession duties and compensating the Exchequer by an increase in the rates of the estate duty. It was also proposed to substitute for the existing relief in respect of the agric. value of agric. property a new relief in the form of an abatement of 45 per cent of the duty chargeable. It was proposed to raise the exemption limit for out-and-out gifts *inter vivos* from £100 to £500. For the proposed increased rates of estate duty see ESTATE DUTIES.

Death, Registration of, see REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

Death's-head Moth, or *Acherontia atropos*, curious species of the family Sphingidae. It is the largest Brit. hawk-moth with downy wings measuring 5 in. from tip to tip, and its body is marked as though with a skull. When it is at rest it sometimes gives out a squeaking noise, produced probably by rubbing the palpi upon the proboscis. The caterpillar is about 4 in. long and is brightly coloured, feeding on potato plants.

Death Valley, or the Amargosa Desert, gloomy tract of desert land from 100 to 250 ft. below the level of the sea, situated in Inyo co., California, U.S.A. The Amargosa R. flows into it. It has a wide variety of bird life, but plant life has only a wide-spaced precarious footing. The first atom bomb tests were carried out there. See D. C. Peattie, *The Road of a Naturalist*, 1946. (See illustration on p. 568.)

Death Watch, name of a certain class of coleoptera or beetle (*Anobium*). They are about $\frac{1}{2}$ in. long, with small, round, and convex bodies of light brown colour. They are found in old wainscoting, and the wood dust they make in the process of their burrowings can often be seen near old woodwork. When disturbed they simulate death. Many unfounded superstitions have grown up around them; the ticking noise which they make by striking the head against wood is really concerned with their reproduction.

Deauville, fashionable seaside resort in the dept. of Calvados, France, on the estuary of the Touques. In the Second World War D. was occupied and fortified by the Gers. who mined its beach, built anti-tank traps along the famous Terrasse de la Mer, and converted luxury villas and beach bars into blockhouses which formed part of Hitler's W. wall. The gardens were riddled with dug-outs and fortifications, the tennis courts were mined, and the racecourse was dug up. But by May 1946 hundreds of Ger. war prisoners had cleaned up the tn. for its first post-war season. Typical of speedily effected changes was the bar of the Normandy Hotel, whose windows had been bricked up by the Gers., which had by that time stained-glass windows, locally made, and depicting the great battles of Normandy of 1944. Pop. 4800.

De Bary, Heinrich Anton (1831-88), Ger. botanist and biologist, who made

valuable discoveries in mycology and bacteriology, demonstrating the power of parasitic growths in the production of disease. Chief works: *Die Mycetozoen* (1864); *Beträge zur Morphologie und Physiologie der Pilze* (1864-82), and *Vorlesungen über Bakterien* (1885) (Eng. trans., 1888).

De Bay, Michael, *see* BAIUS, MICHAEL.

charges its property and assets, and covenants to pay the holder the sum secured by the D. at a fixed date, together with interest up to that time. Under the Companies Acts, every D. must bear the registrar's certificate of registration. There are registered Ds. and Ds. to bearer. The first can only be transferred in the company's books. Ds.

U.S. Information Service, American Embassy
DEATH VALLEY, CALIFORNIA

Debbieg, Hugh (1731-1810), Brit. general and cadet gunner who was present at the sieges of Louisburg and Quebec under the commandship of Wolfe, and served with distinction at L'Orient (1746) and Bergen-op-Zoom (1747). A secret mission to France and Spain occupied him during 1767, and he was entrusted with the protection of London in the Gordon Riots (1780).

De bene esse, technical legal expression equivalent to 'provisionally,' and applied to the conditional doing of an act for the time being, subject to such act being disallowed on a fuller examination of its propriety. The term is particularly applied to the provisional examination of a witness before a trial where it is feared that the witness, by reason of age or illness, may be unable ever to appear at the trial (*see* DEPOSITION). A verdict taken *de bene esse* is one that may be reversed on further consideration.

Debenture (Lat. *debentur*) is etymologically the first word in a document formerly used by the Crown admitting indebtedness to its servants or soldiers. Now we mean a deed by which a company

to bearer are negotiable and pass by delivery with coupon attached for interest. It is a term used by customs officers for a certificate entitling an exporter of goods to receive bounty or drawback on exported goods.

Debit and Credit, *see* under BOOK-KEEPING.

De Bono, Emilio (1866-1944), It. general and Fascist politician, b. at Cassano d'Adda. He took part in the so-called march on Rome in 1922, was later governor of Tripolitania, and foreign minister. He commanded the It. forces in Abyssinia in 1935, and wrote an *apologia* (1936). He also wrote *Anno XIII: the Conquest of an Empire* (1937). Voted against Mussolini in 1943 and, after trial by a special court, was shot as a traitor on Jan. 10, 1944.

Deborah (Heb. 'bee'), famous Israelite prophetess and 'judge,' wife of Lapidoth, who incited Barak to free her people from the Canaanite oppression which they had endured for twenty years. She joined Barak in leading an army against the Canaanites under Sisera, and completely vanquished them in the plain of Esdraelon.

Sisora, a fugitive, was murdered in his sleep by Jacl, wife of Heber, the Kenite. The triumphant outcome of this battle ensured a long peace. The famous 'Song of Deborah' commemorating the victory is regarded as one of the oldest recorded pieces of Scripture.

Debra Tabor, or Deora Taboor, large dist. and tn. of Abyssinia, E. Africa, 35 m. E. of Lake Demben.

Debrecen, or Debreceen, cap. of co. of Hajdu, Hungary. It is the railway and commercial centre for the great plain, or steppe, E. of the Tisza, in which it is situated. Agriculture, cattle- and horse-breeding, manufs. of soap, saltpetre, and tobacco-pipes flourish. Though it is a scattered, rambling place, there are some fine public buildings, including a Protestant college, with library and museums, the finest educational estab. in the country. It is the headquarters of Protestantism and is often called Calvinist Rome. There are four ann. fairs and a famous swine market. Pop. 127,000, of whom 66 per cent are Protestant, 20 per cent Catholic, and 10 per cent Jews.

Debrosses, Charles (1709-77), Fr. lawyer and historian, b. and educated at Dijon. He became a judge in his native tn., and gained the friendship of such distinguished men as Diderot and Buffon. He wrote *Histoire des navigations aux terres Australes* (1756), employing the names of Australia and Polynesia for the first time. He contributed articles on language to the encyclopedia of Diderot and Voltaire, and collected 700 fragments of Sallust which he pub. (1777), *L'Histoire du VII^e Siècle de la République Romaine, par Salluste*.

Debs, Eugene Victor (1855-1926), Amer. railway labour leader, b. at Terre Haute, Indiana. Served as a locomotive fireman. Appointed to Indiana state legislature (1885); president of Amalgamated Railway Union (1893-97) for whom he won a strike on the Great N. Railway. Joined the Socialists in 1897. Socialist candidate for president: 1900, 1904, 1908, 1912, and 1920. From 1914 he ed. the *National Rip-Saw*, St. Louis. In 1918, being opposed to the war, he was sentenced to ten years' imprisonment for obstructing recruiting. It was during his incarceration that he was for a fifth time nominated for president. He was released in Dec. 1921. See *Life Writings and Speeches* (3rd ed.), 1910, and also M. Coleman, *Eugene V. Debs, a Man Unafraid*, 1930.

Debt, liquidated or determinate sum of money due from one person to another. D. includes an obligation to pay money on a contingency which must happen, but not where the event may not happen, e.g. a contract of suretyship is not a D. Ds. may be classified into: (1) Ds. of record, i.e. Ds. evidenced by the records of a court of a record, the principal being recognizances, and judgment Ds.; (2) specialty Ds.—that is, Ds. created by deed or confirmed by special evidence under seal, such as a covenant to pay rent on a lease, and (3) Ds. created by simple contract. Interest is payable on a D. only under an express or implied contract

to pay interest, by trade usage, under a written contract to pay money on demand or at a fixed date, on money fraudulently withheld, in the case of Ds. secured on land, under the Civil Procedure Act, 1833, where the jury allows it, and on all judgment Ds. Ds. are recoverable (a) by action in the high court, whatever the amount. Under Order XIV. of the Rules of the Supreme Court the creditor may apply summarily for final judgment by specially endorsing his writ of summons for the amount and by filing an affidavit stating that in his belief there is no defence to the action, when he will be allowed to sign final judgment unless the debtor gets conditional or unconditional leave to defend by disclosing a *prima facie* defence; (b) by action in the co. court where the D. does not exceed £100, or equitable debts, e.g. in a foreclosure action, up to £500. Actions in the high court may be remitted to the co. court where the creditor's claim is not over £100. There is an analogous procedure by default summons to the summary process in the high court. Actions on judgment Ds. and specialty Ds. are barred after twelve years, and those on simple contract Ds. after six (see LIMITATIONS, STATUTES OF). Judgment Ds. have priority over specialty and simple contract Ds. against the personal estate of a deceased debtor, unless the estate is insolvent, when, if administered by the personal representatives, rates and taxes, wages or salaries of clerks or servants up to £50, and wages of labourers or workmen up to £25, must be paid first, but if administered in bankruptcy, the three classes are payable *pari passu*. Ds. being choses in action are assignable under the Judicature Act, 1873, by writing signed by the assignor, and written notice of the assignment must be given to the debtor. There is now no imprisonment for debt, except on a judgment debt, where a debtor can pay and will not or has voluntarily put it out of his power to pay. In Scottish law Ds. charged on personality are called moveable Ds., and those charged on land heritable Ds. They are recoverable either in the court of session or the sheriff court, there being analogous provisions as to jurisdiction to those which obtain in England. Following the Rom. law actions are only barred by long prescription. The process by which a creditor is allowed to detain the goods of his debtor, which happen to be in the hands of a third party, is by arrestment.

Debt Conversion is the practice adopted by national govts. to reduce the rate of interest payable on national loans raised at periods when money was comparatively dear. Wars are the prin. causes of national debt, and in times of war govts. forced by the urgent need of raising money at very short notice, offer rates of interest which are higher than would be obtained in times of peace. And when the costly business of war is terminated, govts. are faced with long-dated loans bearing high rates of interest. Then the practice of D. C. begins. The hist. of Great Britain for the past 200 years is marked by

numerous operations of this character, and it will be noticed that the practice is most frequent after long and costly wars and in periods of cheap money. For the first conversion of Brit. national debt we must go back to the reign of Queen Anne, when a heterogeneous lot of floating liabilities was converted into £9,177,968 of South Sea Companies 6 per cent stock. The year 1760 saw a conversion of £54,413,433 4 per cent stock into the same amount of new stock. This, however, was to bear latterly the lower rate of 3 per cent. We now come to the period following the close of the Napoleonic wars, when numerous conversions took place. In 1817 the Irish debt of £103,033,750 was converted into debt of the United Kingdom. In 1822 £149,627,867 5 per cent stock was converted into £157,109,217 4 per cent stock, and two years later £70,098,935 4 per cent stock was converted into an equal quantity of stock bearing interest at 3½ per cent. In 1830 £150,790,176 was converted as to a small part into 5 per cent stock at a price of 70, and as to much the greater part into 3½ per cent stock at par. A large conversion took place in 1844, when £248,757,311 3½ per cent stock was converted into new stock bearing interest at the rate of 3½ per cent for ten years and 3 per cent for twenty years. In 1853 Mr. Gladstone, in pursuit of thrift, saw to the conversion of £3,063,906 3 per cent stock. In 1883 £70,241,908 3 per cent stock was converted into terminable annuities, and in 1884 £23,362,596 3 per cent stock was converted into 2½ per cent stock at 102 and 2½ per cent stock at 108. To Mr. Goschen belongs the credit of the last big conversion of the nineteenth century. On March 9, 1888, he brought forward in the House of Commons a plan for the conversion of the different 3 per cent stocks into one class of stock, to bear interest payable quarterly at the rate of 3 per cent for the year ending April 5, 1889, 2½ per cent for the next fourteen years, and 2½ per cent for the following twenty years ending April 5, 1923, and thereafter until redemption. This new stock was to be known as 'Two and three-quarters per cent consolidated stock' until 1903 and afterwards as 'Two-and-a-half per cent consolidated stock.' Mr. Goschen's proposals became law on March 27, 1888, and the scheme was highly successful. Coming down to more recent times, we find that the next series of conversions in Great Britain took place after the close of the First World War. After the outbreak of war in Aug. 1914, the Brit. Gov. had to borrow so heavily that on March 31, 1923, the total national debt stood at the enormous figure of £7,742,233,286. This amount included the capital liability (estimated) in respect of terminable annuities, £11,015,000 owing to the Bank of England and £2,630,769 owing to the Bank of Ireland. The extent of this liability might well have appalled the Treasury, but the process of conversion began. £255,000,000 2½ per cent consolidated stock, £137,470,000 3½

per cent war loan 1925-28, £8,000,000, annuities 2½ per cent, and £1,000,000 annuities 2½ per cent were converted into 4½ per cent war loan 1925-45 under an option extended to subscribers when that issue was made in 1915. In 1917, when 5 per cent war loan 1929-47 and 4 per cent war loan 1929-47 were issued, an option to convert was given to holders of 4½ per cent war loan 1925-45. A certain quantity of 5 per cent exchequer bonds 1919, 1920, 1921 and 6 per cent exchequer bonds 1920 were converted into the new war loans. Four per cent funding loan 1960-90 was issued in June 1919, and the option to convert was offered to holders of 4½ per cent war loan 1925-45; 5 per cent exchequer bonds 1919, 1920, 1921, and 1922; 6 per cent exchequer bonds 1920; 4 per cent national war bonds 1st, 2nd, and 3rd series. The upshot of the option was that £120,617,000 was converted into funding loan and £72,203,000 into victory bonds. In 1921 holders of national war bonds due at latest in Sept. 1925 were invited to exchange their holdings for 3½ per cent conversion loan redeemable at the earliest in 1961, and as a result bonds to the value of £163,328,133 were converted. Other large conversions followed, and on June 30, 1932, money being comparatively cheap, the gov. gave notice of its intention to redeem the whole of the 5 per cent war loan at par on Dec. 1, 1932, holders being invited to continue in the loan at the reduced rate of 3½ per cent as from Dec. 1 and to receive a cash bonus of £1 per cent; i.e. those who accepted this offer of conversion into 3½ per cent by July 31, 1932, were to receive £6 per cent for the whole year. But holders who elected to take payment in cash on Dec. 1, on which date the 5 per cent loan ceased to exist, had to notify the Bank of England of their election by Sept. 30, and holders who failed to send notification of their acceptance of the offer by Sept. 30 were to be taken as having accepted it. This conversion loan of 3½ per cent has no fixed date of redemption but the gov. has the right to redeem it in whole or in part after twenty years. This conversion scheme was estimated to save annually £30,000,000 gross and £23,000,000 net. Pre-war conversion loans repaid since Sept. 3, 1939 (in £100,000's), are summarised in exchequer returns for Aug. 1939 to Aug. 1945 as follows: 4½ per cent conversion loan 101.5; 1 per cent treasury bonds, 100; national savings bonds, 3.6; 5 per cent conversion loan 317.5; 2 per cent conversion loan 244.8; 2½ per cent national defence bonds 20; sinking fund, 80. Total sum repaid £37,400,000.

Debt, National or Public. see PUBLIC DEBT.
Debts, Interallied. At the close of the First World War (1914-18), when the Allies were freed from the tension and strain of actual fighting, the respective govts. were able to devote themselves to the solution of problems which had arisen as a consequence of four years of intense warfare. Great Britain had pledged her credit, not only on her own behalf, but

also on behalf of her Allies. She owed huge sums to U.S.A., and huge sums were owing to her. Arrangements had to be made for the settlement of these colossal debts and delicate negotiations entered upon. In 1922 the question of debt settlement was brought forward as a matter of urgency by U.S.A., which was the sole purely creditor nation amongst the Allies. This brought forth the Balfour note, addressed by Lord Balfour on behalf of the Brit. Gov. to the Fr. ambas. and to the representatives of the various European govts. which were interested. It was set out in this declaration that although Great Britain had lent more than she had borrowed, she was in the main favourable to the cancellation of the war D. which had been incurred as between the Allies. She could not, however, agree to the cancellation of D. owing to her from European nations without a similar concession being made by America in respect of Brit. D. An agreement between Britain and America was concluded in 1923 by which the Brit. debt was funded. Bonds to the value of \$4,600,000,000 were issued dated Dec. 15, 1922, and maturing Dec. 15, 1934, interest being payable half-yearly at the rate of 3 per cent per annum from Dec. 15, 1922, to Dec. 15, 1932, and thereafter at the rate of 3½ per cent per annum until the principal should be repaid. The agreement provided for the repayment of the principal by ann. instalments increasing from \$23,800,000 in 1923 to \$175,000,000 in 1934. This agreement was concluded on behalf of the Brit. Gov. by Mr. Stanley (later Earl) Baldwin. In 1927 an agreement was concluded for the settlement of the war debt of Yugoslavia to Great Britain. Funding agreements were signed in respect of all the allied war D. to Great Britain except that of Russia.

When the Nov. 14, 1932, payment of debt to America fell due, the position was: total funded debt, \$4,600,000,000; principal paid off, \$202,000,000; interest paid, \$1,149,700,000; total paid by Britain, \$1,351,700,000. Notes were exchanged without moving the U.S.A. Gov. in its determination to exact the debt. The Brit. Gov. paid \$19,500,000 in gold, intimating that the payment must not be regarded as implying a revival of the old system, but was to be taken into account when arriving at a final settlement. In 1933 the Brit. Gov. reopened talks in the hope of reaching a final settlement with America, which should not involve a resumption of the claim on Germany for reparations. The U.S. Gov. made no proposals with the result that Britain offered token payments on account of instalments falling due in June and Dec., pending a discussion of a settlement. The position in June 1934 was that Britain had paid well over \$328,000,000 to America in respect of war D. funded at \$4,600,000,000 (\$290,000,000); yet not much more than 4 per cent of the principal had been paid off. Meanwhile other countries were adopting the Brit. attitude. The Fr. Gov. in 1933 refused to pay any instalments either in June or

Dec. upon even the commercial portion of her war debt. America sent out formal notices towards the end of 1934 reminding foreign debtors of the total of \$30,945,000 (or \$154,726,976) due for the Dec. 1934 instalment. The notices included a 'bill' to Great Britain for \$117,670,765 (£23,534,000). Notices continued to be served in the ensuing years by the U.S. Gov. to the Brit. Gov., and the Brit. *chargé d'affaires* in Washington continued to make the customary declaration that the Brit. Gov. would be willing to reopen discussions 'whenever circumstances were such as to warrant the hope that a satisfactory result might be reached' (1938).

The following table of Brit. war debt settlements shows the total debts as funded and the total annuities payable to Great Britain as at the beginning of 1933:

Debtor	Total Debts as Funded £'000	Total Annuities Payable £'000
France	599,628	709,500
Italy	560,000	248,000
Yugoslavia	25,591	32,800
Greece	21,441	25,550
Rumania	18,448	31,250
Portugal	20,134	23,975
	<u>1,245,242</u>	<u>1,159,075</u>

The following table shows the ann. payments due to and from Great Britain — under the war debt settlements and the Young Plan (q.v.):*

Year ending Dec 31	War debt receipts £. (millions)	Reparation receipts £m (millions)	Payment to U.S.A. \$(millions)
1935	18.25	444.8	181.66
1945	18.9	439.1	182.00
1955	18.9	444.2	181.35
1965	20.4	400.6	180.63
1975	20.65	344.6	185.93
1985	20.65	—414.1†	—

* The above figures take no account of the repayment of the instalment suspended during the 'Hoover' year, 1931-32.

† This figure corresponds to the excess under debt receipts of Great Britain over war debt payments in 1985-86.

The following statement shows the govts. which owed money in account of war debts to the U.S.A. payable during the first half of 1933 the full amounts of such moneys which were due to be paid, and the amounts actually paid (\$5 is £1 at par).

	Full amount \$	Amount paid \$
Great Britain	75,950,000	10,000,000
France	40,738,567.5	—
Italy	13,545,437.5	1,000,000
Belgium	6,325,000	—
Poland	2,953,562.5	—
Czechoslovakia	1,500,000	180,000
Rumania	1,000,000	25,000
Yugoslavia	275,000	—
Estonia	228,182.5	—
Finland	148,592.5	148,592
Greece	130,000	—
Lithuania	123,535	—
Latvia	119,609	6,000
Hungary	32,025	—

Deburau, Jean Baptiste Gaspard (1796-1846), famous Fr. mimic, b. in Bohemia, son of a Fr. soldier. As a youth led a wretched life with travelling troupes; but, having learned everything from balancing a ladder on his nose to *le saut périlleux*, he hit on the idea of resuscitating a Rom. pierrot worthy of the days of Bathylus. Thus, with beflowered visage, he came to the Funambules theatre, where Charles Nodier recognised his genius. Aided by his power as a farceur, his sang-froid, lively features, and artistic intelligence, he quickly became the rage of Paris. Gautier, indeed, ranked him as an actor with Talma and Rachel—a happy and rare accident. His son Charles (1829-73) was also well known as a pierrot at the Funambules.

Debussy, Claude-Achille (1862-1918), Fr. musical composer, b. at St. Germain-en-Laye, studied at Paris Conservatoire from age of eleven—under Lavignac, Marmontel, and Guiraud. Under the tuition of Massenet, he won the Grand Prix de Rome with his cantata *L'Enfant prodigue* in 1884. His personality dominated music in Europe for a quarter of a century, and it has been said that D. alone is responsible for the fact that Fr. music is once more 'an example and an ornament to Europe' (M. André-Saurez). He revitalised most forms of musical art, whether symphonic, dramatic, pianoforte, or lyrical. For his sheer technical skill combined with elusive originality, and an adroit use of overtones and of unusual chords, he has been compared to Berlioz, and in point of innovation his legacy to music is the completion of the reform in harmony begun by Chabrier, Gabriel Fauré, and others. After 1884 he lived in Italy for some years, where it is said he tried to forget the cramping influence of the old formulas and to strike out new laws more adapted to his intuition. One result was *Printemps*, an orchestral suite sent from Rome to the Institut, which appears to have shocked that body by its harmonic iconoclasm. In one point D. was well ahead of other innovators—he was not an innovator by mere caprice. He appreciated the oneness of all art; and he saw that music must develop along lines parallel to those along which poetry or painting develop. His next productions, *Ariettes oubliées*, *Cinq Poèmes de Baudelaire*, and *Suite bergamasque*, show the break-away from romanticism towards the direct interpretation of feeling. He composed his celebrated *Prelude à L'Après midi d'un faune* under the inspiration of Mallarmé, a work as original as the *Symphonie fantastique* of Berlioz and baffling for the apparent simplicity with which it succeeds in reflecting the feelings, now ardent, now sensuous, now profound, which it is intended to express. His next masterpieces were *Proses lyriques* (1894), *Chansons de Bilitis*, and *Nocturnes* (1898), all impressionist pieces; and in 1902 his one opera *Pelléas et Mélisande*, an opera which frankly discards not only the old reputedly archaic forms, but also the lyrical dramatic form of Wagner. It is regarded by some critics as exhibiting a

perfect balance between poetry and music. The only other work he wrote for the theatre was the incidental music for d'Annunzio's *Martyre de Saint Sébastien* and a ballet *Jour*, composed for Diaghilev. His later work was mainly chamber music and orchestral, including *La Mer*, *Iberia*, and *Rondes de Printemps*. See L. Laloy, *Claude Debussy*; R. Rolland, *Musiciens*

CLAUDE-ACHILLE DEBUSSY

d'aujourd'hui, 1908; L. Vallas, *Claude Debussy: his Life and Works* (Eng. trans. 1933); O. Thompson, 1937; and E. Lockspeiser, *Debussy* (Master Musicians), 1938.

Decabrists, or Decembrists, Russian military conspirators, including many officers who inaugurated a movement to overthrow imperial despotism (Dec. 1825). They sought to establish the legal equality of citizens, open the courts of justice to the public, abolish all monopolies and military colonies, and carry out much-needed reforms in church and army. In spite of the determination and courage of the conspirators, the movement failed. Nicholas I. treated them with great severity. They were refused a trial, five of the ring-leaders were hanged, and the remainder banished to Siberia. See *Cambridge Modern History* (vol. x.), 1907.

Décadents (Lat. *de*, from; *cadere*, to fall), school of young writers and artists, such as Baudelaire, Verlaine, Mallarmé, and Barrès, who were much discussed in France about 1882. The more debased took absinth and drugs and endeavoured by their eccentricities to attract public attention. The Symbolist movement rose from, and absorbed the best of, the D. The Symbolists were aesthetic and literary. They delighted in half-tones, delicate shades of expression, and placed psychical sensation above realism. 'Decadent' is still applied to those modern writers and artists whose artistic ideal is the production of morbid and unhealthy types. See Symons, *The Symbolist Movement in Literature*, 1899.

Decagon (Gk. *δέκα*, ten; *γωνία*, angle), in geometry a figure with ten sides and ten angles, called a regular 1), when all the sides and angles are equal.

Decalogue (Gk., *δεκαλογος*, ten sayings), name under which the Gk. fathers speak of the Ten Commandments, of which two versions are given in the O.T., viz. in Dent. v. 6-21, and Exod. xx. 2-17. According to the account given in Exod. xx., they were given to the Israelites by Jehovah on Mt. Sinai, and were engraved by his finger on two tables of stone. These being broken, Moses was commanded to hew two fresh tables on which Yahweh again engraved the commands. In the W. Church since the time of Augustine it has generally been held that the first four commandments, giving the duty towards God, were inscribed on the first table, and the last six, the duty towards one's neighbour, on the second. Philo and Josephus, however, assume the natural arrangement of five on each table. There are three distinct arrangements of the commandments: (1) The Talmud makes the introductory sentence, 'I am the Lord thy God which have brought thee out of the land of Egypt, out of the house of bondage,' the first commandment, and then combines the next two (Exod. xx. 3-6) into one, thus keeping the number ten; (2) Rom. Catholics and Lutherans also combine these two commandments and keep the number by splitting the last commandment into two; (3) the Gk. Church, the Anglican Church, and all the other reformed bodies keep the arrangement assumed in this article. The D. deals with moral, not with ritual, questions, and its date is now generally fixed by critics at the eighth century B.C. or somewhat later.

Decameron, collection of tales by Boccaccio written between 1318 and 1388, conceived as related in ten days at a country villa during the plague at Florence. They are of a licentious character, but told with much humour and literary skill. They have been drawn upon by generations of writers, including Chaucer, Shakespeare, and Tennyson. See **Boccaccio**.

Decamps, Alexandre Gabriel (1803-1860), celebrated Fr. painter, b. in Paris, and the pupil of Abel de Pujol, David, and Ingres. He first exhibited in the Salon of 1827, the originality of his style at once attracting notice. He founded the Fr. school of Orientalism, and took high position as a colourist, landscape, and genre painter. 'Café in Asia,' 'Street of a Roman Village,' 'Children Playing near a Fountain,' are among his finest pictures. Chantilly and the Wallace collection in London contain some of his best work. See **lives by Moreau** (1869) and **Clement** (1886).

De Candolle, see **CANDOLLE**, **AUGUSTUS PYRAME**.

Decapitation, or beheading, an anct. punishment employed by the Gks. and Romans. First incurred in England by Earl Waltheof, beheaded by William the Conqueror (1075). Not only felons but also delinquents of high rank were

formerly decapitated, the rebel lords of 1745 being the last Englishmen to incur that penalty. Those capitally convicted in France are still beheaded with the guillotine. See **CAPITAL PUNISHMENT**.

Decapoda, order of malacostracate crustaceans which includes crabs, lobsters, crayfishes, and shrimps, and is therefore the order best known to the vulgar. Usually all the thoracic segments are fused to the head in the species, and there are always five pairs of trunk legs; the sexes are distinct. The decapoda are widely distributed, favouring chiefly the warmer seas. The term is also used for the sub-order of Cephalopoda, which have eight arms and two tentacles.

Decapolis (Lat. from Gk. *δεκάπολις*, ten cities), name used in anct. writings to denote a league of ten cities situated in or near Palestine and mainly E. of the Jordan. In the second century the number was apparently increased. The confederated cities included Scythopolis, Philadelphia, Damascus, Della, Diun, Hippos, Gadara, Gerasa, Raphana in Basban, and Kanatha. Details are obscure, but these tens. were probably founded or settled in by some of Alexander the Great's veterans, when in his conquest of the E. (331 B.C.) he opened up the old Semitic world to the influences of Gk. culture.

Decatur, Stephen (1779-1820), Amer. naval commander of Fr. extraction, b. in Maryland. He achieved distinction by his daring feat at Tripoli (1804) when he made a dash into the harbour and burned the Brit. frigate *Philadelphia*, which the Tripolitans had captured. He also captured the Brit. frigate *Macedonian*, when commodore of a squadron off the Atlantic coast in 1812. Soon after leaving New York (1811) he was engaged in a hard fight with the Brit. fleet and forced to surrender. The same year he sailed in command of a squadron against Algiers, but the war was soon concluded by a treaty dictating terms to Algiers, Tunis, and Tripoli. He met his death in a duel near Washington with Commodore James Isorron. See the standard life by A. S. Mackenzie, 1846, and C. T. Brady, *Stephen Decatur*, 1900.

Decatur 1. City of Macon co., Illinois, U.S.A., situated 10 m. E. of Springfield. Its manufs. consist of corn products, agric. machines, brass goods and tools, cars and trucks, and soda fountains. There are large flour-mills and a univ. The Cincinnati, Hamilton and Dayton, with the Illinois Central railways, pass through the city. Pop. 59,300. 2. City in N. Alabama, U.S.A., formed in 1927 by the union of New D. and D. It has important manufs. Pop. 16,600. 3. City of Georgia, U.S.A., a health resort close to Atlanta. Pop. 16,500.

Decazeville, tn. of France in the dept. of Aveyron, 34 m. N.W. of Rodez by rail. Duc Decazes, minister of Louis XVIII., estab. iron-works, which are still supplied by the iron-mines in the vicinity. It is also the centre of the coalfield of the Aveyron. Pop. 12,100.

Deccan, or **Dekkan**, comprehensively includes those tens. of India that are

situated S. of the R. Nerbudda, though more particularly the dist. stretching between that riv. and the Kistna. The states of Mysore and Hyderabad and the provs. between Madras and Bombay form a part of this large tract. With the Ghats rising to 3000 ft. on the W. it forms a high plateau.

Deceased Wife's Sister. The Marriage Act, 1835, nullified as from that date all marriages between persons within the prohibited degrees of affinity (relations of marriage) while legalising those already celebrated. But by the Deceased Wife's Sister Marriage Act, 1908, marriage with a D. W. S. is legal. The Act of 1907, while validating the union as a civil contract, expressly permits any minister of a church or chapel of the Church of England to refuse to celebrate the marriage without incurring any penalty, civil or eccles.; but the clergyman so refusing may permit another to officiate in his place. The Act does not legalise marriages annulled before Aug. 28, 1907, and saves all existing rights and interests. Consequently the Act in no way affected the devolution of property on intestacy as to the issue of marriages celebrated before the Act.

Decebalus, see DACIA.

Decelea, demus (or par.) of Attica, seized and fortified by the Spartans in the Peloponnesian war.

December (Lat. *decem*, ten), name given to the last, or twelfth, month of the year. It is so called because before the time of Julius Caesar the first month of the old Rom. calendar was March, so that what is now the twelfth month was only the tenth. The A.-S. called it *Mid-winter-month* or *Yule-month*.

Decembrists, see DECEMBRISTS.

Decemviri (Lat. the ten men), ten magistrates of supreme authority at Rome. After the fall of the Tarquins dissatisfaction was still rife among the plebeians, because, there being no written code of laws to protect them, they depended for justice on the pleasure and will of the patricians. The tribunes appealed on behalf of the people to the senate, and in 451 B.C. the new magistrates were appointed (*D. legibus scribendis*, the D. for writing the laws). The first D. were Appius Claudius, T. Genucius, P. Sextus, Sp. Veterius, C. Julius, A. Manlius, Ser. Sulpitius, Pluricius, T. Romulus, Sp. Posthumus. Their authority was supreme, and with their appointment all other magistracies ceased. According to the agreement the plebeians were eligible to the new order, but no plebeian was elected in 451 B.C. At the end of their year of office the D. pub. a code of laws based on the laws of Solon and other great law givers. These laws were exposed to public view and solemnly ratified by the priests as *augurs*. The laws were ten in number and were inscribed on tables in brass. Two more were added, and they became known as the *leges duodecim tabularum* (laws of the twelve tables) (see TWELVE TABLES). The order continued to be elected each year for three years, but in the third year their behaviour became

so despotic that the people were exasperated. The attempt of Ap. Claudius to dishonour Virginia roused the people to abolish the order, and the consuls were restored. The laws of the twelve tables still remained the nucleus of Rom. law. There were other orders of D. at Rome. The *D. sacris faciendis* (D. for the performance of sacred rites) were appointed by Tarquin to guard the Sibylline books; they were originally two, but afterwards ten in number (five being patricians and five plebeians), and Sulla increased their number to fifteen (called *quindecimviri*) in 81 B.C. The *D. litibus judicandis* (D. for judging cases) had jurisdiction in civil cases during the republic and the empire.

Deciduous Trees are those which shed their leaves annually, which takes place in temperate climates in autumn. The fall of the leaf is caused by a layer of cork, the abscission layer, being formed across the base near the insertion of the leaf. This layer becomes disorganised, as water cannot pass through it, and so causes a break, which is hastened by wind or frost.

Decimal Fractions. On account of the difficulty found in manipulating many small fractions such as $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{8}$, particularly in addition and subtraction, it was found necessary to devise some simpler system of notation. This was done by an extension of the ordinary system of numeration. If we take the number 125, the figure 5 = five units; the figure 2 = two tens; the figure 1 = one hundred; i.e. going from right to left a figure becomes ten times as great at each step. A dot (called the decimal point) being placed after the units figure, this process was then carried further, and figures were made to continue decreasing by ten at each step from left to right. Thus, in 125.316, the 3 = three-tenths; the 1 = four-hundredths; the 6 = six-thousandths; the whole number = 125 $\frac{316}{1000}$. To turn any vulgar fraction into a simple decimal fraction it must be possible to bring its denominator to a power of ten. Hence, any vulgar fractions whose denominator contains any prime factor other than 5 or 2, will always contain some element which is repeated to infinity, the process never ending. Thus $\frac{1}{3} = .3333$, etc. This is abbreviated as $\frac{1}{3} = .\dot{3}$, a dot being placed over the figure, and it is spoken of as 'point 3 recurring.' Sometimes a whole series repeats, e.g. $\frac{1}{7} = .142857$ and here a dot is placed over the first and last figures. Similarly, $\frac{1}{16} = .0625$.

Decimal System, name applied to any system of weights, measures, etc., which has the standard unit divided into tenths, hundredths, etc., for parts below it, and multiplied by ten or powers of ten for parts above it in value. It has been adopted for weights and measures and money in most of the European countries, but has been rejected in this country and in America for various reasons, one of the chief being that our system possesses better facilities for dividing into halves and quarters with fairness to purchasers

than does the D. S. It has been found inapplicable to time. See METRE, NOTATION, NUMERALS, GRAMME.

Decimation, Rom. military punishment, inflicting execution on every tenth man chosen by lot, thus obviating too great weakening of the army when a large body of soldiers had been found guilty of a crime meriting death.

— TOP OF FUNNEL

THE DECKS OF THE 'QUEEN ELIZABETH'

Décin, see TETSCHEN.

Decius, Caius Messius Quintus Trajanus, Rom. emperor, b. at Budalia in Lower Pannonia. In 249 he was sent by the Emperor Philippus to put down a rising of the Moesian army, but the soldiers made him their emperor against his will and persuaded him to advance against Italy. They met Philippus near Verona, who after a fierce engagement was killed. Throughout his short reign he was in constant conflict with the Goths and barbarously persecuted the Christians. He was killed in battle against the Goths through the treachery of Gallus, who succeeded him as emperor.

Decius Mus, Publius (340 B.C.): 1. Consul at Rome and commander of the Rom. army during the Lat. war. Tradition says a vision told him that the army of one side and the general of the other must perish. The following day, at Vesuvius, D. sacrificed his life to ensure a Rom. victory. 2. D., son of the above, and four times consul. In order that the Rom. arms might triumph he d. with similar heroism at Sentinum, 295 B.C.

Deeize, tn. in the dept. of Nièvre, France, is situated on a rocky is. in the Loire, at the summit of which is an old castle. It has glass works, potteries, and iron works. Pop. 4000.

Deck, term used in ship structure to indicate the floor or platform extending from side to side of the vessel. It is usually made by covering the D. beams with steel or planking. All Ds., particularly the upper or weather D., have a slight camber or slope towards the ship's side to afford strength and facilitate the dispersal of water. Three, four, and even as many as thirteen (the *Queen Elizabeth*) Ds. are usual in modern ships, the protective Ds., fitted exclusively to men-of-war, being always heavily armoured.

Decker, Thomas, see DEKKER.

Declaration, in the language of pleadings before the abolition of forms of action by the Judicature Act in 1873, meant the statement of his case by the plaintiff in an action at law. It formed the statement of claim, the first of the pleadings in an action in which the plaintiff states the nature of his case at greater length than in the writ of summons. Any natural variation in the D. from the tenor of the writ was ground for objection, and similarly with respect to a statement of claim. The term D. as now used means that part of the order or judgment of an equity judge or judge of the chancery div. which *declares* the rights of the parties to a suit by way of incidental relief, or even where no relief can be given in the action at all other than such as may be implied by the declaratory judgment, as, for example, that a mortgagor's estate is forfeited, that a surety is discharged, that a solicitor shall have a lien on particular property, or that a party is legitimate.

Declaration of Human Rights, Universal, see HUMAN RIGHTS.

Declaration of Independence (America), one of the most far-reaching documents in the hist. of mankind was adopted by the Continental Congress of the thirteen original states of the U.S.A. on July 4, 1776. As it marked the birth of a nation at the historic Independence Hall in Philadelphia, it is still celebrated as the great Amer. national holiday. The adoption of the D. which marked the definite breaking away of the colonies from the rule of Great Britain, was only secured after much delay and doubt. Hostilities had already broken out between the colonists and the troops of King George III. Nevertheless, the Congress sent a petition to the king asking that their wrongs be redressed. He not only declined to receive the petition, but refused to see the messenger who bore it. Furthermore, in a proclamation, he declared the colonists in a state of rebellion and no longer under his protection. Being unable to secure in England all the troops that he needed, King George hired Ger. troops from Hesse-Cassel, hated by the colonists under the name of Hessians. These acts infuriated the Congress and the people, and the convulsion came slowly to them that they had no recourse but to

declare their independence and fight for it. A committee was chosen to prepare a declaration and Thomas Jefferson, afterwards third President of the U.S.A., became chairman, and to him was assigned the task of writing the far-reaching document. It was adopted on July 4 and signed by most of the delegates in the following month. Part of the language of the preamble has passed into the language of the world:

'We hold these truths to be self-evident, that all men are created equal, that they are endowed by their creator with certain unalienable rights; that among these are life, liberty, and pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from consent of the governed. That whenever any form of government becomes destructive of these ends, it is the right of the people to alter or abolish it, and to institute new government, laying its foundations on such principles and organising its powers in such form as to them shall seem most likely to effect their safety and happiness.' It stated that the hist. of King George was one of repeated injuries and usurpations. It recited that he had refused assent to laws necessary for the public good; had dissolved representative houses repeatedly because they opposed his invasions of the rights of the people; had made judges dependent on his will alone; had cut off the trade of the colonies from the rest of the world; had in many cases deprived his subjects of trial by jury; had imposed taxes without their consent; had quartered troops on the people; and taken away their charters. It concluded with a declaration that the colonies were and as of right ought to be free and independent states, severing all allegiance to the Brit. Crown, and that as free and independent states they had all power to levy war, conclude peace, contract alliances, and establish commerce.

This document, backed up by a successful war for independence, changed the course of hist. It for ever challenged the idea of the divine right of kings. It was the inspiration of the Fr. Revolution, with its battle-cry of 'Liberté, Égalité, Fraternité.' Echoes of it were heard often during the First World War and the peace conferences which followed it, when statesmen repeated the doctrine that peoples have the right of self-determination. Monarchs, like the ex-Kaiser, even down to the days of the First World War, sought to enforce the doctrine of their divine right to rule, but the impulsion of self-gov. would not be denied. To-day Great Britain, with a constitutional king, is the shining example to the world of how a nation can have a royal house and yet be one of the freest and most democratic countries in hist. But long before this condition had been reached in Europe, the D. of I. had affected the whole subsequent hist. of the New World. The Sp. colonies of Mexico and of Central and S. America broke away and set up republics whose constitutions were largely modelled on that of the

U.S.A. Brazil broke away from monarchist rule and became a republic. Canada, by generous and far-seeing treatment by the Brit. Crown, remained within the empire, but is just as free as the U.S.A.—master in its own house, as indeed are all the other dominions of the Brit. Commonwealth of Nations. See H. Friedenwald, *The Declaration of Independence, an Interpretation and an Analysis*, 1904; F. Whitton, *American War of Independence*, 1931; and C. Becker, *Declaration of Independence*, 1933.

Declaration of London, document which has for its object the international regulation of the mutual rights and obligations of belligerents and neutrals in time of war between any two or more of the signatories thereto. It was drawn up by the International Naval Conference held in London in 1909, at which plenipotentiaries of the great powers met, primarily for the purpose of coming to some agreement as to the recognised rules of international law in regard to the estab. of an international prize court. It contains seventy-one articles, the most important being those relating to contraband (*q.v.*). In regard to blockade, the D. of L. repeats the Declaration of Paris (*q.v.*), and establishes that a blockade must not extend beyond the ports and coasts belonging to, or occupied by, the enemy, and also that it must be applied impartially to the ships of all nations. When the First World War broke out the D. of L. had not been ratified by Great Britain, but immediately afterwards it was adopted by Orders in Council, with certain modifications, chiefly referring to conditional contraband and the doctrine of continuous voyage (*see* BLOCKADE). As the war progressed the D. was found to be extremely unsatisfactory and, after further modifications, was eventually dropped altogether by the Maritime Rights Order in Council of July 7, 1916. At the outbreak of the war the other belligerents followed much the same course as Great Britain, but gradually the D. was modified out of recognition, and before the end of the war it had ceased to be an instrument possessing binding force. *See also* CONTRABAND.

Declaration of Paris. The object of this D., which was adopted by the leading European powers at the Congress of Paris in 1856, was to assimilate the principles of the maritime law of the different signatories on an outbreak of war. The prin. articles declare: (1) Privateering is, and remains, abolished; (2) a neutral flag covers enemy's goods, except contraband of war; (3) neutral goods, except contraband of war, are not liable to confiscation under a hostile flag; (4) blockades to be binding must be effective. The result of the fact that since 1856 every civilised state, except the U.S.A., Spain, Mexico, and Venezuela, has signed the declaration is that privateers can only be employed by the signatories during a war with one of the four outstanding states. On the outbreak of the Hispano-Amer. war of 1898, the Gov. of the U.S.A. bound itself to observe the

articles of the declaration during the war, while Spain agreed to become bound by articles (2) and (3), with a reiteration that the D. was not binding upon her. The U.S.A. also intimated at the outbreak of the Civil war that they would observe the D.

Declaration of Rights, see BILL OF RIGHTS.

Declarations of Deceased Persons. It is axiomatic in the Eng. law of evidence that hearsay is inadmissible as proof. The best evidence that a particular statement was made is the testimony of him who made the statement. But there are certain cases where it is impracticable to adhere to the rule, and among those excepted cases are the oral or written D. of D. P. Such statements which are relevant to prove any fact in issue or any fact regarded as relevant to any fact in issue include the following: (1) A declaration or statement made by a person who can be shown to have been in actual danger of death, and to have given up all hope of recovery at the time of making the declaration. Such a declaration is only relevant in the trial for the murder or manslaughter of the declarant; and to be admissible the declaration must have had reference either to the cause of death or to the attendant circumstances thereof. (2) A declaration against the pecuniary or proprietary interest of the declarant. It must be shown that the deceased had no interest in misrepresenting the matter in question, that he made the statement at or very shortly after the time when the act occurred which is sought to be proved, and that he had peculiar means of knowing the matter stated. (3) Statements made by a person in the ordinary course of business or in the discharge of professional duty. (4) D. as to pedigree, relating to the pedigree of some person of whom the declarant was a legitimate blood relation. If made after the commencement of the action they would be inadmissible in evidence. (5) In cases where a will has been lost, or there is a suggestion that a particular will was a forgery, or obtained by wrongful means, statements made by the testator concerning the contents of his will or the manner in which he intended to dispose of his property. (6) Statements relating to the existence of a public or general right, e.g. a right of way. For the purpose of perpetuating the testimony of a person whose death is apprehended, the criminal law allows his deposition to be taken down in writing and afterwards used in evidence on proof that the deponent either is dead or unlikely ever to be able to travel or give evidence.

Declaration, Statutory, declaration in the form: 'I (*name*) do solemnly and sincerely declare that (*subject matter of declaration*), and I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of the Statutory Declaration Act, 1835,' was by the Act substituted for an oath or affidavit for most official or departmental matters, including the verification of documents. The oath of a

witness in a court of law is not affected by the Act, which specially excepts it.

Declarator. In Scots law, Ds. or declaratory actions form one of the three classical divs. of Scottish actions. A declaratory action is one in which some right, personal or proprietary, which is actually infringed or threatened is sought to be declared in favour of the pursuer (Eng. plaintiff), but where nothing is sought to be paid or performed by the defender (Eng. defendant). Illustrations are Ds. of marriage, of bastardy, and of irritancy (loss of feu rights by non-payment of feu-duty for two full years). Ds. may be brought either in the court of session or in the sheriff courts, except that Ds. of marriage or nullity and Ds. relating to personal status may not be brought in the latter court.

Declension (Lat. *declentio*, a turning or leaning away, i.e. the form assumed by words as they fall away from the nominative). In grammar the term signifies the inflections or changes a word receives according to its meaning or relation to other words in a sentence. Eng. has no proper Ds., only traces of a dative and genitive, neither has it genders, except in pronouns of third person. Sanskrit has eight cases, Lat. six, and Gk. five. Lat. cases are nominative, genitive, dative, ablative, accusative, vocative. Gk. has no ablative; Sanskrit adds locative. Instrumental case-endings are gradually being dropped, and prepositions used instead, as in Fr. and It. Agglutinating languages are usually prolific in cases: the Finnish has fifteen, the Magyar has twenty.

Declination. The angle between the magnetic meridian (vertical plane through axis of a compass needle placed at any point) and the geographic meridian (vertical plane through that point and the poles of the earth) at any point is called the D. of that point. The fact that a compass needle does not point true N. was first observed by Columbus in 1492. In Great Britain the compass needle points W. of true N. At London the D. is 16° 16' W., at Sydney 9° 36' E., and nil at St. Petersburg (1901), this being one of the few places where the compass needle points due N. This D. is not constant, but changes from year to year. This secular change was first noticed by Burroughs in 1580; for example, in that year the D. at London was 11° E., in 1657 it was nil, while in 1816 it had attained a maximum westerly value of 24° 30'. Since that date it has been gradually diminishing again; 320 years are required, it is computed, to give a complete cycle of secular changes in the D. See ISOCLINIC; AGONIC LINES; MAGNETISM; DIP.

Declination, in astronomy, the complementary term to right ascension (see ASCENSION, RIGHT). The face of the heavens being regarded as a globe—the celestial globe—for the purpose of finding objects—stars, planets, etc.—on it, this globe is crossed by imaginary lines. The *declinations* correspond to similar lines on the terrestrial globe, right ascension being the equivalent of long. and D. of lat. The D. therefore of a star is its

distance in degrees N. or S. of the celestial equator, or ecliptic.

Decoction (Lat. *de*, down, and *coquere*, to cook, boil), term used in pharmacy for the process of forming a solution by boiling an organic drug in water. There are as a rule about five grains of drug to 100 c.c. of D. The drug may sometimes be boiled in oil.

Decolic Acid, see CAPRIC ACID.

Decorated Style, see under ARCHITECTURE, *Gothic*.

Decoration Day, or **Memorial Day**, ann. holiday (May 30) appointed by all the N. and some of the S. states of America for the purpose of decorating the graves of, and commemorating, the soldiers who lost their lives in the civil war.

Decorations, see MEDALS, ORDERS OF KNIGHTHOOD.

Decorations for War Services. *First World War.*—The total number of D. or honours conferred on members of Brit. and Indian forces for services in the field and for services in connection with the war between Aug. 1914 and the termination of hostilities was upwards of 476,000. This number was made up for the most part of D. for services in the field, those in 'connection with the war' being the official description in the case of awards in respect of services during air raids, coastal bombardments, etc., or serving outside a recognised theatre of military operations. For these latter services some 13,000 D. were given. Included in the total were also 5407 awards by way of promotion. The following were the numbers of the various awards made: V.C., 579; V.O. (bars), 2; G.C.B., 14; G.C.M.G., 22; G.B.E. (military div.), 5; K.C.B., 158; K.C.M.G., 197; K.B.E. and D.B.E., 74; C.B., 1052; C.M.G., 2659; C.B.E. (military div.), 1095; D.S.O., 8991; D.S.O. (bars), 784 (one of these was given for bringing down a Zeppelin airship in England); O.B.E. (military div.), 2664; B.E.O. (civil div.), 902; Red Cross and bars, 5986 (of which about 1000 were for field services); M.C., 37,041; M.C. (bars), 3125; D.C.M., 24,571; D.C.M. (bars), 478; M.M., 115,429; M.M. (bars), 5965; M.S.M. and bars, 245,508; Medals, B.E.O., 424. The total number of officers and men who passed through the Brit. Army during the war was approximately 6,000,000. In the S. African war, when the total number of troops in the field was 448,435, the number of D. or honours was 3714, made up as follows: V.C., 79; G.C.B., 3; K.C.B., 25; C.B., 292; G.C.M.G., 4; K.C.M.G., 8; C.M.G., 110; D.S.O., 1143; and D.C.M. 2050. In the First World War the promotions for services in the field included four promotions to field marshal's rank, viz. Lord Haig, Lord Allenby, Lord Plumer, and Sir Wm. Robertson, and for services outside a theatre of war, one such promotion, viz. that of Sir Henry Wilson.

Second World War.—The following is a detailed list of major wartime awards to officers and men of the R.N., R.N.R., R.N.V.R., Royal Marines, and Dominion navies: V.C., 24 (officers, 18; men, 6); G.C., 31 (officers, 26; men, 5); D.S.O., 686; D.S.O. (bars), first bar, 110; second bar,

24; third bar, 3; D.S.C., 4529; D.S.C. (bars), first bar, 425; second bar, 44; third bar, 1; Albert Medal, 35 (officers, 16—1 in gold; men, 19—2 in gold); C.G.M., 70; D.S.M., 6998; D.S.M. (bars), first bar, 152; second bar, 4; third bar, 1; G.M., 136 (officers, 85; men, 51); G.M. (bars), first bar, 16 (officers, 14; men, 2); B.E.M., 2688; B.E.M. (bars), 3; G.C.B., 10; K.C.B., 57; C.B., 150; G.B.E., 6; K.B.E., 59; D.B.E., 2; C.B.E., 362; O.B.E., 970; M.B.E., 1128. Totals: officers, 5981; men 9999. The following honours and awards were made to personnel of the merchant navy and fishing fleet: G.C., 5; Empire Gallantry Medal (now replaced by G.C.), 1; knighthood, 10; C.B.E., 50; O.B.E., 1077; M.B.E., 1291; D.S.O., 18; D.S.C., 213; Albert Medal, 11; G.M., 49; D.S.M., 421; Sea Gallantry Medal, 24; 506; M.M., 16,900; D.C.M., 1850; D.C.M. (bars), 10; B.E.M., 1717; Mention in Dispatches, 994; Commendations, 2568. Total awards, etc., 8149. Promotion to admiral of the fleet: Sir Charles Forbes, Viscount Cunningham of Hyndhope, Lord Tovey, Sir James Somerville, Sir John H. D. Cunningham, and Lord Fraser of N. Cape. Up to the end of 1945 the army awards (excluding campaign stars, defence and general war medals) were 51,800. The number of V.C.'s was 181 (including 1 bar); D.S.O., 4462; D.S.O. (bars), 557; M.C., 10,386; M.C. (bars). The highest number of officers and men serving in the army at any time during the recent war was 2,931,000 (plus 223,000 women). This means that a total of over 4,000,000 passed through the army. The home guard at one period numbered 1,700,000. Many of these were during some of their time in the army. The total who served in the army and home guard at one time or another was over 5,000,000. The army's entitlement to campaign stars, defence medal, and war medal is over 10,000,000. Promotion to field marshal: Lord Ironside, Earl Wavell, Viscount Alanbrooke, Viscount Alexander of Tunis, Viscount Montgomery, Lord Wilson, and Sir Claude Auchinleck. The following awards were made to air force personnel, including dominion and colonial, up to the end of 1945: V.C., 27 (three subsequently to 1945, making a total of 30); G.C., 19; G.M., 151; B.E.M., 1192; D.S.O., 1078; D.S.O. (bars), 92; C.G.M., 113; D.F.C., 18,889; D.F.C. (bars), 1560; D.F.M., 6363; D.F.M. (bars), 57; M.C., 61; M.M., 118; A.F.C., 1709; A.F.C. (bars), 28; A.F.M., 244. The following honours were awarded: G.C.B., 9; K.C.B., 29; C.B., 195; G.B.E., 4; K.B.E., 41; D.B.E., 3; C.B.E., 452; O.B.E., 1155; M.B.E., 1695; R.R.C., 24; R.R.C. (bars), 2; associate R.R.C., 111; mentions, 37,283; commendations, 908. Promotion to marshal of the R.A.F.: Lord Newall, Viscount Portal of Hungerford, Lord Tedder, Lord Douglas of Kirtleside, and Sir Arthur T. Harris.

Decort, **Frans** (1834-78), Flemish lyrical poet. He pub. the well-known Flemish almanac, *Jan en Aleman*, and trans. some of Burns's poems into his own tongue.

Decoy. This word has had a complicated hist. It appears in Eng. first in the

seventeenth century in these senses, as coy and coydock, from the Dutch *koot*. This word is ultimately connected with Lat. *cavea*, a cave or hollow. The *de* at the beginning of the word is considered by some authorities as a corruption of duck-coy, by others as the Dutch article *de*, and by others as a corruption of the Dutch *rende-kooi—eende* being the Dutch for duck. The word was also used in a particular sense to denote a swindler, and also as the name of a game of cards, as early as 1550. A D. is therefore an enclosure for catching ducks or other wild fowl, a contrivance for catching and enticing wild fowl within range of a gun, hence any trap or enticement into a place of danger. Ds. are, as a rule, made on the following plan: Long tunnels lead from the sea, channel, or estuary into a pond or pool; these are covered with an arched net which gradually narrows in width. The ducks are enticed into this by a tame-trained bird also known as a D., or D. duck. Trained dogs are also used. Once the ducks are along the narrow end of the channels or pipes they are easily caught. In America, and sometimes in England, artificial Ds. are used. These are generally made of wood. The D. is placed on the water as if it were feeding. This attracts the other wild fowl within range of the concealed sportsmen. Many books have been written on the art of decoying ducks and wild fowl, the best being Sir W. Payne Sallmeyer's entitled *The Book of Duck Decoys*.

Decree, term formerly given to any adjudication by a court of equity in contradistinction to a judgment in a common law (*q.v.*) court. The plaintiff formulated a written statement of his case in a long technical document called a bill, and the defendant put in a written answer on oath. The D. which was pronounced upon the bill and answer was framed so as to meet all the exigencies of the case. Since the Judicature Act, 1875 (*see also* EQUITY), an adjudication by a judge of the chancery div. upon an action begun by originating summons is generally called a judgment, and an order made in a motion, petition, or *ex parte* application is referred to simply as an order. The term D. has now become more or less restricted to adjudications in administration, partnership, and foreclosure actions in the chancery courts. The term D. has also a well-known meaning in connection with interim and final orders in the divorce court, a D. nisi being the judicial pronouncement of a divorce or judicial separation to take final effect six months later as a D. absolute, if the king's proctor does not intervene. A similar distinction applies to a mortgagee's foreclosure action, the D. nisi being made absolute where the mortgagor does not redeem within the time allowed him by the court. The Ds. of the pope, which are called decretals, may be defined as decisions of the popes in matters of eccles. law. The Ds. of the pope retained their authority as law till the fourteenth century, when the power of the holy see began to decline. From the fifth century

the decretals of the popes have been collected, and there are sev. collections of them. *See also* CANON LAW.

Decrement, *see* INCREMENT.

Decrescent, or **Decrement**, term applied in heraldry to the waning moon, i.e. its horns turned to the sinister.

Decretals, collection of laws added to the canon law of the Church of Rome, consisting of judicial replies by the popes to cases submitted to them for adjudication. The false D. of the ninth century were a blend of authentic material and forged additions. The author, the 'pseudo-Isidore,' lived in Spain as the archbishop of Seville (Isidore), and took the surname Mercator. The false D. had a considerable influence on eccles. hist.

Decretals, False, *see* ISIDORIAN DECRETALS.

Decroly, Ovide (1871-1919), Belgian doctor and teacher. In 1910 he opened a school for backward and abnormal children in Brussels, and used the experience he gained in a school for normal children in 1907. He agreed with the assertion of Dewey, the Amer. educationist, that 'education is not a preparation for life; it is life,' and modelled his teaching on a system of 'centres of interest' (*methode globale*). The system avoids the subdivision of a scheme, with scattered headings, and substitutes groups of ideas as a foundation for lessons over a given period. These groups, previously linked, represent an uninterrupted sequence of themes, which awaken the interest and invite the co-operation of the child. D.'s experiences and conclusions are similar to those of Dr. Maria Montessori (*q.v.*). *See* Amélie Hamade (trans. Jean L. Hunt), *The Decroly Class*, 1925.

Dedeagach, Bulgarian port on Aegean Sea, just W. of mouth of R. Maritsa. During the First World War it sheltered Ger. submarines, and in consequence was bombarded by Brit. and Fr. fleets. Allied forces landed at D. on Oct. 28, 1918, which convinced the Turks, then negotiating an armistice, that Constantinople was threatened. D. was ceded to the Allies by the treaty of Neuilly. Pop. about 3000.

Dedham: 1. Tn. of Essex, England, on the Stour, in the midst of the Constable country, and notable for the vale of 11, subject of that painter's art. Once the centre of the Flemish cloth trade. Pop. 1500. 2. Co. seat of Norfolk co., Massachusetts, U.S.A., situated on the Charles R., 10 m. S.W. of Boston. Fisher Ames was b. here. The prin. manufs. are woollen goods, carpets, and pottery. Pop. 15,500.

Dedication, *see* CONSECRATION.

De Donis Conditionalibus (concerning conditional grants) Statute. This statute, passed in 1285, was intended to prevent the heirs to entailed estates from selling or otherwise disposing of their landed estates as soon as heritable issue was b. to them. This they were enabled to do in spite of the intention of the grantor to tie the estate up in a strict line of descent, by reason of the judicial construction of a grant by A to 'B and the heirs of his body' as a grant of the fee simple (i.e. entire

disposable estate) conditionally upon the birth of issue. The result of this interpretation was that the tenant-entail could not only bar his issue and the grantor's right to the reversion on failure of issue, but could evade his feudal services. The D. D. enacted that the will of the grantor should be observed, but failed in its purpose as soon as recourse was had to the practice of barring the entail by fines and recoveries (*see* COLUSIVE ACTIONS).

Deduction (in logic), *see* under LOGIC.

Dee, John (1527-1608), mathematician and astrologer, b. in London, educated at Cambridge and Louvain. Edward VI. appointed him to a living and gave him a pension; consequently in Mary's reign he was persecuted and narrowly escaped with his life. Things changed, and under Elizabeth he obtained office as intelligencer. For nine years he was warden of Manchester College. During the queen's illness he was summoned for joint consultation with the Ger. physicians on her recovery. He was commanded to draw up a geographical chart of crown lands discovered by Englishmen. This is now in the Brit. Museum.

Dee: 1. Riv., 70 m. long, in N. Wales and Cheshire, rises in Merioneth, and flows into the Irish Sea by way of a wide estuary. The dangerous rapidity with which the tide rises in this neighbourhood is told by Kingsley in his *Sands of Dee*. From Chester to the estuary there is a tidal canal 9 m. long. 2. Riv. in Aberdeen, rises in the Cairngorm Mts., near Ben Macdhuil, and flows through Braemar, Ballater, Aboyne, and Kincardine, entering the sea at Aberdeen. Near Braemar it forms the beautiful cascades, the Linn of D. Balmoral Castle is on its banks. The salmon fisheries are very valuable.

Deed (Lat. *factum*; Norman-Fr. *fact*), instrument in writing or print, upon paper or parchment, duly sealed and delivered, which operates either to pass an interest in property or to confirm a pre-existing contract, by which such an interest passes, or to bind a person hereafter to do, or abstain from doing, something. Ds. are of two kinds, indented and poll. The term indenture implies that the D. is in two parts or similar copies, and that the two parts were cut in a serrated or irregular line so that when placed together subsequently their physical correspondence would evidence the authenticity of each copy. A D. poll is cut even at the edges, and usually contains but one part, being the D. of one person or party only. The modern mode of executing a D. is by signing, sealing, and delivery. The manner of delivering a D. is for the executing party to say 'I deliver this as my act and deed.' Sealing and delivery are essential to the validity of a D., but signing only if expressly made so. A D. which is delivered to a third person, not a party to it, to be given up to the other parties upon the fulfilment of a condition, is termed an *escrow*. The requisites to a valid D. in the U.S.A. are practically the same as in the case of any other contract, but the appointment of an

attorney to execute a D. for another must as a rule be executed with the same formalities requisite to the D. itself. Seals, or whatever equivalent may be used therefor, are required in Alaska, Connecticut, Florida, Illinois, Maine, Massachusetts, Missouri, New Hampshire, New Jersey, New York, Pennsylvania, Virginia, and other states. In nearly all the states Ds. by corporations must be under seal.

Deemster, title of the two chief judges in the Isle of Man, whose duty it is to pronounce doom or sentence. In Scotland it was formerly the title of an inferior official attached to the high court of justiciary, who was also executioner, and who had to recite the recorded judgment.

Deep-sea Deposits, *see* DEPOSITION; DENUDATION.

Deep-sea Exploration, *see* ABYSSAL FAUNA; CHALLENGER EXPEDITION; DEPOSITION; DISCOVERY COMMITTEE.

Deep Sea Fisheries, *see* FISHERIES.

Deer, or Cervidae, form a large family in the group Pecora of the ungulates, in which are also classed the giraffes, oxen, antelopes, sheep, and goats. The characteristic which distinguishes the D. from all other ruminants is the presence of antlers in the males; in the reindeer only they are common to both sexes, and in the genera *Moschus* and *Hydropotes* they are lacking. These antlers are deciduous, falling every year in the rutting season, and consist of bony processes of the frontal bone, covered while growing with a sensitive, vascular, velvety skin. The D. are known fossilised from the Miocene, and there are about sixty living species which inhabit Europe, Asia, and America. *Moschus*, the musk-D., is an aberrant Asiatic genus, remarkable for the presence of a gall bladder as well as the absence of antlers; *Cervus* contains twenty-two well-known species, such as the wapiti, red D., fallow D., and the extinct Irish elk. The roe D., or roebuck, is the smallest of the three wild D. of Great Britain to be found in the woods almost all over Scotland, New Forest, and the Lake Dist. That is to say, the roe have managed to hold on to existence over vast areas of country in which their larger cousins, the red D. and the fallow D., were long since wiped out. *Rangifer*, the reindeer, and *Alces*, the elk, or moose, are circumpolar; *Cervulus*, the muntjac, is indigenous to Asia; *Hydropotes*, the water D., is a Chinese genus.

Kinds of Deer.—There are various kinds of D., such as the wapiti or Amer. D., the lambu D. of India, the Himalaya D., and the red D., which is the kind generally hunted in the Brit. Isles. Other species of D. in Great Britain are the fallow D. and the roe D. The red D. is of a reddish-brown colour, while from the tail underneath the body the colour becomes lighter. The red D. has ever been known by his horns, which differ materially from those of all other kinds of D. The horns consist of a beam from which points or processes project, a twelve-pointer being known as a 'royal' stag. The number of these points determines the age. The

yearling D. has no horns, but at two years old a short spire is thrown out. The age of the D. can also be deduced from the impression of its foot in the ground. If the impression measures full 2 in. at the heel he is 'warrantable,' if more he is large, heavy, and old; and if less, he is too young. The tread of a hind is much narrower than that of the male, particularly at the toe, whilst the hart's is broad and round at the point. The mark of a D.'s tread is called his slot; his haunt is termed his lair; where he lies down, his harbour or bed; where he rolls himself, his soiling pool; and his breaking place over a hedge, his rack. When he goes to water it is termed going to soil, if he is headed back he is blanchied; and if he stops in a riv. or lies down in a pool during the chase it is called sinking himself. Stags engage in ferocious single combat for predominance in a herd.

Deer-stalking.—Method used in approaching D. without being observed by the animal. To stalk is to approach unawares. In England this method of stalking the D. in order to shoot it is rarely adopted, but in Scotland it is generally in vogue. D.-hunting in England is chiefly confined to the W., in the cos. of Devon and Somerset, and also in the New Forest. It is probable that stag-hunting on Exmoor and the Quantocks derives some of its fascination from their unique wildness and picturesqueness. In N. America the method of stalking is largely used.

History.—The chase of the stag was considered one of the most princely and royal sports, and has existed from time immemorial; but whether it was conducted on its present lines until Queen Elizabeth's reign is doubtful. Historical records prove conclusively that there was kennelled at Simonsbath in this reign a pack of stag-hounds which hunted the D. on a similar system to that now in vogue. The method of stalking was not introduced until years later.

Methods of Hunting.—(1) By driving. (2) By stalking. Where the country was partially covered with wood, the forests were 'driven,' and the sportsmen occupied passes where they took their chance of sport, and this method is resorted to generally in the forest of Glengarry (Scotland) and in other places. But, generally speaking, the system has given way to the more exciting amusement of stalking. D., like other animals, seem to foresee change of weather. At the approach of a storm they leave the higher hills and descend to the low grounds, generally one or two days before the change. On the approach of a thaw they leave the low lands and go to the mts. They never perish in snowdrifts, as sheep do, but keep to the bare ground and feed on the tops of heather. When herds of D. are driven they follow each other in a line, so that when they cross the stalker it is customary for him to lie quiet and suffer the leaders to pass before he raises his rifle. If he were to fire at the first that appeared, he would probably turn the whole of them back. Or if he were

to run forward injudiciously after a few had passed, the remainder, instead of following the others in a direct line, would not cross him except under particular circumstances and disposition of ground, but would bear off an end and join the others afterwards. When D. are hard pressed by a dog, they run in a compact mass, the tall ones endeavouring to wedge themselves into it. They will also run in this manner when pressed by drivers on the open moor. D., except in embarrassed situations, always run up wind, and the instinct is strongly implanted in them. Thus they go forward over hill-tops and unexplored ground in perfect security, for they can smell the taint in the air at an almost incredible distance. On this account they are fond of lying in open quarries where the swells of the wind come occasionally from all quarters. By clever arrangement on the part of the stalkers, and by employing men in concealed positions to give them their wind, the D. may be driven down wind, and in certain cases they may easily be sent by a side wind to that side of the forest which they consider as their sanctuary. In large forests the method of stalking with the assistance of hillmen is generally adopted. These are placed at long intervals and help to drive the D., if possible, against the wind. This method, however, cannot be adopted in small forests, as too frequent a disturbance would make the D. forsake the ground. Trained dogs are used to chase the D. after he has been wounded.

Weapons.—The destruction of the woods, the substitution of the gun for the bow and arrow, formed quite an epoch in the habits and size of the D. as well as in the mode of killing. The bow had one advantage over the gun, viz. that of being noiseless, so that a stalker well concealed might repeat shots without giving much alarm. In Sutherland firearms were unknown until about the latter end of the sixteenth century, when a large kind of blunderbuss, named by the people *glas-nadhean*, was introduced. These, however, did not supplant the bow and arrow until after the middle of the seventeenth century. Spears were also formerly used, chiefly for killing wounded D. See Charles IX. of France, *La Chasse royale*, 1858; A. G. Cameron, *Wild Red Deer of Scotland*, 1923; H. Fraser, *Amid the High Hills*, 1923; and Lord Lathyrer, *Deer: Stalking in Scotland and New Zealand*, 1935.

Deerfield, tn. of Franklin co., Massachusetts, U.S.A., on the Connecticut and D. Rs., 33 m. N. of Springfield; much visited by tourists; it comprises sev. vils., many of the houses dating from the eighteenth century. There is a collection of colonial and Indian relics. For many years D. was the frontier post of New England on the N.W. It was repeatedly taken by the Indians. On Feb. 29, 1704, twenty savages with painted faces and hideous acclamations broke into the room of John Williams, minister of the gospel in D., and with 100 of his neighbours, 300 Indians carried him off to Montreal, murdering nineteen by the way,

300 m., and burning 1). before starting. Pop. 3000.

Deerhound, dog resembling the greyhound in general appearance, from which it probably sprung. Ds. are used particularly in deer-stalking, and are very quick runners with a keen scent. The chief points are as follows: Head long and tapering, broadest at the ears, with a flat skull and a black nose (though the nose may be blue in the blue-fawn variety); ears small, soft, and silky, set on high and folded back, and in colour dark, preferably black; neck long, with a good mane, with sloping shoulders and a prominent nape; stern long and tapering, well covered with hair; chest deep and broad; loins well arched and drooping towards the tail, with great breadth across the hips; legs broad and flat; forelegs straight with arched toes. The height varies from 28 to 30 in., the females being as small as 26 in.; weight from 80 to 105 lb., females from 70 to 80 lb.

Deer, Old, par. and vil. in Aberdeenshire, Scotland, 9 m. from Letterhead. The ruins exist of St. Mary's Abbey of D., which was founded in 1218-19. Near here Robert Bruce defeated the Comyns. Area 27,363 ac. Pop. 3700.

Dees, or **Dees-Magyaros**, tn. in Hungary, situated 37 m. N. by E. of Klausenburg. Noted for its salt mines and saline springs. Pop. 10,000.

De Falla, Manuel, *see* FALLA, MANUEL DE.

Defamation, in law, signifies a statement about a person which tends to expose him to hatred, contempt, or ridicule, or to injure him in the way of his trade or calling, or to cause him to be shunned or avoided by his fellow men. Where the statement is in writing or other durable or permanent form it is called a libel; spoken defamatory words are known as slander, though in Scotland this distinction does not exist. A libel may give rise to a criminal prosecution as well as to a civil action for damages, especially where it has a tendency to provoke a breach of the peace. The truth of the libel is no defence in criminal proceedings, save where it is for the good of the public that the statement in question should be circulated. In civil proceedings truth or justification is a complete defence. In slander certain classes of statements are said to be actionable *per se*, that is, the plaintiff is entitled to damages whether he can prove that he has suffered damage or not. Words which afford a cause of action without proof of special damage comprise four classes: (1) words spoken of a man in the way of his trade, business, profession, or calling; (2) words imputing to the person defamed a crime which if proved against him would render him liable to imprisonment or other bodily punishment as opposed to a mere fine; (3) words imputing that the person defamed is suffering from contagious disease, unfitting him for decent society; (4) words imputing unchastity or adultery to any woman or girl. It is no D. to publish in good faith any fair

comment on a matter of public interest, or a correct and fair report of public, judicial, or legislative proceedings; or to communicate in good faith to any person in a manner not in excess of the occasion any information or opinion which it is proper to communicate in the interest of that person, or of the person making the communication, or of the public. Some words are said to be absolutely privileged. Such are judicial utterances, statements made by witnesses on oath, words used by a member of Parliament in Parliament, or by a barrister in court in a case in which he has been engaged, and statements made before a select committee of the House of Commons. Other statements are said to enjoy a qualified privilege, i.e. there is no D. unless express malice can be proved. Reports of judicial and parl. proceedings belong to this class, and to be privileged must not only be fair and accurate, but must not have been pub. from any indirect motive. An apology is no defence to an action of libel or slander, but may go to mitigate the damages.

The lord chancellor appointed a committee under Lord Porter in 1939 to consider the present law of D. and to make recommendations. The committee was suspended owing to the war and its recommendations were not pub. until 1948. No large changes are recommended, but if the many recommendations made are accepted they will go far to meet the more serious complaints against the present system. The true function of the law of D. is the protection of reputation from improper attack, and it is implicit in the committee's proposals that it would be wrong to accede to the request of those who would whittle down this valuable and primary purpose. In the more publicised actions the damages awarded have sometimes been excessive judged by any standard, and the committee therefore suggest that the court of appeal should have power to vary the amount of any award, whether made by judge or jury. As regards 'unintentional defamation,' the committee, while not proposing to reverse the present rule (that a statement was not intended to be defamatory is immaterial in establishing liability), suggests that, if all reasonable precautions are taken, by giving appropriate publicity to a correction and apology (with payment of costs) to clear the reputation of a person unintentionally defamed, no monetary damages should be awarded. The committee, however, were unable to agree whether the plaintiff ought to prove, or the defendant disprove, intention and, unless Parliament itself resolves this difficulty, the ordinary rule relating to the burden of proof will apply. Though the law of libel differs in sev. important respects from that of slander and assimilation under the same rules would be theoretically sound, the committee are not in favour of it. Though they consider the distinction both arbitrary and illogical, they take the view that, were all slander to be actionable like libel, without proof of special damage, the scope for trivial but costly litigation might be enormously

increased. Fear of the law of libel has modified criticism of doubtful activities. Though the risk involved in exposure cannot be altogether avoided, the suggested extension of qualified privilege—so making proof of malice necessary for liability—to the reports of a much larger number of societies and organizations should prove most beneficial by widening the area of protected public criticism. (Cmd. 7356, H.M.S.O., 1948.)

Default, failure to perform some legal or quasi-legal duty. For example a defaulting trustee is one who makes a wrong use of money entrusted to him or who fails to render an account of same. In legal matters the failure to fulfil or obey certain rules of court places a party in D., and judgment by D. may be given against him.

Defeasance, in law, is either a condition relating to a deed, which on fulfilment defeats the force or operation of the deed and renders it void, or is itself a collateral deed made synchronously with a deed of conveyance, containing conditions, on the performance of which the estate created by the conveyance may be defeated. Ds. of freehold estates must be by collateral deed. Ds. may also be of terms of years, executory interests, bonds, and recognisances. Ds. as to title are now never used in practice the necessary conditions always being inserted in the body of the deed.

Defence, Civil, *see* AIR-RAID PRECAUTIONS.

Defence, Committee of, *see* COMMITTEE OF IMPERIAL DEFENCE.

Defence Medal, decoration of the second World War, granted for three years' service with forces in non-operational areas subjected to air attack or closely threatened; for one year's non-operational service with the forces overseas from or outside the country of residence; for three years' civil defence or other specified civilian service in military operational areas and for civil defence service in non-operational areas subjected to air attack or closely threatened. The time qualification in the case of mine and bomb disposal units of the forces is three months. The centre of the ribbon is flame-coloured and the edges are green, symbols of the enemy attacks on our green and pleasant land. Two black stripes represent the black-out. Those qualified for any one of the campaign stars may be granted this award in addition. Members of civilian services in the United Kingdom eligible for war chevrons for war service in the United Kingdom are entitled to the medal, as also are civil defence services in Gibraltar and Malta, etc. The medal is granted without regard to the period of service to those who may have received an award or commendation for brave conduct or commendation for valuable service in the air, provided that the recipient, when the commendation was earned, was serving in a category eligible for the medal.

Defence, Ministry of. The creation in Britain of a minister of defence, 'responsible to Parliament for certain subjects

affecting the three services and their supply', was announced in a White Paper issued on Oct. 5, 1946. The Prime Minister retains the supreme responsibility for defence, but the appointment of a minister of defence, other than the Prime Minister, to co-ordinate the strategic policies and supply programmes of the three services, was to be expected as a by-product of war experience. Although the Prime Minister can never detach himself from responsibility for national security, the military aim is not paramount in peace, and military preparations—and their co-ordination—become a specialised function for a minister giving it his whole time. The new plan is, in fact, an adaptation of wartime practice. The Prime Minister remains chairman of the Defence Committee, and the Chiefs of Staff Committee remains autonomous, enabling the chiefs of staff to speak direct to the Cabinet Defence Committee. The defence minister, as a rule, takes the chair at the Defence Committee 'when international relations are stable.' He is, however, more than an understudy for the Prime Minister, and, in effect, replaces the minister of production in the co-ordination of military supply and of the necessary finance. The Minister of Production's Council has now become the Ministerial Production Committee; the joint war production staff remains, though now under a permanent official chairman; and parallel to it is a new Committee on Defence Research Policy, also under a permanent expert chairman. As with the chiefs of staff, this part of the new organisation indicates a desire to give the fullest weight and freedom to technical advice in the framing of defence policy. One result of this new creation is the disappearance of the Committee of Imperial Defence; but it is claimed that the new mechanism will fit in well with existing and projected means of empire co-operation in military matters, but whether the interchange of service liaison officers will prove to be an efficient substitute for common action in research, supply, and military strategy can be judged only in the light of experience.

Defence of the Realm Act. This was the name applied to a series of legislative measures enacted at different periods of the First World War by the Brit. Gov. The Act was familiarly known as DORA, this name being derived from the initial letters of Defence of Realm Act. The first of the series, known as the Defence of the Realm Consolidated Act, 1914, was passed on Nov. 27, 1914. It authorised the trial by courts-martial, or in the case of minor offences by courts of summary jurisdiction, and punishment of persons committing offences against such regulations as might be made during the war for securing the public safety and defence of the realm by the king in council. Particular attention was directed to offences against the regulations designed (a) to prevent persons communicating with the enemy or obtaining information for that purpose or any purpose calculated to jeopardise the success of the operations of

any of his majesty's forces or the forces of his allies or to assist the enemy; or (b) to secure the safety of his majesty's forces and ships and the safety of any means of communication and of railways, ports, and harbours; or to prevent the spread of false reports or reports likely to cause disaffections to his majesty or to interfere with the success of his majesty's forces by land or sea or to prejudice his majesty's relations with foreign powers. The Act also made it lawful for the Admiralty or Army Council to take over (a) the whole or any part of the output of any factory or workshop engaged in the manuf. of arms, ammunitions, or warlike store; (b) such factories or workshops entirely. In May 1915 the Act gave wide powers to the State over the supply and sale of intoxicating liquors in certain areas. Though highly unpopular the regulations under this type of legislation were revived just before the outbreak of the Second World War, 1939—both Houses of Parliament simultaneously, on Aug. 24, passing the Emergency Powers Act, conferring wide powers on the gov. in time of emergency. Including power to conscript men up to forty years of age, and to take over industrial establs., etc.

Defender of the Faith, title given to Henry VIII. by Pope Leo X. in 1521, to show the Church's appreciation of Henry's defence of the papacy against Luther. It is now part of the regular title borne by the sovereigns of England, as seen on the coins of the realm where the wording is '... Fidel Defensor.'

Deferred Pay was a deduction from the pay of a soldier of the Brit. Army whilst serving, which was paid to him in a lump sum when he finally left the service. It was abolished in 1898 on the introduction of messing allowance. D. P. still exists in the Brit. service, but only in the case of the non-European personnel of certain colonial regiments, e.g. the Hong Kong Singapore Brigade. The rate of D. P. is £3 a year, or, in the case of periods of less than a year, 5s. for each completed period of thirty days.

Defland, Marie de Vichy-Chamrond, Marquise du (1697-1780), one of the most brilliant Fr. letter-writers of the eighteenth century. In 1718 she married the Marquis du D., from whom she soon afterwards separated. Her *salon* in the rue St. Dominique was frequented by the most celebrated literary men of the day, and she made herself a conspicuous and notorious figure in Parisian society. In 1753 she became blind. From 1766 she corresponded with Horace Walpole. Most of her correspondence has been pub.

Defiance, cap. of D. co. in Ohio, U.S.A., 50 m. from Toledo. It manufs. dairy products, automobile bodies, cotton gloves, etc. A fort named D. was built here, 1794. Pop. 9700.

Deficiency Advances, see NATIONAL DEBT.

Defile, long narrow pass or way in which troops can march only in file, or with a narrow front; derivation of the verb D., which means to march in a line or

file; one by one, i.e. single or Indian file, or two by two, i.e. double file.

De Filippi, Cav. Filippo (1869-1938), It. surgeon and explorer, was b. at Turin, and educated at the medical school of Turin Univ. He held posts in surgery at the univs. of Bologna and Genoa. Always a keen Alpine climber, he took part in the duke of Abruzzi's Alaskan expedition, ascending Mt. St. Elias; and also in the expedition to the W. Himalaya and Baltoro Glacier in Karakoram. Under the auspices of the It. and Indian Govs. he led a scientific expedition to Karakoram, 1913-14. He pub. works on all these expeditions: *The Ascent of Mount St. Elias* (1900); *Ruvenzori* (1909); *Karakoram* (1912); *Himalaya, Caracorum e Turkestan Cinese* (1924); works on surgery and chem.; and *Italy's Protection of Art Treasures and Monuments during the War* (1918); *The Relations of the House of Savoy with the Court of England* (1920).

Definition, brief and concise description of a thing by its properties; the process by which the common qualities of objects belonging to any given class are determined and expressed, so as to distinguish effectively between that class and other classes. According to old scholastic logic, a D. must give the mark of the genus (*nota generalis seu genus*) and of the species (*nota specialis seu differentia specifica*); genus denoting the distinctive qualities belonging to the whole class, and species marking out the difference of the part in question.

Deflagration, rapid combustion of charcoal when heated with a nitrate or chlorate. If this occurs when a natural salt is heated with charcoal, the presence of a nitrate is indicated, since chlorates do not occur naturally. If the flame be violet, then potassium nitrate is indicated; while if it be yellow, sodium nitrate is present.

Defoe, Daniel (c. 1659-1731), author of *Robinson Crusoe*, was the son of an Eng. butcher of St. Giles, James Foe. Daniel changed his name to the more aristocratic De Foe. At a dissenting academy he received a good education, and for a brief space was ambitious to become a dissenting minister, but the idea was renounced, and about 1685 he entered the hosiery business. It is known that he travelled in France and Spain, volunteered in King William's army in 1688, and made other unsuccessful attempts to embark on a business career, but about 1700 he definitely settled down in London to eke out a livelihood by journalism and vigorous pamphleteering. His rough but lively satire of 1701, entitled *The True-born Englishman*, was a spirited apology of the king's Dutch nationality, based on the folly of any people claiming purity of blood and in particular of the Eng., who are—according to D.—a most composite race. But it was his *Shortest Way with the Dissenters* (1702) which first made him notorious throughout the country, for the House of Commons ordered the book to be burned; and the following description of him was advertised to ensure his speedy apprehension: He is 'a middle-sized, spare

man, about forty years old, of a brown complexion, and dark brown-coloured hair, but wears a wig; a hooked nose, a sharp chin, grey eyes, and a large mole near his mouth.' This famous treatise was alleged to be written by a 'high-flying' churchman, who advocated a second Bartholomew's Day as the only effective means of getting rid of the obnoxious nonconformists. The fact that the Church party at first accepted the remedy as a serious proposal naturally aggravated their indignation, when it became known that the whole pamphlet was a monstrous satire on their violent intolerance. However, the 'unabashed Defoe' found the ordeal of thirce standing in the pillory fairly pleasant, as the entire populace was on his side. His release

DANIEL DEFOE

After the engraving by M. Vandergucht.

from Newgate, where he was confined, was due to Harley's intercession with the queen in 1704. The manly dignity of his poem, *A Hymn to the Pillory* (1703), reveals D.'s character in its most favourable light. In 1704 appeared the first number of his periodical, the *Review*, which was issued three times a week, and which has never been surpassed for its combined qualities of diversity of matter, excellence of style, and rapidity of production. Over 5000 printed pages in all were compiled by D. himself for this periodical alone. Passing over his fine denunciation of indiscriminate charity (1704) and his elaborate *History of the Union of Great Britain* (1709), we come to his masterpiece, the immortal *Life and Strange Adventures of Robinson Crusoe*, of York, Mariner (1719). This amazing work of fiction, the verisimilitude of which impresses the most indifferent reader, was based on the four years' solitary residence on the is. of Juan Fernandez of Alexander Selkirk, with whom D. became personally acquainted on his return. It is safe to say that no other writer of fifty-eight has ever produced a work comparable to *Robinson Crusoe* for the apparent artlessness of its unadorned yet intensely dramatic and arresting

style, or for the irresistible reality of its atmosphere, which is, after all, one of pure romance. In the same year he pub. a sequel, *The Further Adventures of Robinson Crusoe*, but perhaps only one in twenty thousand who has read the first has read the second—for indeed the genius that makes Part I. immortal is no longer there. D. wrote a third part in 1720, *Serious Reflections during the Life and Surprising Adventures of Robinson Crusoe*, but it is quite unreadable and never reprinted.

In a short article it is impossible to mention one quarter of what this most prolific of authors wrote. In his *An Appeal to Honour and Justice* (1715) he attempted to apologise for his discreditable time-serving policy in politics. Under Godolphin he had accepted a regular salary as a staunch Whig (1706), but he unblushingly turned Tory so as to serve his old patron Harley when he returned to office, 1710. His *Memoirs of a Cavalier* and *Captain Singleton* (1720), and *A Journal of the Plague Year* (1722) are all excellent illustrations of his power to work up circumstantial, but fictitious, detail into the most convincing of narratives. Lord Chatham believed the first to be a true hist., and few would doubt but that the plague was described by an actual eye-witness, anxious only to leave behind him an authentic record. Yet D. was a child of seven when it occurred. Prosperity rewarded D.'s indefatigable activities, and he was able to build himself 'a very handsome house' in Stoke Newington. He was buried in Bunhill Fields. Perhaps his fecundity, his vivid imagination, his literary versatility, and his impressive style have been somewhat obscured by the unheroic, unromantic character of his moral standard (as exemplified in the realistic novel, *The Fortunate Mistress*, (1724)) and beliefs, as also by his offensive, though by no means unique, political inconsistencies. The best collected ed. of D.'s works is the *Novels and Selected Writings*, 14 vols. (1927-28). See G. Chalmers, *Life of Defoe*, 1785; W. Chadwick, *Life and Times of Daniel Defoe*, 1859; W. Minto, *Defoe* (Eng. Men of Letters), 1879; T. Wright, *Life of Daniel Defoe*, 1891; W. P. Truitt, *Daniel Defoe: How to Know Him*, 1916; P. Dutton, *Defoe et ses romans*, 1921; and J. Sutherland, *Defoe*, 1937.

Deportment, in Scottish law, denotes the forcible opposition or resistance made to an officer of the law who is at the time employed in executing a legal warrant.

De Forest, Lee, Amer. physicist and wireless technician, b. Council Bluffs, Iowa, 1873. Graduated from the Sheffield Scientific School of Yale Univ. in 1899. He has devoted his whole life to wireless, being a pioneer in the development of wireless telephony in America. He has taken out over 200 U.S.A. patents on radio telephony and telegraphy inventions. One of his most important is the 'Audion' detector, oscillator, amplifier, which made possible transcontinental telephone service both by wire and wireless. He also carried out experiments on phonofilms, later known as 'talkies.' He

became vice-president of the Radio Telephone Company in 1913.

Deformity, condition arising from imperfect or perverted development of any structure of the body. Ds. may be congenital or acquired. The conditions giving rise to congenital abnormalities are studied under the name of teratology. Acquired Ds. are due to accident, disease, the maintenance of abnormal conditions in the course of a trade or occupation, or deliberately contrived compression at the dictate of custom, religion, etc.

Defregger, Franz, Ritter von (1835-1921), Austrian genre painter. The picture that first made him famous was 'Speckbacher,' painted in 1868, a picture of the Hofer rising in 1809. After this came 'The Dance,' 'The Prize Horse,' and genre pictures of Tyrolean peasant life. In 1876 he painted his famous 'Victors Return,' and in 1898 his masterpiece, 'Hofer going to his Death.' See life by H. Hammer, 1940.

Degas, Hilaire-Germaine Edgard (1834-1917), Fr. painter and engraver, was b. at Paris and educated at the Ecole des Beaux-Arts. He was one of the most celebrated impressionist painters. His subjects include portraits, racehorses, ballet girls, and the circus, and he painted in oils, water-colours, and pastels; he was also a lithographer. Of his works the chief are 'War in the Middle Ages' (Salon); 'Steepchase'; 'Family Portraits'; 'Ballet of La Source'; 'Portraits of Criminals'; 'Races'; 'Interior of a Cotton-Broker's Office at New Orleans'; and 'The Rehearsal.' In the Luxembourg Gallery at Paris are the 'Danseuse sur la scène'; 'Danseuse nouant son brodequin'; 'Un Café, Boulevard Montmartre'; and 'Les Figurants.' See lives by J. Meier-Graefe, 1924; A. Vollard, 1928; and R. Schwabe, *Degas the Draughtsman*, 1948.

De Geer, Louis Gerhard, Baron (1818-1896), Swedish statesman who will be remembered for his reform of his country's representative system (which had existed from the later Middle Ages) to a bicameral elective system in 1865-66. Amongst De G.'s books, some of which are written in fine style, are *Minnesteckning öfver Hans Järta* (1874); *Minnesteckning öfver A. J. v. Hopken* (1881); *Minnesteckning öfver B. B. von Platen* (1886); his own *Minnen* (1892), invaluable for its historical information; some novels and essays. See C. G. Malmstrom, *Historiska Studier*, 1897.

Degeneration, Physical, see PHYSICAL DETERIORATION; BIOLOGY.

Dégérando, Joseph Marie, Baron (1772-1842), Fr. statesman and author of philosophical and philanthropic works, was b. at Lyons. He went to Germany in 1797 and became a private in Massena's army, during which time he wrote *Des Signes et de l'art de penser*. He was afterwards appointed secretary-general to the ministry of the interior by Napoleon, and later vice-president of the Council of State. Of his works the most important are *De la génération des connaissances humaines* (1802); *Histoire comparée des systèmes de philosophie* (1803); *Education des sourds-*

muets de naissance (1827); and *Du Perfectionnement moral, ou de l'éducation de soi-même* (1828).

Deggendorf, tn. in Lower Bavaria, Germany, rich in churches: the Church of the Pilgrimage to the Holy Sepulchre was begun in 1337. A favorite summer resort in beautiful scenery. Pop. 8000.

D'Eglantine, Philippe François Nazaire Fabre, see FABRE D'ÉGLANTINE.

Deglutition, see SWALLOWING.

Dégoutte, Jean Marie Joseph (1866-1938), Fr. general who gained distinction in the First World War when commanding the Fr. Sixth Army during the Ger. retreat from the Marne in July and Aug. 1918. He qualified at the Ecole Normale Supérieure but suddenly decided to go to St. Cyr, was commissioned to the 4th Zouaves, and went to Tunis. Studied law and languages, becoming proficient in Chinese, Malagasy, and Ger. He served in the Chinese war of 1900, and before the First World War held an important post in Morocco. Commanded the Moroccan div. in the earlier part of the war. Promoted again in 1917 he was given command of the Sixth Army in the final phase of the war, reaching the rank of general of div. Was commander-in-chief of Fr. troops in occupation of Rhine from 1919 to 1924. Member of Supreme Army Council.

Degree of Latitude, length along a meridian such that the difference between its N. and S. ends is one D. (360th part of the circumference of a circle). A D. of longitude is the length between two meridians that make an angle of one D. at the poles.

Degrees in Arts were first granted in the Middle Ages. Even in Rom. times the expression arts or liberal arts was freely applied to certain branches of learning, and about A.D. 1200 those who devoted themselves to the study of philosophy and science in contradistinction to theology, medicine, and law were said to belong to the Faculty of Arts. Their course of study embraced the 'Trivium,' that is, grammar, dialectic, and rhetoric, and the 'Quadrivium,' which included arithmetic, geometry, astronomy, and music. For such were the divs. of knowledge handed down by the schools of the Rom. Empire. In the twelfth and thirteenth centuries the earliest univs., such as those of Bologna, Paris, Oxford, and Cambridge, began to develop, and it was found necessary to confer some recognised licence on those eligible to teach. Originally, therefore, the degree was a certificate endowing its owner with the privilege of teaching in public at the various centres of learning. The pope was regarded as the final giver of every degree, and no community of pedagogues, however learned, could call themselves a univ. unless they had obtained the papal recognition. Thus in Paris the Master of Arts degree was primarily nothing more than a formal permission from the chancellor of Notre Dame Cathedral for its holder to take his master's chair among his brother profs. and to embark on his pedagogic career.

Candidates for D. in A. were obliged even as late as the eighteenth century to take part in dialectical discussions or disputations—a performance known as the keeping of his 'Act.' On three occasions the aspirant was obliged to read a Lat. thesis and then to enter into a debate, conducted on a syllogistic form, with a doctor of the faculty and one or more opponents. At first the subject for discussion was almost invariably taken from Aristotle, but later it was based, for one of the occasions at least, on the *Principia*, or some other treatise of Newton. The last vestige of this system of 'disputation' or 'Act,' for the B.A. degree finally disappeared from Cambridge Univ. in 1838, when written examinations became the one recognised test. Gradually the latter had superseded the disputations, as it was found impossible by this means adequately to examine the knowledge of the student in such subjects as mathematics. It soon became the rule in leading univs. that no matriculated student could attain to a degree unless he had conformed to regulations regarding attendance at lectures and residence in the univ. At Paris in the fifteenth century a course of four years' study was one of the qualifications necessary for the master in arts, the minimum period for a degree in most univs. to-day being three years. In Cambridge an honours degree in arts is now called a tripos, a name originating from the fact that on the day for conferring new degrees it was the custom for an old bachelor to sit on a tripos or stool and to enter into a mock and humorous disputation with his new associates. The Bachelor of Arts degree is of comparatively recent growth, and in Scottish univs. there is an M.A., but no B.A. degree. Mathematics and natural philosophy, classics, and mental science and Eng. literature are the three depths, proficiency in any of which entitles to an M.A. degree. Modern languages, hist., literature, mathematics, and classics are the recognised subjects for arts degrees in Oxford, Cambridge, and London Univs., etc., to-day. Many univs. give D. in A. *honoris causa* to men who have distinguished themselves in statesmanship, letters, art, science, etc., but who have not earned the distinction by passing the qualifying examinations. In some univs. the M.A. degree may be bought. Most of the univs., except Oxford and Cambridge, now admit women to their D. in A., London and Dublin being pioneers in this reform. Other arts degrees besides those already mentioned are J.L.A. of St. Andrews (Lady Literate in Arts), Ph.D. (Doctor of Philosophy), the crowning distinction in Amer. univs.; Ph.B. (Bachelor of Philosophy); A.M. (*Artium Magister*), the Amer. Master of Arts; A.B. (*Artium Baccalaureus*), the Amer. Bachelor of Arts; Litt.D. (Doctor of Literature); B.Litt. (Bachelor of Literature); D.Phil. and B.Phil. (Doctor and Bachelor of Philosophy).

Degrees in Commerce, see under COMMERCIAL EDUCATION.

Degrees in Law, see under LEGAL EDUCATION.

Degrees in Science are of comparatively recent institution. They are of two kinds: Bachelor of Science (B.Sc.) and Doctor of Science (D.Sc.). Oxford Univ. has a 'Final Honour School' in Natural Science, and a B.Sc. may be taken by original research or dissertation. At Cambridge the tripos may be taken in natural science and in mechanical science (engineering). At London a B.Sc. degree may be taken by men and women, *internally*, i.e. when a specified number of lectures have been attended at a recognised school of the univ., or *externally*, by home students. The prov. univs. and colleges, e.g. Manchester, Sheffield, Leeds, etc., have made a special point of scientific study. At the Armstrong College students who have passed the required examinations in engineering, mining, manufs., or agriculture are admitted as associates in physical science of the Durham Univ.

De Gubernatis, Angelo (1840-1913), It. author and orientalist, b. at Turin. He was appointed prof. of Sanskrit at Florence in 1863, and at Rome in 1891. His works include *Zoological Mythology* (1872); *Storia comparata degli usi Natalici* (1872); *Ricordi biografici* (1873); *Mitologia Vedica* (1875); *Mythologie des Plantes* (1878); *Dizionario biografico degli Scrittori contemporanei*; and *Storia universale della Letteratura* (1882-85).

Dehiscence, in botany, term indicating the bursting of the author of a flower to allow the escape of the pollen; in the case of fruit it indicates the break-up of the fruit or seed case to allow the seeds to escape. Fruits are said to be indehiscent when the ripe seed-vessel falls to the ground without letting the seeds escape. There are three kinds of D.: *valvular*, the seed-vessel parting in divs.; *transverse*, the seeds escaping by the falling of a lid; *porous*, seeds escaping through small pores.

Dehiscent Fruit, see under FRUIT.

Dehra, cap. of the D. Dun dist. in the United Provs., India. Is prettily situated in the midst of a mt. valley 2300 ft. above sea level. The temple of its founder, Guru Ram Rai, at the end of the seventeenth century, forms the chief ornament of the tn. Here are the Indian Forest College and the Prince of Wales Military College. D. enjoys a great reputation as a hill resort, and has a large resident pop. of Anglo-Indian and Indian pensioners. Pop. 50,000.

Dehra Dun, a dist. in the United Provs., India, consists of a broad but barren valley, deluged in the unhealthy rainy season and dried up in the summer. The extensive woods consist mostly of pines, and, on the slopes of the Himalayas, of cedars and silver firs. The 180,000 natives, mostly Hindus, cultivate maize, millets, sorghum, and rice.

Dehydrogenation (in chem.). When hydrogen is removed from an organic compound and no other elements replace it, the process is known as D. Many aromatic compounds may be dehydrogenated

by heating with sulphur or with selenium. Thus cyclohexanol will give phenol, and cyclohexyl mercaptan thiophenol, when heated with sulphur. See also OXIDATION.

Deianeira was the daughter of Althæa and Cæneus, and the sister of Melæger. Hercules and Achelous fought for D.; Hercules was victorious and so claimed her for his wife. She was the unwilling cause of her husband's death by sending him the robe which was presented to her by the centaur Nessus. The robe was supposed to preserve love, but in reality it was poisoned. When Hercules, through having won the robe, was dead, D., in despair, put an end to her own life. See R. Jebb, introduction to the *Trachinæ* of Sophocles, 1882.

Deidamia, daughter of Lycomedes (q.v.), king of the Dolopians in the is. of Scyros. When Achilles was concealed there in maiden's attire, she became by him the mother of Pyrrhus or Neoptolemus.

Deification, see APOTHEOSIS.

Dei Gratia (Lat. by the grace of God), expression supposed to have first been used at the Council of Ephesus (A.D. 431), and signifying a complete dependence on the will of God. Until the fifteenth century it was used only by the clergy after their names, as an expression of dependence. After that date it was assumed by kings, but the signification changed from that of dependence to assertion of power and the idea of the theory of the divine right of kings.

Delces, or **Dajauku**, first king of Media, who, according to Herodotus, reigned from 709 to 645 B.C., though Noldeke gives from 700 to 647 as his dates.

Delotarus (d. 30 B.C.), tetrarch of Galicia, received from the Rom. Senate the title of king of Galicia and Armenia, in return for his services during the Asiatic wars. In the civil war he joined Pompey. Cæsar took from him Armenia, and left him only his title. He was accused of plotting against Cæsar's life, and Cicero defended him in an oration still extant.

Deiphobe, Sibyl at Cumæ, daughter of Glaucus.

Delphobus, son of Priam and Hecuba. He married Helen after the death of Paris, and was killed by Menelaus at Troy.

Deira, anct. Anglian kingdom, extending from the Tees to the Humber. With its N. neighbour, Bernicia, it was afterwards merged in the kingdom of Northumbria.

Deirdre, mythological heroine of one of the three tragic Gaelic poems of Ireland. Destined to be the bride of King Conchobar, D. falls in love with Naisi (or Noisi), son of Usnagh, and is protected by him and by his brothers. The king slays the three young men, and the poem, *Deirdre's Lament over the Sons of Usnagh*, recalls the happy days spent with Naisi in Alba (i.e. Scotland), on Lough Etive and contrasts it with her present misery in the house of the king. See K. Meyer, *Ancient Irish Poetry*, 1911.

Deir-el-Kamr, or **Deir ez Zor**, tn. on the W. side of Lebanon, on healthy fruitful

terraces, with about 8000 inhab. (Maronites, Druses, and Jews), who produce wine and silk.

Deism (from Lat. *deus*, god), strictly speaking the belief in a god, synonymous with theism as opposed to atheism. The term is generally used, however, in opposition to revealed religion, and especially to Christianity. Thus Deists are those who believe in a personal God, the Creator of the universe, but regard him as detached from the world to which he has made no revelation. The term is still further restricted to the movement which gained ground in England at the end of the seventeenth century, and flourished during the former half of the eighteenth century. It was characterised by a strong aversion from Christianity, and a belief that the light of nature and reason are sufficient guides in doctrine and practice. It called forth many defenders of orthodoxy from among the Queen Anne prelates, and it had but little final effect on Eng. thought. It considerably influenced Voltaire, and had much in common with the later Ger. rationalism. Lord Herbert of Cherbury is regarded as 'the father of English deism,' and the other chief names in the movement are Charles Blount, Matthew Tindal (author of *Christianity as Old as the Creation*), Wm. Wollaston, Thomas Woolston, John Toland (author of *Christianity not Mystical*), Anthony Ashley Cooper, third earl of Shaftesbury, Viscount Bolingbroke, and Anthony Collins.

Déjazet, Pauline Virginie (1797-1875), Fr. actress. b. at Paris. She went on the stage when she was five years old, played at the Théâtre des Jeunes-Élèves, in 1821 at the Gymnase, in 1834 at the Théâtre du Palais-Royal, from 1844 to 1849 at the Variétés, and at the Théâtre Déjazet.

De Kalb, city of De K. co., Illinois, U.S.A., 60 m. W. of Chicago. Barbed wire was invented and is still made here, also pianos and wagons. There is a trade in canned vegetables, etc. Here is the Illinois State Teachers' College. Pop. 5100.

Dekkan, see DECCAN.

Dekker, Eduard Douwes, or 'Multatuli' (1820-87), Dutch writer, b. at Amsterdam, who became assistant-resident at Lelak, W. Java. He began to protest against the abuses of the Dutch colonial system, and being threatened with dismissal, he resigned his post, and returned to Holland. His fame as an author was made by his brilliant romance, *Max Havelaar* (1860), exposing the scandals of the Dutch Gov. in Java. His *Ideeen* were pub. 1862-77, and another novel, *De Geschiedenis van Wouterje Piderse* (1890). See life by J. Saks, 1937.

Dekker, Thomas (c. 1570-c. 1641), Eng. dramatist and pamphleteer. b. in London, but little is known of his life. His name is often mentioned in Henslowe's *Diary* in the last years of the sixteenth century as being in receipt of loans and payments for writing various plays in conjunction with Ben Jonson, Drayton, Wilson, Chettle,

and others, and he seems at that period to have been much in request as a playwright. Henslowe also mentions the fact of having advanced him forty shillings to release him from prison, where he was confined for debt; but in 1613-16 he was again in prison for the same reason. He is mentioned in the *Diary* for the first time on Jan. 8, 1597, as having sold a book, i.e. the MS. of a play. He has been called the Dickens of the Elizabethan period, though in life and character the two men were utterly unlike. D. wrote without any thought of reforming things he saw, wishing only to depict them; he had the great power of being able to make imaginary figures seem real, though often writing under great pressure. His plays afford information about the details of lower-class life, such as the interiors of shops, houses, and taverns, and the haunts and habits of vagabonds, and other London life. They also contain a few charming songs, which show that he must have been possessed of very great lyrical talent. His best plays include *The Shoemaker's Holiday* (1600); *Old Fortunatus* (1600); *The Honest Whore*, in two parts (1604-30); *The Virgin Martyr* (1622); and *The Witch of Edmonton* (pub. 1658). In 1603 he wrote *The Patient Grissel* with Haughton and Chettle; with Webster in 1607 *Westward Ho!*, *Northward Ho!*, and *Sir Thomas Wyatt*; and *The Sun's Darling* with Ford, pub. in 1656. His best plays were ed. by E. Rhys in the Mermaid series (1887). See A. C. Swinburne, 'Thomas Dekker' in *The Age of Shakespeare*, 1908; Mary L. Hunt, *Thomas Dekker*, 1911; E. K. Chambers, *The Elizabethan Stage*, 1923; and U. M. Ellis-Furnor, *The Jacobean Drama*, 1936.

De la Bèche, Sir Henry Thomas, see BÈCHE.

De Laborde, Henri François (1764-1833), Fr. general, son of a baker, b. at Dijon. He joined in the wars of the revolution on the side of Napoleon. In 1793, after the battle at Saverne (Zabern), he was made general. He was for a time governor of Corsica. In 1812 he served with Napoleon in the Russian war.

Delacroix, Ferdinand Victor Eugène (1798-1863), Fr. historical painter, leader of the Romantic movement, b. at Charenton, near Paris, his father being foreign minister under the Directory. He was a brilliant colourist and a bold innovator. His earliest success (1822), 'Dante crossing Acheron in Charon's Boat' (Louvre), is an epoch-making picture. He also produced lithographic illustrations of *Hamlet*, *Macbeth*, and of Goethe's *Faust*. In 1845 he was employed to decorate the library of the Luxembourg, and the ceiling of the Salon de la Paix in the Hôtel de Ville, 1853. 'The violence of Delacroix's character seems to show itself in the scenes of frenzy and bloodshed which he loved to paint and around which his imagination continually played. In his many pictures of animals fighting, the masks of tigers and horses assume expressions of malevolence that are disconcertingly human. . . . If we do not look for *joie de vivre* in the work of Delacroix we certainly find the

emotional force of his nature translated into terms of colour—colour glowing luridly among the swirling shadows of a general conflagration. The superbly inventive colour distracts attention from what is happening to the persons depicted; the wonderful painting of the madman's clothes in his 'Tasso in Prison' makes us oblivious of what Delacroix most wants the observer to feel—the desolation of the poet's condition.' (Edward Sackville West). See lives by C. Maclair, 1909; R. Eschollier, 1926-28; and H. Graber, 1938; and his *Journal* (abridged in Eng. trans. by W. Pach), 1948.

De Koven, Henry Louis Reginald (1859-1920), Amer. composer, b. at Middletown, Connecticut. First served as a musical critic; studied music in Europe; among his compositions are *Don Quixote*, *Maid Marian*, *The Golden Butterfly*, *The Wedding Night*, *The Three Dragoons*, *Robin Hood* (1890) (this last-named being one of the most successful of Amer. comic operas), *The Canterbury Pilgrims* (1917), and *Rip Van Winkle* (1920).

Delagoa Bay, see LOURENÇO MARQUES.

Delagrè, Léon (d. 1910), was one of the first aviators in Europe. He began by flying a biplane, and was an exhibitor of one in 1908. For some time before his death he flew a monoplane, attaining a speed of 50 m.p.h. on this machine at Doncaster. He was killed while flying before a crowd of people at the Croix d'Huis aerodrome.

De la Mare, Walter (b. 1873), Eng. poet and novelist, was b. at Charlton, in Kent, of Scottish and Huguenot descent. Educated at St. Paul's Cathedral Choir School, he entered the city office of the Anglo-Amer. Oil Company in 1889, but always devoted his leisure time to his writings. Under the pseudonym of 'Walter Kamal' (an anagram on part of his surname), he pub. *Songs of Childhood* in 1902, and two years later his first novel, *Henry Brooken*. In 1906 he produced a volume of *Poems*. The story of *The Three Mulla-Mulgars* and the psychic novel *The Return*, which won the Polignac prize, appeared in 1910. Then came in succession *The Listeners and other Poems* (1912), *Peacock Pie* (1913), *Motley and other Poems* (1918), *Flo'ra* (1919), and *Collected Poems, 1901-18* (1920). In 1921 he produced varied works: *The Veil and other Poems*; *Crossings*, a play; and a story, *The Memoirs of a Midgel*. *The Riddle and Come Hither* appeared in 1923; *Ding Dong Bell* (1924); *Broomsticks* (1925); *The Connoisseur* (1926); *Told Again and Stuff and Nonsense* (1927); *Stories from the Bible* (1929); *Poems for Children* (1930); *The Fleeting and other Poems* (1933); *Early One Morning* (1935); *The Wind Blows Over* (1936); *This Year, Next Year* (1937); *Memory and other Poems* (1938); *Behold, this Dreamer* (1939); *Pleasures and Speculations* (1940); *Bells and Grass* (1941); *Collected Poems* (1942); *Love* (1943); *Collected Rhymes and Verses* (1944); *The Burning Glass* (1945). For the beauty and mysticism of his poetry he is frequently compared with Coleridge and

Blake, and for his symbolism with Maeterlinck. See R. L. Megroz, *Walter de la Mare*, 1924, and F. Reid, *Walter de la Mare, a Critical Study*, 1926.

Delambre, Jean Baptiste Joseph (1749-1822), Fr. mathematician and astronomer. He early attracted the friendship of the Abbé Delille, and obtained a place in the Collège de Plessis. Afterwards he entered the Collège de France, where he taught and studied under Lalande, and on the latter's death succeeded to the professorship of astronomy. With Méchain he was appointed by the Fr. Gov. to measure the arc of the meridian between Barcelona and Dunkirk. His chief works were the *Base du Système Métrique Décimal* (1806-10) and *Histoire de l'Astronomie*, 1817-27.

Deland, Margaretta Wade (1857-1945), Amer. authoress, b. at Allegheny, Pennsylvania; daughter of S. Campbell. She was educated at Pelham Priory, a school kept by King women near New York. She taught industrial design in the Girls' Normal College, New York, 1878-79. Her many tales include *John Ward, Preacher* (1888); *The Awakening of Helena Ritchie* (1906); *The Iron Woman* (1911); *The Hands of Esau* (1914); *Around old Chester* (1915); *The Vehement Flame* (1922); *New Friends in Old Chester* (1924); *The Kays* (1926); and *Captain Archer's Daughter* (1932).

Delane, John Thaddeus (1817-79), an editor of *The Times*, was perhaps the most distinguished journalist of his day. He was offered the editorship of the great newspaper when he was but twenty-four years of age, and with but little hesitation he took up the difficult and onerous position, which he held until within two years of his death. He devoted his whole life, and all his energy, to the interest of *The Times*, and under his direction it attained so high a position that, even under the altered conditions of journalism, no organ of public information, however great its circulation, can hope easily to rival it. A regular diner-out. D. knew everybody, and many of his acquaintances were of great use to him in his professional career. He seldom wrote for his paper, but was a rigorous censor of his contributors. See life by A. I. Dasent, 1908.

Delano, Jane Arminda (1862-1919), Amer. nurse who distinguished herself in the First World War. B. at Townsend, New York, she first trained as a teacher, then later as a nurse at the Bellevue Hospital School of Nursing in 1884. During the Sp.-Amer. war she became interested in Red Cross work, and from 1911 devoted her life to its organization. In 1918 she was made director of the dept. of nursing, supplying nurses to the army and navy. For her services in France she was awarded the Distinguished Service Medal and the Amer. Red Cross.

Delany, Patrik (c. 1685-1768), Irish divine, was a popular preacher, and an intimate of Swift when that great man returned to his native country after the death of Queen Anne. It was his affection for the dean of St. Patrick's that caused him in later life (1754) to publish his *Observations upon Lord Orrery's Remarks*

upon the Life and Writings of Dr. Jonathan Swift, in which he rebutted certain damaging statements made by Orrery. In 1743 D. married Mrs. Pendarves, who wrote her reminiscences, issued posthumously.

De la Pole, see POLIX.

De la Ramée, Louise, see OUIDA.

Delarey, or De la Rey, Jacobus Herkllass (1847-1914), assistant commandant-general of the Transvaal forces in the Boer war from 1899 to 1902. In 1899 he opposed Lord Methuen at Belmont, at Enslin, at Modder R., and at Magersfontein. In 1900 he defeated Gen. Clements at Nooitgedacht; was himself repulsed near Ventersburg in 1901, at Vlakfontein, and at Moedwill, where he made an attack on Maj.-Gen. Kekewich. In 1902 he captured von Donop's convoy near Wolmarinstad, also Lord Methuen's at Tweebosch. On March 31, 1902, he was defeated by Gen. (later Lord) Kitchener. He joined the Boer peace delegates on April 9 at Klerksdorp, and signed the conditions of surrender at Vereeniging, May 31. In Sept. he came over to England with Louis Botha and Christian de Wet. He became a member of the Transvaal Assembly, and later a senator of the Union of S. Africa. He was shot dead near Johannesburg by a police patrol who mistook his car for that of a criminal gang, Sept. 16, 1914.

De la Rive, Auguste Arthur (1801-73), Swiss physicist, b. at Geneva; son of Charles (Gaspard de la R., prof. of pharmaceutical chem. there. At twenty-two became prof. of natural philosophy in the Geneva Academy. He investigated the temp. of earth's crust, and invented electro-gilding. He wrote *Traité d'électricité théorique et appliquée* (1851-58).

Delaroche, Hippolyte, called Paul (1797-1856), Fr. painter. He studied under Gros, and, like Delacroix, revolted early against the classicism of the school of David. He soon gained popularity, and met with far less opposition than Delacroix. In 1827 he gained the decoration of the Legion of Honour for his 'Capture of the Trocadéro,' and in 1833 was made prof. at the Ecole des Beaux-Arts. After a visit to Italy he received a commission in 1837 for a picture 27 metres long, to decorate the lecture theatre of the Ecole des Beaux-Arts. The picture represents the artists of his times assembled in groups on both sides of some white marble steps, at the top of which are seen all the sculptors and architects of the Parthenon. The figures are all admirably represented. It was finished in 1841, and in 1855 was badly damaged by fire; D. set himself to repair the damage, but d. before he could do so. In 1835 he exhibited 'Head of an Angel,' a study of Horace Vernet's daughter, whom he loved with an absorbing passion all his life, and from the grief caused by her death he is said never to have recovered.

De la Roche, Mazo (b. 1885), Canadian novelist. She was awarded the *Atlantic Monthly's* \$10,000 prize for her novel *Jalna* (1927), the first of a series of stories of three generations of the Whitecoaks—a tempestuous family living on an Ontario estate and ruled by an iron-willed matri-

arch. Other books of the family chronicle: *Whiteoaks of Jalna* (1929, dramatised 1936); *The Master of Jalna* (1933); *Young Renny* (1935); and *Whiteoak Harvest* (1936). Other books: *Portrait of a Dog* (1930); *Growth of a Man* (1938); *The Sacred Bullock* (short stories, 1939); and *Whiteoak Heritage* (1940).

De la Rue, Warren (1815-89), Eng. astronomer, b. in Guernsey. He made a particular study of the solar conditions in their relation to electricity, and greatly advanced the development of solar physics and astronomical photography. His work, *Researches on Solar Physics*, was pub. 1869-70, and *On the Phenomena of the Electric Discharge* in 1881.

De La Salle, see LA SALLE, RENÉ

ROBERT CAVELLER, and JEAN BAPTISTE. De Latre de Tassigny, Jean, Fr. general, see under WESTERN FRONT in SECOND WORLD WAR.

Delanunay, Louis Arsène (1826-1903), Fr. actor, son of a wine-seller. He made his appearance at the Comédie Française as Dorante in Corneille's *Le Menteur*. Then began his long and brilliant career in young lovers' parts, in which he acted until sixty years of age. He played with success in the dramas of Victor Hugo and Molière, but it was especially in de Musset's plays that his talents found their best expression.

Delavigne, Jean François Casimir (1793-1813), Fr. poet and dramatist, b. at Le Havre. At the age of sixteen he composed an ode on the birth of Napoleon's son. During 1815 he wrote a series of satires against the restoration of the Fr. monarchy, which was known as *Messe-messes*, and he wrote most of his prin. plays between the years 1820 and 1830. They are *Les Vêpres Siciliennes* (tragedy) (1818); *Les Comédiens* (1820); *Le Paria* (1821); *L'Ecole des Vieillards* (1823), one of his best works; *Marino Faliero* (1829); and *Les Enfants d'Edouard* (1833). He wrote a hymn called *La Parisienne* for the revolution in 1830, and *La Varsouienne* at the time of the Polish rebellion. Probably his best lyric was that called *La Toilette de Constance*. In 1832 he wrote a tragedy called *Louis XI.*, which was founded upon Scott's *Queen of Burward*. In 1835 *Don Juan d'Autriche* was produced. A collection of his works was pub. in 1885.

Delaware, S. Atlantic state, and one of the original thirteen states of the U.S.A. Except for Rhode Is. it is the smallest, having an area of only 2057 sq. m. Its boundaries are Pennsylvania on the N. and N.W., D. R., the largest in the state, D. Bay, and the Atlantic Ocean and New Jersey on the E., Maryland on the S., and Maryland and Pennsylvania on the W. The hilly country of the N. yields some minerals, including kaolin, granite, brick and tile clays. The forests of cypress swamp in the S. once afforded excellent timber. Brandywine R. is famous for the revolutionary battle of 1777. Some of the tidal salt marshes along the bank have been reclaimed by dikes, and therefore rendered tillable. Agriculture is the chief industry of the

state, Indian corn, wheat, oats, and potatoes being the crops most cultivated, while the hay harvest brings in a large share of revenue; 85 per cent of the state's total acreage is in farms. It ranks second in the U.S.A. in tomato-packing. Sev. varieties of fruit are also grown profitably, notably peaches. The fisheries include shad, oyster, crab, and sturgeon. Clay products include brick and tile, and stone, sand, and gravel are quarried. Iron, steel, and leather industries all flourish, the prin. manufacturing centre being Wilmington, which, like New Castle and Lewes, has also an excellent harbour. D. has a good railroad (of over 325 m.), and therefore transportation facilities, and the state is crossed by a canal connecting D. and Chesapeake Bays. Settled first by Swedes and Finns from Christiania in 1638, D. passed into the hands of the Dutch in 1655, and nine years later was surrendered, together with New Amsterdam (New York), to the Eng. In 1682 Wm. Penn obtained proprietary rights in the state, which finally procured a constitution in 1776. Although a slave state up to 1861, D. was not in favour of secession, and sent many men to join the ranks of Lincoln. The state possesses a small univ. (1833), which is situated in Newark. The name of the state is derived from that of the Brit. colonial governor, Thomas West, Lord de la Warr (q.v.). The pop. of D. is 266,500. The prin. cities are Wilmington, 112,500; Dover, 5500; Newark, 4500; New Castle, 4400; Milford, 4200. See E. N. Vallandigham, *Delaware and the Eastern Shore*, 1922, and W. A. Powell, *History of Delaware*, 1928.

Delaware, co. seat of D. co., Ohio, U.S.A., on the Olentangy R.; it has sulphur and iron springs in the vicinity, and is the seat of Ohio Wesleyan Univ. (1844) and many seminaries. Rutherford Hayes was b. here. Pop. 8900.

Delaware River, U.S.A., is formed by two branches which rise in the W. Catskills of New York and unite at Hancock, D. co. Hence it flows E. to Jersey, where it deflects through the Kittatinny Mts., forming the D. Water Gap; 40 m. below Philadelphia it expands into D. Bay, an estuary 11 m. wide at its entrance and 60 m. long, which, owing to its breakwater, constitutes a spacious harbour. Length of riv., 410 m.

De la Warr, Thomas West, Baron (1577-1618), colonial governor of America, b. in Hampshire. In 1602 he succeeded to the titles and estates as the third (counting from Lord West, the second founder) or twelfth (counting from Roger de la W., the first founder) baron. In 1609 he was a member of the Virginia Company Council, and was appointed governor and captain-general of Virginia for life. He sailed in 1610 with three ships and 150 settlers equipped at his own expense and landed at Jamestown. He was a just and efficient ruler, rebuilt Jamestown, and constructed two forts. In 1611 he returned to England, but hearing of the misrule of his deputy, he set sail for Virginia, but *d. en route*. See DELAWARE.

Delbrück, Martin Frederick Rudolf (1817-1903), Prussian statesman, b. in Berlin. He was given charge of the commercial and industrial dept. of the Board of Trade in 1859, and did much to create the Zollverein. He helped Bismarck considerably before the Franco-Prussian war in holding together the S. Ger. states, and during the war was of the greatest service at home. Later he differed somewhat from Bismarck on the tariff question. He resigned in 1876 and sat as a member of the Reichstag.

Delbrück, Hans (1848-1929), Ger. historian, b. at Bergen, Rugen. He was appointed in 1896 prof. at the univ. of Berlin, in succession to Treitschke. As an historian he consistently took war as the basic fact of all hist. His *Art of War* was always widely read in Germany. It is said that the strategical conception of the double encirclement adopted by Hindenburg and Ludendorff at the battle of Tannenberg was suggested by D.'s analysis of the battle of Cannae. After the First World War he began a *History of the World*, of which he had completed 4 vols. at his death. Among his other works are lives of Frederick the Great, Napoleon, Moltke, and Ludendorff, and works on military strategy.

Delcassé, Théophile (1852-1923), Fr. statesman, b. Nov. 1, at Pamiers, Ariège. He was a prominent figure in European politics for twenty-five years. He helped to bring about the Franco-Russian alliance, was one of the architects of the Franco-It. *rapprochement*, and was largely responsible for the Entente Cordiale. He was thirteen times a minister, and foreign minister for seven years continuously. He first read for the Bar, and then joined Gambetta on the staff of the *Republique Française*, writing articles on foreign policy. Began his political career as deputy for Foix in 1889, and was colonial minister in the Dupuy Cabinet, 1894. He was made minister of foreign affairs in 1898 under Brisson, in which year he settled the differences between Great Britain and France over the Fashoda (q.v.) question. He held the same position in the Dupuy (1898), Waldeck-Rousseau (1899), Combes (1902), and Rouvier (1905) Cabinets. From the outset, it was his settled policy to lift France from the state of weakness and isolation in which it had been the aim of Germany to keep her ever since the treaty of Frankfurt, and it has been said of him by Gauvain that his diplomacy saved his country. He became minister of marine under M. Briand, 1909, and continued to hold office under MM. Monis and Poincaré. He was on the committee which, in 1911, investigated the general conditions of the Fr. Navy. As mediator between the U.S.A. and Spain he was entirely successful, and peace between these two nations was concluded in Paris. In Feb. 1913 he was appointed ambas. at St. Petersburg, the appointment being generally regarded as indicating increased emphasis of the Dual Alliance, more especially directed against Ger. ambitions; and on his return, in Feb. 1914, he ex-

pressed his suspicions of Ger. aggressive designs. He negotiated the famous pact of London, by which the Allies agreed to make peace overtures only by common agreement. He was not successful in an attempt to revive the Balkan Entente, and on Oct. 14, 1915, he retired from office after a dispute with the Fr. Cabinet on the Salonika expedition, and thereafter dropped out of Fr. politics, mainly through disappointment when Bulgaria entered the war. There can be no doubt of his intense devotion to the service of his country. As an orator he eschewed rhetoric but employed language which was classical in its purity. See G. Reynald, *La Diplomatie française: l'œuvre de Théophile Delcassé*, 1915, and C. W. Porter, *The Career of Théophile Delcassé*, 1930.

Del Credere Commission, higher rate charged by an agent, in respect of which he guarantees the solvency of the purchaser. The contract need not necessarily be in writing, and the principal has no right to make a claim on his agent before he has sought to recover his due from the third party.

Deledda, Grazia (1875-1936), It. author, b. at Nuoro in Sardinia. She began to write at an early age, and her novels and short stories, which are in a naturalistic vein, are remarkable for the sympathy and humour with which they describe the life of the peasants of Sardinia. She has the classic qualities—simplicity, freshness, and that fine restraint that leads the great mind into intensity of effects. Among her best known novels are *Elias Portolu* (1902); *Dopo il divorzio* (1905; Eng. trans. *After the Divorce*); and *La Madre* (1920; Eng. trans. *The Mother*, 1928). Other works: *L'Ombra del Passado* (The Shadow of the Past) (1908); *Canne al vento* (Reeds in the Wind) (1913); *La fuga in Egitto* (The Flight into Egypt) (1926). She married Palmerino Maddesani, a gov. official, in 1897, and leaving Sardinia for the first time she settled down to a happy married life in Rome. Her literary reputation grew, and in 1926 she was awarded the Nobel prize for literature. See SHORT STORY.

Delegates, Court of, was the prin. court of appeal in eccles. causes, and from the decisions of the Admiralty court. By a statute passed in the second year of the reign of William IV. the court was abolished, and its powers transferred to the Privy Council.

Delfico, Melchiorre (1744-1835), It. economist, b. at Teramo in the Abruzzi. His special study was political economy and jurisprudence, and the writings he pub. had great influence in the country, and many abuses were corrected. One of his most important works led to the abolition in Naples of certain restrictions in connection with the sale and exportation of agric. produce. Made a counsellor of state in the brief reign of Joseph Bonaparte in Naples. Employed on the new judicial organisation of Naples by Murat. President of the commission of archives under King Ferdinand I. Granted a large pension on retirement. Among his notable works was his *Researches in*

Roman Jurisprudence (1790). In this and other works, which have been reprinted sev. times, he anticipated the scepticism of Niebuhr, and treats the early hist. of Rome as fabulous, denying to the Romans, before the second Punic war, all arts but that of agriculture and making war. See G. de Tipaldo, *Biografia degli Italiani illustri*, 1834; and G. de Filippis Delfico, *Della Vita e delle Opere di Melchiorre Delfico*, 1836.

Delft, one of the most charming tns. in Holland, 8 m. N.W. of Rotterdam, having clean canals bordered with lime-trees; the R. Schie passes through it and out into the Maas at Delfshaven. D. is an almost perfect specimen of a seventeenth-century Dutch tn. Here William the Silent was assassinated, and the hole in the staircase made by the bullet can still be seen. The first floor of his residence, the Prinsenhof, is used as an Orange museum. Beneath his monument in the New Church are the vault of the House of Orange and the memorial of Grotius, the great jurist. In the old church is the monument of Adm. van Tromp, a victor in thirty-two battles, and that of Piet Hein, admiral of the W. India Company, who in 1628 captured the Sp. treasure fleet. The Raadhuis or tn. hall in the Groot market contains portraits by van Mierevelt, who was b. here. The famous D. pottery (*g.v.*) business has been revived. There are manufs. of yeast, alcohol, glue, and gelatine, dyes, machinery, cigars, telegraph and telephone cables. Pop. 61,600.

Delft Pottery, brown earthenware, covered with an opaque enamel for painting upon, and a thin transparent glaze over all. It was introduced at D. towards the last decade of the sixteenth century by Dutch potters who sought to reproduce an imitation of Chinese blue-painted white porcelain, and the attempt was successful enough to lead to a large export trade. The ware, after being baked in a kiln, was steeped in liquid tin enamel, which latter, after absorption, left a thick white layer for painting upon. The articles made were chiefly of a domestic kind, such as large dishes or platters, ewers, mugs, etc. In England blue and white D. was made in Lambeth early in the seventeenth century; John Ariens van Hamme was granted a patent there in 1760 for making tiles and porcelain in the Dutch manner. Bristol D. is a buff ware, often speckled with blue or purple. Liverpool D., also bluish in tint, was made first in the eighteenth century. Staffordshire D. was produced in the seventeenth and eighteenth centuries, and resembles that of Liverpool and Lambeth.

Delgo, or **Delje**, tn. of upper Egypt, situated on the Nile. Pop. 11,000.

Delhi, city and prov. in the Punjab dist., India. The city, which is now the official cap. of India, as it was that of the Moghul empire from 1637, is on the r. b. of the Jumna, 112 m. N.N.W. of Agra, and is served by five railways, including the E. Indian, N.W., and Bombay-Baroda lines. Gold and silver filigree work, glazed pottery, wood carving, shawls, and

jewellery are the chief industries. Wheat, sugar-cane, barley, and cotton are grown in the dist. (1290 sq. m.), whose hard and stony soil is irrigated by the gov. canals of Agra, W. Jumna, and Ali Mardan. The pop. of the city (including New Delhi and Shahdara) is 521,800, and of the prov. 917,900 (area of prov. 574 sq. m.). Its historic 'Ridge' will ever be remembered as the base of the Brit. during the terrible siege of 1857, when the mutineers held out for three months. The death of the gallant Nicholson, the capture of the king of D. by Hodson, and the explosion of the ammunition magazine by Willoughby, to whom a memorial was erected in 1888, are indelible incidents in the pages of the Indian Mutiny. D. has been successively

E. N. A.

IVORY-CARVER OF DELHI AT WORK
IN THE BAZAAR

the scene of the great Durbars of 1877, 1903, and 1911, when Queen Victoria, King Edward VII., and King George V., who, with Queen Mary, attended the celebration in person, were respectively proclaimed empress and emperors of India. On Dec. 12, 1911, his Imperial majesty announced that the administrative cap. was to be moved from Calcutta to Delhi, where a new city was built on the E. slopes of the hills to the S. of D. New D. is free from floods, has a natural drainage, and allows for a pop. of 70,000. It is built on a rocky platform. The architecture of the city is W. with distinctive Indian features, and was designed by Sir Edwin Lutyens (*q.v.*) and Sir Herbert Baker (*q.v.*). The main buildings are the two secretariat buildings, Government House and the legislative building or Parliament, a round pillared building, half a mile in circumference. Other important buildings are the museum, the record office, and the houses of the members of the governor-general's Executive Council. All gov. depts. have their headquarters at New D. The main avenue, the King's Way, is spanned by a triumphal arch, which is the all Indian war

memorial to the Indian regiments that fought in the First World War. In 1922 a Bill was passed for the estab. of a teaching and residential univ. at New D. During the building operations of the city 290,000 men were employed.

Delhi Conference, called in 1940 on the proposal of the viceroy, Lord Linlithgow, to develop the war capacities of the participating countries—Australia, New Zealand, S. Africa, India, Burma, S. Rhodesia, Ceylon, the E. African dependencies, Hong Kong, Brit. Malaya, and Palestine—particularly in regard to the maintenance of the Brit. forces in the Middle E. The aim of the conference was to relieve Great Britain of such of her war burdens as could be borne by the participating countries in the development of their own resources to meet both their own and the ever-increasing war needs of Great Britain. Associated with the conference was a Brit. Ministry of Supply mission which went to India to investigate the measures to be taken in India to expand the production of munitions and other war supplies. An E. Group Council, with headquarters in India, was formed to put into effect the joint war-supply policy for the E. hemisphere prepared by the conference.

Delia, quinquennial festival of Apollo at Delos.

Delian League, see DELOS.

Delibes, Clément Philibert Léo (1836–91), Fr. musical composer, b. at St. Germain-du-Val (Sarthe). His first noteworthy composition was the ballet music for *La Source*, which was produced in 1866. This was very successful, and he followed up with another similar work, called *Coppélia*, in 1870, also an opera entitled *Le Roi l'a dit* (1873). In 1876 he produced a mythological ballet, *Sylvia*, and then a grand scena, *La Mort d'Orphée*. In 1865 he was second director at grand opera, and a prof. of the Paris conservatoire in 1880.

Delilah, Samson's Philistine mistress, who treacherously wrought his undoing (see Judges, xvi, 4 et seq.). See also SAMSON. The story is the theme of Saint-Saëns's opera *Samson et Dalila*, produced at Weimar in 1877.

Delille, Jacques (1738–1813), Fr. poet. His trans. of Virgil's *Georgics*, 1769, brought him into prominence, and on Voltaire's recommendation he was admitted into the academy. His didactic poem, *Les Jardins* (1782), received extravagant praise. During the revolution he settled in London, where he trans. *Paradise Lost*. On his return to France he produced a trans. of the *Aeneid*.

Deliquescence (Lat. *deliquescere*, to melt), chemical term signifying the property common to certain compounds (caustic potash, chloride of calcium, etc.) of absorbing moisture from the air and becoming wet and sticky. Deliquescent substances form a class of *hygroscopic* substances, the other class being those that absorb moisture but do not become wet and sticky, e.g. black oxide of copper.

Delirium, temporary derangement of the mental processes, similar to the condition of insanity, but usually asso-

ciated with some form of bodily disease. D. may accompany any feverish condition, and varies in intensity according to the extent and degree of the fever; inflammatory disease affecting the brain is particularly liable to cause D. A toxic condition of the blood induced by the absorption of drugs such as opium, chloroform, and alcohol is apt to cause mental aberration. Exhaustion, whether as the effect of wasting disease, prolonged bodily exertion, or nervous strain, is also a possible cause. The types of mental perversion are illusions, hallucinations, and delusions. Illusions are false perceptions, where the image formed in consciousness does not correspond with the external object; hallucinations are fictitious perceptions, where images are formed without any external object; delusions are false ideas, where the subject conceives a state of things to be true without any foundation in reality.

Delirium tremens is one of a series of symptoms arising from continued indulgence in alcohol. It rarely happens that a single bout of heavy drinking culminates in this form of alcoholism, although the effects of long continued drinking may show themselves after a particularly heavy bout. Some individuals seem altogether immune, the poisonous effects of alcohol not including actual D. From the fact that many patients have more than one attack, it appears either that the first attack predisposes to another, or that certain individuals are especially susceptible. Lately it has been shown to be due to a deficiency of vitamin B upsetting the normal metabolic process of the brain. Any bodily disorder acts as a predisposing cause, and the patient complains of general ill health just before the characteristic symptoms set in. He has a feeling of restlessness during the day, and either does not sleep or is troubled with bad dreams during the night. Mental confusion increases until any form of mental derangement may appear. There are muscular tremors and continual perspiration. The patient has hallucinations, seeing unpleasant animals all around him; he may have delusions, being convinced that he is being confined by enemies. He is liable to be violent on occasion, and may need mechanical restraint. The attack usually lasts about four to six days, ending in a deep sleep, and leaving the patient in an extremely exhausted state. The greatest danger lies in the exhausting effects of the disorder, and the treatment should aim at sustaining the patient. Alcohol should be withdrawn entirely, and mechanical restraints should be avoided, all efforts being made to soothe the patient by endeavouring to persuade him that he is in the hands of friends.

Delisle (Lisle de), Guillaume (1675–1726), Fr. scientist of Paris, eldest son of the historian and geographer (d. 1720), pupil of his father and of Cassini. He was one of the founders of modern geography. Before him all maps were based on those of Ptolemy (second century A.D.). He pub. about 134 maps, many

purely geographical, others in connection with eds. of voyages of discovery. In 1700 appeared his map of the world, and celestial and terrestrial globes. In 1702 D. became a member of L'Académie des Sciences, in 1718 geographer to King Louis XV. He wrote *Atlas Géographique* (not pub. until 1789), and contributed to *Mémoires de l'Académie des Sciences*.

Delisle, Joseph Nicholas (1688-1768). Fr. astronomer, b. in Paris. He was first drawn to study astronomy by an eclipse of the sun on May 12, 1706. In 1725 he went to St. Petersburg by order of the Empress Catherine, and there founded an observatory. He is chiefly famous as the originator of a method for observing the transits of Venus and Mercury by instants of contacts.

Delisle, Léopold Victor (1826-1910). Fr. historian and librarian, b. at Valognes, Manche. From 1874 to 1905 he was general administrator of the Bibliothèque Nationale in Paris, and in 1897 a catalogue of the Bibliothèque Nationale was begun under his supervision. He wrote *Catalogue des actes de Philippe-Auguste* (1886), etc.

Delitzsch, Franz (1813-90), celebrated theologian and Hebraist, was b. at Leipzig. His great learning and work diffused theological knowledge and criticism not only in Germany but also in England and America. His commentaries on Genesis, the Psalms, Proverbs, and Ecclesiastes (1847) were included in the complete commentary on the O.T., ed. by Keil and D. His other works are *System der biblischen Psychologie* (1855); *Jesus und Hillel* (1867); and a trans. of the N.T. into Heb. (1877).

Delitzsch, Friedrich (1850-1922). Ger. Assyriologist, son of Franz D., who wrote many important works, the chief being *Assyrische Studien* (1874); *Wo lag das Paradies?* (1881); *Assyrische Grammatik* (1906); and *Die grosse Täuschung* (1920). He also gave some lectures on *Babel und Bibel*, which, owing to the Ger. emperor's personal intervention, caused a good deal of discussion.

Delitzsch, tn. of Saxony, Germany, 12 m. N. of Leipzig. It is noted for manufs. of sugar, cigars, chocolate, and shoes, and rolling-mills. Pop. 16,500.

Dellum, anct. geography, was a tn. of Greece, situated on the coast, in Boeotia, about 25 m. N. of Athens. It was the scene in 424 B.C. of a battle, when the Athenians were defeated by the Boeotians.

Delius, Frederick (1863-1934). Brit. musical composer, of Dutch and Ger. ancestry, was b. at Bradford, Yorkshire. Educated at Bradford Grammar School and the International College, Isleworth. He at first entered his father's business of wool importer, travelling to Germany, Sweden, and France, but in 1884 he went to Florida to grow oranges. Here he bought a piano and received instruction from the Brooklyn organist, Thomas F. Ward, who lived with him on the plantation. D. had played the piano as a small child, and when about seven years of age had been given violin lessons, which he had continued in Germany under Hans Sitt.

After a period of music-teaching in America, he returned to Europe, and at the Leipzig Conservatoire in Aug. 1886 studied under Hans Sitt, Reinecke, and Jadassohn. His orchestral suite, *Florida*, was performed in 1888, with Grieg and Sinding in the audience. In the same year he made Paris his home, and for six years composed operas, a string quartet, and a sonata. His friends at this period included Ravel, Strindberg, and Gauguin, and he met and married the artist, Jelka Rosen. In 1897 he provoked a storm in Sweden by his satirical rendering of the Swedish national anthem. In May 1899

Hardt & Fry

FREDERICK DELIUS

his music was performed at the old St. James's Hall, London, meeting with both adverse and enthusiastic criticism. In the same year he settled down on a small property at Grez-sur-Loing, near Fontainebleau, where he lived and composed until his death. A D. festival, organised by Sir Thomas Beecham in London in 1929, aroused much enthusiasm, performances being given of *A Mass of Life*, *Ipplachia*, and extracts from the operas *Fennimore and Gerda* and *A Village Romeo and Juliet*. *A Mass of Life* (*Zarathustra*), which is regarded as his greatest composition, is an epic of initiation, of the bringing to birth of God in Man, and has been described as 'a work which in its grandeur, its breadth of vision, and its wealth of beauty is unsurpassed by the most monumental achievements in music' (*A Dictionary of Modern Music and Musicians*, 1924). D.'s music is marked by a rare sense of introspection. This is exemplified alike in his earlier and later work, e.g. in his sonata *Paris*, which is far from reflecting

the popular fallacy of a garish and gay city, and his *Brigg Favr*, a splendid ruminative sonata. In 1930 he produced a third sonata, said to have been begun before his eyesight failed. This exhibits the same subtly delicious and slow opening, spirited and elegant *andante scherzando*, and sad introspective close as are to be found in *The Walk to the Paradise Garden* and the *Three Pieces*. Opinion is somewhat divided on the merits of D.'s music. His emotional range was limited, his rhythmic subtlety not marked, and as he relied mainly on his harmonic resources the result is often a certain monotony of mood and texture. See Clara Delius, *Frederick Delius: Memories of My Brother*, 1935; Sir T. Beecham, *A Mingled Chime*, 1941; N. Cardus, *Ten Great Composers*, 1945; and A. Hutchings, *Delius*, 1948.

Delius, Nikolaus (1818-88). Ger. philologist and Shakespearian scholar, b. at Bremen. From 1855 to 1880 he was a prof. at Bonn. His prin. work was *Abhandlungen zu Shakespeare* (1878 and 1887).

Dell, Ethel May (Mrs. Gerald T. Savage) (d. 1939), Eng. novelist, whose first book was *The Way of an Eagle* (1912). After that she produced over twenty vols.—novels and collections of short stories. She married Lt.-Col. G. T. Savage, D.S.O. in 1922. Her stories, as well as her verses (a small book of which appeared in 1923), appealed to readers who unite a love of romance with a pious orthodoxy. Among her novels were *The Knave of Diamonds* (1913); *The Rocks of Valpre* (1914); *The Keeper of the Door* (1915); *Greatheart* (1918); *The Obstacle Race* (1921); *The Allar of Honour* (1928); and *Honeyball Farm* (1937).

Della, Casa Giovanni, see CASA.

Della Cruscan Academy (Crusca Accademia della), body of Eng. people who resided in Florence in 1785 and pub. under the title of *Florence Miscellany* worthless poetry. These works were pub. in England in the *World* and the *Oracle*, and enjoyed a wonderful degree of popularity until Gifford in his *Baviad* and his *Mæriad* severely criticised them. These criticisms were so merciless that the school entirely died out.

Della Porta, Giambattista (c. 1541-1615), It. physicist, was b. and d. in Naples. As a youth he travelled in Italy, Spain, and France, and when only about fifteen had already formulated the first three vols. of his *Magia Naturalis*. He took part in the foundation of the Accademia dei Oziosi in Naples, then later, himself, founded the Accademia Secretorum Naturæ. Pope Paul V. caused the latter to be closed, but in 1610 D. P. was admitted to the Accademia dei Sinceri. Besides his works on natural magic, optics (including the camera obscura), gardening, physiognomy, and other subjects, he wrote sev. successful comedies in his later days which were collected and pub. in Naples in 1726.

Della Quercia, Jacopo (1374-1438), It. sculptor, b. at La Quercia near Siena, son of a goldsmith. Executed a beautiful tomb for the wife of Paolo Guinigi, tyrant

of Lucca, and the Fonte Gaia, built in the square at Siena, 1409-19. He partly decorated the portal of San Petronio, Bologna, with sculptural reliefs.

Della Robbia, see ROBBI.

Dellys, small seaport in Algeria, with 4000 inhab., of whom about 1000 are Europeans. It has a church, hospital, school of arts and crafts, and large barracks.

Delmenhorst, tn. in the free state of Oldenburg, Germany, with 24,700 inhab., noted for manufs. of linoleum, textiles, and with rolling-mills.

De Long, George Washington (1844-81), Amer. explorer, native of New York. He took part in a relief expedition to the Arctic, where Charles Francis Hall was exploring Melville Bay (1873). In 1879 he commanded the *Jeannette* on a Polar expedition, when in 1881 the ship foundered, and after months of hardship he succumbed in N. Siberia. See *Voyage of the 'Jeannette'* (1882), ed. by his wife.

Delorme, Philibert (c. 1510-70), Fr. architect, b. at Lyons, studied in Rome, one of the great exponents of the Renaissance style. Patronised by Catherine de' Medici. He constructed the Tuileries, in collaboration with Jean Bullant, by order of Charles IX. His masterpiece was the Château d'Anet (1552-59), which was built for Diane de Poitiers. Some of his work is to be seen at Chameoncaux, and the tomb of St. Denis remains as a perfect specimen of his art. See studies by L. C. Colomb, 1882, and H. Clouzot, 1910.

Delos, smallest (about 3 m. long and 1 to 1½ m. broad) and most famous of the Cyclades Is. in the Ægean. Its modern name is Mikra Dili, lying between Megali Dili (anc. Rheneia) and Myconus. Its name (Δῶλος) refers to the legend that suddenly it rose above the surface of the waves, and that, whereas at first it floated, Zeus fastened it to the bottom so as to make it a safe refuge for Leto, who was there able to give birth to her twin offspring, Diana and Apollo. Henceforward the little is. was sacred to Apollo, within whose precincts were built many temples and treasures, including a shrine in his own honour. D. was famous for the splendour and solemnity of her festivals, to which men came from all corners of the earth, and the periodic festival was also frequented by hundreds of merchants; for on the fall of Corinth in 146 B.C. D. became a great mart—a centre for the extensive trade between S. Europe and the Asiatic coast. Her excellent roadstead became known to slave traders, who often bartered as many as 10,000 slaves a day at D. Many laws and customs bear witness to the inviolable and holy character of the shrine. The tn. of D., built at the base of the great granite crag known as Mt. Cynthus, never recovered from its devastation during the Mithridatic war of 87 B.C. Half-way up the slope of the hill Cynthus ten great blocks of granite form a vaulted chamber which was the anc. temple seen by Æneas when he paid his homage to the city of Apollo (Æneid, iii. 84). Between

Cynthus and the sea may still be seen the ruins of temples, courts, and colonnades, even a portion of the colossal statue of the god himself and the remains of the shining city. See A. E. Haigh, *The Attic Theatre*, 1889, and W. A. Laidlaw, *A History of Delos*, 1933.

Delphi (now Kastri), tn. situated on the S.W. spur of Parnassus in the valley of Phocis. It was so called from Delpheus, the son of Apollo, but Pytho was also a popular name for the city, as it was here that Apollo, as a baby, slew the serpent Python. The story of how Latona's son gained possession of the oracle, the great glory of D., was dramatically represented each year at the festival of Septeria. At D. was guarded the sacred stone, the *omphalos* or navel, which was supposed to mark the centre of the earth. Legend gives the following account of how the seat of oracle came to be founded. There was a cleft in the ground, the vapour from which caused a gouty to gesticulate and dance in the most frenzied manner, and to utter weird expressions, accepted as inspired prophecies. Accordingly a temple over the spot was erected to Apollo. At first the oracles, which were always sung by a priestess called Pythia, were delivered only on Apollo's birthday, but later, if the sacrifices were propitious, the Pythia prophesied each day. These oracles were given in ecstacy and often very ambiguous and metaphorical hexameters, until men sarcastically remarked on the imperfection of the prosody of the god, who was, notwithstanding, the patron of all the poets, after which they were enunciated in prose. Up to the time of the Persian wars all Gk. states and many foreigners from Italy and Asia, as for instance the famous Croesus of Lydia, came to consult the god on such vital questions as the sending out of colonies, the declaration of war, and the enactment of new laws, but after that time honour and glory fell away from the sanctuary because of the venality, deceit, and strong Spartan sympathies of the priesthood. The temple, the exterior of which was Doric, and the interior Ionic, was the repository of splendid votive offerings and statues, many of which were ruthlessly carried away by Nero to Rome, and later by Constantine the Great to adorn his new cap. During the Sacred war (356-346 B.C.) the Phocians sacked the treasures, and were afterwards condemned for this sacrilege to pay 10,000 talents to the shrine. The Delphic temple was the chief sanctuary of the Amphictyonic league, which controlled international right, and from 586 B.C. onwards celebrated the famous Pythian games. The theatre of D., which is one of the best preserved, lies to the S.W. of the temple. No doubt D. was an information bureau which had its intelligence agents everywhere throughout Greece. That for a thousand years it maintained its illimitable prestige by pure trickery is unlikely. 'It is neither easy,' said Aristotle, of oracular dreams, 'to despise such things, nor yet to believe them.' Except after consultation with

D. no Gk. colony was ever founded, and even Plato thought the advice of D. a wise preliminary in all national undertakings. There were dignity and pathos in the last of its oracles to the Emperor Julian: 'Go ye and tell the emperor that the carved work of this sanctuary is cast down upon the ground, and the god thereof hath no longer where to lay his head. And the laurel of his divination is withered, and the waters that spoke with voices are dried up.' See T. Dempsey, *Delphic Oracle*, 1918; F. Poulsen, *Delphi*, 1920; P. Hutton, *Greek Cities*, 1932; and P. de la Coste-Messelière, *Delphes*, 1943.

Delphin Classics, set of sixty-four vols. of Lat. and Gk. classics, ed. in France from 1674 to 1730 by thirty-nine scholars under the direction of Montausier, Mme Anne Dacier, Bossuet, and Huet. They were for the use of Louis XIV.'s son, called the Grand Dauphin. They are now of little use.

Delphinidae, see DOLPHIN.

Delphinium, extensive genus of the ranunculaceae order, abounding in temperate parts of the N. hemisphere and cultivated in gardens under the name of larkspur. *D. Ajacis*, the common larkspur, is often cultivated for its flowers, and has usually a single carpel; *D. consolida*, a hardy ann., has also one carpel, and its varieties are grown under the name of rocket larkspurs. *D. Barlowii* is a magnificent double-flowered perennial hybrid; *D. grandiflorum*, *D. Sibiricum*, and others constitute the bee larkspurs, so named from their resemblance to that insect; *D. staphisagria*, the stavesacre, inhabits warmer countries of S. Europe, and its seeds produce the poisonous alkaloid 'delphinine,' used in medicine.

Delphinus, or The Dolphin, small constellation near Aquila. From time immemorial it has been identified with a dolphin, the Romans calling it Vector Arionis (the bearer of Arion) and the Gks. the Sacred Fish.

Delphos, city of W. Ohio, U.S.A., 70 m. S.W. of Toledo, with railway shops. Pop. 5700.

Del Rio, city of S.W. Texas, U.S.A., co. seat of Val Verde co., a trading centre, shipping wool and mohair. Pop. 13,300.

Delta (from the shape of the Gk. letter Δ, delta), name applied to alluvial tracts of land enclosed between the bifurcating branches of a riv. and the sea which receives them. The term was first used with reference to the mouth of the Nile. Ds. are formed by the solid matter or fine silt, which is brought down in suspension by all rivs., and which is the measure of the denudation they accomplish in their course. The formation of Ds. seems to depend rather on the absence of opposing currents, where the rivs. reach the sea, than on the amount of sediment carried down. For where there are strong ebb tides or ocean currents the detritus is deposited out at sea. Thus Ds. nearly always occur in inland lakes, in sheltered bays, and especially in the tidelose estuaries of the Mediterranean. But it would seem that every riv. tends to form a D., and in support of this theory it may be noted

that all large estuaries are being gradually silted up. The La Plata, for example, is full of shallows and sandbanks, and Darwin held that the green pampas was merely the result of sediment accumulated in a former and larger estuary of that river. As regards the great D. of the Nile (8569 sq. m.), the old belief that Egypt was the gift of that riv. is strictly true with reference to lower Egypt. This D. begins to be formed 90 m. from the sea, and at its greatest breadth is 85 m. across. But one of the greatest Ds. in the world is that of the Ganges. The enclosed region of 31,880 sq. m. is itself traversed by innumerable streams that are continually interlacing. Over the D. the riv. reaches the ocean through some fifteen mouths, the most easterly branch being the main stream, whilst the most westerly is the sacred Hughli. The deltaic arms of the Niger are seven in number, the chief channel being the Nun, the most easterly Old Calabar; the tract enclosed, which is as large as Ireland, is covered with jungles, forests, and swamps. Ds. are termed lacustrine, fluvial, or oceanic, according as the channels which form them flow into lakes, rivers, or seas.

Delta Metal, alloy invented by G. A. Dick in 1833. It is really a variant of high tensile brass, consisting of copper and zinc, to which a small proportion of ferro-manganese has been added.

Deltoid, triangular, having the shape of the Gk. letter Δ (delta). The *deltoid muscle* is attached to the clavicle, acromion, and spine of scapula, and also to the shaft of the humerus; its function is to raise the upper arm.

De Luc, Jean André, see LUC.

Deluge, The (through O.F. from Lat. *diluvium*, flood; *dilucere*, to wash away). great flood or submersion of the earth by means of which almost the whole human race was destroyed. The name is more particularly applied to the Noachian D. described in the book of Genesis. Traditions of such a D. are to be found among many races of the world. Not only the Hebs. but also the Indians, Persians, Babylonians, Syrians, Amers., and Poly-nesi-ans record such an occurrence in their early literature. No trace of the story is found in Africa, even among the anc. Egyptians, but the classical story of Deucalion related by Ovid is well known. These traditions speak of the D. as covering the whole earth, and the natural interpretation of the biblical account would support this belief. This evidence was, until recently, considered conclusive both to Jews and Christians. Geologists, however, found that the constitution of the stratified rocks, and even of the surface deposits, rendered such a belief impossible, and the general view of the flood now is that it was partial and local, possibly owing its origin to a sudden and extraordinary rising in the Euphrates valley, occurring at the same time as a great rainfall. The Babylonian accounts are most interesting ones and show remarkable parallels with the biblical version. They agree with the latter in making the flood a punishment for sin, but the theology is

frankly polytheistic, the flood being sent by Bel against the entreaties of Ea. The Chaldean king, Xisuthros, takes the place of Noah, and when the flood is imminent Ea, the god of wisdom, warns him to prepare himself. He builds a ship 600 cubits long, 60 cubits broad, and 60 cubits high, and covers it with bitumen. Into this are brought all kinds of animals. Then for six days darkness and storm covered the earth, all creatures being destroyed but those in the ark. On the seventh day the ship grounded on Mt. Nizir, and Xisuthros opened the window. He sent forth a dove and a swallow, both of which return, and finally a raven which does not return. He then descends from the ship, and offers sacrifices to the gods. A fragment of a copy of a much older original than this, dating from the thirtieth century B.C. and discovered by Shiel, gives a slightly different account from this, so by that time sev. Babylonian accounts must have existed. As early as the eighteenth century it was pointed out that the narrative in Genesis was inconsistent in many particulars, and was compounded of two narratives. These are distinguishable by the fact that in the one Jehovah is the word used for God, while in the other Elohim is used. See also ZIEGLER. See II. Usener, *Smiltsagen*, 1899; G. Gerland, *Die Mythos von der Smiltut*, 1912; C. L. Woolley, *Excavations*, 1927; and H. Peake, *The Flood: New Light*, 1930.

Delusion, see HALLUCINATION; ILLUSION.

Delvin, Baron, see NUGENT, SIR

RICHARD.

Delvino, or Delbino, tn. of Albania, 18 m. N.W. by W. of Janina. The hills around are covered with orange groves and olive plantations. Pop. 6000.

Delyannis, Theodoros (1826-1905), Gk. statesman, b. at Kalavryta. In 1878, after the treaty of San Stefano, he ordered that Thessaly should be invaded. The Gk. Army only evacuated on the understanding that England would further the Gk. cause at the Congress of Berlin. He was president of the council in 1885 when Greece demanded from the powers the lands that had been promised to that country. He was Prime Minister from 1890 to 1892 and from 1895 to 1897, and was nominally responsible for the war of 1897. He was again Prime Minister from 1902 until he was assassinated in 1905.

Demand and Supply, see SUPPLY AND DEMAND.

Demantoid, emerald-green garnet, being a gem variety of Andradite, cut and worn as a precious stone in Russia. Found in granular masses in serpentine in the Urals, and sometimes known as Uralian emerald, though the true emerald also occurs in those mts.

Demaratus, king of Sparta from 510 to 491 B.C., when he was deposed by Cleomenes. He then went to Persia, where he was welcomed by Darius, and he afterwards accompanied Xerxes in his invasion of Greece.

Demavend, Mount, chief summit of the Elburz range of mts., situated in the prov. of Mazandaran, Persia. It reaches a

height of 18,500 ft., is conical in form, and volcanic. Large quantities of sulphur and pumice stone are obtained from its slopes.

Dembea, productive, well-cultivated dist. of Abyssinia, situated to the northward of Lake D. The cap. of the dist. is Gondar.

Dembinski, Henryk (1791-1864), Polish patriot and general who, from 1809 to 1813, went as a volunteer to fight in the wars against Russia and Germany, and he distinguished himself greatly at the battle of Leipzig. He became general in the Polish Army in the rising against Russia, 1830-31, and at the fall of Warsaw he fled to France. In 1849 he joined the Hungarians against the Austrians and Russians, and was made commander-in-chief of the Hungarian Army by Kossuth, but was defeated at Kapolna. See E. Danzer, *Dembinski in Ungarn*, 1872.

Deme, originally meant the dist. inhabited by a tribe which formed an independent community. These small communities gradually became joined together into larger ones, and the word came to signify a country dist., a township, or a par. These Ds. were especially important in the gov. of Attica as founded by Cleisthenes in 508 B.C.

Démembre, or **Dismembered**, see under **HERALDRY**.

Dementia, see **INSANITY**.

Demerara, riv. and co. of Brit. Guiana. The riv. enters the Atlantic at Georgetown (*q.v.*); its length is about 200 m. The co. lies mostly between the Rs. D. and Berbice, and fronts the sea for about 65 m. It was originally a Dutch settlement. The brown sugar known as D. was first produced here. See further under **BRITISH GUIANA**.

Demeter, in Gk. mythology, the daughter of Cronus and Rhea, and the sister of Zeus. She was the mother of Proserpine, who, whilst gathering flowers, is supposed to have been carried off by the god of the underworld, Pluto. D., on discovering the rape, leaves Olympus and goes down to the earth, where she dwells amongst mortals, and especially at Eleusis, to the inhab. of which place she brought great blessings. But in wrath for the rape, she visited the earth with a great dearth, and it was not until she was promised by Zeus that her daughter should visit her for two-thirds of the year that her anger was appeased, and the earth again gave forth plenty. In gratitude for the hospitality of the Eleusinians before she leaves the earth, she is supposed to have instructed them in mysteries by which she in future desires to be honoured. Deep meanings were read into the Eleusinian rites, and they were celebrated annually. Many meanings have been read into this story which readily lends itself to interpretation, either in teaching the principle for future life, or as an allegory which shows the ann. marriage of the mother earth (*ge-meter*). The story has many variations. The Romans, received from Sicily the worship of D., to whom they gave the name of Ceres. They celebrated in her honour the festival of the Cerialia. She was

looked upon by them much in the same light as Tellus (see **GÆA**). Pigs were sacrificed to both deities. Her worship acquired considerable political importance at Rome. The decrees of the senate were deposited in her temple for the inspection of the tribunes of the people. For the religious significance of the D. cult, consult Sykes and Allen, introduction to the 'Hymn to Demeter,' in their ed. of the *Homeric Hymns*, and the references there given. A very interesting account of the whole D. story is given in Pater's *Greek Studies*. There is a lovely seated statue of the D. of Cnidos in the Brit. Museum. See also J. Lawson, *Modern Greek Folk Lore and Ancient Greek Religion*, 1910, and A. Dietrich, *Mutter Erde*, 1925.

Demetrius Nicator, or **Demetrius II.**, king of Syria (146-126 B.C.), son of D. Soter (*q.v.*). He remained in exile for sev. years after his father's death, and then landed in Cilicia and defeated Balas, who had usurped the throne. He married Cleopatra, an Egyptian princess, and lived a life of cruelty and vice. In 138, during a war with the Parthians, he was taken prisoner and detained for ten years, the throne being filled in the meantime by his brother, Antiochus Sidetes. He regained his position as king in 128, but his subjects rebelled and he was murdered at Tyre.

Demetrius Phalereus (345-c. 283 B.C.), Grecian orator and philosopher, b. at Phalerum; studied under Theophrastus; was forced to flee into exile by Phocion. After Phocion's death Cassander made him governor of Athens in 316, and he administered the affairs of the city wisely for ten years. His works, which seem to have been highly esteemed, have all perished.

Demetrius Poliorcetes (the be-leger), or **Demetrius I.**, king of Macedonia (294-286 B.C.), b. about 335 B.C., the son of Antigonus, one of Alexander's generals. In 307 he accomplished the deliverance of Greece from Lyander and Ptolemy, and immediately after completely defeated Ptolemy in a naval battle off Cyprus. He made an alliance with Seleucus, and finally gained the mastery of Athens, whence he was recalled to become king of Macedonia at the assassination of the young king, Alexander. He was expelled from Macedonia by Lysimachus and Pyrrhus, who invaded the country, and fled to Cilicia, where he was forced to surrender to Seleucus. He d. in prison in the Syrian Chersonese about 383.

Demetrius Soter, or **Demetrius I.**, king of Syria (161-150 B.C.), b. about 185 B.C., son of Seleucus IV., or Philopator. As a boy he was sent to Rome as a hostage and detained there while his uncle, Antiochus Epiphanes, usurped the throne on the death of Seleucus in 175. He finally escaped, and was acknowledged king by the Syrians, and later by Rome. He was opposed by the Maccabees, and killed in a battle against Alexander Balas.

Demi-lion, **Demi-man**, or **Demi-rose**, see under **HERALDRY**.

Demi-monde (Fr. *demi*, half, and *monde*, world or society), word that came into use

from the name of a play by the younger Dumas in 1855. Applied to women who disregard all laws of propriety and morals, and therefore can only be half recognised by society.

Deming, co. seat of Lunaco, S.W. New Mexico, U.S.A., with a large sanatorium for tuberculosis. Pop. 4000.

Demir-Hissar, see *Siderokastron*.

Demise, Anglo-Fr. legal term (from the Fr. *démêtre*, to send away) for the transfer of a property, especially by lease. The phrase 'demise of the crown' is used in Eng. law, and means the immediate transfer of kingship and all its attributes to the next heir without any interregnum.

Demi-semiquaver, note in music equal to half a semiquaver, or the thirty-second part of a semibreve. It is written like a crotchet, but with three tails.

Demirgus, or **Demirgus**, name given in Gnostic thought to the God who was regarded as the creator of the material world, as distinct from the true, eternal, and unknowable God, who had no connection with matter. By the famous heretic, Marcion, the D. was identified with Jehovah, the God of the Jews.

Demmin, tn. of Germany, in the prov. of Pomerania, with 13,000 inhab. It has old tn. walls, and was one of the oldest Slav settlements in Pomerania, and was only conquered by Henry the Lion in 1164. It belonged to Sweden from 1648 to 1720. The R. Peene is navigable to this point, and there is trade by it.

Democracy. Term is of Gk. origin and means literally 'power of the people.' It is used to designate a form of state government. A democrat is a partisan of government by the people. The kernel of a democratic state-form is the constitutional right of the people to govern themselves. It further means a society based on equality. In a metaphorical sense the word D. is also employed to characterise the tendency of the progressive nations during the last two centuries toward the realisation of a social and political organisation based on popular control. Continental writers, especially the Fr., use the word in a social sense; Gk. philosophers used it in a government sense; and Eng. and Amer. political writers limit its use to the actual exercise of political power by the people. D.'s final aim is not confined to the estab. of a republican gov., and can accommodate itself within the limits of a monarchic state. A monarch reigns, but does not govern. In democratic republics all citizens have equal rights, and are as a body, at least theoretically, the formal rulers of the state. In practice the real power is exercised by certain privileged classes. Monarchies and republics are both exposed to the danger that a master man gets hold of the reins of state and rules as a despot, or dictator. The decadence of the aristocratic and moneyed classes leads to *oligarchy*. The degeneration of the masses leads to the worst of all powers, to *ochlocracy*—anglicised, the rule of the rabble. D. as a social principle rests upon the doctrine of the essential equality of all men—a notion derived from the

Christian conception of the equality of all men before God, which owes its transference from religion to society and politics mainly to the works of Jean Jacques Rousseau. It must not be forgotten also that the so-called Ds. of the ancients were anything but democratic in sentiment or in social structure. In modern times the revival of militarism in Europe during the latter half of the nineteenth century has delayed the progress of D. The marvellous industrial expansion and the grandiose economic development during the same period have aided D. very much, but they have also exposed it to the acute onslaught of plutocratic predominance. Modern political D. is derived from the social conception of the equality of all citizens, and is satisfied with nothing less than the substantial participation of the whole of the people in the management of the state. The rise in Europe after the First World War of the varying totalitarian systems of government, denoting the single-party (in Germany National Socialist, in Russia Communist, in Italy Fascist, in Spain Falangist) dictatorial type of government, as opposed to the Liberal conception of the state which assigns to the state only restricted powers while reserving the maximum powers to the free discussion and decision of the individual or the elected representatives of the individual, gradually eliminated all pretence of democratic principles in the government of those countries. For soon the sphere of state influence extended over the whole of private life as well as public, and demanded the full submission of the individual to the requirements of the state without even any pretence of freely elected representation. The Second World War was, in effect, the inevitable conflict between the opposed ideologies of D. and its negation, totalitarianism. See T. Paine, *Common Sense*, 1776; A. de Toqueville, *Democracy in America*, 1842; T. E. May, *Democracy in Europe*, 1877; Sir H. Maine, *Popular Government*, 1885; J. Bryce, *American Commonwealth*, 1888; W. E. Lecky, *Democracy and Liberty*, 1896; J. A. Hobson, *Democracy after the War*, 1917; Sir N. Angell, *The Public Mind*, 1926; J. A. R. Marriott, *Dictatorship and Democracy*, 1935; E. Giraud, *La Crise de la Démocratie*, 1938; B. E. Lippincott, *Democracy in Transition*, 1938; Cicely Hamilton, *Lament for Democracy*, 1939; R. Lennard, *Democracy*, 1941; E. Barker, *Reflections on Government*, 1942; H. J. Laski, *Reflections on the Revolution of our Time*, 1943; and A. D. Lindsay, *The Modern Democratic State*, 1943.

Democrats, name of one of the two great historic parties in the U.S.A., the Republicans (q.v.) being the other. Roughly speaking—but it is, of course, only a very rough generalisation—the D. may be compared to the Liberal party in Great Britain, and just as the latter party have shared alternately the government of the United Kingdom with the Conservative party, so in the U.S.A. the D. have, since the estab. of the republic, shared the spoils of office with the leading opposition

parties of the time. The policy of the D. has undergone many changes during the last century, but in the main D. have stood for state rights and human rights as against the growing tendency of the central or federal gov. to usurp power. This question of state right has always been to the fore in the U.S.A., and was one of the first questions to agitate the young republic. George Washington, the first president, with his lieutenant, Alexander Hamilton, secretary of the treasury, was the leader of the party called the Federalists, which stood for a strong national or centralised gov. Opposing him was Thomas Jefferson, the secretary of state, who stood for decentralisation (see CENTRALISATION), and whose party was known indifferently as the Republicans or Democratic Republicans, or the D. The title of Republicans disappeared towards the end of the first decade of the nineteenth century, and that of Democratic Republicans in the campaigns of 1828. The party elected Jefferson as president in 1801, and remained in control of the gov. till 1841. Since then they have been in power from 1845 to 1849, 1853 to 1861, 1885 to 1889, 1893 to 1897, and 1913 to 1921. Democratic presidents since Jefferson have been Madison Monroe, J. Q. Adams, Jackson, Van Buren, Tyler, Polk, Pierce, Buchanan, Cleveland, Thomas Woodrow Wilson, F. D. Roosevelt, and H. S. Truman. In pursuance of their general policy of supporting state rights, the D. in the main lent their aid to the S. states before the Civil war, 1861-65. The party opposing them took the old name of the D., viz. Republicans, in 1856. In later years, after the passions of the Civil war had cooled, the questions at issue between the D. and the Republicans were mainly the currency and the tariff. President Grover Cleveland crystallised the Democratic attitude by speaking of a tariff for revenue only, that is one to raise only such money as the gov. needed for its expenses, rather than the high protective tariff which the Republicans advocated to aid Amer. manufs. The currency issue became acute in the famous campaign of 1896, when Wm. Jennings Bryan was the Democratic nominee for president on the free silver platform. He advocated bimetalism (*q.v.*) instead of the gold standard. In three separate presidential campaigns, when he was the nominee, this was one of the great issues, and then it dropped out of the party platform. Even on the tariff the D. are not such extreme opponents as they used to be, admitting that a certain amount of protection is necessary for the country, but fighting the mt.-high tariffs the Republicans put into the Bill signed by President Hoover. One of the more recent presidential campaigns was fought by the D. mainly on the prohibition issue, the nominee, 'Al' Smith, being a 'wet.' It resulted in an overwhelming defeat for his party, four S. states voting Republican for the first time since the Civil war. After the Civil war the D. were pressed into the background, and they did not recover

until 1876. Democratic administrations were elected in 1884 and 1892 (Cleveland), 1912 and 1916 (Woodrow Wilson), 1932, 1936, 1940, 1944 (Roosevelt-Truman). The Democratic party, as implied above, is historically the low-tariff party, and is sometimes looked upon as the more liberal party in the U.S.A., but the difference between the two great Amer. parties is not simply a question of left and right, still less of Liberal and Conservative in the Brit. connotation of those terms, for there are Liberal and Conservative Republicans, as well as Liberal and Conservative D. The Democratic party has of old been strongest in the S. states—the solid S.—and these states are still Democratic. The main issue in the earlier terms of President Franklin Roosevelt was the New Deal. Later this was merged in the war effort; but on foreign policy there is no marked or obvious difference between the D. and the Republicans, though it may be that there is a stronger tendency to traditional Amer. isolationism in the latter. See F. R. Kent, *The Democratic Party*, 1928.

Democritus (b. c. 460 B.C.). Gk. philosopher, was a disciple of Leucippus (whose atomic theory he developed), and the most learned Gk. before Aristotle. Though his father had been so wealthy as to entertain Xerxes and his host on their expedition against Greece, D. managed to dissipate his fortune during his quest for knowledge in Europe, Africa, and Asia, and having reduced himself to poverty, only escaped the ignominy of having no funeral by reciting his *Diacosmos*, after which he was promised a public burial. Nothing practically remains of his many works on astronomy, mathematics, art, literature, and ethics—works which he composed in the solitude of a garden near Abdera, his native city. See T. Gomperz, *Greek Thinkers*, 1901.

Demography, see VITAL STATISTICS.

Demoiselle, or Numidian Crane, grui-form bird, *Anthropoides virgo*, closely allied to the cranes. It is indigenous to Asia, is a winter visitor to Africa, and often frequents S. Europe.

Demoivre, Abraham (1667-1754), Fr. mathematician and demographer, b. at Vitry and educated at Sedan, Saumur, and Paris. On the revocation of the Edict of Nantes he, being a Protestant, fled to England, and supported himself by giving lessons and by lecturing. He owed much to Newton's *Principia Mathematica*, and afterwards dedicated his *Doctrine of Chances* to that Eng. mathematician. He was chosen as judge in the famous contest between Newton and Leibnitz for the merit of the invention of fluxions. His pub. works include *Annuities upon Lives* (1725) and *Miscellaneous Analytica de Seriebus et Quadraturis* (1730). Referred to by Pope: 'Sure as Demoivre without rule or line.'

D.'s Hypothesis is an hypothesis on the duration of human life, formed by D., as he informs us in the preface of his *Treatise on Annuities*, some years after the pub. of the first ed. of his *Treatise on Chances*, on the inspection of Halley's

Breslau Tables. Observing that the decrements of life at the middle ages were very nearly uniform, D. made an extension of this law to the whole of life, not thereby intending to assert that any such principle was correct for childhood and old age, but simply that the effect of the error upon the value of annuities at the middle ages of life would be trivial. The hypothesis is as follows: *Of eighty-six persons born, one dies every year, till all are extinct.* The remainder of eighty-six years, at every age. D. called the complement of life. The half of the complement of life is the average duration (commonly called the expectation); and the peculiarity of D.'s Hypothesis is that, according to it, every person has an even chance of living the average time of people of his age, which is not true of other tables. The Northampton Tables certainly do nearly coincide with this law at the middle periods of life, but the Carlisle and most other tables differ materially from it.

Demonetisation, term used in connection with currency in two senses. The first and more general sense is used for the divesting of money of a standard value (see Bimetallism). The second significance of the word is the withdrawing of coin from circulation. This is done by proclamation stating that after a specified date a certain coin will not be legal tender.

Demonology, branch of religion which deals with evil spirits or demons. In every religion the presence of these spirits is recognised. In the lowest cults they receive almost exclusively the worship and sacrifice of men. The beneficent deities are considered as easy-going, and they may be trusted to continue in a course of helpfulness to man. Occasionally gratitude must be shown to them, or any cessation of their benefits must be renewed by some propitiation, but they may generally be ignored. The evil spirits, on the other hand, are not less active than powerful, and man must ever be on the watch to propitiate them. In this stage the witch-doctor, whose powers are handed on in a kind of guild, flourishes well. As religion improves in any community, the influence of the evil spirits is gradually limited. Their powers become less and they assume much less attention. Two chief classes of demons are recognised, though in primitive thought the distinction is not clearly drawn. The first class consists of departed human beings who are regarded as still influencing the race, and capable of doing it good or evil. The second class consists of spirits which never inhabited a body, and which are frequently derived from the powers of nature, and are conceived of as associated with the manifestation of that power. It will be seen, too, that the distinction between good and evil spirits depends more upon the sphere of their action than upon their nature. Fire and disease are evil when they attack the individual, but beneficent when invoked against his enemies. As the idea of God evolved, so did the idea of the evil forces opposed to Him. In primitive religion all is vague and confused. Then when definite polytheism is

reached, the evil spirits become limited in number, have definite spheres assigned to them, and receive names. This process, however, is not invariable, for among the Koreans, who numbered their demons by billions, an increase of culture seems to have brought about an increase of these spirits. Here, too, they are not considered as especially malignant. Finally we have monotheism, God being opposed by one single evil spirit. Perfect dualism is found in Zoroastrianism, where every good is opposed by its evil, and Ormuzd is opposed by Ahriman. Similarly in Christianity and O.T. Judaism, Jehovah is opposed by Satan, and the hosts of the good angels are opposed by the hosts of the fallen angels. Here, however, we find the evil definitely placed in subordination to the good, a fact which is most clearly exemplified in Job, where Satan appears as a servant of God, whose permission he must ask before tempting Job. The gospels distinctly recognise the belief that disease was sometimes the result of possession by demons, and the early church carried on Christ's method of expelling them. Exorcists long formed an active minor order, and the name still remains in the Rom. Catholic Church. The common opinion of the early church was that the gods of all heathen nations were evil spirits who had usurped the place of God, an idea which found its greatest expression in Milton's *Paradise Lost*. In the N. lands they were further discredited by being made ridiculous. The Satan of the miracle plays was a fool whom every one might outwit, the ancestor of the Elizabethan clown. The most elaborate system of D. is the Muslim, which is largely derived from that of the popular Judaism shown in the apocalyptic books. Belief in more or less malevolent spirits survived throughout the Middle Ages, and late examples of belief in witchcraft among the educated may be found in Burton and Sir Thomas Browne. Popular belief has not yet gone. The belief in vampires is chiefly found in Slavonic lands, but many references to the succubi and incubi, supposed to consort with women in their sleep, may be found everywhere. See Sir Walter Scott, *Demonology and Witchcraft*, 1830; Roskoff, *Geschichte des Teufels*, 1869; E. B. Tylor, *Primitive Culture*, 1871; M. Conway, *Demonology and Devil Lore*, 1879; P. Carus, *History of the Devil and the Idea of Evil*, etc., 1900; M. Summers, *The History of Witchcraft and Demonology*, 1926, and *The Vampire: his Kith and Kin*, 1928; and G. Hübener, *Beowulf and German Exorcism*, 1935.

Demonstration (Lat. *demonstrare*, show forth, point out), strictly, indubitable proof of a proposition, proof in which the conclusion follows of necessity from the premises. The great domain of D. is mathematics, in which all proofs are derived from simple axioms. It is often loosely used for any proof, even an imperfect one, or even for an explanation and exhibition of specimens and practical operations in science and art (anatomical, laboratory, cookery D.).

De Montherlant, Henry, see **MONTER-LANT**.

De Morgan, Augustus (1806-71), eminent Eng. mathematician, *b.* at Madura in India. He was prof. of mathematics in London Univ. from 1828 till his death, though he resigned his appointment for a period in consequence of the rejection of a candidate, James Martineau, for the chair of logic, on account of his religious opinions. De M. had strong ideas about the union of logic and mathematics, and in his series of papers entitled *A Budget of Paradoxes*, he discussed mathematical fallacies with much wit and the keenest logic. His ideas, however, encountered fierce opposition from the metaphysician, Sir Wm. Hamilton. In support of a decimal coinage he drew up a report which was recommended by a committee in the House of Commons. He wrote treatises on almost every dept. of mathematics, on arithmetic, algebra, trigonometry, differential and integral calculus, this last pronounced to be the most complete treatise on the subject ever produced in England. His other important works are *Elements of Algebra* (1835); *Essay on Probabilities* (1838); *Formal Logic* (1847); *Book of Almanacs* (1851); and *A Budget of Paradoxes* (1872). See life by S. E. de Morgan, 1857.

De Morgan, William Frend (1839-1917), novelist, *b.* in London, eldest son of Augustus de M., a distinguished mathematician and fourth Wrangler, Cambridge Univ., and grandson, on his mother's side, of Wm. Frend, reformer and scientific writer. Educated at Univ. College School and Univ. College, London. He began his art training in Cary's studio, and subsequently studied at the Royal Academy. He designed in stained glass, and experimented in lustre and pottery work, besides painting generally. Though not successful as a painter (the character of Charles Heath in *Alice for Short* may be regarded as a portrait of the author, whose early promise as a painter never materialised), he succeeded in perfecting his lustre process (a resuscitation of a fifteenth-century process by Gubbio), and furthermore elaborated a new process for painting in Persian colours beneath the lustre. His 'tile-pictures' were also a great success and decorated the cabins of many an ocean liner. Later he became a member of the celebrated Chelsea aesthetes (Burne-Jones, Ford Madox Brown, Dante Gabriel Rossetti, and Wm. Morris). After this his health broke down, and he sojourned for some time in Florence, being compelled on his return to alleviate his labours by taking a partner into his designing and tile-making business. This business was never a great commercial success, and closed about 1901. But though clever as a designer and lustre worker, it is as a novelist that de M. will go down to posterity. His appearance in the role of novel writer was startling, for it is rarely that a man when over sixty years of age can hope to write a successful first novel. Yet de M.'s *Joseph Vance* (1906), with its intimate and realistic touches, its quiet humour and lively

imagination, was hailed generally as a fine work. *Alice for Short* (1907)—his masterpiece—with its pregnant delineation of a child's feelings in slum life—stamped de M. as one of the best of modern novelists. His last novel was *When Ghost Meets Ghost* (1914). In style his novels are of the Dickensian or James order. The foundations are laid solidly, but the development is somewhat tedious, as was the manner of some Victorian writers. Though the life of the nineteenth-century London is vividly portrayed, there is no Zolaesque realism. De M. was too sensitive, perhaps too amateurish, an artist, too charitable in sentiment and genial in temperament to search after the uglier sides of truth and passion, or to try to express such truths in dramatic word-pictures. After 1914 he concentrated on experiments in aircraft and submarine defence, and with these he was busy until his death. Other novels: *Somehow Good* (1908); *It Never Can Happen Again* (1909); *An Affair of Dishonour* (1910); and *A Likely Story* (1911).

Demosthenes (c. 384-322 B.C.), the greatest Athenian orator and statesman, *b.* in the deme of Peania, in Attica, his father being a wealthy citizen. His father *d.* early, leaving much wealth to his children, but the trustees abused their trust entirely. D. prosecuted them on coming of age, and his success on this occasion led to his decision to embrace public life. He underwent a most strenuous course of training to overcome his natural defects. To strengthen his voice he declaimed to the sea in stormy weather, striving to make his voice heard. To overcome stammering he practised speaking with his mouth full of pebbles. To improve his delivery he studied under Satyrus, the actor, and before a mirror. His first appearance in politics was made in the year 354, when in his speech 'On the Navy Boards' (Symmories) he discouraged attack on Persia. To 352 belongs his speech 'For the Megalopolitans,' but his fame was not achieved till the next year, when in his First Philippic he made a strenuous attack on Philip of Macedon, urging his countrymen to cease their mutual jealousies and unite against this common menace. In 349 D. delivered his three Olynthiacs, in which he urged the Athenians to defend Olynthus against Philip. In 347, however, Philip gained this last Athenian outpost, and D. was one of the ambas. sent to negotiate peace with the Macedonian king. The probity of the orator himself was above suspicion, but bribery in other quarters was more successful, and the conqueror was allowed to possess himself of Thermopylae. Peace was concluded in 346, but Philip's intrigues went on continually, and D. gave himself to the work of denouncing them in no measured terms. To this period belong his Second and Third Philippics (344 and 341). On the same work of counteracting Macedonian influence he had gone as ambas. to the Peloponnese in 344. The famous speech 'On the Affairs of the Chersonese,' in the same year as the Third Philippic, forms

with the latter oration D.'s crowning effort. When Philip again began a course of active aggression in 340, it was D. who rallied all possible forces against him and supported Gk. hopes until the terrible disaster of Charonea. This ends the era of the political activity of D. Henceforth he devoted himself to municipal affairs. So highly was he held in honour that, in 336, Ctesiphon proposed that he should be presented by the state with a gold crown. To prevent this Bill passing the Assembly, Æschines gave notice that he should proceed against Ctesiphon for introducing an unconstitutional measure. He procrastinated until 330, when his speech 'Against Ctesiphon' evoked from D. the immortal oration 'On the Crown.' In 324

DEMOSTHENES

the orator was accused of appropriating twenty talents, and was imprisoned. He escaped, and was recalled in the next year to support the Athenian league against Antipater. On the failure of this, Antipater demanded his surrender, and he fled to the temple of Poseidon, where he took poison to avoid capture. The private life of D. was of the noblest, and his strenuous and unselfish exertions in the cause of his country entitle him to a high place among the great men of antiquity. All critics since his own day have held him as the greatest of all orators. For list of eds. see J. B. Mayor, *Guide to the Choice of Classical Books*, 1885 and 1886. See also A. Schäfer, *Demosthenes und seine Zeit*, 1856-58; S. H. Butcher, *Demosthenes*, 1879; W. Engelmann, *Scriptores Graeci*, 1881; F. Blass, *Demosthenes*, 1883; and A. W. Pickard-Cambridge, *Demosthenes*, 1914. The best Eng. version of D. is by C. R. Kennedy (Bohn's Library).

Demosthenes, son of Alcisthenes, an Athenian general, prominent in the Peloponnesian war. In 425 he garrisoned Pylos, a rocky promontory on the Lacedaemonian coast, and defended it against the Spartans till relieved by the Athenian fleet, when he forced the Spartan force on Sphacteria, a neighbouring is., to capitulate.

Shortly afterwards he gained Nicias, but failed to gain Megara. In 413 he and Eurymedon were sent to the relief of Nicias, who was in difficulties at Syracuse. He made a night attack on Epipolae, but was defeated, and counselled Nicias to retreat. This he postponed till too late, and the Athenians were totally defeated in two battles and Nicias and D. taken prisoners. Both committed suicide.

Demotic Writing. The term demotic, from Gk. *demotikos*, of the people (*demos*, people), vulgar, popular, and *enchorial* (from Gk. *enchorios*, of the country) denote that this Egyptian writing was used for the purposes of daily life. Indeed, while Herodotus (ii. 36) employs for it the term *demotika grammata*, vulgar characters, Clement of Alexandria (*Stromata*, v. 4), of about A.D. 200, who gave us the names hieroglyphic and hieratic, calls the D. W. *grammata epistolographika*, epistolary characters, that is the script used for writing letters.

D. was a development of hieratic, which was the cursive form of Egyptian hieroglyphic writing. Externally the D. signs became so cursive that their aspect had nothing in common with that of the original hieroglyphic characters. The difficulty in reading D. is increased by the fact that two or more hieratic signs were combined into a single D. character, thus creating a kind of monogram.

However, as a system of writing, D. was no more advanced than hieroglyphic, and essentially it consisted of ideograms and phonograms; the former representing concrete objects or abstract ideas without expressing their names, the latter representing spoken words or phonemes. On the other hand, in order to eliminate ambiguities and confusion in interpreting the texts, the number of homophones (i.e. signs having the same sounds, but representing different objects and, thus, being of different form) was so reduced that generally speaking the single phonemes could only be represented by one or two different characters. Unlike hieroglyphic and hieratic, which could be written in different directions, D. always was written horizontally, from right to left. D. originated in the eight and seventh centuries B.C., and gradually developed till it received its final form in the fourth century B.C. In the time of the Ptolemies, Alexander the Great's successors in Egypt, which they ruled until the occupation of Rome, D. was considered to be of greater importance than hieratic. Proclamations and documents of general importance were, then, set forth in hieroglyphic, D., and Gk. In the famous Rosetta Stone, D. occupies the middle portion of the stela.

The latest D. document which can be dated belongs to A.D. 476. It was the end of the Egyptian scripts, but the Egyptian language did not die out. It continued to be used as *Coptic*, for which a new alphabet was created. Out of its thirty-two letters twenty-five were borrowed from the Gk., and seven signs were taken over from the D. W. for Egyptian sounds which could not be expressed by Gk. characters. See W. Spiegelberg, *Demotic*.

tische Grammatik, 1925; E. Seidl, *Demotische Urkundenlehre nach den frühptolomäischen Texten*, 1937; S. It. K. Glanville, *Catalogue of Demotic Papyri in the British Museum*, 1939; and D. Dirlinger, *The Alphabet, a Key to the History of Mankind*, pp. 66-71, 1948.

Demotika, see DDMOTICHON.

Dempsey, Sir Miles Christopher (b. 1896), Eng. soldier, b. at Hoylake, Cheshire; educated at Shrewsbury School, from which he went to the R.M.C., Sandhurst, in 1914; commissioned in 1915, and saw service in France and Iraq during the First World War. He received his majority in 1932, and was promoted to the rank of lieutenant-colonel in 1938. He distinguished himself in the early part of the Second World War by the rearguard action which he conducted to defend the evacuation of the Brit. Army from Dunkirk. He later commanded the 13th Corps of the Eighth Army in N. Africa, and was also one of the Brit. commanders in the invasion of Europe in 1944. In the subsequent campaign in France and Germany he led the Second Army with the rank of lieutenant-general, and entered Germany with his troops in Jan. 1945. Awarded D.S.O., 1940; M.C., K.C.B., 1944 and K.B.E., 1945. Commander-in-chief allied land forces, S.E. Asia, 1945-46; commander-in-chief Middle E., 1946-47.

Dempsey, William Harrison (Jack) (b. 1896), boxer, b. at Manassa, Colorado, of Scottish, Irish, and Amer. extraction. Originally a hard-rock miner, D. fought his first professional fight in Colorado in 1914. By defeating Willard in 1919 he became world's heavyweight champion, and in 1921 he enhanced his reputation by knocking out Carpentier at Jersey City. In 1922 he toured Europe, and in 1923 a terrific contest with Firpo ended in Firpo's defeat. D. defeated every boxer of note until in 1926 he lost his title to Tunney, and a year later made a gallant effort to regain it, but was defeated on points after ten rounds.

Demurrage, allowance made to a ship-owner by the freighter for the detention of the ship in port beyond the specified time of sailing. A certain number of days, called lay days or lie days, are allowed for receiving and discharging cargo, and it is usually stipulated that the freighter may detain the vessel, after the expiration of these days, on payment of so much *per diem* for overtime. The D. ceases as soon as the vessel is cleared ready for sailing, though she may be prevented from doing so by adverse winds, etc.

Demurrer. In the language of pleadings in an action at law, D. signifies an issue upon a matter of law as opposed to fact, i.e. it confesses the facts as stated by the opposite party to be true, but avers that those facts disclose no cause of action or ground of defence. A D. is now known technically as an objection in point of law. In criminal law D. is an objection by the accused that the facts, even if true, do not in law constitute the crime with which he is charged. Such a D. seldom occurs in practice.

Demy (i.e. half-fellow), name given to the holder of a scholarship at Magdalen College, Oxford.

Demy, particular size of paper. In printing paper each sheet measures 22 in. by 17½ in.; in drawing paper 22 in. by 17 in.; and in writing paper 20 in. by 15½ in.

Denain, tn. of Nord, France, 14 m. E. of Douai. Has coal-mines and ironworks. An obelisk marks the scene of Marshal Villars's victory over the Allies under Prince Eugène, July 27, 1712. Pop. 24,900, which originated with an abbey in the eighth century.

Denarius: 1. Rom. silver coin, first minted 269 B.C., equal at first to 10 asses, whence its name, but afterwards considered equal to 18 asses, when the weight of the as was reduced in consequence of the scarcity of silver. The value of the D. under the republic was rather more than 8½d., and at a later period about 7½d. The gold 1. was worth about 25 silver denarii. 2. Also a weight. The Rom. pound (libra) contained 96 denarii, the ounce 8, and the D. 3 scruples.

Denbigh, Rudolph Robert Basil Aloysius Augustine Feilding, ninth Earl of (1859-1939), lord-in-waiting to Queen Victoria and to King Edward VII. from 1897 to 1906. He joined the Royal Artillery in 1878, fought in the Egyptian campaign of 1882. He will be chiefly remembered for his activity in the introduction and development in Britain of the sugar-beet industry. His efforts both by propaganda and in Parliament resulted in the erection of the first sugar-beet factory, at Cantley, Norfolk, in 1912.

Denbigh, or Denbighshire, co. of N. Wales, on the Irish Sea, and between the Dee and the Conway. Area 664 sq. m. It contains the fertile valleys of Llangollen and the Clwyd. The whole surface is rugged and mountainous. The rocks are chiefly Silurian clay and graywacke slates, with some granite and trap, and bands of Devonian, Carboniferous, and Permian strata. Coal, lead (yielding some silver), iron, limestone, grndst me, and flagstone abound. It yields excellent dairy produce, and is well timbered. Chief tns.: Denbigh, Ruthin, Wrexham, Llanrwst, Abergele, Holt, and Ruabon. Rvs.: Dee, Conway, Elwy, Clwyd. Tumuli and other pre-Rom. remains still exist. Pop. 158,000.

Denbigh, co. tn. of Denbighshire, 30 m. W. of Chester, but the assizes are held at Ruthin. Stands on a steep limestone hill, which is crowned by an anct. castle on the site of a fortress erected by William the Conqueror. The gatehouse is one of the finest in England, from whence can be had a magnificent view of the vale and hills. The newer part was built at the bottom of the hill, after the destruction of a great part of the old tn., about 1550. In 1645 Charles I. took refuge in the castle after the battle of Rowton Heath. Pop. 2,000.

Dender, riv. of Belgium. Its source is in the prov. of Hainault, and its course is N. and N.E., through Hainault and E. Flanders. It joins the Scheldt at Dendermonde, after passing Ath, Grammont,

Ninove, and Alost, and is navigable from its junction with the Scheldt to Ath.

Dendera (Gk. *Tentyra*, or *Tentyris*; Coptic *Tentore*, probably from Tel-n-Athor, the abode of Athor), vil. in Upper Egypt, once a populous tn., situated near the l. b. of the Nile, in 26° 13' N. lat., 32° 40' E. long. It is celebrated for its temple, which dates from the period of Cleopatra. The temple is 220 ft. long and about 50 ft. broad, has a noble portico supported on twenty-four columns. The walls are covered with hieroglyphics, and on the ceiling of the portico is a zodiac in which the crab is represented by a scarab. There are other sacred buildings, including a temple of Isis.

Dendermonde, or **Termonde**, tn. of E. Flanders, Belgium, has suffered much from war. In 1667 the inhab. repulsed Louis XIV. by opening the sluices and inundating the whole dist. He said that only an army of ducks could take it, but Marlborough did take it in 1706. On Sept. 4, 1914, the Gers. entered it and damaged or destroyed 1200 out of 1400 houses, after looting them all. The Belgians reoccupied it on Sept. 10, and it was bombarded and retaken by the Gers. on Sept. 16. The Gothic fifteenth-century church of Notre Dame was much damaged by the bombardment, and the tn. hall of the fourteenth to sixteenth centuries was burned. The imposing Palais de Justice adjoins it. Pop. 9300.

Dendrites, or **Dentritic Markings**, geological term. Stains usually black or brown, and branching like fern fronds. They are generally found in the joints and at the div. planes of rocks. They are caused by infiltration of iron and manganese solutions into cracks from whence they have afterwards evaporated. Like markings are also seen in agate or chalcedony, forming a species of moss-agate.

Dendromys (Gk. *δένδρον*, tree, *mys*, mouse), a genus of rodents, belongs to the family Muridae, which comprises mice, rats, voles, and other well-known creatures. It consists of about half-a-dozen species dwelling in Ethiopia. *D. typpus* (or *mesomelas*) is about 8 in. long, over half its length belonging to its strong, slender, prehensile tail. In colour it is reddish-brown above, whitish beneath, and its habitat is the branch of a tree, where it constructs a nest and rears its young.

Dendrophis, genus of tree-snakes of the sub-family Colubrine, all of which are non-venomous and harmless. The keeled scales along the back are wider than those along the flanks, and the snakes glide up trees in almost a straight line. The genus has representatives in Australia and Africa.

Dene Holes, excavations found in Kent and Essex, England, about whose origin and purpose there is some conjecture. The theory has been advanced that they are flint quarries worked by Neolithic Man, dating back to the third millennium B.C. Against this theory, for surface flints could be found, it is noted that they are in a pattern of threes, associated with tumuli and earthworks in the same

pattern. The chambers are in trefoll or double trefoll, the ceiling having a rectangular even shape, and a planned construction is therefore suggested. The possibility of their having been used as granaries is discounted by some, as grain could hardly be successfully stored because of the humidity.

D'Enghien, Louis Antoine, Henri de Bourbon Condé, Duc, see ENGHEN.

Dengue, or **Breakbone Fever**, or **Dandy Fever**, epidemic infectious disease, peculiar to tropical countries. In many ways it resembles rheumatic fever and influenza. The typical case begins with pains in the back, limbs, and joints, a rising temp. following rigors. Before the temp. falls an itching rash appears; the temp. generally falls about the fifth day. There is, however, an intermittent type in which the temp. sinks on the third and fourth days, and rises on the fifth before its final lysis. Extreme weakness follows, and heart failure has to be guarded against by the use of stimulants and nourishment, and also much rest; but it is rarely fatal. It is thought that D., like malaria, is carried by mosquitoes.

Den Haag, see HAGUE, THE.

Denham, Sir John (1615-69), Eug. poet belonging to the Caroline group. b. at Dublin. He was educated in Dublin and at Trinity College, Oxford, where he gained the reputation of being 'a slow, dreaming, young man, and more addicted to gambling than study.' In 1634 he married and went to live at Bgham, Surrey. At the outbreak of the Civil war he was high sheriff of Surrey, but he had no military ability, and surrendered Farnham Castle, of which he was governor, to the Parliament. After a short imprisonment he joined the king at Oxford, and engaged in many secret services for him. Soon after the Restoration D. lost his reason, according to common report, on account of the duke of York's attentions to his wife. D. was a better poet than soldier or diplomat, and his poem *Cooper's Hill* (1642), describing the scenery of the Thames valley at Bgham, was the model of Pope's *Windsor Forest*. Among his other works were *The Sophy* (1642), a tragedy in five acts; *The Anatomy of Play* (1651), a prose tract against gambling; *The Destruction of Troy* (1656), a paraphrase of the second book of *Æneid*; and *Directions to a Painter* (1667), a bitter satire on the shameful conduct of the Dutch war—although D.'s authorship of this is uncertain; and a beautiful elegy on Abraham Cowley (1667).

Den Helder, see HELDER.

Denla, city and seaport in the prov. of Alicante in Spain, on the Mediterranean, and 45 m. from Alicante. Founded by the Phœnicians and once called Hemeroscopion, it was the place where Sertorius fled to after his revolt in Rome, 81 B.C. This tn. is the centre of the export raisin trade, but it also exports grapes, oranges, almonds, onions, and ground nuts. In Moorish times the pop. was 50,000, but now the inhab. number 13,000.

Denier, formerly the unit of silver

coinage in France, worth $\frac{1}{2}$ of the *livre d'argent*. Cf. the Lat. *denarius* (first issued c. 269 B.C., worth 10 asses). From the sixteenth century a copper coin of insignificant value, worth $\frac{1}{2}$ of a sou.

Denifle, Friedrich Heinrich Seuse (1844-1905), Austrian priest and historian, b. at Imst, Tyrol, son of Johann D., schoolmaster and organist. Studied at Brixen. Joined Dominicans, 1861. Received holy orders, 1866; visited Rome; became prof. of theology in Dominican monastery, Graz, and famous as preacher. Archivist to Vatican, 1883; prepared new ed. of St. Thomas Aquinas. With P. Ehrle ed. *Archiv für Literatur und Kirchengeschichte des Mittelalters* (1885-1900). His *Luther und Luthertum in der ersten Entwicklung* (1904-9) (completed by Weis) aroused much controversy. See lives by M. Grabmann, 1905, and A. Troger, 1908.

Denikin, Anton (1872-1947). Russian general of humble origin; entered the army 1887, became a divisional commander in S. Army in the early part of the First World War. At the Russian Revolution he joined Kornilov (q.v.) and was later imprisoned with him. Both escaped and gained the shores of the Black Sea in the Caucasus. Here they joined Gen. Alexeyev's volunteer army. Kornilov d. in March 1918, and D. commanded the force which opposed the Bolsheviks in S. Russia. On Alexeyev's death D. became leader of the anti-Bolshevik forces in S. Russia. D., though a good soldier, was not equal to the occasion as a politician, and he vainly tried to set up a military dictatorship. By the summer of 1919 his forces became demoralised, and when the Bolsheviks attacked them in Nov. 1919 they broke up completely. After the collapse of his army D. fled to Istanbul. He was offered asylum in England, but preferred to go to Brussels. Later he lived in France and finally went to America, where he d. His conduct of the campaign which ended in the 'White' retreat from Orel in 1919 has been criticized on grounds of strategy. That he failed was due in part to his own lack of the 'indefinable qualities which make a leader of men, in greater part to the extraordinary conditions of the civil war. He pub. sev. vols. on the history of the Russian Revolution and Civil war. Two of these, *The Russian Turmoil* (1922) and *The White Army* (1924), appeared in Eng.

Deniliquin, municipal tn. of New S. Wales, Australia, situated on the Edwards R., in the co. of Townsend, about 490 m. S.W. of Sydney. Pop. 3000.

Denis, Denys, or Dionysius, patron saint of France. He was the first bishop of Paris, and is supposed to have been put to death about the third century. He was in Paris towards the end of that century, and was ordered to appear before the Rom. governor, and on refusing to give up Christianity was condemned to death. The abbey of St. Denis is built over his burial-place. His festival is Oct. 9. See also ST. DENIS.

Denis, Louise Mignet (1712-90), niece of Voltaire and his constant companion.

She went with him to Berlin, to Geneva, and to Ferney. Voltaire addressed to her many of his letters.

Denis, St., see ST. DENIS.

Denison, George Taylor (1839-1925), Canadian soldier and author, b. in Toronto. Grandson of Lt.-Col. George Taylor D. (1783-1853), who raised the volunteer corps known as Denison's Horse. Called to the Bar, 1861; became a lieutenant-colonel in the active militia, 1866. Served against the Fenian raid of 1866 and the rebellion of 1885. In 1877 he was appointed police magistrate of Toronto. His prin. work, *A History of Cavalry* (1877), is a standard book and has been trans. into Russian, Ger., and Jap. He also wrote *The Fenian Raid at Fort Erie* (1866); *Modern Cavalry* (1868); *Soldiering in Canada* (1900); *The Struggle for Imperial Unity* (1909); and *Recollections of a Police Magistrate* (1920).

Denison, city of Grayson co., Texas, U.S.A., 3 m. S. of Red R., with railway repair shops, mills, oil refineries, and wagon works. Pop. 15,500.

Denizen (through Fr. from Lat. *de intus*, from within), one who obtains through letters patent certain of the privileges of a Brit. subject. When abroad he enjoys the same advantages as a Brit. subject.

Denizli, or Denizli, tn. of Asiatic Turkey, about 50 m. S. of Alashehr, and connected with Izmir (Smyrna) by rail. It is the trading centre of an important agric. region, manufacturing textiles; exports barley, opium, cotton, and nuts. The ruins of Laodicea are near by. Pop. 17,000. (tl of D. 315,400).

Denka, or Dinka, large tribe of Negro people living on both sides of the Nile in the Sudan. The chief source of their wealth is their cattle.

Denman, Thomas, first Baron Denman (1779-1851), lawyer, was called to the Bar in 1806, and entered Parliament twelve years later. He had arrived at such a high position as an advocate in 1820 that Queen Caroline made him her solicitor-general. In that capacity, with Brougham, who was the queen's attorney-general, he took an active part in her defence before the House of Lords, and it was these men who compelled the gov. to withdraw the Bill of Pains and Penalties. D. became attorney-general in 1830, and was lord chief justice from 1832 until 1850, when ill health compelled him to resign. He was an able though not a brilliant judge. See life by Sir J. Arnold, 1873.

Denman College, Abingdon, Berkshire, England, college of the National Federation of Women's Institutes. Training is given in many subjects, including citizenship, domestic crafts, gardening, and literature. It was founded in 1948 with funds raised by women's institutes throughout the country, with assistance from the Carnegie United Kingdom Trust.

Denmark, kingdom of N. Europe, and the smallest of the N. states, lying between 54° 34'—57° 45' N. lat., and 8° 6'—15° 12' E. long., consisting of a part of the European mainland (the peninsula of Jutland) and the is. Sjælland (or Zealand),

Fünen, Lolland (or Laaland), Falster, Møn, Langeland, the is. of Bornholm in the Baltic and sev. smaller is. The outlying possessions of D. comprise Farøe Is. and Greenland. In 1944 Iceland (*q.v.*) severed all ties with the Dan. Crown. Jutland is separated from Norway by the Skager Rack, and from Sweden by the Kattegat. The is. of Fünen and Zealand make three channels—the Little Belt, the Great Belt, and the Sound, which is the quickest route to the Baltic. The surface of Jutland presents an almost continuous plain, only a few feet above sea level, but the flatness of the landscape is relieved by the gentle slopes of wooded hills. The highest point is Ejler Bavnehøj, which reaches a height of about 560 ft. Jutland is thus a part of the great European plain. The W. coast of Jutland is low and sandy, with long spits of sand fringing shallow lagoons. The W. coast is thus without adequate harbours, and its shoals and sandbanks are a peril to mariners. The Lim Fjord, which is quite unlike the fjords of Norway in character, cuts Jutland in two. The prin. fjords and inlets of D. are the Ise Fjord, Roskilde-Fjord, and Ringkøbing-Fjord. As no inland point in Jutland is more than 50 m. distant from the sea there are no rivs. of importance. The Gudenaa, the longest, is only 85 m. long. There are many small lakes and well-constructed canals, which compensate for the dearth of riv. transport. The climate of D. is rendered temperate owing to the proximity of the sea on all sides, and resembles that of the E. of Scotland. The cold in the is. in winter is less severe than in Jutland. There are no deposits of coal or minerals of much value in D. The W. portions of Jutland consist of barren moorland to some extent, but the E. div. is very fertile and rich in pasture.

More than 75 per cent of D. is under cultivation, and there are now 204,000 farms. One-fourth of the pop. live exclusively by agriculture, and about one-half by manufs. and trade. The chief plant products are wheat, rye, oats, barley, grass, roots, and potatoes. Cattle, sheep, horses, pigs, and poultry are reared. In normal years bacon, butter, cheese, and eggs are produced in great quantities, with a large surplus for export. Beet-sugar and margarine are also manufactured. The fishing industry is increasing in importance and value, and the number of vessels in use is 15,000. Woollen, cotton, and linen goods are manufactured, but mainly for home supply. Paper-making, iron-smelting, and porcelain manufs. are thriving industries. D. has a unique situation with regard to commerce. It is the key to the Baltic, and is in a good line of communication with all the chief ports of Europe. The Danes have from very anct. times been a great sea-faring people, and in temperament are well suited for commercial life. The chief exports are agric. produce, including bacon (190,000 metric tons before the Second World War), butter (150,000 metric tons before the war), eggs (1,400,000,000 before the war), hides, skins, horses, and cattle; and from Greenland and the Farøe Is. dried fish,

elderdown, feathers, and oil. In normal years two-thirds of the exports go to England, and the value of the total exports from 1933 to 1938 averaged £60,000,000. The chief imports are iron, coal, and other minerals, including oils, timber, woollens, silks and cottons, hardware, fruit, tea, coffee, cereals, feeding stuffs and fertilisers, oil seeds, and colonial produce. The value of the goods sold by Britain to D. was over £12,000,000. The chief Brit. exports to D. are coal, coke, and manufactured fuel, iron and steel, cotton-piece goods, and woollen and worsted yarns and manufs.

The estab. church is the Evangelical Lutheran Church, introduced in 1536, at which date the church revenue was taken over by the Crown. Great tolerance is given to all religious sects, and no political inconvenience is experienced by the heterodox. Education was made compulsory in 1814, and is free. A notable feature for adult education is the system of Folk High Schools (*q.v.*), instituted in 1844 at Røedding. The univ. of Copenhagen was founded in 1479, and since 1875 admits both men and women students, now numbering nearly 6000. The univ. of Aarhus, founded in 1933, has 1000 students; the technical high school of D. at Copenhagen has 1700 students.

Copenhagen (København), on the is. of Zealand, is the prin. tn. and cap. of D. Pop., including suburbs 1,100,000. It has many fine public buildings. Elsinore, with its strong fortress of Kronborg, commands the Sound. Odense (92,400) is the chief tn. on the is. of Fünen. Aalborg (60,800) on the Lim Fjord is an important mkt. tn. and canal front. Other tns. are Aarhus (107,300), Horsens (32,400), Randers (36,400), Esbjerg (43,200), Fredericia (22,900), Kolding (27,600), and Vejle (27,100). The area of D., including the is. in the Baltic, is 16,576 sq. m., and the pop. is 4,045,200. The Farøe Is., area 540 sq. m., have a pop. of 29,200. A wide measure of autonomy was granted in 1947 to the people of the Farøe Is.

The throne is hereditary, and the power of the monarch is limited by the constitution. There is a Diet (Rigsdag) of two chambers: the Senate (Landsting) of 76 members, elected for eight years, and the Folketing of 149 members, elected for four years. A new constitution, involving the abolition of the Landsting, and the lowering of the franchise age from twenty-five to twenty-three, was rejected in 1939 by a narrow margin.

The navy (fleet and coast-defence forces) includes two destroyers, two frigates, ten torpedo boats, three submarines, ten motor torpedo boats, mine-sweepers, mine-layers, and surveying vessels. The army is organised in two divs. and sev. special regiments. In 1948 a home guard was estab. D. has also a small air force.

D. possesses about 5000 km. of railways, half of which are operated by the state, and half by companies in which the state or municipalities have an economic interest. Compared with other countries the railway net in D. is very highly developed,

and this holds whether measured by the area of the country or by the number of inhab. The motorisation of the country has made considerable headway, and in proportion to the number of inhab. D. has, next to France and Great Britain, more motor vehicles than any other European country. D. occupies an excellent position in the centre of the great N. European countries, and is striving to become one of the centres of the air-borne traffic of the future. The Dan. aviation company is one of the oldest in existence in the world, and is rapidly increasing its flying equipment. Before the Second World War the Copenhagen aerodrome was used by many foreign aviation companies, and these connections have now been re-established, notably with London, Paris, and New York. This airport now has four cement runways, the longest of which is 1200 metres. The Dan. merchant marine has 600 vessels—steamships, steam tankers, motor-ships, and motor-tankers, and 1400 smaller craft.

The monetary unit, the *kroner* of 100 *ore*, is of the value of 1s. 1½d. or about 19·35 kroner to the pound sterling.

History.—The story of D. during the first nine Christian centuries is steeped in the mists of saga and legend. The Danes claimed origin from Dan, and tradition points to Zealand as being the original home of these peoples, and certainly always a religious sanctuary. Pliny gives us our earliest reference to this country, and further references are made in Tacitus. It was from D. and the surrounding neighbourhood that the A.S. pirates swooped down on the coasts of Britain and finally made their settlements. In the stories of Beowulf we are able to trace some signs of the Dan. royal house and the extent of the Dan. dominions, but the facts which we gather are themselves obscured by the mists of tradition. We read of a Dan. king Harald fighting against the Swedes and dying in battle about the middle of the eighth century, whilst gradually these references to the Danes increase in the annals of the nations of Europe. We find, as they begin to become known as Vikings and sea-rovers, that the Frankish chronicles of the time of Charlemagne make mention of them; whilst during the ninth century the stories of their raids and the deaths of their kings are mentioned as events in the hist. of Scotland and of Saxony.

The hist. of D., however, became more authentic towards the beginning of the ninth century. Attempts are made from the great Ger. sees to convert the Danes, their kings begin to be recognised by the other kings of Europe. From about the year 800 almost to the end of the fifteenth century the name of Dane was feared throughout Europe. To the Litany was added the new phrase 'From the fury of the Dane, Good Lord, deliver us.' The Northmen was a term applied generally to the sea-rovers who were not all Danes, but who at the commencement of the raids certainly were. The raids of the Vikings had undoubtedly the one great result of making the monarchies of Europe feudal.

From the reign of Charles the Great to the settlement of Rollo the Dane in France, Europe was disturbed everywhere by the raids of these pirates of the N. During the ninth century many efforts were made to convert the Dane, but it was not until well after the middle of the tenth century that we may regard D. as having been in any sense fully converted. During the tenth century D. tried to extend her territory, parts of Germany were seized, especially the mouths of the rivers. During the reign of Canute the Great the whole Scandinavian peninsula for a time became one, but the attempt to dominate England, started by Sweyn and continued by Canute the Great, failed (1042).

The hist. of D. during the eleventh and twelfth centuries is troubled and complicated. Between the death of Canute the Great and the accession of Valdemar the country was harassed by internal troubles, and by continual disputed successions. With the accession of Valdemar I. D. began to become a really strong and consolidated kingdom. The country was the most fertile and the nearest to W. civilisation of the countries of Scandinavia. This gave it advantages which it was not slow to use. The church also, once it became a national church, did much to help in the consolidation, and D. gradually became the leading nation of the Scandinavian peninsula. Under Valdemar I., Canute VI., and Valdemar II., the nobles fell thoroughly under the influence of feudalism, the people were rich, and D. appeared to have a period of great prosperity before it. In 1241 Valdemar II. d., and throughout the thirteenth and fourteenth centuries civil war and constitutional struggles continued. The nobles gradually became more powerful than the king. The monarch was shorn of many of his prerogatives. The nobles gained charters, but used their power simply for the increase of their own wealth. On the death of Christopher II. (1332) D. was torn by internal struggles, and was on the point of total disintegration. On the death of Christopher II., Valdemar IV. came to the throne. He re-established the royal power, and crushed the nobility. He had to rebuild the whole strength of the nation, and by careful attention to details he did so. Further, he was by no means despotic: of his own free will he recognised many of the privileges which the nobles and people had obtained during the anarchy, and in 1360 was issued King Valdemar's charter. Under his daughter Margaret D., Norway, and Sweden were united by the union of Kalmar (1397). This union benefited only D., and was highly unpopular in the other two countries. Further, it threatened the power of the Hanseatic league, with the result that D. found herself involved in a long war with Holstein—the work of the league. Under Christian I. (of Oldenburg) both the Danish Slesvig and the Ger. Holstein were incorporated in D. (1460), and the king had to promise that the two dukedoms should remain united for ever. The monarch lost steadily in power to the lords of the manors, who became the

aristocracy of the fifteenth century, and the peasants were reduced to mere serfs.

During the fifteenth century the union of the three kingdoms was broken up. Norway remained with D.—she was by far the poorest of the three kingdoms and had been practically depopulated by the Black Death. Sweden still for a time was nominally ruled by the Dan. kings, and D. was still the leading power of the three kingdoms, but during the early sixteenth century the union received a fatal blow in a massacre by Christian II. at Stockholm (1520). From that time the Swedes were the irreconcilable foes of the union. Christian II., however, attempted to establish a strong and well-governed kingdom. This reign coincided with the Reformation in Europe, and finally he was driven into exile, and his uncle, Frederik I., became king. Sweden also at this time was separated for ever by the election of Gustavus Vasa to the throne of Sweden. The reign of Frederik I. was a period of transition, but during the reign of his son, Christian III., the Reformation doctrines were definitely estab. in D. The townspeople and the peasants attempted a rising in 1534-36 against the nobility, but they were denounced by the Assembly of Lords, who also dealt a final blow at the Itom. Catholic Church in D., the lands of the bishops being handed over to the king and the lords. A new church ordinance was drawn up and approved by Luther, and in 1537 the Dan. Church became entirely Protestant. The revenues of the Church were employed for the good of the nation, the fleet was strengthened, and the power of D. increased. During the sixteenth century D. was one of the great powers of Europe, and we may well regard the reigns of Frederik II. and Christian IV. as the period of D.'s greatest power.

The accession of Christian IV. marks a period which may be aptly termed transitional. The power of the king, although nominally very great, was in reality limited by the liberties and privileges of the nobility, and by the increasing liberal tendencies of the burgesses. D. was, above all else, a great Scandinavian power, and she still possessed Norway. This led her into continual disputes with Sweden and also with the maritime nations, Holland and England, who coveted the North Sea fisheries. D. exploited her controlling position at the entrance and exit of the Baltic by levying a duty on the cargo of all ships passing through the sound. Before the end of the reign D. had begun to lose to Sweden some of her ters., and from that time her possessions continually grew smaller. The next king, Frederik III., although still further shorn of his royal powers, was nevertheless imbued with an idea of winning back the lost ters. In this he was steadfastly supported by his people, and finally, when Charles X. seemed to be surrounded by insuperable difficulties in Poland, D. rushed to war. They were beaten and crushed by the Swedes, the last campaigns of this war forming one of the most dramatic episodes of the hist. of

war, and D. was forced to sign a disastrous peace at Roskilde in 1658. This was followed by a second war with Sweden, and this time the terms of the treaty were rather easier for D., much that she had given up was restored, but her Swedish provs. were lost, and the dominion of the N. passed out of her hands for ever. The war had the further result of removing the privileges from the nobles, and finally after much intrigue and a threatened *coup d'état*, Frederik III. succeeded in forcing the Council of the Realm to recognise him as an hereditary monarch. Thanks to the burghers he was soon able to establish himself as an absolute monarch. From 1660 to 1848 Dan. kings ruled according to 'the king's law' without a Parliament or an Estates Assembly. The change was on the whole beneficial to D. and of vast importance to Norway, which became prosperous and more energetic. During the reign of Christian V., and under the wise diplomacy of the Chancellor Griffenfeldt, D. seemed likely to become again a great European power. The ambitions of France and the alliance of that country with Sweden gave D. her opportunity. The chancellor played his hand with skill, and it was not until Sweden openly attacked Prussia that D. came definitely into the field as the opponent of the Fr. and Swedes. The fall of Griffenfeldt in 1676, however, paved the way for the humiliation of D., and the peace made in 1679 did not benefit D. at all, although on her had fallen the brunt of battle.

During the early part of the eighteenth century she played an important part in the N. war, in which Sweden, Hanover, and Prussia were involved, only to find at the end of it that Prussia and Hanover benefited by her territorial conquests, while she had to remain satisfied with financial compensation and the incorporation of the ducal part of Sleavig under the Dan. Crown. For a time the country remained at peace, and a beginning was made to attempt to end serfdom in D. During the eighteenth century it was mainly questions of land tenure and agriculture that troubled the Dan. statesmen. Attempts had been made to bring about relief by abolishing such services as militia service, but the price of corn still continued to fall and the peasantry still continued to emigrate. For a time reactionary measures were tried, and these for a short time had the desired effect. Efforts were made to restore the trading prosperity of the nation, and these not without success. Treaty after treaty was signed which gave D. great trading privileges, but still the agric. affairs at home did not improve. Under the Bernstorffs affairs improved, and before the end of the century D. had declared the importation of corn to be free and had practically emancipated her peasantry. The foreign policy of the century may be summed up in the word neutrality, and by studiously remaining firm to this policy she was enabled to steer clear of all the wars which Europe waged during this period. But it was also a close adherence to this policy and to the

domination of Russia that resulted in two breaches with England.

In 1800 the armed neutrality of the N. threatened the power of England. Prussia, Sweden, and Russia leagued themselves together, and the latter power practically forced the acquiescence of D. Napoleon closed the continental ports and the Brit. Navy replied by blockade of W. Europe. When D. organised a convoy system to protect her shipping, Britain found it necessary to detach D., and so Parker and Nelson sailed for Copenhagen, where the Dan. fleet was destroyed and the fortifications dismantled. The second breach was caused by Napoleon's desire to close the harbours of the N. to Brit. trade. D. desired to remain neutral and resolved to attack even France if she could not remain neutral; but an Eng. fleet was dispatched to take possession of the Dan. fleet, and at the same time to offer her very generous terms. D. was prepared to be courted, but not to be coerced. The result was England took by force what she could not obtain by diplomacy, and D. became an ally of Napoleon and remained staunch to the end of the war. In 1814, by the treaty of Kiel, she lost Norway to Sweden, and in the following year, as duke of Holstein, the Dan. king joined the Ger. confederation, but refused to allow Slesvig to become a member of it, since it formed part of the Dan. kingdom. The position of D. during the period immediately following the Napoleonic wars was one of great poverty and distress. Essentially an agric. country, the falling price of corn impoverished her, and the loss of Norway, although to a certain extent a relief, was by no means as great a relief as it seemed. One great reform was introduced during this period: the educational reform of 1814, which provided for the compulsory education of every child from the seventh to the fourteenth year. This reform was the forerunner for many liberal measures which led up to the granting of the democratic constitution in 1849. Absolute monarchy had ended. In March 1848 the Ger. Holstein leaders demanded a free joint constitution for Slesvig and Holstein, while the Dan. National Liberals advocated a free constitution for D. and Slesvig and the separation of Holstein from Slesvig. The ensuing war between D. and Holstein had great international ramifications, and finally the protocol of London was drawn up by the great non-Ger. powers in 1850, guaranteeing the indivisibility of the Dan. monarchy. D. had to promise not to attach herself closer to Slesvig than to Holstein. However, in 1863 D. promised Holstein a new constitution of her own, while Slesvig was to have a *joint constitution with D.* Bismarck struck and D. lost both Holstein and Slesvig. The loss of Slesvig entailed a revised constitution promulgated in 1866. For nineteen years D. was governed by Estrup despite parl. opposition. In 1894 he was forced to retire, and the Conservative and Democratic parties struggled for supremacy. In 1901 the Farmers' party formed their first adminis-

tration. In 1906 King Christian IX. d. and was succeeded by his son, Frederik VIII. Frederik continued his father's policy of upholding Parliament, but the event in political affairs in D., which has called for most comment, however, was the resignation of the minister Alberti in 1908, after he had held office for over seven years. He was sentenced to penal servitude for embezzlement. In 1912 Frederik VIII. d. suddenly, and his son, Christian X., became king. In 1915 Christian signed a revised constitution (*see under CONSTITUTION*), as the Upper House was at last forced to pass a Reform Bill putting its powers on a more democratic basis. During the First World War D. succeeded in maintaining her neutrality, and by the treaty of Versailles it was decided to settle the Slesvig question by plebiscite. In 1920 N. Slesvig voted for D. by 75,431 votes to 25,329, and was incorporated with D. under the name S. Jutland Provs. D. entered the League of Nations in 1920. Thereafter D. was occupied with economic stabilisation. The independence of farmers was guaranteed by a law increasing the size of small holdings but prohibiting amalgamation. Prosperity had come from the land, and by 1927 the stabilisation of the currency was complete. Repeated but unsuccessful attempts were made in Parliament to effect disarmament.

In 1924 the first Social Democratic Gov. came into power with the assistance of the Radicals, who had governed the country during the First World War. After a Liberal interval in 1926-29 the Social Democrats ruled until the Second World War. D.'s position at the opening of the war was difficult. She early co-ordinated her policy of neutrality with that of the other Scandinavian states. Pledges were given by both Germany and Britain to respect that neutrality. A non-aggression pact with Germany was ratified in June 1939. How worthless was this pact was shown when Germany suddenly on April 9 in the following year overran D. In their official announcement of the invasion, the Ger. Gov. stated that the invading forces would not interfere in the internal affairs of the country. But in the result Germany showed no more compunction in denuding D. of her stocks than she showed in the case of Czechoslovakia or Poland. D. made short resistance to the invaders. Coming thereafter under Ger. control she felt the full rigour of the Brit. blockade, for her dairy and industry had always depended on imported feeding stuffs and fertilisers.

History during the German Occupation, 1940-45.—Despite the non-aggression pact which Hitler had signed with D. on May 31, 1939, Ger. troops marched across the Dan. frontier on April 9, 1940. Heavy concentrations of Ger. forces on the Slesvig border had warned the Danes of the menace to their country, but they were powerless. After a short but fierce resistance the Social-Democratic Premier Stauning gave in under strong protest. King Christian appealed to the country to show a dignified and correct demeanour

to the Gers. People felt bound by loyalty to his request. The king's sense of reality and deep sentiment of responsibility offered a guarantee which no political leader in D. was able to counterbalance. A core of resistance hardened under the lead of J. Christinas Møller, Conservative leader and minister of commerce, but the Gers. soon ousted him through the helpless Dan. Gov. Gradually effective power passed from Stauning to the collaborationist, Scavenius, the foreign minister, from whose policy Stauning consistently held himself strictly aloof. Scavenius despised the Nazis, especially

Royal Danish Embassy

THE BRIDGE ACROSS THE LITTLE BELT,
CONNECTING JUTLAND AND FUNEN

the Dan. Nazis, but he was at heart a Prussian Junker and, like Stauning, he was convinced that Germany would win the war, and so he regarded as Europe's central power. In a memorandum dated April 9, 1940, to the Dan. Gov. on the aims and purposes of their invasion the Ger. Reich gave all manner of specious promises, one of which was that they would respect the integrity and independence of D. The country was, however, economically flooded; leading politicians were forced out of office in the search for quislings; writers were arrested; and a censorship estab. The Gers. also openly discussed the role which was assigned to D. under the New Order (*g.v.*), and which gave to D. merely the functions of a vassal state. The whole country was in a ferment, and the Prime Minister had constantly to repeat the king's appeal for order and tranquillity, and, by way of warning, the heavy sentences imposed for insults to Gers., sabotage, and demonstrations were given wide publicity.

Scavenius openly asserted that the Dan. Gov. 'recognised an economic and political new order under German leadership,' and he proclaimed D.'s willingness to seek her place in 'a necessary and reciprocal co-operation with Germany'—declarations which presumably it was hoped would ensure that other Ger. promises made at the time of invasion might be kept. Among them were two of great significance: Germany had no desire to create for herself in D. bases for the struggle against England; the Dan. Army and fleet were to be maintained. But in Jutland aerodromes sprang into existence one after another, a very big one being constructed at Aalborg. Dan. farmers of N. Jutland had to drive miles out of their way when travelling towards that tn., all traffic on the main roads having been diverted. Hero sham vils. and churches were set up, farmyards on wheels, wireless transmitters concealed in pine woods. A large seaplane base was built near Thisted. D.'s eight torpedo boats, her only naval assets, were taken by the Gers. The Dan. Army was reduced to the size and functions of a mere police force. A Ger. attempt to force D. into a customs and currency union with Germany failed, notwithstanding the support of Scavenius, owing to the firmness of the king and the rest of the gov. Dan. agriculture and industry were pressed into the service of the Gers. Fortunately the most valuable part of the Dan. mercantile marine was out of the Gers.' reach on April 9, 1940, and joined the allied cause. Big public works were designed in conformity with Ger. directions as a link in the chain of plans for a Ger.-dominated Europe. These included unnecessarily large harbour extensions and road-making schemes. Meanwhile, however, a Dan. council had been set up in London as a rallying centre for Danes abroad who wished to fight in the allied cause.

From the end of August 1943 the Danes were openly at war with Germany. By noon Aug. 29, following the rising, some Dan. warships reached the Swedish ports of Malmö and Landskrona, while other ships, unable to make good their escape, were scuttled by their crews. Earlier the Scavenius Gov., with the endorsement of King Christian, had rejected a Ger. ultimatum imposing all manner of restrictions on Dan. life and liberty. The Danes had always been convinced of Germany's ultimate defeat and chafed under the stigma of the great betrayal of 1940, which tricked them into apparent acquiescence in the Ger. occupation. Under the inspiring leadership of the Dan. Freedom Council, which maintained the closest liaison with supreme headquarters allied expeditionary force, and resistance movement intensified sabotage against Ger. lines of communication and estab. The clandestine press flourished, most underground papers drawing their news from the B.B.C. transmissions in Dan. and from the illegal news agency 'Information.' Meanwhile a secret army was being built up, armed with weapons

dropped by Brit. aircraft, to join with the Dan. brigade which was being trained in Sweden for the liberation of D. The Gers. struck at the Jews, of whom most reached Sweden safely, thanks to excellent illegal ferry arrangements, and later at the police.

On May 5, 1945, the Ger. armies in D., N.W. Germany, and Holland surrendered to P.-M. Montgomery, who during a visit to Copenhagen later in the month declared that the Dan. resistance movement had been 'second to none.'

Post-war Period.—On the eve of the liberation a Coalition Gov. had been formed by representatives of the traditional political parties and the resistance movement under the leadership of Vilhelm Buhl, with J. Christmas Møller as minister for foreign affairs. In Oct. 1945 a new Rigsdag was elected, the Liberals (farmers) forming the gov. After a new general election in 1947 the Social Democrats took over the administration as a minority gov. In 1945 D. entered United Nations. In 1949 she signed the N. Atlantic Pact and joined the Council of Europe.

Danish Language and Literature.—Before the year A.D. 1000 the language spoken in D. was more or less identical with the language spoken in Norway and Sweden. The first Dan. texts known are runic inscriptions from about A.D. 400 and there are many runic stones from the Viking period and the early Middle Ages. The special Dan. characteristics from this period are the substitution of single long vowels for diphthongs, and the loss of initial *h* before *i*. Not until about 1300 is there a real literature in Dan. The most important sources are some prov. laws, medical books, and later also prayer books, travel books, legends, a collection of proverbs, and a rhymed chronicle (the first Dan. printed book, pub. 1495). In this period initial *h* disappears before *n*, *l*, and *r*, and original diphthongs have become monophthongs; original mutation has often been lost, and three distinct dialects have developed—of Scania, of Zealand, and of Jutland. Altogether, before 1500 a considerable simplification has taken place: the original masculine and feminine genders of the nouns have developed into a common gender, and the conjugation of the verbs have been greatly simplified. The most important sound change after 1500 is the change after a vowel of *p*, *t*, *k* into *b*, *d*, *g*.

The introduction of Christianity brought many Lat. and Gk. loan words into the Dan. language, and in the later Middle Ages the influence of the Hanseatic traders and the Ger. nobility brought many Low Ger. loan words into Dan. The importation later on continued with many Fr. and Eng. words.

An important element in modern Dan. is the 'glottal stop,' which developed from an original accent. Until 1948 Dan. followed the Ger. habit of writing all nouns with capital letters, but this has been abandoned by an Act of the Dan. Rigsdag in 1948. At the same time the letter *z* was officially accepted instead of

aa. The standard dictionary is *Ordbog over det danske Sprog* a work in progress, of which 24 vols. have been pub., 1918-49. For the hist. of the language, see P. Skutntrup, *Det danske Sprogs Historie* (in 3 vols.) (1943-49). Most of the Dan. literature of the Middle Ages is in Lat. Of particular prominence is the twelfth-century historian Saxo Grammaticus, whose work *Gesta Danorum*, in sixteen parts, contained the saga of D. from mythical times to 1216. Anct. Dan. heroic legends (e.g. the legend of Amleth) form the most important part of the entire work. Of eminent importance are also the Dan. ballads of which a total of nearly 550 exist in about 3000 varying eds. The most important of them were created between 1200 and 1500. They were the property of the chivalry and sung as an accompaniment to dances, but they were not written down till after the end of the Middle Ages. They are more epic in character than the Fr. and Ger. ballads, and there is a distinct resemblance between Dan. and Scottish ballads. The first printed ballad ed. appeared in 1591 (by A. S. Vedel). The modern scholarly ed. (by Grundtvig, Olrik, and Gruner Nielsen) is in 5 vols (1853-1919). Dating from the Middle Ages is also a collection of proverbs (by Peder Laale), law-books, edifying books, and some few dramas. The period of the Dan. Reformation (1520-70) is first marked by a great many polemic pamphlets, with Poul Helgesen (b. 1480) as the outstanding defender of the Catholic Faith, and Hans Tavsén, Christen Pedersen, and Hans Mikkelson as the prominent representatives of Lutheran doctrines. Peder Palladius, the first Lutheran bishop of Zealand, wrote a *Visitation Book*, characteristic of its frank and lively style, and Christen Pedersen made a trans. of the Bible, pub. in 1550 as *Christian III's Bible*—from the text of which the written modern Dan. language is derived. Among the hymn-writers of this period special mention should be made of Hans Thomison and Hans Christensen Sthen. The Reformation was followed by a period of Lutheran orthodoxy with Niels Hemmingsen (1513-1600) as its great theological exponent. The first Dan. hist. to succeed Særo's work was written by Arild Huitfeldt, whose work *Danmarks Riges Historie* was pub. in 10 vols. in 1595-1605. There were many scientific and scholarly works from the sixteenth and seventeenth centuries by Anders Sørensen Vedel (1542-1616), Erik Pontoppidan, Peder Syv (and 1707), Tycho Brahe (1546-1601), Ole Rømer, Thomas Bartholin, Niels Steensen, Ole Borch, and Simon Paulli. A new artificial poetry imitating the classics was written by Anders Arreboe (1587-1637), whose chief work, *Herememus* (1661), describes the Creation in hexameters and alexandrines. Søren Therkelsen imitated Fr. pastoral poetry, and Anders Bording (1619-77) was a versatile poet of the baroque period; he was also the editor of D.'s first newspaper, *Den danske Mercurius* (1666-77), where the news appeared in rhymed alexandrines. The greatest poet of the

seventeenth century was Thomas King (1634-1703), whose hymns are still much in use. In the beginning of the eighteenth century Ludvig Holberg (later Baron Holberg) (1684-1754) is the greatest name. He was b. in Norway, but settled down in D. where he became a prof. in the univ. of Copenhagen. His first work as a satirical writer was the mock-heroic poem *Peder Paars* (1718-20), but his main importance for Dan. literature rests in his thirty-three comedies of which the first fifteen—the moralizing comedies of character—came 1722-23, while most of the other comedies appeared 1723-27. Holberg is D.'s sole playwright of European importance, and with his comedies he created the modern Dan. drama. Holberg also wrote sev. histories, thus a *Danmarks Riges Historie* (1732-35), which superseded Huitfeldt's. Finally Holberg was also a writer of philosophical essays, *Moralske Tanker* (1744), and *Epistler* (1748-54), and the author of an imitation of Swift's *Gulliver's Travels*; *Niels Kibns underjordiske Rejse* (1741). He wrote his own memoirs (1728-43).

H. A. Brorson (1691-1764) was a writer of Pietistic hymns, Ambrosius Stub (1705-1753) an inspired and versatile poet, whose poems range from religious hymns to drinking songs. Johan Herman Vessell (1742-85), was a talented satirist and humorist, whose mock-heroic drama, *Kærlighed uden Strømper* (1772), ridiculed the bad imitations of Fr. classicism. Towards the end of the eighteenth century there were various Brit. influences upon Dan. literature. The writings of Young and Thomson and Pope are traceable in sev. Dan. poets, notably in Tullin. The Eng. 'Spectator literature' had great effects on Dan. periodical literature, and Shakespeare, Milton, Sterne, Ossian, and Fielding had their effects on Johannes Ewald (1743-81). His odes, his tragedies with subjects from Nordic legends and mythology, and his patriotic heroic play *Fiskerne* (1778) deserve special mention. The latter contained his poem 'Kong Christian,' which has become the Dan. royal anthem. Ewald wrote an impressionistic sketch of his own life, *Levnets og Meninger*, pub. after his death (1804-8). P. A. Heiberg (1758-1841) was a violent radical inspired by the ideas of the Fr. Revolution. For his anti-monarchistic writings he was made an exile and lived the latter half of his life as a refugee in France. Another radical writer was Malthe Conrad Bruun who became later a well-known geographer. Jens Baggesen (1764-1826) distinguished himself as an emotional lyrical poet, a humorist, and a fine prose-writer. His autobiographical sketch *Labyrinten* (1792-93) has a high place in the hist. of Dan. prose.

The romantic revival in D. came via Germany and began with the works of Adam Oehlenschläger (1779-1850). His lyrics, his tragedies (often with motives from old Dan. legends), and his re-writing in verse of old Norse mythology, in *Nordens Guder*, had an enormous influence on Dan. literature and thought in the nineteenth century. To the romantic

school belonged also Schack v. Staffeldt (1769-1826) and B. S. Ingemann (1789-1862), whose historical romances are Dan. equivalents to Scott's Waverley novels. Ingemann was also a pure and exquisite lyrical poet of many 'Morning and Evening Songs'. N. F. S. Grundtvig (1783-1872) also belonged to the romantic school. He was a very prolific writer, D.'s greatest hymnlist, her most renowned educationalist, a liberal politician, and a diligent historian and antiquarian; his influence has been very considerable both in and outside D. Carsten Hauch (1790-1872) was a sober and genuine poet, novelist, and dramatic writer. A new realistic interest made itself felt in the writings of Poul Møller (1794-1838) and St. Blicher (1782-1848). Poul Møller's greatest contribution to Dan. literature is his novel *En dansk Students Eventyr* (1824). Blicher was inspired by the Ossian poetry of Macpherson; outstanding among his lyrics is *Trækflugten* (1838). His many short stories have a realistic background in Jutlandish life and conditions. Johan Ludvig Heiberg (1791-1860) introduced Hegelian philosophy into D., and was for a time the dominating literary critic of Copenhagen. He re-created the Fr. *vaudevilles* on Dan. soil, but he also wrote more serious dramas, e.g. the national drama *Elverhøj* and the philosophical drama *En Siel efter Døden* (1841). His mother, Fru Gyldenbourg, was well known for her stories with everyday subjects, and his wife Johanne Louise Heiberg was a famous actress in the Royal Theatre of Copenhagen. To the same aesthetic school belonged also Henrik Hertz (1798-1870), an author of epic and lyric poetry and of bourgeois plays and serious romantic dramas. Prominent among a new school of lyrical poets about the middle of the century were Christian Winther (1796-1876), Ludvig Bødtcher (1793-1874), and Emil Aarestrup (1800-1856). Especially Winther and Aarestrup are known for their fine love lyrics. Frederik Paludan-Müller (1809-76) was originally influenced by Byron, but he gradually became the great moralist in Dan. literature. His main work is the verse novel *Adam Homo* (1841-48). Hans Christian Anderson (1805-75) even in his own lifetime acquired international fame through his *Fairy Tales*. He was also the author of sev. novels, plays, and poems, and his own fate—the poor shoemaker's son who became a world-famous genius—is reflected in most of his writings. It is the subject of his memoirs, *The True Story of My Life* (1855). Another contemporary writer of European fame is Søren Kierkegaard (1813-55), a religious philosopher whose books are on the borderline of philosophy and belles-lettres. Among his philosophical works, *Either-Or* (1843), is the main work. M. A. Goldschmidt (1810-87) was a gifted novelist of Jewish origin, who described conditions among the Jewish community in Copenhagen. His chief novels are *En Jøde* (1845), and *Karmen* (1867). Less important are the poets Carl Ploug (1813-94), J. C. Hostrup

(1812-92), Christian Richardt (1831-92), and H. V. Kaalund (1818-85). H. E. Schack wrote one novel of great importance *Phantasterne* (1857).

About 1870 a new radical, 'naturalistic' movement began in D., led by the eminent critic Georg Brandes (1842-1927). His chief work *Main Currents in Contemporary European Literature* (1871-90) were met with both enthusiasm and antagonism, but his many critical works had an enormous influence on Scandinavian literature. J. P. Jacobsen (1847-85) was the first exponent of naturalist fiction in D. through his two novels *Fru Marie Grubbe* (1876), and *Niels Lyhne* (1880), and his short stories. Holger Drachmann (1846-1908) was mainly a lyrical poet, generally considered D.'s finest poet in the nineteenth century. Henrik Pontoppidan (1857-1943) was a sober and distinguished novelist, whose novel *Lykke-Per* (1898-1904) is one of the landmarks of the Dan. novel. Other novelists from the 1880's are Karl Gjellerup (1857-1919) and Herman Bang (1857-1912). In the nineties a generation of lyrical poets were the dominating names: Johannes Jørgensen (b. 1866), Viggo Stuckenberg (1863-1906), Sophus Clausen (1865-1931), Ludvig Holstein (1864-1943), and Helge Rode (1871-1937). Jakob Knudsen (1858-1917) was a novelist inspired by the ideas of Grundtvig and the Dan. Folk High Schools, and Gustav Wied (1858-1914) was a cynical satirist as a writer of novels and plays.

A new 'peasant movement' was inaugurated in Dan. literature by the Jutlandish lyrical poets Thøger Larsen (1875-1928), Johan Skjoldborg (1861-1936), and Jeppe Aakjær (1866-1930), and by the Jutlandish novelist Johannes V. Jensen (b. 1873), whose main work, *The Long Journey*, is based on the Darwinistic theories of evolution. Jensen is also a fine lyrical poet and essayist. Martin Andersen Nexø (b. 1869) has won international fame with his proletarian novels, *Pelle the Conqueror* (1906-10), and *Daughter of Man* (1917-21). His *Memoirs* (1932-39) rank very high. Other noteworthy novelists are Harald Klode (1878-1918), Knud Hjortø (1869-1932), and Marie Bregendahl (1867-1940).

Of the authors between and after the two wars, special mention should be made of the novelists Jacob Paludan (b. 1896), Johannes Buchholtz (1882-1940), Harry Selberg (b. 1880), Hans Kirk (b. 1898), Knuth Becker (b. 1893), Thit Jensen (b. 1876), Mogens Klitgaard (1906-45), Harald Hørdal (b. 1900), Marcus Lausson (b. 1907), H. C. Branner (b. 1903), and Martin A. Hansen (b. 1909). Of the lyrical poets the most important names are Hans Hartvig Seedorff Pedersen (b. 1892), Kai Hoffman (b. 1874), Tom Kristensen (b. 1893), Otto Geilsted (b. 1888), Nis Petersen (1897-1943), Paul la Cour (b. 1902), Tove Ditlevsen (b. 1913), and Morten Nielsen (1922-44). The prominent playwrights from this period are Kaj Munk (1898-1944), Kjeld Abell (b. 1901), Soya (b. 1896), and Knud Sønderby (b. 1909).

Art.—Dan. art portrays national culture stretching over ten millenniums, from the time when birds and animals were carved in amber with a high degree of artistic competence, to the pottery of Copenhagen of to-day, with its wonderfully perfect glazes and correct shapes. In the years 2000-1500 B.C. the Danes had not yet learned from the rest of Europe the secret of bronze, yet they carved copies of bronze axes in stone with a craftsmanship equal to the best anc. ritual jade carvings of the sinic world. When they learned how bronze was made they developed an exquisite art in bronze (1500-800 B.C.), inventing the signal-horn or *lur*, stated to be one of the oldest musical instruments in the world: some of these lurs can still be played. The early bronze period of D. coincided with the Cretan, and the later period with the heyday of classical Greece: this independent flowering of a culture is sufficient refutation of the theory that lands beyond the influence of Mediterranean culture were barbarous until the eleventh century A.D., when the Christian church reached D. Dan. art continued to find its expression in architecture and decoration, in the building of the cathedrals at Lund, Ribe, and Viborg (1140). Early Gothic is found in the brick-built cathedral of Roskilde (after 1200). Gothic style was introduced in the cathedral of Aarhus Haderslev, as well as the Cisterian monasteries of Løgum and Sorø. Many guildhalls, e.g. in Copenhagen and Aarhus, as well as farmhouses of the late Middle Ages, are still well preserved, and show the influence of lower Saxon styles. There are numerous castles and smaller country mansions dating from the sixteenth to the eighteenth century. Notable among those in Dutch Renaissance style are Kronborg (1571-85), Frederiksborg (1602-22), Rosenborg (1613-16), and the Bourse at Copenhagen, on which four fairy-tale dragons twist their tails into a delicate spire. Like England and Holland D. resisted the baroque of S. Germany, and in the cap. the palace of Christiansborg was rebuilt (1771-40) in early Fr. classic style, but the modern building, by the architect Thorvald Jørgensen, dates only from the present century. D.'s most noted sculptor is Bertel Thorvaldsen (1768-1844), who obtained world fame. Among architects who have achieved renown outside their own land are C. F. Harstorf (1735-99), C. F. Hansen (1756-1845), P. V. Jensen-Klint (1853-1930), and T. F. Willumsen (b. 1863), also painter and sculptor. In modern Dan. architecture schools, libraries, stadiums, factories, univ. buildings, and hospitals show solid worth, tempered with elegance; notable in this work are Kay Fisher and C. F. Möller.

The first Dan. painters representing neo-classicism in the eighteenth century were N. A. Abildgaard (1743-1809) and Jens Juel (1745-1802). C. W. Eckersberg (1783-1853) was a pupil of David in Paris. Among his contemporaries in the 'Golden Age' were Christen Købke (1810-48), P. C. Skovgaard (1817-75),

J. T. Lundbye (1818-48), and Dankvart Dreyer (1816-52). To the same period belonged also the fine illustrator Wilhelm Marstrand (1810-73). The greatest Dan. painters towards the end of the nineteenth century were P. S. Krøyer (1851-1909), L. A. Ring (1854-1933), Theodor Philipsen (1840-1920), Vilhelm Hammershøf (1864-1916); among the twentieth-century Dan. painters special mention should be made of Poul S. Christiansen (1855-1933), Fritz Syberg (1862-1939), J. F. Willumsen (b. 1863), Harald Giersing (1881-1927), the two brothers Joakim Skovgaard (1856-1933), and Niels Skovgaard (1858-1939), Niels Larsen Stevns (1861-1941), Edvard Wele (1879-1943), Olaf Rude (b. 1886), Oluf Høst (b. 1884), Johannes Larsen (b. 1867), Jens Søndergaard (b. 1895), Vilhelm Lundstrøm (b. 1893), and Knud Agger (b. 1895). Particularly noteworthy among modern Dan. sculptors are Kai Nielsen (1882-1924), Gerhard Henning (b. 1880), Adam Fischer (b. 1888), Astrid Noack (b. 1889), Mogens Bøggild (b. 1901), and Knud Nellemose (b. 1908).

Fine craftsmanship in furniture, interior decoration, ornaments, porcelain, and jewellery, remains a notable feature of Dan. art: the silversmith, Georg Jensen (1866-1935), achieved fame as an artist, and created the silverware which bears his name.

Weitemeyer, *Denmark*, 1891; A. Redsiob, *Architektur und Kunstgewerbe Alt-Danemarks*, 1914, 1921; E. Fahlø, *Danmarks Malerkunst*, 1927; H. Topsøe-Jensen, *Scandinavian Literature*, 1929; and *Scandinavian Literature from Brandes to Our Day*, 1929; C. S. Peters and V. Anderson, *Illustreret dansk Litteraturhistorie*, I-IV, 1929-35; H. Antrup Larsen, *Scandinavian Literature*, 1930; Helge-Kjærsgaard, *Die dänische Literatur der neuesten Zeit*, 1934; F. Blankner, *History of the Scandinavian Literatures*, 1938; H. Brix, *Danmarks Digtelse*, 1944; and E. Breddsdorff, *A Bibliography of Danish Literature in English Translation*, 1949.

GENERAL: C. Holland, *Denmark, the Land of the Sea*, 1928; E. Jensen, *Danish Agriculture: its Economic Development*, 1937; J. H. S. Birch, *Denmark in History*, 1938; J. C. Møller and Katherine Watson, *Education in Democracy: the Folk High Schools of Denmark*, 1944; P. Palmer, *Denmark*, 1945; Politikkens Forlag, *Facts about Denmark*, 1946; J. Danstrup, *History of Denmark*, 1948; and K. Williamson, *The Atlantic Islands: A Study of the Faeroe Life and Scene*, 1948.

Dennis, Alfred Lewis Pinneo (1874-1930), Amer. historian, b. in Beloit. He was prof. of hist. at Bowdoin College, 1901-4; associate prof. of hist. at the univ. of Chicago, 1904-5; and prof. of hist. at the univ. of Wisconsin from 1906 to 1920. Among his books are *Eastern Problems at the Close of the Eighteenth Century* (1900); *Anglo-Japanese Alliance* (1923); and *Foreign Policies of Soviet Russia* (1924).

His Adventures in American Diplomacy, pub. in 1928, covers the decade 1896-1906—one of the most perilous periods of Amer. diplomacy. The value of the work lies in the use made of hitherto largely unpublished state documents and private papers of Roosevelt, Olney, Hay, Root, and other statesmen.

Dennis, John (1657-1731), Eng. critic, son of a saddler of London, where he was b. He was educated at Harrow and at Cambridge Univ. He lived the improvident life of a literary adventurer, and was a political writer, a poet, a dramatist, and a critic. It is as the last that he is principally known, not from his own works, but from having been preserved in the amber of Pope's *Essay on Criticism* and *The Dunciad*. A well-instructed if small contemporary critical public recognised in D. the first and most philosophical expositor of the sublimity of Milton's verse. Wordsworth, Bowles, Coleridge, and other romantics found him an inspiring writer. But it was not until the twentieth century that justice was done to him as a critic, in Prof. D. Nichol Smith's *Eighteenth-century Essays on Shakespeare* (1903). In regard to dramatic criticism it is possible that, had his views been respected, the course of Eng. comedy might have been stronger and saner; but public opinion preferred such plays as Steele's flimsy *Conscious Lovers*. D., unfortunately for himself, was throughout his life a butt for nimbler wits and spirits more sociable and pleasant than his own, and early he was condemned by Pope and Swift as 'a Whig dog' and left unread. Nor was he any match for the malice and cleverness of Pope, who did not appreciate D.'s criticisms of his work. But at least if a surly and sour critic D. was a passionate lover of spiritual and intellectual beauty. This is evident in his best known work, *Essay on the Genius and Writings of Shakespeare* (1712), and also in his *Reflections Critical and Satirical on Pope's Essay upon Criticism* (1711), *Remarks upon 'Cato'* (1713), and *A True Character of Mr. Pope and His Writings* (1716). His own original plays were dull and are interesting only because they illustrate his sound dramatic theories, among which was no slavish adherence to the unities. His adaptations of *The Merry Wives of Windsor* (*The Comical Gallant*, 1702) and of *Coriolanus* (*The Invader of His Country*, 1720) have been criticised for vandalism, but a juster estimate of their critical beliefs and aims now prevails. Much is owed to the first collected and complete ed. of D.'s critical writings, *The Critical Works of John Dennis*, ed. by E. N. Hooker (2 vols.), 1939, 1943. See H. G. Paul, *John Dennis, His Life and Criticism*, 1911.

Denny, Jn. of Scotland in the co. of Stirling, situated on the Carron. Iron and coal are obtained in the neighbourhood, and there are large foundries and iron-works, chemical works, and paper mills. In the vicinity are the ruins of Torwood Castle, and also of Herberthshire Castle, which was destroyed by fire in 1914, the Lady's Lead, and Carron Glen. The

banks of the Carron were the scene of many of the most stirring and heroic deeds recorded in Scottish hist. Pop. 9000.

Denominations, The Three, was composed of the three D. of dissenters—Presbyterians, Baptists, and Independents—living in or near London. They had the privilege of presenting an address to the sovereign at certain times, and in 1727 'the General Body of Protestant Dissenting Ministers of the Three Denominations' was organised.

Denotation, see CONNOTATION AND DENOTATION.

Density. Absolute D., term used in physics to express the quantity or mass of matter contained in any unit of volume. Relative D., or sp. gr., is the comparison of the mass of the substance concerned with the mass of the same volume of some standard matter, which for liquids or solids is generally taken as water at its temp. of maximum D. (4° C., 39° F.) and at ordinary pressure; for gases the standard is hydrogen at ordinary temp. and pressure. Since in the metric system, which is usually employed, the unit of mass is the weight of a c.c. of water at 4° C., the relative D. is the same as the absolute D. Since, however, weight is proportional to mass, the weight may be substituted for the mass without causing any material difference. The least dense substance known is lithium (0.53) if the D. of water be called unity; the densest is iridium (22.4); the D. of hydrogen is 0.0009. See SPECIFIC GRAVITY.

Dent Blanche, see BLANCHE.

Dent, John Charles (1811-87), Canadian journalist and writer on historical subjects. B. at Kendal, Westmorland, and was taken to Ontario in infancy. He was called to the Bar in 1865 and practised for a short period. He returned to England and worked as a journalist there and later in Toronto. His pub. works include *The Canadian Portrait Gallery* (1880-81); *The Last Forty Years: Canada since the Union of 1841* (1881), in collaboration with Henry Scadding; *Toronto: Past and Present* (1881); and *The Story of the Upper Canadian Rebellion* (1885). See also J. King, *The Other Side of the 'Story' . . . of the Rebellion*, 1886.

Dent, Joseph Malaby (1819-1926), Eng. pub., b. at Darlington. After some early training as a bookbinder in his native tn., he went to London in 1867, where he worked at his craft for sev. years before setting up his own workshop. A book-lover from the first, he began then to experiment in a small way as a book producer and publisher. Having estab. himself in offices and a bindery in Great E. Street (remote from the ordinary London publishers' purlieus) in 1888, he put forth, in a most attractive format, some notable eds. of Ellis's *Essays* and other authors. He had already formed a friendship with some of the Tynbee Hall residents, attended lectures at that White-chapel 'varsity,' and made excursions to France and Italy with them, which widened his ideas as a projector of fine illustrated books. In his quest for art he was a shrewd discoverer of talent in young

artists, among these being Aubrey Beardsley, R. Anning Bell, and Arthur Rackham. The Temple Shakespeare appeared in 1894 and *The Temple Classics* in 1896, both under the editorship of Israel Gollancz; and they were followed by pocket eds. of favourite authors, which quickly gained for him a reputation as a London publisher of the first rank. In 1897 the business was transferred to 29-30 Bedford Street, Covent Garden, and in 1912 he built Aldine House on the opposite side of the same street. In the former building he planned the scheme which developed into Everyman's Library (*q.v.*), the story

Drawing by Dora Noyes
J. M. DENT

of which venture he has told in some detail in his *Memoirs* (1928). His idea was to build up a great 'city of books' on democratic popular lines, and he always kept in view the type of reader who, like himself, had to gain his literary knowledge and information by reading vol. after vol. as time allowed.

Always zealous in the cause of education, he also produced many series of educational books, e.g. Dent's Modern Language Series, ed. by Prof. Ripman; *The Kings Treasures of Literature*, ed. by Sir Arthur Quiller-Couch, etc., which have proved their value by their wide circulation throughout the schools of the empire. The conception of *Everyman's Encyclopedia* and its realisation in its original form were also due to his enterprise. Throughout his career publishers and book-lovers and the great reading public in America appreciated and supported his many and varied enterprises. In Canada, too, he formed a growing connection by

his repeated visits, and in 1912 a branch Aldine House was opened at Toronto. He was succeeded as head of the firm by his son, Hugh Ralston (1874-1938).

Dentalium, or **Elephant's Tusk Shell**, one of the three genera of molluscs which form the class Scaphopoda. The shell is tusk-shaped and open at both ends, from the larger of which the long foot appears and is used in creeping movements. The mollusc has tentacles around its mouth, is lacking in eyes and heart, and lives in muddy sand at great depths of the sea.

Dental Service, National, see NATIONAL DENTAL SERVICE.

Dental Surgeon, see DENTISTRY.

Dent-du-Midi, mt. summit, belonging to the Swiss Alps. It is situated in the prov. of Valais, and attains a height of 10,696 ft.

Dentil (architecture), one of a series of cubical blocks, like teeth in shape, placed beneath the corona of a cornice. Mostly found in the Composite, Corinthian, and Ionic orders. Generally the height of each D. is double its width, while the interdentils, or spaces between the blocks, are one-third the height.

Dentine, see TEETH.

Dentistry, see under TEETH.

Dentition, process of cutting the teeth. See under TEETH.

Denton: 1. tn. 7 m. S.E. of Manchester, England; manufs. felt and silk hats. Pop. 17,000. 2. Vil. in the W. Riding of Yorkshire, England. 2½ m. N.E. of Ilkley. The bp. of Sir Thomas Fairfax. 3. Co. seat of D. co., Texas, N.W. of Dallas, U.S.A., raising cotton and grain and manufacturing pottery and bricks. The seat of the N. Texas College for women and of the College of Industrial Arts for women. Pop. 11,100.

D'Entrecasteaux, group of Brit. is., situated in the Pacific Ocean, off the S.E. coast of New Guinea. They consist of three prin. is., separated by narrow channels, with a total area of 1083 sq. m. Their name is derived from the Fr. admiral, Bruni D'E.

Denudation, wearing away of the surface of the earth, a process which is carried on by various agents. The effect of D. is seen in the various features of the earth's surface, as riv. valleys, gorges, and the shapes of cliffs and rocks. Water in various forms—rivers, streams, rain, frost, and glaciers—is the great cause of D., though some may be due to plants and animals. The rivers wear away their beds and make them wider with the continual flow of their water, and carry away particles of rock washed down by the rain or other agent, and so wear away the surface over which they flow, the amount of D. done by a riv. varying according to the region. Glaciers also are powerful in this respect, owing to the debris which they carry along in their courses. Rain wears away the surface of the rocks considerably both by beating on them and by chemical processes. Frost is instrumental in splitting the rocks to pieces, and in causing fissures in them, whereas the sea wears away the bases of cliffs, thus causing the overhanging rock to give way, and altering from time to time the shape

of the coast-line. The general appearance of the land, therefore, is due to the various denuding agents in any particular locality, and although many hundreds of years may pass before the change is perceptible, yet on examining the land it can be seen that it is always undergoing this D. See C. Lyell, *Principles of Geology* 1830-33.

DEODAR

Denver, cap. of Colorado, U.S.A., on the S. bank of S. Platte R., 15 m. from the E. base of the Rocky Mts. in a rolling plain. It is the largest city between the Missouri R. and the Pacific. It is the nearest large city to important gold and silver mines and oil shale deposits. The city is the official gateway to twelve national parks and thirty-two national monuments. Among the peaks visible from D. are Pike's Peak, Mt. Evans, Gray's Peak, Long's Peak, and Torrey's Peak. The state Capitol of granite, with a dome covered with Colorado gold, cost \$2,500,000. The state historical museum contains collections of relics of prehistoric, Indian, and pioneering life. The city park of 320 ac. has a collection of Colorado animals, the univ. (with over 10,000 students) and the Carnegie Library (280,000 books). From a tower 330 ft. high on the Daniels & Fisher store a bird's-eye view of D. can be obtained. It is 1 m. above the sea. The union station was built in 1914. The municipal auditorium seats 12,000. The mint is one of the three coinage mints of the U.S.A. D. is a distributing centre of the automobile industry and has the largest cattle and sheep market in the W. The leading industries are meat-packing and mining machinery and engineering. Pop. (1940) 322,400.

Denys, St., see DENIS.

Deoband, tn. of India, in the United Provs., with a celebrated Arab college, 45 m. N. of the city of Meerut. Pop. 18,000.

Deodand (Lat. *Deo* and *dandum*, to be given to God), term used for anything which had caused the death of a human being, whether that death was brought about intentionally or accidentally, as by the

law the thing was given over to the Crown to be put to some good use, and thus 'given to God.' This practice was abolished in 1846.

Deodar, native state of India, situated in Gujarat, Bombay. It has an area of about 440 sq. m., consisting of a hot sandy plain with no rivers. Pop. 19,700.

Deodar, or *Cedrus Deodara*, species of conifer, which occurs in the Himalayas. The plant is a beautiful evergreen tree, the leaves persisting for over a year, and the cone takes two or three years in ripening.

Deodätum, see **ST. DIE**.

Deodoriser (Lat. *de*, away from; *odor*, smell), substance used for destroying harmful smells, chiefly those which arise from decomposing matter. Charcoal and quicklime are very powerful **De**. Disinfectants may be **De**s. if they destroy smells as, for instance, zinc chloride.

Deogarh, tn. of India, in the prov. of Bengal, and the dist. of Sonthal Parganas. Twenty-two temples of Shiva are found there; it is a noted resort for pilgrims, and is on the E. India Railway. Pop. about 8500.

Deogire, see **DAULATABAD**.

Deols, called also **Bourg-Dieu**, tn. of France in the dept. of Indre, and lies N.E. of Châteauneuf. It is noted for its medieval abbey with its beautiful church now in ruins. Pop. 3000.

D'Eon, **Chevalier**, see **EON DE BEAUMONT**.

Deoprayag, see **DEVAPRAYAGA**.

Deora Taboor, see **DEBRA TABOR**.

Deori, tn. of Sambulpur dist., Central Prov., India. Pop. about 4000.

Deoxidation, see under **OXYGEN**.

Department (Fr. *département*), term used for a territorial div. of France corresponding roughly to an Eng. co. Before the revolution France was divided into thirty-four provs., but in 1790 by a decree of the Assembly it was redivided into eighty-three **De**s. Under Napoleon the number was increased to 130, but is now ninety. The three **De**s. of Algeria, since 1881, have been regarded as **De**s. of France proper, and in 1947 the colonies of Martinique, Guadeloupe, Réunion, and Fr. Guiana were given the status of overseas **De**s. They receive their names generally from a prominent riv. or mt. contained within their boundaries. Each **D.** is presided over by a prefect, and is divided into arrons., each under a sub-prefect. The arrons. are divided into cantons, and the cantons into coms. corresponding to an Eng. par. Paris is in the **D.** of the Seine.

De Pere, city of Browne co., Wisconsin, U.S.A. It has foundries, machine shops, and manufs. boats, paper, etc. Pop. 6300.

Depew, Chauncey Mitchell (1834-1928), Amer. politician, attended Yale Univ., and was called to the Bar in 1858. His political career began in 1861, and in 1888 he was one of the candidates for the presidency. In 1899, and again from 1905 to 1911, he was U.S. senator (for New York). Chairman of the board of directors for three railroads, including the

New York Central and Hudson R. Railroad Company.

Depew, manufacturing tn. of Erie co., New York. Pop. 7000.

Dephlegmator, section of a distilling apparatus which separates vapours of different boiling points, the less volatile being condensed and returned to the still. The simplest form of **D.** is an elongated plain or bulbous tube emerging from the still in which condensation results from air-cooling, the surviving vapours roughly representing the more volatile constituents. The most effective **D.**, however, consists of a column of bulbs so arranged that the condensed vapours are temporarily retained, while the vapours from the still pass through them. The result is that an exchange is continuously effected between the more volatile constituents of the condensed liquid and the less volatile constituents of the vapours arising from the still. If the heat is sufficiently regular, it is possible to tap distillates of different boiling points according to their distance from the source of heat.

Depilatories (from Lat. *depilare*, to pull out the hair), chemical agents, such as calcium hydro-sulphide, or a mixture of pitch, resin, and lime, used for the removal of superfluous hair from the scalp, face, or other skin surface. Electric needle treatment, known as electrolysis, is the modern and most effective depilatory.

D'Epinay, Louise Florence Pétronille Tardieu des Clavelles, see **EPINAY**.

Deploy, military expression, meaning literally to unfold. A general is said to **D.** or spread out his troops when he so alters their formation as to present a wider front to the enemy, his object being to have as many weapons as possible on the front and fighting line.

Deportation, term revived during the First World War to describe the practice adopted by Germany of deporting the civil pop. of an enemy country which had been occupied. This was carried out in Belgium, and the practice was adopted largely to secure what was in effect slave labour. Not only the Belgian working class, but even high officials suffered, e.g. Burgomaster Max was deported to a Silesian fortress in Sept. 1914. On Oct. 3, 1916, a decree was issued from Ger. general headquarters authorising Ger. military courts to deport, for the purpose of forced labour, any unemployed Belgians. The order raised a storm throughout many civilised countries, but it was put into execution, and thousands of men were compelled to work in Germany, thus releasing men for service in the field. During the Second World War Germany resorted to the same practice on an even larger scale, and the forced labour thus secured was organised with thoroughness and brutality as a part of the Ger. war machine. The Polish people suffered the most in this respect. After the invasion of Poland in 1939 unknown numbers of Poles were driven from their homes and transported to what were described by their conquerors as special reserves, but were, in fact, no more than

open country, while it is estimated that some 3,000,000 Poles were put to forced labour in Germany during the course of the war. Over 1,000,000 Poles were also deported to Russia in 1939, and of these a number were later drafted into the Polish Army which was created in the U.S.S.R. to fight against Germany. France also suffered severely during the Ger. occupation, and the number of Frenchmen deported for labour in Germany amounted to 765,000. In 1943 there was also wholesale D. of Jews from Denmark at the hands of the Gers., and the civil pop. of Norway also suffered in the same way. (See also DISPLACED PERSONS.) For D. as a statutory punishment during the seventeenth and eighteenth centuries, see TRANSPORTATION. See A. J. Toynbee, *The Belgian Deportation*, 1917, and E. M. Kulischer, *The Displacement of Population in Europe* (International Labour Office), 1943.

Deposit, in the law of bailments (borrowed from the Rom. law), signifies a movable thing which a man puts in the hands of another to keep till it is asked back, nothing being given to the depositary for his custody of the thing. The benefit being entirely unilateral, the depositary is not liable for loss or deterioration, provided he is not guilty of dishonesty or gross negligence. If, however, he voluntarily undertook the custody of the thing, he would be answerable for loss or damage occasioned by merely slight neglect. Money is said to be on D. with a banker as opposed to money on current account. The transaction is really a loan, repayable by the banker on demand with or without interest, according to agreement. In contracts for the sale of land D. means a sum customarily given in part payment of the purchase money as a guarantee of good faith.

Deposition. By the action of the various superficial or epigene agents of change (wind, sun, rain, running water, and frost) rocks are disintegrated and the material transported from place to place, finally forming the sev. deposits classified below. *Eolian deposits* are those deposits, showing no definite stratification, formed by the action of the wind. Examples of these are the sand dunes which occur on our coasts and the remarkable loess found in the valley of the Rhône and extending over the whole of central Europe. *River deposits* occur in banks and terraces. The sediment carried by the riv. in suspension is laid down where the current is slackest along the riv. course. Thus, alluvial fans and cones are formed at the bases of hills where there is a sudden decrease in the gradient of the riv. When a stream reaches a lake or the sea, its current is destroyed and the sediment in suspension is dropped, giving rise to deltas and 'lacustrine deposits.' The main types of riv. deposits are alluvial cones and fans, alluvial plains, deltas, and levees. *Glacial deposits* are occasionally of considerable thickness, as in terminal moraines (see GLACIERS). *Lacustrine deposits* may be mechanically formed, as

when sediment is deposited from rivs., or may be chemically or organically formed. The chemically formed deposits are chiefly deposits of sodium chloride and carbonate and sulphate of lime, caused by supersaturation of the waters due to evaporation. The organically formed deposits are calcareous shells of fresh-water molluscs, or may be the siliceous remains of diatomaceous plants. *Marine deposits* are of the greatest importance, and may be divided into two classes: (1) Shore or littoral deposits, and (2) deep-sea deposits. The former consists of gravel, sand, or mud brought down by rivs. or worn off the coasts by wave action, i.e. are made up of terrigenous or land derived material. The material brought down by rivs., if not directly deposited to form deltas, may be carried out and deposited on the sea bottom. The deposits thus formed may vary, alternately coarse and fine, according to the state of the riv.; but in the case of material formed by wave action, it is always arranged in order of coarseness, gravel nearest the coast, then sand, then fine mud and silt. These mechanical deposits are found fringing the land to a distance of from 100 to 200 m. out to sea, corresponding more or less with the 100-fathom submarine contour. On the outer edges of this fringe are found the blue, red, and green, and the volcanic muds. Beyond this depth we find the second class of marine deposits. These are chiefly organic, and are either calcareous or siliceous. The calcareous deposits are formed by the accumulation of coral polyps, giving rise to reefs and coral is. The Globigerina ooze, which occurs throughout the Atlantic Ocean and in parts of the Indian and Pacific Oceans, consists of the calcareous shells of Foraminifera, which live at the surface of the water, but which after death sink and accumulate upon the ocean floor. Beyond a depth of about 2 m. this ooze is not found, since the shells are dissolved before they reach the bottom. On the ocean floor in the deeper parts, below 2½ m., are found the siliceous oozes, i.e. the radiolarian and diatomaceous oozes. The former is made up of the siliceous shells of Radiolaria, and is found in the E. Indian Ocean and in the Pacific. The latter, consisting of the siliceous frustules of diatoms, is found in a wide belt encircling the S. Ocean. Red clay is a red-brown deposit, and consists of the insoluble residue of Foraminifera, manganese nodules, glauconite crystals, pumice, volcanic and meteoric dust, and phosphatic nodules. It is found in the deepest parts of the oceans below 2500 fathoms, and contains fossils such as the teeth of sharks and the ear bones of whales. The greater part of the floor of the Pacific Ocean is covered by the red clay, which is the most widely spread oceanic deposit. For classification of deep-sea deposits see Sir John Murray's *Report of Challenger Expedition*, 1891.

Deposition, in law, the written testimony of a witness in a judicial proceeding. Ds. before a magistrate are the sworn statements or affirmations of those who

are cognisant of the facts relating to a crime for which some person has been arrested. These statements are committed to writing, by the magistrate's clerk, and read over and signed by the witness making them and by the magistrate. Such Ds. are not evidence at the trial of the accused, but those of a witness who is dead or too ill to travel are evidence. Ds., whether in favour of or against the prisoner, may be taken before the committing magistrate in the presence of the prisoner, and subsequently given in evidence at the trial. To perpetuate the testimony of persons whose death is apprehended, or who are dangerously ill, a magistrate has power to take their evidence down in writing and transmit it to the proper quarter to be read at the trial in the event of the deponent proving unable to appear. In all these cases the prisoner must be given an opportunity of cross-examining the deponent at the time the D. was taken. In civil courts, where the rule against hearsay evidence is less strictly applied, Ds. were before the Judicature Acts the normal manner of producing evidence on the trial of a suit in chancery. At the present day witnesses must be called, although affidavits are in common use for the purpose of furnishing evidence upon minor issues of fact.

Deposition of Clergymen is usually the result of immorality, matrimonial infidelity, or heresy. It involves the loss of benefice and holy orders, and is administered by the eccles. courts of the Anglican and Scottish Churches.

Depreciation, see under BOOK-KEEPING.

Depressed Classes, see UNTOUCHABLES.

Depression and Melancholia, see INSANITY.

Depression, Cyclonic, see METEOROLOGY.

Depression of the Land, see SUBSIDENCE.

Depretis, Agostino (1813-87), It. statesman, early identified himself with the conspiracies of the followers of Mazzini. Governor of Brescia in 1859, he accepted the following year the pro-dictatorship of Sicily, where his efforts to reconcile the divergent policies of Garibaldi and Cavour with regard to the political status of the Is. proved quite ineffectual. His premiership dates from 1881 to 1887. Though his administration was marred by his transformist policy, and his extravagance in finance he was instrumental in enlarging the suffrage, creating the Triple Alliance, and removing the long-disputed grist tax.

De Profundis (Lat. out of the depths), title and first words of Ps. cxxx., one of the seven penitential psalms. According to the Rom. rite it forms part of the office for the burial of the dead.

Deptford, metropolitan bor. of London, separated from Greenwich by the Ravensbourne, 3½ m. E. of London Bridge. Part of St. Paul's par. lies in Surrey, whilst the whole of St. Nicholas' lies in Kent. The bor. consists only of the par. of Deptford St. Paul, that of Deptford St. Nicholas being included in Greenwich. Here are the royal victualling yard, which supplies the R.N., a hospital for master

mariners, and Goldsmiths' College. D. is a dist. of poor streets, but there is a park of 11 ac. on the site of Sayes Court where Peter the Great stayed in 1698. D. is rich in historic memories. Here it was that Elizabeth knighted Drake on his return from his voyage round the world in the royal dockyard laid down by her father, and open until 1869. In a street brawl in D., Marlowe, the dramatist, met his death, and here lived Lord Howard, Evelyn, Adm. Benbow, and Grinling Gibbons, the sculptor. The acreage is 1562.7. Pop. 112,500.

Depth Charge, explosive device for sinking hostile submarines. It is a case containing a high explosive charge ignited by a hydrostatic valve. This valve can be set to the required depth below the surface. Even if the explosion fails to sink the submarine it may be sufficient to force it to rise to the surface, when it may be sunk by gun fire. A D. C. may either be released from an inclined chute or projected by a mortar. The second method has the advantage that it enables the charge to be fired at its objective, instead of delaying action until the vessel reaches the point where the submarine was located. Between thirty and forty Ger. submarines were sunk by D. Cs. in the First World War, and they were used with success by the R.N. in the Second World War.

De Quincey, Thomas (1785-1859), Eng. author, after an adventurous career as a youth, during which he cemented friendships with Wordsworth, Lamb, and other famous personages, and visited Scotland and the metropolis, found himself before he was thirty a victim of the opium habit. Settling at Kendal, he earned a living in 1819 as editor of the *Westmorland Gazette*, a position he held for about two years. He then went to London, and was introduced by Lamb to the best literary society. He began to write for the *London Magazine*, and to this periodical contributed the *Confessions of an English Opium Eater* (1821). He thenceforth wrote regularly for the monthlies, and became a frequent contributor to *Blackwood's*, in which appeared his *Murder considered as one of the Fine Arts* (1827, 1839). He pub. his novel *Klosterheim* in 1839, and his *Logic of Political Economy* twelve years later. De Q. is as happy when writing hist. as when writing literary criticism, as much at home when portraying his contemporaries of the Lake school as when engaged upon the story of his own life. He is so full of learning that he is always digressing. Even when his judgment is not sound there is no doubt about the depth of his erudition. And with all this he is no dry-as-dust, no mere pedant, even when the subject matter of his essay is caviare to the general, for he had studied life as well as books. One of his greatest merits is his splendid prose style. It is true that this is not always sustained, but when the spirit moved him there was no height to which he could not attain. Excellent when writing on such abstract subjects as the Literature of Knowledge and the Literature of Power, he could be pathetic.

as in the episode of Ann of Oxford Street in the *Confessions*, or ironical, as in *Murder considered as one of the Fine Arts*. This last, if it lacks something of the strength of Swift's *Modest Proposal*, is free from its brutality. That this essay should be so successful is the more remarkable, because humour was by no means De Q.'s strong point. That point was his imagination, the assistance of which he did not deny himself even when writing his autobiography. It was his imagination which inspired him to such essays as *The English Mail Coach* (1849), and which enabled him to produce the dramatic ending of his essay *Joan of Arc* (1847), where he contrasted the death visions of the Maid of Orleans and her judge, the bishop of Beauvais. The collected writings were ed. by D. Masson in 14 vols., 1889-90, and the uncollected writings in 2 vols., 1890, with preface and annotations by J. Hogg. See also biographies by D. Masson, 1855; H. A. Page, 1877; J. Hogg, 1895; H. A. Eaton, 1936; and M. Elwin, 1948.

Dera Ghazi Khan, or **Dera Ghazee Khan**, dist. and tn. of the W. Punjab, Pakistan, situated in the Multan div. The area of the dist. is 5606 sq. m., and it is irrigated by gov. canals. The tn. of D. G. K. has manufs. of silk and cotton goods, and ivory ornaments. Pop. 21,000.

Dera Ismail Khan, or **Dera Ismael Khan**, dist. and tn. of the N.W. Frontier Prov., Pakistan. The dist. has an area of 9410 sq. m., and is very dry, being in parts almost desert. The tn. stands near the Indus, and has manufs. of cotton goods, scarves, and inlaid woodwork. Pop. 60,500.

Derating Act, see under **RATES AND RATING**.

Derayah, see **DARAIYEH**.

Derbend, or **Derbent** (Persian, iron gates), tn. in the autonomous S.S.R. of Daghestan, R.S.F.S.R., on the W. shore of the Caspian Sea, 153 m. N.W. of Baku, of oriental appearance, the walls and citadel having been, possibly, built by Chosroes Anosharvan, shah of Persia (A.D. 531-79), or by Alexander the Great to protect Persia against the N. tribes. Has trade in fish, fruit, and wine. Pop. 24,000.

Derby, **The Earls of**, Eng. title which has been borne by the family of Stanley since 1485. Earlier it had been held by the family of Ferrers. The family of Stanley is of very considerable antiquity. *Thomas*, second *Baron Stanley* (1435-1504), was created earl of D. in 1485, for his services at Bosworth, where he crowned the victor, *Edward Stanley*, third *Earl* (1508-72), took a prominent part in affairs military and political. He was a commissioner for the trial of Lady Jane Grey, and was a Privy Councillor under three sovereigns. *Henry Stanley*, fourth *Earl* (1531-93), was a marked character in the reign of Elizabeth. He married in 1555 Margaret Clifford, granddaughter of Mary Tudor, sister of Henry VIII. He was a commissioner at the trial of Mary Queen of Scots (1586); two years later was sent on a mission to

Spain, and on his return was appointed lord high steward. Many of the successors to the earldom distinguished themselves in one way or another; but none rose so high as *Edward George Geoffrey Smith*, fourteenth *Earl* (1799-1869). Entering Parliament in his twenty-third year, in the Whig interest, he was appointed by Canning in 1827 under-secretary for the colonies, an office he retained under Goderich. In the Grey administration (1830) he became chief secretary for Ireland, in which capacity he did excellent work. He joined the Conservatives in 1835, and six years later accepted the colonial secretaryship under Peel. He it was who persuaded Peel not to offer Disraeli a post in his administration. In 1844 he went to the House of Lords as Lord Stanley. It was not until 1851 that he succeeded to the earldom. In the following year he formed a protectionist administration, in which, having overcome his dislike and distrust of Disraeli, he gave that statesman the office of chancellor of the exchequer. This administration held office only a few months; and D. did not really enjoy the fruits of power until he again became Prime Minister in Feb. 1858, but his second ministry only lasted sixteen months. D. became Prime Minister for the third and last time in 1866, but two years later ill health compelled his resignation, and the once-despised Disraeli ruled in his stead. He was referred to by Lytton in *The New Timon* (1845) as 'frank, haughty, rash, the Rupert of debate'—which last phrase is often erroneously attributed to Disraeli, and on the whole it would be difficult to find a better description. He was not a great, or even a consistent statesman, and much of the credit that was given to him, especially in the reconstruction and reorganisation of the Conservative party after the fall of Peel, belonged of right to Disraeli. He was, however, a good man of business, and an excellent speaker. His eldest son, *Edward Henry Stanley*, fifteenth *Earl* (1826-1893), was also a statesman. Under-secretary for foreign affairs in 1852, three years later he refused the colonial secretaryship under Palmerston, but accepted that office in his father's administration. In D.'s third ministry he became foreign secretary, and retained that position under Disraeli. He succeeded to the earldom in 1869, and became again foreign secretary under Disraeli (1874-78). He went over to the Liberal camp in 1880, and two years later became colonial secretary under Gladstone; but was opposed to Home Rule, and became leader of the Liberal Unionists in the House of Lords. Like his father, he was a good speaker, and it is to the credit of his sincerity that by leaving the Conservatives in 1880 he sacrificed his succession to the premiership. He d. in 1893, and was succeeded by his brother, *Frederick Arthur Stanley*, Baron Stanley of Preston (created Aug. 1886), b. 1841; who had been M.P. for Preston, for N. Lancashire, and for Blackpool, successively, from 1865 to 1886; a lord of the admiralty in 1863, financial secretary to the war office

1874-77, to the treasury 1877-78, secretary of state for war 1878-80, vice-president of committee of Council on Education 1885, secretary of state for colonies 1885-86, president of board of trade 1886-88, and governor-general of Canada 1888-93. As sixteenth earl, he was lord mayor of Liverpool 1895-96, mayor of Preston 1901. He was at different times chancellor of the univ. of Oxford and Liverpool, and, dying June 14, 1908, was succeeded by his eldest son, *Edward George Villiers Stanley*, separately noticed as seventeenth earl (see DERBY).

Derby, Sir Edward George Villiers Stanley, Bt., K.G., seventeenth Earl of (1865-1948), b. April 4, eldest son of sixteenth earl and Lady Constance Villiers. Educated at Wellington College, and served in Grenadier Guards 1885-95. He was aide-de-camp to governor-general of Canada (his father) 1889-91. In 1893 his father succeeded to the peerage, and D. for the next fifteen years was known by the courtesy title of Lord Stanley. Returned from Canada in 1891, and in 1892 was elected as a Unionist for the West-houghton div. of Lancashire, and sat for the constituency until he was defeated in 1906. Two years after his election he was appointed a junior lord of the treasury. During the Boer war he was first chief press censor and later private secretary to F.-M. Lord Roberts. He became financial secretary to the war office in 1900, and in 1903 he was appointed postmaster-general with a seat in the Cabinet—an office which he held until 1905. His defeat in the following year was due in some measure to a controversy with post office workers over conditions of employment, in which he did not reveal the tact and sympathetic understanding so conspicuous in his later career. After his defeat he remained out of Parliament till, on his succession to the earldom in 1908, he succeeded also to a seat in the House of Lords. He did not engage in the controversies between the two Houses, preferring more congenial spheres of public activity; thus in 1909 he became chancellor of Liverpool Univ., and in 1911-12 lord mayor of Liverpool and chairman of the Lancashire Territorial Force Association. As director-general of recruiting during 1915-16, first under Lord Kitchener and later under Lloyd George, he performed one of his most conspicuous public services by organising what came to be known as the D. scheme of voluntary enlistment—the culminating effort made by the first Coalition Gov. in the First World War to adhere to the voluntary principle. When Lloyd George formed the second Coalition Gov., in Dec. 1916, D. became secretary of state for war. Early in 1918 he was appointed Brit. ambas. in Paris, and remained there for nearly two years. Though many of the larger issues in 1918-19, notably the peace conference, passed over his head into the hands of the Prime Minister and his leading colleagues, D.'s counsels carried weight, but he ended by becoming one-sidedly pro-Fr., while Lloyd George developed a bias in the opposite direction,

with the result that in 1920 D. retired. On his return to England he found the beginnings of a Conservative revolt against the Coalition, and had he put himself boldly at the head of the malcontents he might perhaps have become Prime Minister. When, however, Bonar Law became Prime Minister of a Conservative Gov., which most of the ex-Cabinet ministers of his party were debarred from joining by their loyalty to the Coalition, D. returned (1922) to his old post as war minister and only retired with the defeat and resignation of the first Baldwin Cabinet in Jan. 1924. That was his last Cabinet office, and therewith his political career ended, for he waived his claims to further office when the ex-Coalition Conservatives returned to the fold. D. was a great patron of the turf. His horses were successful in many of the great events under the rules of the Jockey Club, but it was not until 1924 that he won the Epsom Derby with Sansovino; in 1933 he was again successful with Hyperion, one of the best horses in thoroughbred list. He took the 1942 substitute race with Watling Street. Altogether he won more than 1000 prizes, including twenty 'classics,' and his prize money amounted to £245,000.

Derby, parl., municipal, and co. bor. and the co. tn. of Derbyshire, England, on the Derwent, 125 m. from London, 40 m. from Birmingham, 64 m. from Manchester, and 92 m. from Liverpool. Some of the street names, like Sadler Gate, St. Mary's Gate, and Friar Gate, have their origins in the tn.'s proud and anct. hist. Dominating the top of St. Mary's Gate is D. cathedral (All Saints') in Queen Street, the second highest (210 ft.) par. church in England. Of the sixteenth century, the tower is one of the finest examples of Gothic architecture in the country. D. is a suffragan bishopric in the diocese of Southwell. D.'s main thoroughfare, St. Peter's Street, takes its name from the anct. church standing here, one of six mentioned in Domesday Book. St. Peter's Church is in the Perpendicular style, with some Norman details. Other churches are St. Alkmund's, in Decorated style, rebuilt in 1846; St. Werburgh's, named after Werburgh, daughter of the king of Mercia, and the church where, on June 3, 1735, Dr. Johnson married Mrs. Porter. The chief Rom. Catholic church is St. Mary, designed by Pugin. In the Wardwick is the free library and museum, the latter notable for the Prince Charlie room, with its memories of the invasion by the Young Pretender. The museum and art gallery, together with the library in the same building, was presented to the tn. by Michael Thomas Bass, M.P., in 1878, extensions being made to the art gallery in 1914-15 by means of a Carnegie Trust grant. At St. Mary's Gate is the co. hall. Built in 1660, the hall has been modernised (1866), but the façade remains unaltered. Features of old D. include the 'Dolphin,' an overhanging black and white inn of 1530, standing within the shadow of the cathedral; D. School, first mentioned in a

charter of 1160 (though the present building, in King Street, dates from 1554)—Flamsteed was a pupil there; the first Methodist preaching house in St. Michael's Lane; the tall square tower, with arched, canopied roof, of John Lombe's silk mill; the chapel of St. Mary's of the Brigge, dating from the thirteenth century; and the unpretentious house in Exeter Street, where Herbert Spencer was b. The old mayor's parlour was demolished in 1848. It was a timbered Elizabethan house, and was overlooked by the new council house. The features of modern D., created by the central improvements scheme, are the council house, the bus station, the Riverside Gardens, Morledge Market, and the cattle market. The council house dwarfs all nearby buildings; it is built in russet brick, with four massive stone pillars. D. is governed by a council of sixty-four members, of whom sixteen are aldermen, elected by the councillors, who number forty-eight, and are elected by the citizens. There are fifty-one primary schools, and eighteen secondary, with four grammar schools. The D. school of arts and crafts for advanced courses in art is administered by the local authority. A school of science was commenced in 1870, the title being changed in 1891 to D. Municipal Technical College. The technical college of to-day was opened in 1899, and since then has been considerably enlarged. The D. training college, founded in 1850 by the diocese of Lichfield, became in 1927 the D., Southwell, and Lichfield College. Institutions include Queen Street baths, built in 1932; the Royal Infirmary, the hospital for women, and four other hospitals. The oldest park belonging to the corporation is the Arboretum, given to the tn. in 1840, and laid out by the architect J. C. Loudon; other parks include Darley Abbey (60 ac.), opened by the duke of Kent in 1931; Markeaton Park (200 ac.); the Racecourse Park (125 ac.); Riverside Gardens, which, like the Arboretum, is in the midst of a densely built-up area; the municipal sports ground; and various miscellaneous parks and recreation grounds. The D. airport at Burnaston, 5 m. from D., on the D.—Burton main road, is owned and controlled by the D. Corporation.

D. is a great industrial centre, renowned for the quality of its engineering products. As headquarters of the old Midland railway it soon became an important railway centre, not only for operational and administrative purposes, but by virtue of the large locomotive, carriage, and wagon works built near the station. After 1900 the process of industrial expansion continued, with the estab. of the great Rolls-Royce factory in 1906. Although D. is not one of the largest of midland industrial tns., there is considerable diversity of industries: aero engines, aircraft components, iron castings, sugar refining, electric motors, cables, can-making machinery, power presses, mining equipment, steam units for electric-power plants, hosiery, rayon, narrow fabrics and tapes, porcelain. (Royal Crown Derby porcelain), paints and chemicals.

Of the settlements made by the Angles one was called Northworchige. The Danes renamed it Deoraby. Until the Domesday survey it is evident that D. was never much more than a mkt. tn. The earthworks and defence keep which William the Conqueror had erected there were a poor defence compared with the great Norman castles erected elsewhere, and indeed its name, Copecastle, denotes market castle. Then, however, the right to have a merchant guild was confirmed, together with a monopoly in cloth-dyeing. Records show that D. sent its first two bor. members to Edward I.'s twenty-third Parliament in 1295. In the sixteenth century the houses were built of wood, and there was no refuse disposal—conditions which, of course, prevailed in other tns. In the Black Death (1349) one in every two of the total pop. of the co. d. The 1592 plague started in All Saints' par., and rapidly spread to St. Alkmund's and St. Peter's and other pars. The remarkable thing is that insanitary conditions persisted well into the nineteenth century. D.'s charter was confirmed from time to time, and in James I.'s reign six fairs were permitted. In 1637, under a charter of Charles I., local gov. was vested in a mayor, nine aldermen, and a number of brethren and burgesses, and the number of fairs permitted was increased to seven. D.'s last charter was granted in 1682 by Charles II. D. began to emerge as a manufacturing centre at the end of the seventeenth century. In 1719 Thomas Cotchet introduced England's first silk mill, on the Derwent. John Lombe, a mechanic at this mill, went to Piedmont, where he made drawings of the secrets of the lt. machinery, and built a large new mill next to Cotchet's. By 1750 more than 300 people were working in it; but to-day only the tower survives. An impetus was given to industry by the opening of the D. Canal. Three years later (May 30, 1839) the railway came to D., at first between Nottingham and D. only, but soon afterwards the Birmingham, Gloucester, and D. Junction railway was opened, and in 1841 D. was linked by rail to Leeds, and on the amalgamation of the separate companies into the Midland Railway Company, D. was made its headquarters, a circumstance, which, as indicated above, was to have a great effect on D.'s ultimate growth. The city returns two members to Parliament. Pop. (1931) 142,000; estimated (1949) (including suburbs) 190,000.

Derby, city of New Haven co., Connecticut, U.S.A., 10 m. W. of New Haven. It has an opera house and a public library. Among its manufs. are pianos and organs, woollen goods, pins, keys, typewriters, and ammunition. Pop. 10,200.

Derby China, porcelain known for its vivid crimson colouring, chrome green, mazarine blue, and its ornate gilding. The industry seems to date from the middle of the eighteenth century. Early D. C. was made of a glassy grit and clay. Later bone ash was introduced. Figure and group modelling were always characteristic of the best D. C. The marks used

were the letter D and the word Derby in script, but the first generally recognised mark is the D with a small anchor crossing the upward stroke, and the anchor and crown used during the Derby-Chelsea period. The earliest names of makers were those of Wm. Duesbury, father and son, and Bloor. The Crown Derby Company was formed in 1877 and, in 1890, it was granted the privilege of changing its title to the Royal Crown Derby Porcelain Company.

Derby Day, second day of the summer meeting at Epsom in Surrey, falling sometimes in May, sometimes in June. The most important races are run on this day, especially the D. race for the celebrated D. stakes, instituted by the earl of D. in 1780. The subscription for the D. is £50, the winner receiving a sum not less than £5000. The road from London to Epsom is covered on this day by a continuous stream of automobiles, coaches, carriages, vans, coster carts, etc. There is also a D. run every spring at Churchill Downs, the famous race track in Louisville, Kentucky, U.S.A. The winner receives \$10,000.

Derbyshire, midland co., England, bounded by Yorkshire, Cheshire, Staffordshire, Leicestershire, and Nottinghamshire. The S. part of the co. is fertile, and produces cereals and root-crops, but the N. is very rugged and mountainous, and the Peak dist. provides some of the most picturesque scenery in England. Here, in the S. spurs of the Pennine chain, rise the numerous rivs. of the co., tribs. of the Mersey, the Don, and the Trent. After the Trent itself, which intersects the S. part of the co., the chief rivs. are the Derwent, Wye, Dane, Goyt, Dove, and Rother. In the neighbourhood of Buxton and Matlock are valuable medicinal mineral springs. One of the chief industries of the co. is coal-mining, chiefly in the E. div.; other minerals and metals worked are iron, lead, zinc, barytes, fluorspar, and gypsum. Sandstone, marble, and pipe-clay for the potteries are also obtained. Sheep-farming is very extensive in the hilly dist. of the N., while the S. plains form a noted corn-growing and dairy-farming dist. Other industries are porcelain, silk, cotton, hosiery, iron, woollen, lace, and elastic-web manufs. The chief rivs. are Derby (the co. tn.), Matlock, Buxton, Chesterfield, Glossop, Ilkeston, and Belper. D. contains numerous antiquities, but its only important historical association is with the retreat of Prince Charles Edward (1745). The chief places of interest are the ruined abbeys of Dale and Beauchief, the Saxon crypt of Repton, Haddon Hall, Hardwick Hall, and Chatsworth. The stone circle at Arbelow is the most important in England after Stonehenge. Since 1885 D. returns ten members to Parliament, two for the bor. of Derby and eight for the co. Area 1029 sq. m. Pop. 757,000.

Derceto, or **Dercetis**, Gk. name for the Syrian goddess Atargatis, who is depicted as half woman and half fish. She is identified with Astarte, and the centre of her worship was Hierapolis.

Dercum, Francis Xavier (1856-1931). Amer. neurologist. In 1892 he described the disease known as D.'s disease (*Adiposis dolorosa*). His chief works are *Clinical Manual of Mental Diseases* (1913); *Biology of the Internal Secretions* (1924); and *Physiology of the Mind* (1925). Modern treatment of certain mental disorders owes much to D.'s pioneering work in showing the relationship between such diseases and the glands.

Derecske, com. in Bihar co., Hungary. Pop. 10,000.

Dereham, East, mrkt. tn. of England in Norfolk, 16 m. N.W. of Norwich. There are iron foundries, malt-houses, coach works, and a boot factory. A monument has been erected to Wm. Cowper, the poet, who took up his residence here in 1796, and is buried here. George Borrow was b. here in 1803. Pop. 6000.

Derelict, term in Eng. law, denoting any property which the owner has deserted or wilfully cast away. It is most commonly applied to a ship abandoned by the captain and crew. The first concern to a wreck can claim salvage from the Crown or from the persons who have a right to unclaimed D. vessels. Land reclaimed from the sea is said to be D. (i.e. forsaken by the sea, from Lat. *derelinquere*), and belongs either to the owner of the adjoining lands, supposing it is given up gradually, or to the Crown in case of a sudden and considerable recession of the sea.

Derg, Lough, 4 m. N.W. of Pettigoe, co. Donegal, Eire, is 3 m. long by 2½ m. broad, with an area of 24 sq. m. It has a beautiful aspect, in spite of its wild, dreary shores, being studded with many small is. Saint's Isle has the remains of a ruined priory. Station Is. was the reputed scene of St. Patrick's purgatory, and was long one of the most celebrated places of pilgrimage in Ireland. It is still visited by many of the Irish from June 1 to Aug. 15.

Derham, William (1657-1735), Eng. philosopher and divine, b. at Stoulton, near Worcester. In 1696 he pub. the *Artificial Clockmaker*, and from 1711 to 1712 he was Boyle lecturer. His other works are *Physico-Theology* (1713); *Astro-Theology* (1715); *Christo-Theology* (1730); and *A Defence of the Church's Right in Leasehold Estates* (1731).

De Rivera, Primo, see PRIMO.

Dermatine, mineral compound with a sp. gr. of 2.1, found in Waldheim, Saxony, and consisting of silica, magnesia, protoxide of iron, and water. It is reniform, stalactitic, brittle, and resinous, its colour being blackish-green with yellow streaks.

Dermatitis, skin disease accompanied by inflammation. It may be due to a number of causes. Specifically, *Eczematous D.* is an affection in which the skin becomes inflamed and is subject to severe desquamation of the cuticle.

Dermatology (Gk. *derma*, skin), the science of the treatment of the skin and skin diseases. See SKIN.

Dermestidæ, a family of Coleoptera, contains numerous species of beetles which are harmless when adult, but in the

larval stage do much damage to the collections of naturalists, and are particularly destructive to skins.

Derna, coast tn. in Cyrenaica. It is situated on a bay which is frequently inaccessible during spring and winter, in an oasis of date palms and bananas. After Benghazi it is the most important settlement in Cyrenaica. The tn. changed hands sev. times during the campaigns in N. Africa in the Second World War. It was captured by the Brit. on Jan. 30, 1941, and reoccupied by the Its. on April 8, recaptured on Dec. 22, and again reoccupied by the Ger. and It. armies on Feb. 7, 1942. It finally fell to the Allies in the Eighth Army advance after El Alamein in Nov. 1942. Pop. 10,000.

De Robeck, Admiral Sir John Michael (1862-1928), second son of fourth Baron de R. of Gowan Grange, Naas, Eire. Entered the R.N. as a cadet 1875, captain 1902, rear-admiral 1911. Vice-admiral 1917, admiral of the fleet 1925. At the outbreak of the First World War was appointed to command of 9th Cruiser Squadron, and was engaged in the protection of commerce on the Finistère station, where he captured the N.-Ger. Lloyd steamer *Schlesien*. He was appointed second in command of the fleet at the Dardanelles early in 1915, and succeeded to the chief command on March 16, 1915. At the end of 1916 he was appointed to command the 2nd Battle Squadron of the Grand Fleet, a position he retained to 1919, when he was appointed commander-in-chief of the Mediterranean Fleet. At the same time he was Brit. high commissioner at Constantinople pending the signature of Turkey to the peace treaty. In 1922 he was appointed commander-in-chief of the Atlantic fleet and held that position until 1924.

De Rougemont, Louis, real name Henri Louis Grin (1847-1921), pseudo-explorer. Native of Gressy, Switzerland. Became known first through his address to the anthropological section of the Brit. Association, on Sept. 9, 1898, in which he claimed to have lived for thirty years among the Australian aborigines. His imaginary adventures in company with an E-kimo named Etukishuk were pub. serially in the *Wide World Magazine*. His complete exposure as an impostor was made in the *Daily Chronicle*. D. in Kensington infirmary.

Déroulède, Paul (1846-1914). Fr. man of letters and politician, studied law from 1863 to 1869, and was called to the Bar in 1870. During the Franco-Prussian war, in which he served, he was taken prisoner at Sedan whilst trying to rescue his wounded brother (1870). His *Chants du soldat*, pub. in 1872, attained such popularity that in 1875 he was encouraged to bring out his *Nouveaux Chants d'un soldat*. Gounod wrote the music for his patriotic hymn, *Vive la France*, which was sung at the exhibition of 1878. His name is especially associated with the *Ligue des patriotes*, which he instituted in 1882. But when he tried to use the organisation to promote the cause of Gen. Boulanger, he was obliged to retire from his presi-

dency. The league was suppressed by the gov. in 1889 as a political menace. Deputy for the first time in 1889, he became notorious for the violence of his anti-Dreyfus policy. Banished in 1900 for attempting to replace the parl. constitution by the Republican plebiscite, he was allowed to return to France in 1905.

Derrick, Samuel (1724-69), Eng. writer, was first a linen-draper, then a play-actor, and finally succeeded Beau Nash as master of ceremonies at Bath and Tunbridge. Gross immorality brought to a miserable end his prodigal career, yet Boswell tells us that Dr. Johnson always spoke of him with kindly feeling. His literary performances have sunk into oblivion.

Derry, see LONDONDERRY.

Derry, tn. of Rockingham co., New Hampshire, U.S.A., 10 m. S.E. of Manchester. It is a summer resort and sends milk to Boston, and has sundry manufacturing. Pop. 5100.

De Ruyter, Michiel Adriaan (1607-1676), Dutch naval commander, b. at Flushing, where there is a monument to him in the Jakobskerk. A captain in 1635, he was stationed some time in the E. Indies, and in 1647 sunk a detachment of Algerian ships off Salée. In 1652 he succeeded in preserving his convoy of merchantmen in spite of the conflict with the Eng. fleet near Plymouth. During the war of 1652-54 De R. ably seconded van Tromp, so that at the close of the struggle the Dutch leaders had at least held their own against Adms. Blake and Monk. During the second Eng. war, de R. obtained a narrow victory, after a tough fight, over Monk in 1666, but was himself obliged to retreat to Dutch harbours before Ayscue a little later in the same year. But it was in 1667 that de R.'s daring brought him his highest glory, for with de Witt he sailed up the Medway as far as Chatham, and there destroyed all the Eng. shipping. In 1659 he had aided Denmark by conquering the Swedish fleet. In 1671 he won some advantage over the combined Eng. and Fr. fleets in Solebay, but in 1676, whilst engaging in a desperate encounter with the Fr. Adm. Duquesne at Syracuse, he received a mortal wound.

Dervishes (from a Persian word meaning 'seeking doors,' that is 'beggars') are the same as the Arabian fakirs. In the earliest times the D. were the passionate disciples of some revered sheikh or master, learning from him words of wisdom, and fighting his battles against the unbelievers, but sometimes also deserting him to return to the world. Of the thirty-two orders of D. and the countless sub-orders, the best known is probably the Qalandarite, which figures in the *Arabian Nights* as the Calenders. This fraternity, the members of which are under an oath always to travel, is an offshoot of the Baktashite order, which flourishes in Albania and Turkey, and consists really of antinomians, like the Rifates or howling D., who in their ecstasy are held to be under the influence of divine inspiration, and can therefore commit the most horrible crimes with impunity. But

their favourite actions at such periods are to cut themselves with knives, or to eat serpents, fiery coal or glass, or like the Mevlevis, founded by the pantheist Jelâl-ud-Din, to perform the most extravagant of dances. During their novitiate, candidates for admission to an order are almost invariably subjected to hypnotic influence from the sheikh. Attached to these orders are fellowships of lay brothers, not unlike the lodges of Freemasons. The theology is invariably some form of Sufism which embraces a belief in the sufi hierarchy of saints. In spite of the wearisome sameness of their pious formulas and recitations, the D. are still held in the highest veneration among the people.

Derwent: 1. Riv. of Cumberland, England, rises near Bow Fell and Scafell, and flowing N. and N.E. to D. Water and Bassenthwaite, then W. through a narrow valley past Cockermouth, falls into the Solway Firth near Workington, a total length of about 31 m. The water is wonderfully clear, but the riv. is not navigable. 2. Riv. of Derbyshire, England, rises in Bleaklow Hill, N. of the peak, and flowing through a narrow valley, where it receives the Noe and Wye, flows S. past Chatsworth, Matlock, and Belper into a low plain S. of Derby. From here it flows S.E. in a very winding course, to join the Trent, near Sawley, on the Leicestershire border, a total distance of about 60 m. The riv. is not navigable except for pleasure boats in certain reaches near Matlock. 3. Trib. of the R. Tyne, England, 31 m. long, forming for part of its course the boundary between Northumberland and co. Durham. 4. Riv. of Yorkshire, England, rising on the Yorkshire moors, and flowing 57 m. S. through Malton to join the Ouse between Selby and Goole.

Derwent Water, lake in the S.W. of Cumberland, England. At a height of 238 ft. above sea level, it stretches for 3 m. to the S. of Keswick. An enlargement of the D. R., which flows out towards the Irish Sea at the N. extremity, its greatest breadth is 1 m., the depth never exceeding 72 ft. Overlooked by Castle Head (530 ft.) and distant mts. at the foot, and enlivened by abrupt rocky banks, it is noted for its wild beauty, and especially for the Floating Isle and the Lodore Falls near its head. Brandelhow, on the W. side of the lake under the slopes of Catbells, and brought by public subscription in 1902, was the first National Trust property in the Lake Dist. Castle Head (1 m. S. of Keswick) was presented by Sir John and Lady Randles in 1925, as was also Crow Park, close to Keswick. Friar's Crag and Calf Close Bay, on the E. side of the lake, were bought by public subscription in 1922 as a memorial to Canon Rawnsley. The Ruskin memorial on Friar's Crag was handed over to the trust in 1900. Cockshott Wood and Stable Hills, also on the E. side of the lake, were presented by their owners in 1925 and 1929 respectively.

Derwentwater, James Radcliffe, or **Radcliffe, Earl of** (1689-1716), leader in the Jacobite rebellion of 1715, was cap-

tured and confined to the Tower of London after the rout at Preston. His youth, courtesy, bravery, and rank, as also the efforts of his friends, and his own appeal for the king's mercy were powerless to stay his execution in 1716 on Tower Hill.

Derzhavin, Gavril Romanovitch (1743-1816), Russian poet, b. at Kazan. In 1762 he entered the army as an engineer, and in 1791 the Empress Catherine appointed him secretary of state, and in 1802 minister of justice. His best poetry was produced during the busiest part of his career, and is marked by sublimity and vigour of thought and expression. His most famous work is *Oda Bog, or The Address to the Deity*. His works have sev. times been reprinted and trans. since the first collected ed. in 1810. His complete works (in 7 vols.) were not pub. until 1864-73.

Desaguadero: 1. Riv. of Peru and Bolivia, since 1904 part of the boundary of Bolivia. It is a sluggish stream, not navigable beyond Corocoro, draining Lake Titicaca and flowing S. for 184 m. with gradually lessening volume to Lake Pampa Aullagnas or Poopo. It gives its name to the valley dist. of the Andes, through which it flows. 2. Riv. in the W. of the Argentine, draining a depressed area of saline lakes and small streams, including Laguna Belvedere, and with apparently no outlet to the ocean. In its lower courses it is known as the Rio Salado.

Desaix de Veygoux, Louis Charles Antoine, see VEYGOUX.

Desart, Sir Hamilton John Agmondesham Cuffe, fifth Earl of and seventh Baron, also Viscount Castle Cuffe, of Desart, co. Kilkenny (1848-1934), b. Aug. 30, second son of third earl. Called to Bar, 1872; solicitor to Treasury and queen's (and king's) proctor, 1894-1909. Director of public prosecutions, 1894-1908. Succeeded to peerage, 1898. Brit. representative in various negotiations abroad. During his tenure of office as director of public prosecutions he undertook the prosecutions in the following *causes célèbres*: Jameson Raid case; Jabez Balfour, of Liberator front notoriety; the Maybrick murder case; the moat farm murder; the trial of Neil Cream; and the Lord Russell bigamy case in the House of Lords.

Desaugiers, Marc Antoine Madeleine (1772-1827), Fr. dramatist and songwriter, b. at Fréjus; fled from the terrors of the revolution to San Domingo, where, however, during the great Negro rebellion he was captured and was within an ace of losing his life. On his return to France in 1797 a storm of popular applause at once greeted his operas and comedies, which were produced in rapid succession at the Théâtre des Variétés and the Vaudeville. A higher literary merit belongs to his drinking songs and lampoons, which he sang himself with considerable *clat* in many Parisian salons. At his death he was acting as manager of the Vaudeville.

Desbarres, Joseph Frederick Wallis (1722-1824), engineer, b. in England, of Huguenot parents. During the siege of

Quebec he served as aide-de-camp to Gen. Wolfe, and was in the act of reporting to Wolfe when the latter received his mortal wound. The engineering operations during the conquest of Canada, which followed, were under his charge, whilst from 1763 to 1773 he surveyed the shores of Nova Scotia. When he had made a number of charts of the N. Amer. coast for Lord Howe, he accepted the lieutenant-governorship first of Cape Breton (1784-1804), and afterwards of Prince Edward Is. (1805-13).

Desborough, John (1608-80), Eng. soldier and statesman, b. at Eltisley, Cambridgeshire. In 1636 he married Jane, sister of Oliver Cromwell, on whose side he fought gallantly during the Civil war, and whom he upheld in Parliament. He opposed Cromwell's assumption of royalty, however, although he sat himself in Cromwell's House of Lords, and after the protector's death he became a strong partisan of Fleetwood. Made a councillor of state by the Rump Parliament in 1659, he was later dismissed, and in 1660 and 1666 he was imprisoned in the Tower for intrigue. His death occurred at Hackney, London. Butler satirised him in *Hudibras* and the *Parable of the Lion and Fox*.

Desborough of Taplow, Baron, see GRENFELL.

Descartes, René (Latinised as *Renatus Cartesius*) (1596-1650), Fr. philosopher, b. at La Haye, in Touraine, and educated at the Jesuit school of La Flèche. In 1617 he went to Holland and entered the army of Prince Maurice of Orange. In 1619 he entered the service of Bavaria, and while in winter quarters at Neuberg on the Danube found time for the reflections which afterwards resulted in the *Discours de la méthode*. In 1625 he settled in Paris, but went to the Netherlands in 1629, and lived there mainly until 1649. In 1650 he went to the court of Sweden at the invitation of the Queen Christina, but he d. at Stockholm within a few months. In 1666 his body was removed to Paris, and in 1819 transferred to St. Germain-des-Près. D. is generally considered the 'father of modern philosophy.' Even in his school-days he found it impossible to accept scholastic tradition and theological dogma as knowledge, and his first step towards evolving a philosophical system was to discard all books. In 1637 appeared the *Discours de la méthode*, in which he traces his mental development from his earliest years to the point when he refused to believe anything unless it were supported by incontrovertible and absolute proof. Starting with doubt as the only sure test, he applied it to all that had hitherto passed as knowledge, and the only proposition which stood the test seemed the fact of his own existence. This he formulated as 'Cogito: ergo sum,' clearly describing the relation between consciousness and existence. From this he next concluded that 'whatever is clearly and distinctly thought must be true,' whence he arrived at the idea of the existence of a Perfect Being, because from the intuition of our own imperfection we evolve the idea of perfection, and if the

idea of perfection is certain, then perfection must exist. The cardinal point in the philosophy of D. is the essential difference between spirit and matter, between thinking and extending substances, into one of which classes all things fall, and which can in no way exert any influence upon each other or partake of each other's attributes. The principles of the *Discours de la méthode* are dealt with more fully in *Méditations de prima philosophia* (1641) and *Principia philosophiæ* (1644). From philosophy he applied his principles to physics, and his celebrated theory of vortices, explaining the motions of the heavenly bodies, was only superseded by Newton's theory of gravitation. It was

RENÉ DESCARTES

Engraving from the painting by Franz Hals.

in mathematics that D. achieved the most lasting results; he first recognised the real meaning of the negative roots of equations and founded analytical geometry, the application of algebra to geometry. Besides his philosophical and mathematical treatises, D. was the author of *Traité des passions de l'âme* (1649), for Queen Christina. See also CAMBRIDGE PLATONISTS; INNATE IDEAS. See J. Millot, *Descartes, sa vie, ses travaux, ses découvertes*, 1867-71; K. Fischer, *Descartes and his School* (Eng. trans.), 1887; *Descartes: his Life and Times*, and trans. of the chief works by Elizabeth S. Haldane, 1905-11; *Cambridge Modern History*, vol. IV., 1906, 'Descartes and Cartesianism'; G. Milhaud, *Descartes, Savant*, 1921; C. von Brockdorff, *Descartes*, 1923; C. Adam and G. Milhaud, *Correspondance*, 1936-41; L. Brunschwig, *Descartes et Pascal*, 1945; and S. V. Koeling, *Descartes*, 1948.

Descent (from Norman-Fr. *discent*), see — in heredity, DARWINISM; in law, INHERITANCE; in science, BIOLOGY.

Deschamps, Eustache (c. 1338-1415), Fr. poet, b. at Vertos in Champagne. Ope

of the victims of the siege of Rheims and an eye-witness of the march against Chartres and the signing of the treaty of Bretigny (1360), he cherished to his death a bitter hatred of the Eng. nation. Besides serving in the Flemish wars he is said to have suffered imprisonment by the Saracens, and to have wandered through Syria and Egypt, besides visiting Italy and Hungary. In his roamings from castle to castle, where he entertained lords and ladies with his songs, he must fully have satisfied his innate spirit of adventure. In 1360 he became vassal to Princess Isabella, and for some time he was *huissier d'armes* to King Charles V. Indeed, the list of honourable offices he held under nearly all contemporary princes attests his great popularity. The numerous *virelays*, *satires*, *ballades*, *rondeaux*, and farces of this roi de Laidure, as he styled himself, which were unprinted till 1832, justify his claim to be recognised as the first lyric poet to write in modern Fr. His one epic poem was entitled *Miroir de Mariage*. His complete works were pub. by Q. de Saint-Hilaire and G. Raynaud in 11 vols. (1878-1903).

Deschanel, Emile Auguste Étienne Martin (1819-1904), Fr. man of letters, b. at Paris, was appointed to the professorship of rhetoric at Paris. He was obliged to leave France because of the vehemence with which he preached republican doctrines in his *Catholicisme et Socialisme* (1850). But in 1881 he was elected to the chair of modern languages in the Collège de France. Most of his pub., e.g. *Les Courtisanes grecques* (1854), *Études sur Aristophanes* (1867), and *Le Romantisme des classiques* (1882), deal with the literature of the ancients. His son, Paul Eugène Louis (1856-1922), was president of the Fr. republic in 1920.

Des Chutes, riv. of U.S.A., which rises on the E. side of the Cascade Mts. Its course is chiefly N., and its length is about 320 m. It flows through a volcano dist., intersecting Wasco co., and finally enters the Columbia R.

Descriptive Geometry, theoretical basis of architectural and mechanical drawing. The architect has to represent by plans, elevations, and cross-sections the building under construction in such a way that his drawings are not only intelligible to the contractor, but also so that the latter can deduce the actual dimensions of each part represented on the diagram. *See further under GEOMETRY.*

Deseronto, small tn. of Ontario, Canada, situated on the bay of Quinté, in Hastings co., about 30 m. S.W. of Kingston. Has trade in lumbering and fruit growing. Pop. 2000.

Desert (Lat. *desertum* from *deserere*, to abandon), geographical term for a barren and uninhabited dist. of large extent. The term is used to include the Tundras (q.v.), or frozen plains fringing the Arctic regions, the great ice-wastes of the Arctic and Antarctic continents, and sometimes the temporary wastes or steppes which are covered with vegetation only for a few months in the spring. The name is more usually restricted, however, to the hot,

dry dists. of the S. latitudes, where the temps. are extreme, the rainfall very scanty, and evaporation very rapid. These hot Ds. occur in two belts encircling the earth; in the N. hemisphere there stretch the Great Sahara, Libyan, and Nubian Ds., the Ds. of Arabia, Persia, Turkestan, and Gobi, and continued in the great basin of N. America. The S. ring, less extensive and more broken, includes the Kalahari D. in Africa, the interior of Australia, and the Atacama D. in S. America. The essential characteristic of a D. is its lack of rain and the scarcity both of moisture on its surface and of watery vapour in the atmosphere which might decrease the excessive radiation. The temps. are extreme, ranging from 120° F. in the daytime, with the sand itself at a temp. of 150° F., to below freezing-point at night. Ds. occur at all altitudes, from below sea level to several thousand feet above it, and may be of a flat appearance broken only by driving waves of sand, and bounded by the sharp circle of the horizon, or a rocky plateau, hollowed and cut into valleys and ravines. Cloud-bursts provide the greater part of the scanty rainfall, and sandstorms of terrific force and velocity are of frequent occurrence. The mirage (q.v.) is a peculiar feature of great Ds., and is largely the cause of the tales of genii and evil spirits prevalent among D. peoples. Absolute lack of vegetation is rare, but the plants grow very scantily, and are specially adapted to D. conditions, being mainly of the spinifex family and the prickly variety of the cactus, whose glazed surface retains such moisture as it obtains from the soil. *Anima*' life is similarly restricted, the camel being the only beast of burden able to withstand D. conditions. Where natural springs are found the surrounding land becomes a marvel of fertility, and an oasis (q.v.) settlement grows up, while the rivs., such as the Nile, are used for the irrigation of wide tracts, and the sinking of artesian wells is frequently practised in the Sahara. *See also Gobi; KALAHARI; SAHARA. See A. McIlarny, Deserts and the Birth of Civilisation, 1932, and The Role of the Deserts, 1934; P. B. Sears, Desert on the March, 1935; and J. Harris, Soil of Desert Vegetation, 1936.*

Desertion, and **Deserters**, intentional abandonment of a post or obligation to which the offender is bound by legal or moral laws: (1) D. in the navy or army is being absent without leave when there is no intention to return, as distinguished from absence without leave from other causes. The practice of deserting from one regiment to another to avoid foreign service or aiding civil power is now designated fraudulent enlistment, as distinguished from D. D. when on active service is punishable with death in all European countries. All who attempt to induce D., or who harbour deserters, are liable to punishment. When D. occurs at other times it is punished with a maximum of two years' imprisonment for the first offence, and a term of penal servitude to be determined by the president of the court martial, for all subsequent

offences. All deserters must be tried by court martial, and when convicted forfeit all prior service and such advantages accrued to them from such service, as well as being liable to serve again for the full term of the forfeited service. (2) D. from the merchant service is punishable with forfeiture of pay, and as directed by the Merchant Shipping Act, 1894. (3) D. of wife or children. A deserted wife, by the law of England, may take proceedings against her husband for a maintenance order if she becomes chargeable to the par. He may be charged as a rogue and vagabond under the Vagrancy Act, 1824. D. without cause for at least three years is a ground for a petition of divorce by husband or wife; and, similarly, either spouse may present a petition for judicial separation. The Summary Jurisdiction (Married Women) Act of 1895 gives her the custody of any children there may be up to the age of sixteen, and provides that the husband shall pay a weekly sum towards their maintenance. In such circumstances the wife may obtain an order to protect such property as she may herself acquire, or already possesses in her own right. In Scotland D. without sufficient cause for four years is ground for a decree of divorce. See DIVORCE; HUSBAND AND WIFE.

Deshoulières, Madame Antoinette Du Ligier de la Garde (1638-91), Fr. poetess, b. at Paris, elected member of the *Académie de la Poésie et de l'Art*, and considered by Voltaire the best of the women poets of France. She was a prominent figure for her beauty and wit at the court of Louis XIV., and was the centre of a circle of the most eminent literary men of her time. She spent her early married life at Brussels, and was imprisoned in the Château de Wilworden for eight months by the gov. (1657) on account of her efforts to secure her husband's pardon. She wrote odes, ballades, madrigals, and idylls, of which only a few of the last have lived. Complete eds. of her works were pub. in 1695 and 1799.

Desiccation (Lat. *desicare*, to dry up), the process of drying or removing water from a substance. This may be done by heating the substance and causing evaporation of the moisture, or by various chemical agents, such as calcium chloride, sulphuric acid, potassium hydrate, which are applied by means of a desiccator. This is a closed vessel in which the substance to be dried is placed, together with the hygroscopic substance which is to dry it. Vacuum D. is a quicker process, and is caused by exhausting the air from the desiccator. Currents of dry air also act as desiccators. Certain organisms have the power of undergoing the process of D. and retaining sufficient latent life to enable them to recover, but the longer the period of D. has been, the longer they take to recover; hemetodes, or 'paste-cells,' have been known to revive after nearly twenty years. Rotifers are said to recover after a long period of D., but it is generally considered that it is only the eggs which survive, that the fully developed organism is really dead. Bear-

animalcules, or tardigrades, are also said to survive. Among plants, seeds and spores seem able to resist any period of D.

Design (Lat. *designare*, to mark out), in the fine arts is the drawing or plan which is to act as a guide to the finished representation; the arrangement of the details which are to go to make the whole not only with regard to their artistic completeness, but also with regard to their appropriateness and general utility in the position which they are designed to occupy and the materials from which they are to be constructed. D. does not necessarily mean originality or novelty, more frequently it is the development of old ideas to suit new conditions. In some arts, such as pottery and silver or goldsmiths' work, the form and material are an essential part of the D.; in such arts it is necessary, therefore, that the designer should know the processes, the qualities of the materials, and the practical use of the requisite tools, so that he is not only a designer, but also a practical craftsman. The keen competition for export markets after the Second World War has increased the importance of D. in industry, and in 1948 was held an important exhibition by the Faculty of the Royal Designers for Industry at Burlington House, London.

Design, in law, see COPYRIGHT and TRADE MARKS.

Design, Schools of. The first school of design was opened under the auspices of the Council of the Gov. School of Design at Somerset House in 1837. On the re-organisation of the schools in 1852, the three main objects in view were: (1) The promotion of elementary knowledge of drawing and modelling; (2) special instruction in the knowledge and practice of ornamental art; and (3) the practical application of such knowledge to the improvement of manufactures. In 1857 the central or national art training schools were removed to S. Kensington, where they have since remained. Similar S. of D. grew up in the large prov. tns. Thus as early as 1840 state grants were given to Manchester, Birmingham, Glasgow, etc., to assist them in the erection of such schools. Later new technical schools were estab. throughout the country, where enamelling, metal repoussé, wood-carving, and other artistic handicrafts were taught, as well as drawing and the laws of ornament. Since the Education Act of 1902 the art schools in most tns. have been taken out of the hands of private committees, and are now managed by the municipalities with moneys derived from the local rates. The Central School of Arts and Crafts in Southampton Row (estab. by the L.G.C. in 1896) and the Leicester School of Art may be taken as types of the many modern estab. where art is taught in strict relation to industrial requirements. See also INDUSTRIAL DESIGN, COUNCIL OF.

Desio, tn. of Italy, in the prov. of Lombardy, situated about 10 m. N. of Milan. It cultivates silk and is the bp. of Pope Pius XI.

Desirade, is. belonging to the Fr. W. Indies, situated 4 m. E. of Guadeloupe,

and having an area of 10 sq. m. Fishing is the chief industry. D. was the first is. discovered by Columbus on his second journey. Pop. 1400.

Desire is used in psychology of all instances where the subject is stirred to action not by percepts—that is, by signs of the presence of the objects of pleasure—but rather by imagination or ideas. D. in man corresponds to appetite in animals, and may be defined, according to Spinoza, as 'appetite with the consciousness of it.' But 'whether a man be conscious of his appetite or not, the appetite remains one and the same thing.' In ordinary speech it is customary to speak of the D. of tangible things as also of the D. of abstractions, such as of wealth or truth. Intensity of D. depends on the force of the impulse to action, and not on the degree of delight which is expected to follow the fulfilment of that D.

Deslys, Gaby (c. 1884–1920), Fr. music-hall comedienne and dancer, was well known in Paris before her first appearance in London—viz. at the Gaiety Theatre, Sept. 1906. Till 1915 she was a great favourite with the London public, alike for her personal beauty and for the dazzling nature of her costumes. Besides her prin. business, she also took part in light opera and farce. She d. in Paris. She left a life interest in her fortune of £400,000 to her mother and sister; after their deaths it was to go to the poor of Marseilles.

Desmids (Gk. *δεσμός*, bond) constitute a large genus of fresh-water algae which bear considerable resemblance to diatoms, but differ from them in being bright green in colour and having the cell-wall composed of cellulose instead of silica.

Des Moines: 1. Riv. of Iowa, U.S.A. Rising in the S.W. of Minnesota, it traverses Iowa with a south-easterly course, and finally joins the Mississippi below Keokuk. Its drainage area is some 14,650 sq. m., whilst its total length is 550 m. 2. Cap. of Iowa, U.S.A., at the mouth of the Racoon R., on the Des Moines R., contains the Iowa state Capitol building on a hill, with a fine view of the city; Fort Des Moines, the largest U.S. cavalry post; the city hall; court house and coliseum; Des Moines Univ., belonging to the Baptist Bible Union of N. America, and the Drake Univ. of the Disciples of Christ. There are 870 ac. of parks. The ann. state fair is attended by more than 400,000 persons. There is a large trade in corn and coal, also manufs. of meat products, clothing, furniture, agric. implements, and much printing of newspapers and journals. It is under a commission form of government. The pop. has increased from 3965 in 1860 to 159,800 in 1910.

Desmond, Earls of, Irish family who exercised considerable influence over the S.W. of Ireland. Beginning with Maurice Fitzgerald (d. 1356) the line came to an end in Gerald Fitzgerald, who was murdered finally in his retreat among the Kerry Mts. (1583), his place of hiding having been betrayed to the Eng. This Fitzgerald, the fifteenth of the title, had

sacked Youghal and murdered the inhab. as a direct challenge to Elizabeth's Gov. Consequently he was proclaimed a traitor, and spent the last two years of his life wandering miserably from place to place.

Desmoulins, Lucie Simplicie Camille Benoit (1780–94), Fr. revolutionist and journalist, b. at Guise, Aisne, came into notice after his harangue to the populace on July 12, 1789. 'To arms!' he cried; 'this dismissal (i.e. that of Necker) is the tocsin of the St. Bartholomew of the patriots.' The mob, after hearing the address, rushed out in thousands to seize arms: two days afterwards the Bastille fell. Nevertheless a stuttering speech drove D. to write his inflammatory addresses. His pamphlets entitled *La Philosophie du peuple français* (1788), *La France libre* (1789), and the series that subsequently appeared in *Les Révolutions de France et de Brabant* (1789–91) contain the germs of Socialism, whilst at the time their rapid dissemination caused the violent doctrines contained therein largely to control the trend of contemporary events. Associated first with Mirabeau, and on his death with Danton, D. was present with the infuriated people who stormed the Tuilleries (Aug. 1793), and was largely responsible for the downfall and ruthless massacres of the Girondists, for under the inspiration of the dictator, Robespierre (who had been his school friend), he had pub. his *Histoire des Brissolins* (1793), which contained denunciations of the Girondist leader, Brissot. After the Hébertistes had also been dispatched, a revulsion against such wholesale carnage seized D., the result being the pub. of *Le Vieux Cordelier* (1794). Herein he advocated a fresh policy, this time one of forbearance and clemency, in which he was abetted by Danton and Laëroix, but his exuberant fancy and irresistible delight in Aristophanic humour caused him to represent the great Robespierre in a ridiculous light. The latter, realising the personal danger of such an attack, suffered the Committee of Public Safety to condemn D. with the still nobler Danton to the guillotine in April 1794. A few days later Lucie Duplessis, his young and loving wife, in spite of her hold over the dictator, passed bravely in the tumbril to her death. See R. Arnaud, *La Vie turbulente de Camille Desmoulins*, 1928.

Desna, riv. of the R.S.F.S.U., which rises in the region of Smolensk. It flows S.E. to Briansk, then S.W. until it joins the Dnieper. Its prin. tribs. are the Seim and the Snov, and the riv. is navigable almost throughout its course of 350 m.

Desolation Island, see KERUELEN LAND.

Desor, Pierre Jean Edouard (1811–82), Swiss geologist who climbed the Jungfrau in 1841. The results of his research into Jurassic echinoderms were pub. in his *Synopsis des échinodermes fossiles* (1858) and *Echinologie helvétique* (1868–73), for the latter of which he collaborated with P. de Loriol. His *Aus Sahara* (1865) contains his inquiry into the physical phenomena of that desert, whilst his investigations into the anct. lake habitations of Switzerland form a contribution to paleontology.

De Soto, Fernando, *see* SOTO.

De Soto, tn. of Jefferson co., Missouri, U.S.A. It is situated on Joachim Creek, and has railroad shops, manufacturing of plate glass, shoes, and cloth. Pop. 5100.

Despard, Mrs. Charlotte French (1844-1939), one of the prin. leaders of the women's suffrage movement, especially in its militant aspect. Was much influenced by the works of Shelley, and often said that, as a result of reading his *Revolt of Islam* she became a rebel. In the militant days she was twice imprisoned for actions in connection with this movement. Her reforming activities were by no means confined to the women's movement. She laboured as a poor law guardian and a Socialist orator, and for a time lived at Nine Elms. She was as well known among the poor of Dublin. Though a sister to the late Earl Ypres, she was an extreme pacifist during the First World War. In 1919 she stood for Parliament at Battersea. After the war she went to live in Dublin, where her support of Mr. de Valera, both before the treaty of 1922 and in the ensuing civil war, brought her into conflict with the authorities. In 1926, at the age of eighty-two, Mrs. D. marched from the Embankment to Hyde Park in a procession of women representing the various professions to demand equality of franchise; and with the royal assent to the Bill in 1923 she saw her greatest ambition realised.

Despard, Edward Marcus (1751-1803), Irish conspirator, spent eighteen years in military service in the W. Indies, and later as superintendent of Yucatan. Recalled on trivial charges and found innocent even of these (1792), he was, notwithstanding, imprisoned for two years. He was finally beheaded because of his share in a plot to assassinate the king.

Despeisis Silk, *see* ARTIFICIAL SILK.

Despencer, Baron de, *see* DASHWOOD, SIR FRANCIS.

D'Espercy, Louis Félix Marie François Franchet, *see* FRANCHET D'ESPERET.

Des Fériers, Bonaventure *see* PÉRIERS.

Despotism, in modern application, the oppressive and sometimes illegal rule of one man; the reverse of democracy. The name, like tyrant, is of Gk. origin and had nothing of its present significance. The title despot was given to the master of a household of slaves; then to the absolute ruler of E. countries with whom the Gks. came in contact. Later it came to be an honorary title given to princes in the Byzantine empire, and it is still employed in something of its old sense as a mode of addressing a bishop in the Gk. Church. The beginning of its present use was the employment, as in the case of tyrant, of the word to describe a ruler who had no right to be the ruler although his actual method of government may have been excellent and beneficial.

Despoto Dagb, *see* KHODOPH MOUNTAINS.

Despréaux, Nicolas Boileau, *see* BOILEAU-DESPRÉAUX.

Desquamation, shedding of the epithelium or surface skin, which takes place after certain diseases such as scarlet fever. It is likely that these epithelium

scales are a source of infection; thus the patient is quarantined until the peeling of the skin is complete. A high temp. sometimes causes the skin to come off in large flakes.

Dessalines, Jean Jacques (1758-1806), Negro emperor, b. in Guinea, Africa, and carried to Haiti as a slave. In the insurrection of 1791 he assumed the name of his master, a Fr. planter, and fought as a lieutenant under Toussaint l'Ouverture. After submitting to France he was made governor of the S. part of the is., but began the war anew, defeated the Fr. at the battle of St. Marc, and after unspeakable cruelties drove them from the is., 1803. Haiti declared itself independent in 1804, and D. was elected governor, and in the following year emperor under the title of Jean Jacques I. His tyranny and cruelty soon alienated his supporters, and in 1806, while trying to suppress a revolt, he was murdered by Pétion and Christophe, the latter of whom succeeded him.

Dessau, cap. of the former duchy and free state of Anhalt, Germany, on the l. b. of the Mulde, 70 m. S.W. of Berlin. Among the chief buildings are the former ducal palace (1748), with a valuable library and picture gallery and standing in beautiful grounds; the tn. hall (1899-1900), sev. picture galleries, and the Schlosskirche. The fine W. wing of the Schloss dates from 1540. The tn. has monuments to Leopold, prince of Anhalt-D. (1676-1747), and to the philosopher, Moses Mendelssohn (b. here in 1729). It was also the bp. in 1823 of Max Müller, the orientalist and philologist, who d. at Oxford, 1900. D. is noted for manufs. of machinery, chocolate, gas-cooking, and heating apparatus and chemicals, and a good trade in corn and garden produce. Aircraft factories were erected in the neighbourhood of the tn., which became an objective of the allied air offensive in 1944, during the Second World War. The tn. was captured by the U.S. First Army on April 21, 1945. Pop. 91,400.

Dessuk, a tn. of Egypt, on the Nile, 12 m. N.E. of Damanhur, has a Muslim high school with 250 students. About 7 m. N. are the ruins of the anc. Egyptian cap., Buto.

De Staël, Madame, *see* STAËL.

Desterro, *see* FLORIANOPOLIS.

Destouches, Philippe (1680-1754), Fr. dramatist, b. at Tours. His real name was Néricault. In 1699 he became secretary to the Fr. ambas. in Switzerland, and wrote during the time *Le Curieux impertinent* (1710); *L'Ingrat* (1712); *L'Irrésolu* (1713); and *Le Médisant* (1715). From 1716 to 1722 he was secretary to the embassy in London. On his return to France he was elected to the academy, 1723, and subsequently produced *Le Philosophe Marié* (1727) and his masterpiece *Le Glorieux* (1732), a picture of the struggle between the old nobility and the wealthy bourgeois. Like Molière, he wished to revive the comedy of character, but in style he rather followed Boileau-Despréaux; his later comedies were spoilt by his carrying the moralising tendency to extremes.

Destroyer, Torpedo Boat, small, fast, unarmoured warship heavily armed with torpedo tubes and guns up to 4.7 in. This class of vessel was developed to supersede the 'torpedo gunboat' or 'torpedo catcher', which in turn had been built to destroy torpedo boats. The destroyer acts in flotillas and her duties are to sink the destroyers of the enemy by gunfire, torpedo the larger enemy ships, protect her own battle fleet from torpedo attack, and set up smoke-screens. During the 1911-18 and 1939-45 wars destroyers were also used for escorting convoys of merchant shipping, combating the submarines by means of explosive depth-charges, and as minelayers. The first Brit. destroyer was built by Messrs. Yarrow in 1893 and named *Hawock*. She was much lighter and smaller than the 'catchers' she was replacing, but had relatively great length with a low free-board and was equipped with high-speed engines capable of developing 3500 brake horse-power which enabled a speed of 26½ knots to be attained. The great advance in speed of this vessel and her sister ships over the existing torpedo boats was due mainly to the alteration in lines, small draught, high engine power, and reduction in weight brought about by using thinner plates—in some cases they were only ½ in. thick—and cutting out armour plating. Landmarks in the design of destroyers were the introduction of the water-tube boiler, replacement of reciprocating engines by steam-turbines, and the use of oil fuel instead of coal. Torpedo tubes used to be rigidly fixed in the bows, but as the speed of the torpedo was improved, these had to be abolished because, after firing, the destroyer at first overran the torpedo, which soon gathered way and hit the parent ship behind. There are a considerable number of classes of D. in the Royal Navy. Their names include 'Gallant', 'Daring', and 'Weapon', three classes for which ships were in course of construction at the end of the Second World War, 'C', 'Battle', 'Zambesi', 'Wagon', 'Valentine', 'Ulster', 'Trowbridge', 'Saumarez', 'Rotherham', 'Onslow', 'Hunt', 'Blankney', 'Tribal', 'Intrepid', and others. A vessel of the 'C' class (*Cesar*, *Chequers*, *Comet*, etc.), may be taken as an example of a typical modern D. Details are: 362½ ft. in length, and 35½ ft. beam, 1710 tons displacement, speed 34 knots (capable of 38), four 4.5-in. guns, six anti-aircraft guns (four of 40 mm. and two of 20 mm.), eight 21-in. torpedo tubes in quadruple mountings. Ds. of the 'Battle' class are larger with 2325 tons displacement and were designed for service in the Pacific in the war against Japan. They have a speed of 36 knots, four 4.5 guns, twelve 40-mm. anti-aircraft guns, and ten 21-in. torpedo tubes. A typical modern D. of the U.S. Navy is that of the 'Allen M. Sumner' class. Its dimensions are 376½ ft. by 40½ ft. with a displacement of 2200 tons and a speed of over 35 knots. Its armament includes six 5-in. guns, twelve 40-mm. anti-aircraft guns, and ten 21-in. torpedo tubes. Larger vessels are those

of the 'Gearing' class which with similar armament have a length of 390½ ft. and a displacement of 2400 tons. The flotilla-leader is a kind of super-destroyer, being larger and more powerfully armed than the others, and acts as flagship to destroyer flotillas.

Destructors, furnaces employed for the destruction of refuse. The disposal of refuse from tins, has presented a problem to the authorities from time immemorial, but with the concentration of pop. reached in modern civilisations the matter became urgent. Such methods of disposal as dumping into the sea are clearly possible only in special circumstances, but the fact that much of the refuse consists of carbonaceous material (e.g. paper, straw, animal and vegetable remains, cluders, etc.) suggested the idea of destroying it by combustion. Destructor - furnaces are commonly erected in series, and, after the refuse has been collected, tins, cans, and pieces of iron are withdrawn magnetically, fine dust is removed, and the residue then fed into the furnaces. High temps. are necessary (about 2000°) for satisfactory destruction, and in some cases the heat evolved is used to produce steam and electricity. Destructors are comparatively expensive to construct and run, but the convenience and cleanliness are worth paying for. Many different types of destructors are in use, e.g. the Heenan type and the Horsfall and Sterling type.

Desuetude, technical word in Scottish law, denoting the revocation of some law, simply through the practice of some usage, quite contrary to the terms of the law, which has received its sanction through a general consensus of opinion, and not through any legal enactment. Thus when a man was charged in 1887 with opening a pie and lemonade shop on Sunday he set up a plea of D. as regards the law of 1661 against Sabbath profanation. In this particular case the Act of 1661 was held not to have 'gone into D.' In English jurisprudence, a statute never lapses 'by desuetude', but can become inoperative only by repeal.

Desvaulsiaceae, name formerly applied to monocotyledonous plants of the order Centropetalaceae. The species are small, sedge-like herbs of no known utility found in the southern hemisphere.

Desvres, tn. in the Pas-de-Calais dept. of France, 10 m. E.S.E. of Boulogne with tanneries and porcelain manuf. Pop. 5000.

De Tabley, John Byrne Leicester Warren, Baron (1835-95), Eng. poet, educated at Eton and Christ Church, Oxford. Between 1859 and 1865 he pub. seven volumes of verse, remarkable for their grace and refinement of feeling, but his *Philoctetes* (1866), which won the admiration of Gladstone and Browning, first gave full illustration to his fine classical culture. His careful drama entitled *The Soldier of Fortune* (1876) met with a cold reception; a selection of *Poems Dramatic and Lyrical* (1893), proved that his poetical gifts had not been impaired by his life as a recluse. De T. was also an excellent amateur in botany and numismatics, and his work on the flora of Cheshire was pub.

in 1899, with a memoir by Sir M. G. Duff.

Detachment, in its military sense, refers to a small number of infantry or cavalry despatched from the main army, brigade, battalion, company, or whatever division it may be, for the performance of some particular duty. In naval terminology the word is similarly used to denote the dismissal from the fleet or squadron of two or more vessels on a special service. A 'gun detachment' means the number of artillery soldiers told off to take care of a single gun.

Detaille, Jean-Baptiste Edouard (1848-1912), Fr. painter, who was a pupil of Meissonier, his first picture exhibited in the Salon being 'A Corner of Meissonier's Studio' (1867). His finest pictures are undoubtedly his realistic paintings of military life, either of the scenes from contemporary wars, such as his 'En reconnaissance' (1875), 'Le Régiment qui passe' (1876), and his 'Salut aux blessés' (1877), which represent episodes in the Franco-Prussian campaigns, or from the Napoleonic battles such as his 'Sortie de la garnison de Huningue en 1815,' and his representations of Napoleon in Egypt (1878), and of the engagement between Cossacks and the Imperial Guard in 1814 (1870). His best known portraits are of the Prince of Wales, Duke of Connaught, and Emperor of Russia (1898), whilst 'Le Réve' (1888) and 'Les Victimes du devoir' are two of his most famous pictures. In 1898 D. was elected a member of the Fr. Institute, and was the holder of many foreign honours and decorations.

Detective, see under POLICE.

Detective Story, The, was originated by the genius of the Amer., Edgar Allan Poe, whose *The Murders in the Rue Morgue* (1841) and *The Purloined Letter* (1845) have rarely, if ever, been surpassed in brilliance of analysis and invention. Poe was soon followed by the Fr. writer, Emile Gaboriau, whose *L'Affaire Lerouge* (1866) and *Le Dossier 113* (1867), etc., were eagerly read. He was followed among his countrymen by Bolsgebey, author of *Le Forçat Colonel* (1872), Gaston Leroux and Maurice Leblanc, but apart from these writers and the later Belgian author Georges Simenon, the development of the detective story has been mainly in the hands of the many authors in this genre in Great Britain and America. In England the vogue may be said to have begun as a result of the stories by Sir Arthur Conan Doyle who took up and extended the conventions of the detective story established by Poe—the apparently insoluble crime, the clues misleading the police, the quicker-witted detective and his admiring follower who tells the tale. Doyle created the character of Sherlock Holmes, whose name became a synonym in many languages for detective, and the first of the several books of Sherlock Holmes' *Adventures*, *Memoirs*, etc., was *The Study in Scarlet* (1887). Doyle also established the scientific side of detection in fiction which has been developed by many subsequent writers, notable among whom is Agatha Christie. G. K. Chesterton (q.v.) in his

Father Brown series used the D.S. for the discussion of religious ideas.

Deterioration, Physical, see PHYSICAL DETERIORATION.

Determinants. In mathematics, a system of symbols whereby many calculations are facilitated. Consider two homogeneous linear equations, $a_1x + b_1y = 0$; $a_2x + b_2y = 0$. By multiplying the first by b_2 and the second by b_1 , and subtracting, we get $x(a_1b_2 - a_2b_1) = 0$, whence $a_1b_2 - a_2b_1 = 0$. This may be written $\begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} = 0$, and the expression on the left is called a D. of the second order, consisting of two rows and two columns. The value is not altered by changing rows into columns or vice versa, thus $\begin{vmatrix} a_1 & a_2 \\ b_1 & b_2 \end{vmatrix} = a_1b_2 - a_2b_1$. Interchanging two rows of columns changes the sign; thus $\begin{vmatrix} a_2 & a_1 \\ b_2 & b_1 \end{vmatrix} = a_2b_1 - a_1b_2$. Consider three homogeneous linear equations, $a_1x + b_1y + c_1z = 0$; $a_2x + b_2y + c_2z = 0$; $a_3x + b_3y + c_3z = 0$. From the second and third we get by the rule of cross-multiplication

$$\begin{vmatrix} a_2 & a_3 \\ b_2 & b_3 \end{vmatrix} x - \begin{vmatrix} a_2 & a_3 \\ c_2 & c_3 \end{vmatrix} y + \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} z = 0$$

This may be written $\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$ and

the expression on the left is known as a D. of the third order, consisting of three rows and three columns. It is to be noted that the coefficient of a_1 , b_1 , or c_1 is the D. of the second order obtained by omitting the row and the column containing that constituent in the D. of the third order. Some of the properties of D. are: if two adjacent columns or rows are interchanged, the sign of the D. is changed without other alteration in value; if two rows or columns are identical the D. = 0; if each constituent in a row or column is multiplied by the same factor, the D. is multiplied by that factor. See T. Muir, *The Theory of Determinants in the Historical Order of Development*, 1923, and *Contributions to the History of Determinants*, 1930.

Determinism (from Lat. *determinare*, to prescribe), the name applied to the doctrine that man's every action is directly dependent either on his environment or on his impulses and motives, the dependence being so mathematical that his behaviour could in every case be predicted were it possible to appreciate the exact nature and relative force of the external and internal impulses which drive him to behave as he does. It is therefore a doctrine in direct opposition to the doctrine of Free Will, taught in Christian ethics, and known to psychologists under the names of Indeterminism, Voluntarism, and Indifferentism, by which it is held that man has complete moral freedom to choose between different courses of action. 'Hard' D. bears a very

close resemblance to necessitarianism, and the old fatalistic beliefs, whilst 'soft' D. accounts for 'remorse' by allowing that in some cases it is really open to a man to make a deliberate choice. The theory of evolution, by which man is regarded as a mere link in the 'chain of causal development,' as owing his motives, appetites, and aversions, and, indeed, his whole mental outlook largely to inherited tendency and environment, lends support to the determinists.

Detinue, a term in law for the action brought for the recovery of goods, or their value, with damages for detaining them if they cannot be recovered, by the real owner of the goods against whoever is in actual possession of the same.

Detmold, cap. of Land Lippe, Germany, at the foot of the slopes of the Teutoburger Forest, 25 m. S. of Minden by rail. The chief buildings are the palace of the reigning prince (1550), a natural hist. museum, and a theatre. It has a chemical industry. There are many visitors in summer attracted by the beauty of the Teutoburger Wald. The poet F. Freiligrath (1810-70) and the dramatist Grabbe (1801-36) were both natives of D. On a hill about 3 m. S.W. of the town is a colossal statue of Arminius (Hermann), chief of the Cherusci, who defeated the Rom. general, Varus, here in A.D. 9. Pop. 17,500.

De Tocqueville, Charles Alexis Henri Maurice Clérét, *see* TOCQUEVILLE.

D.D.T., *see* DICHLORODIPHENYLTRICHLOROETHANE.

Detonator, small supply of an easily-exploded substance used to discharge the main explosive constituent of a cartridge, shell, or mine. A substance formerly in general use for this purpose is mercury fulminate, which in British service ammunition was mixed with potassium chlorate and antimony sulphide in proportions depending on whether the D. was to be exploded by percussion or by a time fuse. The fulminate when exploded produces gases at a high temperature and pressure, conditions under which dynamite and other comparatively inert explosives are effectively discharged. Mercury fulminate has now been largely superseded by such improved detonators as lead azide, PbN₂. The term D. is also applied to the small metal cases fixed on railway lines to serve as fog-signals. *See also* SIGNALS.

Detritus, a geological term denoting gravel, sand, or other water-worn matter, and angular, or subangular débris, which have accumulated in consequence of the disintegration of rocks.

Detroit, fourth largest city in the U.S.A., is in Michigan, on the R. Detroit, 18 m. above Lake Erie and 284 m. E.N.E. of Chicago. It is connected with Windsor in Canada (on the opposite bank of the riv.) by bridge and tunnel. It is built on the slope of the riv. bank, with wide tree-shaded avenues. Among the chief buildings are the City Hall (1868-71), the Co. Court House, the churches of St John's Episcopal and First Congregational, the Rom. Catholic churches of St. Anne and

Sacred Heart of Mary, the Rom. Catholic College (1877), and many huge skyscrapers. D. is an important railway centre, and carries on an enormous commercial traffic by riv. and lakes. D. was estab. as a trading post in 1701 by a Fr. fur trader. In 1760 it was taken by the Brit. and continued as a military post until it was surrendered to the U.S.A. in 1796. D. has been the home of the motor car since the early days of their manufacture. The Ford Motor Co. was incorporated on June 16, 1903. The largest factories of automobile parts are also at D. D. is one of the chief centres of the manuf. of medical and pharmaceutical preparations, which began in 1856 in a single room 12 ft. square. Other important industries are varnish, paints, oil, shipbuilding, aircraft, railway works, lumber yards, machine shops, brick-making, tobacco, furniture, tyres, tinned meat, etc. The College of Medicine has 250 students. The University of D. was first so called in 1911. The pop. was 79,577 in 1870, 466,000 in 1910, 993,680 in 1920, and estimated in 1945 to be 1,680,000. *See* C. E. Catlin, *The Story of Detroit*, 1926; W. A. Simonds, *Henry Ford and Greenfield Village*, 1938; F. Barcus, *All Around Detroit*, 1939.

Detroit, University of, an institution for higher education conducted by Jesuit fathers under the auspices of the Rom. Catholic Church. Over 3000 students attend the various courses, which embrace arts and sciences, commerce and finance, civil engineering and law.

Detskoe Selo. *See* PUSHKIN.

Dettingen, vil. of Bavaria, Germany, situated in Lower Franconia, on the Main, 8 m. N.W. of Aschaffenburg. It is noted for a victory which was won in 1743 by the Brit., Ger., and Austrian forces under George II. over the Fr., under Marshal Noailles. It was the last battle in which an Eng. monarch took part. Pop. 1500.

Detva, or Gyetva, mkt. tn. of Hungary, situated about 18 m. E. of Alsóh. Pop. 7500.

Deucalion, in Gk. mythology, the son of Prometheus. When Zeus, in anger at the world's wickedness, resolved to destroy all mankind by a flood, D. built a boat which, after floating for nine days on the water, rested on the top of Parnassus. Having inquired of the oracle what they were to do next, they were ordered to throw stones behind them; those which D. threw became men, and those thrown by Pyrrha, his wife, became women. *See* Ovid, *Metam.* i.

Deule, riv. in the dept. Pas-de-Calais and Nord, France. It is a trib. of the Lys, which itself unites with the Scheldt in Belgium. Rising near Carency, it flows past Lille, where it once filled the moat of the pentagonal citadel, and Quénou, joining the main riv. near Deulomont.

Duarte, tn. of E. Flanders, Belgium. Centre of the picturesque dist. of the lower Lys. Splendid landscapes and pastures. Windmills, historical castle in Renaissance style. Pop. 1000.

Deus Nogueira Ramos, João de (1830-96), Portuguese poet who probably appeals to a greater number of his countrymen than any other native poet with the exception of Camões and Garrett. But for his ardent admirers, none of his poems would have reached the public, for he was indifferent to fame and a careless, spasmodic composer. Posterity will treasure his spontaneous and emotional lyrical outpourings such as his *Rachel*, *Marina*, *Descalça*, and above all his exquisite *Ramo de Flores* (1869). The *Campo de Flores* (1893) is the best ed. of his poems. By turns D.'s writing is imitative, idyllic, pessimistic, and devout, and notable for its intense purity and elemental simplicity.

Deuteronomy, the name of the fifth book of the Pentateuch, which from the seventeenth century onwards was one of the great battle-grounds of biblical criticism. Before that time, it was universally held to be of Mosaic authorship, but it is now often regarded as a gradual compilation, of which the greater part dates from the reign of Manassah. An earlier form was discovered in the reign of Josiah, and exercised a great influence on that monarch. The work sub-divides greatly. Chaps. i.-iv. and v.-xl. give two introductory exhortations, the former being largely historical. After this come a variety of exhortations and historical accounts interspersed with poems. The high moral tone of the book is shown by the fact that of a quotation from it Christ said: 'On these words hang all the law and the prophets,' and that from D. were taken all Christ's answers to the Tempter in the wilderness. The name of the book is taken from the Septuagint trans. of the words 'this law' in chap. xvii. 18. See S. R. Driver, *A Critical and Exegetical Commentary on Deuteronomy*, 1895; J. Finn, *The Unity of the Pentateuch*, 1917.

Deutsch, Immanuel Oscar Menahem (1829-73), Ger. Heb. scholar, studied Heb. and Chaldean literature under his uncle, a rabbi, and in 1855 became an assistant in the library of the Brit. Museum. His fame grew out of his brilliant article on 'The Talmud,' which appeared in the *Quarterly Review* of 1867. Besides contributing to Smith's biblical dictionaries, he was an authority on Phœnician antiquities.

Deutshbrod, see NEMEČY-BROD.

Deutsche Bank is one of the big banks in Germany. It was founded in 1870 with its chief office in Berlin. Its main purpose was to provide a ready assistance in all financial matters to Ger. commercial men. The D. B. did good service in Germany's rapid development in industry and commerce which took place during the last two decades of the nineteenth century and continued up to the outbreak of the First World War in 1914. In addition to branches throughout the German Reich, it had others in Europe, particularly in the S.E. The D. B. amalgamated with the Disconto-Gesellschaft (founded 1856) in 1920, the combined share cap. amounting to 285 million, with reserves of 160 million marks. In 1933 the Dresdner and Commerzund Privat-

bank were also assimilated, and further widening of its network of branches took place in 1938. At the end of 1944 the balance of the D. B. exceeded 8,700 million marks.

Deutsch-Eylau, see EYLAU, DEUTSCH.

Deutsch-Krone, tn. of Prussia, Germany, situated 15 m. N.W. of Schneidemühl, between the lakes Radau and Arers. There is trade in wood and cattle. The tn. is at an important road junction and was an objective in the Soviet offensive at the end of the Second World War. It was captured by the Red Army on Feb. 11, 1945. Pop. 11,000.

Deutz, tn. of Rhineland, Germany, situated on the r. b. of the Rhine, opposite Cologne, with which it was incorporated in 1888.

Deutzia genus of Saxifragaceae, grows wild in the N. of India, China, and Japan. *D. scabra*, *D. gracilis*, and *D. crenata* are cultivated in Britain, and the first-named is remarkable for its silicles stellate hairs.

Deuxponts, see ZWEIFBÜCKEN.

Deux Sèvres, see SÈVRES, DEUX.

Deva, tn. in Rumania, on the Maros, 82 m. E. by N. of Fehesvar. It has picturesque ruins. Pop. 8700.

De Valera, Eamon (b. 1882), Irish patriot and statesman, b. in New York City, his father being Spanish and his mother Irish. He was educated in Ireland at Blackrock College and the Royal Univ. at Dublin. He gained several scholastic degrees and taught mathematics, Fr. and Lat. in various colleges and educational establs. Whilst engaged in his educational pursuits his political sympathies were being nurtured in the atmosphere of Sinn Féin, but though an enthusiast, he did not become a prominent Sinn Féiner until the 1916 Easter Revolution, during which he commanded a party of insurgents. He was taken prisoner and sentenced to death, but this was commuted to penal servitude for life. At the general amnesty in 1917 he was released, and again plunged into political affairs, becoming the directing head of the Sinn Féin movement. He gained great prestige on being elected member of parliament for East Clare and was elected president of the 'Irish Republic' in Oct. 1917. He was re-arrested in May 1918 and confined in Lincoln prison, from which he escaped or was allowed to escape in Feb. 1919, to U.S.A. In 1921 he returned to Ireland, and was one of the negotiators of the treaty which brought the Irish Free State into being, although he repudiated the treaty. He revolted against the Irish Free State, and was captured in Aug. 1923, to be released in July 1924, when he again entered the political arena. In Aug. 1927 he took the oath of allegiance in Parliament, and led the Flanna Fail Opposition to Cosgrave's party in the 'all. In the elections of 1933, however, he secured a sound majority over Cosgrave, and again became president of the executive council (i.e. Prime Minister). He met with some opposition in the country from O'Duffy's Blueshirt movement, which, however, he reduced to insignificance by the speech he made in the Dail

when the Wearing of Uniforms (Restriction) Bill became law. He then went ahead with his programme of social and agricultural reform. Production and wages rose, and the numbers employed increased. The Senate as a reactionary body was abolished, and the Governor-Generalship was slowly whittled away until in 1937 it disappeared. D. played the leading part in framing the present Constitution of Eire by which the country became a sovereign independent state, owing no obligation to the Eng. Crown except in respect of the appointment of foreign representatives and the signing of

in S. Ireland or Eire, but his efforts were checked by the outbreak of I.R.A. terrorism, although this was denounced by D. With the beginning of the Second World War D. brought the army up to war strength and A.R.P. services were started. He had, however, the support of the country behind him in declaring the neutrality of Eire—a position which he maintained throughout the war.

In Feb. 1948, following a general election, his party (Fianna Fail) was defeated by a combination of Fine Gael, Farmers' and other parties and he was succeeded as Taoiseach (Prime Minister) by John A. Costello. He then went to America to publicise his campaign against partition (see EIRE).

Devanagari, or Nagari, called also the 'town-script,' is that form of the Sanskrit alphabet which is in general use among Hindu scholars, and appears in all works on Sanskrit by Europeans. It was possibly introduced to India about 800 B.C. by traders from Mesopotamia. It is at least probable, in view of the similarity of certain letters, that there is some kinship between the Nagari and the Phœnician alphabet, which in its turn may have been derived from Egyptian hieroglyphics. The Indo-Aryan vernaculars, Gujarati, Rajasthani, and Bihari, are usually written in Nagari characters.

Devant, David (1868-1941), Eng. illusionist, b. in London, son of an artist in poor circumstances. Worked as a page boy and telephone operator, but spent much of his time in the study of conjuring. Began by touring in the provinces and, in 1893, appeared with Maskelyne at the old Egyptian Hall, from which time his reputation was established. Became Maskelyne's partner in 1905 and continued to perform at St. George's Hall till attacked by a nervous breakdown at the beginning of the First World War. Not only the leading conjurer of his day, but sometimes regarded as the foremost magician of all time. Much curious information about the tricks and illusions he practised may be obtained from his books *My Magic Life* (1931) and *Secrets of My Magic* (1936).

Devaprayaga, or Deoprayag, vil., 2266 ft. above the sea-level, at the confluence of the Alaknanda and Bhagirathi, in the dist. of Garwal, N.W. Provinces, India. The two rivers form the Ganges below Deoprayag. Here is the famous temple of Rama Chandra, the resort of Hindu pilgrims.

Devavanja, tn. and com. of Hungary, 45 m. S.W. of Debreczon. Pop. 14,000.

Development. In music, whether referred to a phrase or more especially to a subject, denotes its fulfilment, or unfolding of all the qualities it contains by variation in harmony, rhythm, tonality, and by the building, as it were, of more or less elaborate structures upon the original melody. Signifies in geometry the unrolling of any conical or cylindrical surface, and in general the smoothing out into a plane surface of any curved one. In mathematics it always means the process by which one mathematical term is

EAMON DE VALERA

International treaties. The so-called 'Economic War' with England of 1932-38 was brought on by D.'s refusal to pay the regular land annuities to the British Gov. This conflict was ended by the London Agreement which D. negotiated with Neville Chamberlain in 1938. The Brit. Gov. accepted £10,000,000 in final settlement of the annuities and Eire gained virtual sovereignty. England surrendered the right to enter or fortify Irish ports. The elections which followed further strengthened D.'s position. The obligation of the Oireachtas to take the oath of allegiance to the Crown was abolished, as also was the right of appeal to the Judicial Committee of the Privy Council. In 1938 D. began to intensify the campaign for the absorption of Ulster

exchanged for another of equal value. D. may also be said to cover the whole subject of investigation in the science of embryology.

Development Commission, a gov. dept. set up under the Development and Road Improvement Funds Acts of 1909 and 1910, for the purpose of administering funds for the development of agriculture, and rural industries, fisheries, land reclamation and harbour maintenance.

Development and Road Improvement Funds Act, 1909, provides for the appointment of Roads Boards with power to construct and maintain new roads and to make advances to co. councils and other highway authorities in respect of the construction of new roads and the improvement of existing roads. Every road constructed by the Board was to be a public highway. The powers are now merged in the ministry of transport. See also **DEVELOPMENT COMMISSION; HIGHWAYS**.

Devenish, is. and par. of N. Ireland situated in Lough Erne, co. Fermanagh. The surface is hilly in parts, and boggy. The soil is very fertile, and good crops are raised. Limestone and sandstone are quarried. Pop. 3000.

Deventer, anct. tn. of Holland in Overijssel, situated on the Yssel, 8 m. N. of Zutphen, and 25 m. N. of Arnhem. It has exactly the appearance of a tn. of the Middle Ages. Part of the prin. church dates from the twelfth century, the crypt of St. Lebuinus is supposed to date from 1040. The Weigh-house is a curious little edifice of 1528. There are many elegant and charming houses and iron foundries and carpet factories. D. was captured from the Spaniards by Prince Maurice of Orange. The artist Terburg, whose pictures are to be found all over Europe, lived at D. and died there in 1681. Pop. 43,900.

Deventer, General Sir Jacob Louis Van (1874-1922), S. African soldier, b. in Orange Free State. He came into prominence as one of General Smuts' lieutenants during the Boer War, particularly in connection with the invasion of Cape Colony. He served on Botha's staff in the campaign in German S.W. Africa, 1914-15. Commanded a mounted brigade at the outset of the campaign against the Gers. in E. Africa and eventually commanded the whole force. After much hard fighting he drove his opponent, General Paul von Lettow-Vorbeck, into Portuguese ter.

De Vere, Sir Aubrey, originally Hunt (1788-1846), Irish poet, educated at Harrow, where Byron and Peel were his schoolmates. A country gentleman, he lived a life of retirement, writing without any care for his public. He took a great interest in public events, and was superior to the common prejudices of his class. His sonnets appeared first in 1842, and were spoken of by Wordsworth as 'the most perfect of our age.' *Julian, the Apostate*, was published in 1822, and *The Duke of Mercia* and several poems in the following year. See memoir by his son Aubrey (q.v.) in D. V.'s *Mary Tudor*, 1884.

De Vere, Aubrey Thomas (1814-1902), poet, was the third son of Sir Aubrey de Vere, of Curragh Chace, Adare, co. Limerick. In 1842 he published *The Waldenses, or the Fall of Iora*, which contained also some exquisite lyrics, and in the following year he issued a companion volume, *The Search after Proserpine, Recollections of Greece, and Other Poems* (1843). Besides poems, he wrote in prose concerning Ireland's wrongs, for while he held no brief for the disruption of the union he was an ardent sympathiser with the distress of the Irish folk. *English Misrule and Irish Misdeeds* (1848) was the principal of these works, *Ireland and Proportional Representation* (1885) the last. Not a great poet, yet at his best, especially when the theme was romantic, rose to a high level. He pub. his *Recollections* in 1897. See W. P. Ward, *Aubrey de Vere, A Memoir*, 1904.

Deveron, or the **Blackwater**, riv. of Scotland, which rises in the mts. of Cabraich at a height of 1850 ft. It is at first merely a mt. torrent, but passing through Aberdeenshire and Banffshire, it gradually becomes broader and slower, until after a course of 60 m. it enters the sea at Banff. Salmon and trout abound in its waters.

Devereux, Robert, Robert, and Walter, see **ESSEX, EARLS OF**.

Devers, Jacob Loucks (b. 1887), Amer. soldier, b. in York, Pa., Sept. 8; graduated at West Point. He became an authority on mechanisation, and in 1939 was chief-of-staff responsible for the defences of Panama. In 1942 he was promoted to Lieutenant-General and was chief of U.S. armoured forces. In 1943 he became Commander of the U.S. Forces in the European theatre of war and later deputy Commander in the Mediterranean theatre. He relinquished this appointment to take command of the Sixth Army Group, consisting of U.S. and Fr. forces, operating in the S. of France and in Alsace.

Devi, or **Durga** (Sanskrit, inaccessible), in Hindu mythology the daughter of Himavat (the Himalayas) and the wife of Shiva. She is depicted with ten armed hands, a kindly face, and attendant lions to suggest the ferocity of her nature. Bloody sacrifices are offered her, whilst her birthday is annually celebrated at the great Bengaleso festival in the sixth Hindu month.

Deviation, see under **COMPASS**.

Devise, see under **HERALDRY**.

Devil (O. Eng. *deofol*, Lat. *diabolus*, from Gk. *δᾱβολος*, slanderer), in Christian theology the great spirit of evil who works in ceaseless antagonism to God. The word is also used for inferior evil spirits under his command. The general evolution of the idea of a single spirit of evil has already been shown in *Demonology* (q.v.), and its development in the O.T. and N.T. will here be shown. The idea appears first in the account of the fall given in Genesis. Here the temptation comes from the serpent, created by God, but most subtle of creatures, whose hostility to God is not clearly stated. The idea of subservience to God is also

shown in such references as 1 Sam. xvi. 14, and 1 Kings xxii. 22, and the conception of Satan (Heb. 'the adversary') is a development of the post-exilic period. Here, though his personality is made more distinct and his opposition to God and his servants is recognised, we still find him regarded as a minister of God. Thus, in Job ii. Satan appears among the sons of God, and asks God's permission to test the virtue of Job. It is this aspect of the tempter that is generally considered in later times. The dualistic idea, which considers Satan as the adversary of God, ruling over a separate kingdom of evil, is largely due to the contact of Jewish with Persian modes of thought. In Tobit iii. Asmodeus appears as the equivalent of Satan, and in Wisdom ii. 24 is identified with the serpent who tempted Eve. The *Book of the Secret of Enoch* further relates the revolt of Satan and his fall from Heaven. In the N.T., the Jewish system is taken for granted. Satan is spoken of under a variety of names, the D. (Heb. ii. 14), the Enemy (Matt. xiii. 39), Beelzebub (Matt. x. 25), the Adversary (1 Pet. v. 8), and in Revelations as the Accuser of the Brethren (xii. 10), the Old Serpent (xx. 2), and the Great Dragon (xii. 9). Jesus distinctly recognises a kingdom of evil spirits, ruled by a prince, whom it is his work to overcome. The common conception in the early Church may be shown by a quotation from A. Harnack's *History of Dogma*: 'the present dominion of evil demons was just as generally presupposed as man's need of redemption, which was regarded as a result of that dominion.' The fathers generally held that Satan had dominion over this present world, though Christ had freed his servants from the Satanic power. Irenaeus in the second century represents this freedom as being gained through Christ's payment of the ransom to Satan, and this idea gained ground, though it was definitely repudiated by Anselm among others. Later liberal Christian thought was inclined to neglect all consideration of the D., and to consider belief in Satan as an inessential part of the faith. For views on the subject the works of Kant, Schleiermacher, Dörner, Martensen, Ritschl, Kaftan, etc., may be consulted. See also *Les Études Carmélitaines: Satan* (Bruges), 1948.

Devil-fish, an opprobrious name applied to various fishes, chiefly belonging to the Myliobatidae, or eagle-ray family. It is also applied to the octopus, which is, of course, not a fish, but a mollusc, and to the anglers (*q.v.*) or sea-devils which have the technical name of *Lophius piscatorius*. Sea-devils have flat and tessellated teeth, broad flat bodies and long, thin, whip-like tails; they are voracious and crush molluscs with their hard teeth. Species of the different genera attain great size.

Deville, Etienne Henri Sainte-Claire, see **SAINTE-CLAIRE**.

Devil's Advocate, see **ADVOCATUS DIA-BOLI**.

Devil's Bridge (Ger. *Teufelsbrücke*): (1) Famous bridge over the Reuss in the canton of Uri, Switzerland, 1½ m. from

the spot where the St. Gothard Pass road comes out on to the Valley of Andermatt. Here the riv. which is 4590 ft. above sea-level, forms a fine waterfall of 100 ft. (2) Hamlet in Cardiganshire, Wales, 10½ m. E.S.E. of Aberystwyth, and also a double bridge over the Mynach, which here runs at the bottom of a gorge, 114 ft. deep, making four falls from 16 ft. to 100 ft. within a m. The upper bridge dates only from 1753, but the lower was built in the eleventh century by the monks of Strata Florida.

Devil's Coach-horse, or **Black Cocktail**, the beetle known less graphically as *Ocypus solens*. This species, which is Brit., is about 1 inch in length, narrow in shape, active in habit, and usually carnivorous in diet.

Devil's Dyke: (1) Anct. earthwork extending from Wood Ditton to Roach in Cambridgeshire, England. It is 18 ft. high, and once formed a boundary between E. Anglia and Mercia. (2) A huge fissure 4½ m. N.W. by N. of Brighton in Sussex, England. It has a railway station and is the object of excursions for tourists from Brighton, there being now a cable way to take passengers across from one side of the chasm to the other.

Devil's Island, French Guiana, see **SALUT, ÎLES DU**.

Devil's Lake, city in N. Dakota, U.S.A., co. seat of Ramsey, seat of the State school for the deaf. Near by is an important wild animal preserve. Pop. 6,200.

De Vinne, Theodore Low (1828-1914), Amer. printer and writer on typography, was b. at Stamford, Connecticut, on Dec. 25, 1828, and was early apprenticed to a printer. At twenty-one he was employed by Francis Hart of New York; became junior partner in 1858, and after Hart's death in 1877 changed the name of the firm to Theo. L. De Vinne and Co. He was part-founder and president of the Grolier Club, whose early pubes. were produced by the De Vinne Press. His work was invariably of the highest quality, the *Century Dictionary* showing his artistry and care. His chief works are *The Invention of Printing* (1876), *The Practice of Typography* (1900-1904), and *Notable Printers of Italy during the Fifteenth Century* (1910).

Devizes, mkt. tn. and municipal bor. of Wiltshire, England, near the Kennet and Avon Canal. The tn. owes its origin to a magnificent castle, of which very few fragments remain, built by Roger, Bishop of Salisbury, about 1132. Round the castle grew up a prosperous tn. which from the time of Henry VIII. till about 1820 was famous for its cloth, and from the time of Edward III. for its wool. The tn., besides its modern castle, contains a remarkable Gothic mkt.-cross; the partly Norman churches of St. John and St. Mary, a museum, and a corn exchange. Its modern industries are the grain trade, tobacco, and snuff works, breweries, and the manuf. of silk and agric. implements. Pop. 8,000.

Devolution: (1) The first war embarked on by Louis XIV. of France with the single object of extending the boundaries of his

kingdom is known as the War of Devolution. When his father-in-law, Philip IV. of Spain, died, Louis, by introducing a civil right of inheritance into politics, claimed Flanders as the possession of his wife, Maria Theresa. (2) Also the name given to the schemes for the administration of Ireland, as enunciated by the Irish Reform Association, formed in 1903.

Devon, riv. of Scotland, which rises in the Ochil Hills at a height of 1800 ft. It is noted for its beautiful scenery, which has been immortalised by Burns. There is a series of remarkable falls, below the Crook of Devon, known as the Devil's Mill. Caldron Linn, and Rumbling Bridge. Trout abound in the riv., and after a course of 33 m., it falls into the Forth at Cambus.

Devon Breed, see under CATTLE.

Devonian system, in geology. The term was first used by Murchison for the greater part of the Paleozoic strata of Devonshire, instead of the older term 'Old Red Sandstone,' because the strata in Devonshire, while being otherwise identical with the 'Old Red Sandstone' of Scotland, Hereford, and S. Wales, and occupying the same position between the Silurian and Carboniferous periods, contain a much more copious and rich fossil fauna and flora. The conditions under which the Old Red Sandstone and the Devonian strata were deposited are so very different, however, that later geologists do not use the terms synonymously. Strata of the D. S. are also found in the Ardennes, Bohemia, and the Ural mts. See OLD RED SANDSTONE.

Devonport (before 1824 called Plymouth Dock), until 1914 parl., municipal, and co. bor., situated on a peninsula formed by the Hamoaze and Stonehouse Pool at the head of Plymouth Sound, and forming with Plymouth and Stonehouse the 'Three Towns.' D. is one of the chief naval and military stations in the Brit. Isles: it owes its origin to the dockyard established here by William III. in 1689. The naval estab. extend nearly 4 m. along the Hamoaze and include, besides the original dockyard, the Keyham steam yard and factory, the gun-wharf, the Gov. House and Admiralty House on Mount Wise, the naval and military barracks and the Royal Naval Engineering College at Keyham. In 1896 fresh extensions were begun at the Keyham Yard, which were opened under the name of Devonport North Yard, by the Prince of Wales in 1907. There is a powder magazine on Drake's Island at the entrance to the Hamoaze (estuary of the Tamar); Mount Edgcumbe on the N. side is guarded by forts, and the harbour is fortified and guarded by warships. D. and Stonehouse were amalgamated with Plymouth in 1914, the three now forming the city of Plymouth, created such on Oct. 18, 1928. Pop. 83,000.

Devonport, Sir Hudson Ewanke Kearley, first Viscount and Baron of Whittington, Bucks (1856-1934), youngest son of George Ewanke Kearley, of Tarrant Gunville, Dorset. He represented Devonport as a Liberal from 1892 to 1910, being

parl. secretary to the board of trade from 1905-8. During the First World War he was food controller (1916-17) and he received his viscountcy in 1917.

Devonshire, Spencer Compton Cavendish, eighth Duke of (1833-1908), Eng. statesman, the eldest son of William Cavendish, second Earl of Burlington, and was known as Lord Cavendish until 1858, when, his father succeeding to the dukedom of Devonshire, he bore the courtesy title of Marquis of Hartington. In 1857 he entered Parliament, as a Palmerstonian Liberal, and in 1874, on the defeat of Gladstone at the general election, he resigned his leadership of the party, and the liberals then chose Hartington in his stead. In 1880, on the defeat of Disraeli, he was invited to form an administration, but Gladstone having returned to the House to take up the matter of the 'Bulgarian atrocities,' he withdrew in favour of his old chief. In 1882 he went to the War Office, and was there during the period of disaster which resulted in the evacuation of the Sudan and the death of Gordon. Owing to his views on Home Rule he declined office when Gladstone again came into power in 1886, and moved the rejection of the Bill, which shortly afterwards was thrown out on the second reading by a majority of ninety. At the general election which followed, the Conservatives and the Liberal-Unionists (as the seceders called themselves) were in a majority, and Lord Salisbury invited Hartington to form a Coalition Ministry, in which he would accept office. This Hartington declined to do, hoping that by some means the Liberals and the Liberal-Unionists might in the near future be able to coalesce. This wish was not fulfilled, and it was not until 1894 that the Duke of Devonshire (as he became in 1891) accepted office in a Conservative Gov. He then became President of the Council under Salisbury, and retained his office under Balfour. In 1904 he resigned, being opposed to the policy of tariff reform, which henceforth became the leading feature in the Conservative programme. He died at Cannes on March 21, 1908. 'The Duke,' as he was called in his later days, wielded great influence in the country, and was one of the most popular figures in the kingdom. People were amused at his lethargic manner, and were delighted to believe the story that he yawned during his maiden speech in the House of Commons, and that thereupon Disraeli remarked to a neighbour, 'That young man will go far.' In private life, he was also popular, and an intimate friend of King Edward VII. In his early days he was fond of hunting, and all his life he was a notable follower of the turf, which was, perhaps, his chief interest outside politics.

Devonshire, Sir Victor Christian William Cavendish, ninth Duke of, (1868-1938), b. May 31; eldest son of third son of seventh duke. Educated Eton, and Trinity College, Cambridge. He entered Parliament at the age of twenty-three as member for W. Derbyshire, a seat that had been held by the Cavendish family for the greater part of two

centuries. Nine years later he was appointed treasurer of the Household, first under Queen Victoria and later under Edward VII. In 1903 he became financial secretary to the Treasury. He lost office when the Liberals gained power in 1906, and it was not until 1915, with the advent of the Coalition gov., that he returned to the gov. as civil lord of the Admiralty. He held that position for only a few months, and from 1916-21 was governor-general of Canada. After the break-up of the Coalition ministry he became, in 1922, colonial secretary and by coming forward with a personal guarantee of £500,000, was largely instrumental in saving the project of the Brit. Empire

orchards. D. is rich in pastures, and is famous for its cattle and dairy produce. The climate is so mild that in some parts the vegetation is of a sub-tropical character, aloes and fig-trees, and even oranges growing in the open. The land is rich in minerals, the tin mines were long important, and copper, lead, iron, and manganese have been all worked, as well as china and terra-cotta clays, granite, marble, limestone and sandstone. Fish abound around the coasts. Apart from the gov. industries at Plymouth, the chief are the lace manuf. at Tiverton and Honiton, woollen goods and serges, boots and shoes, potteries, gloves, and paper-mills. Cider is made all over the co.

THE DEVONSHIRE COAST NORTH OF HARTLAND QUAY

Exhibition at Wembley from abandonment. He retired from public life in 1921. His son, Lord Hartington, who succeeded to the dukedom, was parliamentary under secretary of state for dominion affairs and from 1924 to 1938, member for W. Derbyshire.

Devonshire, S.W. co. of England, bounded by the Bristol Channel on the N., Cornwall on the W., the Eng. Channel on the S., and Dorsetshire and Somersetshire on the E. It is the third co. in size in England, with an area of 2604 sq. m. The surface is hilly, with the rugged plateau of Dartmoor, broken into numerous rugged 'tors', in the S.W.; Exmoor in the N.W., and Blackdown. On the lower slopes the soil is very fertile, especially in the dist. of 'South Hams' with its gardens and apple orchards. The coast-line of D. extends for about 150 m.; the N. coast is very rugged with cliffs 400-500 ft. high and great rocky inlets, of which the chief is Bideford Bay. On the S. coast are Bolt Tail and Start Point among others; and Tor Bay and Plymouth Sound, which is one of the finest harbours in the kingdom. The chief rvs. are the Tamar (59 m.), the Exe (54 m.), the Dart, the Teign, the Taw, the Torridge, and the Plym. Besides its

Besides Plymouth, the chief tns. are Exeter, the cap., Torquay and Paignton, noted health resorts; Tiverton, Barnstaple, Tavistock, Brixham, Dartmouth, Teignmouth, and Princetown on Dartmoor, the great convict prison. Among the famous men born in D. were Sir Francis Drake and Sir Walter Raleigh, Sir John Hawkins, John Davis, Sir Humphrey Gilbert, Sir Richard Grenville, John Churchill (Duke of Marlborough), Sir Joshua Reynolds, S. T. Coleridge, and Charles Kingsley. D. is considered by many to be unsurpassed as a region for the holiday-maker. Scenery, history, antiquities including age-worn cromlechs and circles, a graciousness in its people, a mild climate, all combine to interest alike the literary man, the artist, the photographer, and the walker. The co. returns seven members to Parliament. Pop. 734,000. See J. Prince, *Worthies of Devonshire*, 1701; R. N. Worth, *History of Devonshire*, 1886; S. Baring-Gould, *A Book of Dartmoor*, 1900; Victoria County History, *Devonshire*, 1906; F. Gribble, *The Romance of the Man of Devon*, 1912; V. C. Clinton-Baddeley and S. Palmer, *Devon*, 1928; H. Williamson, *Devon Holiday*, 1935.

Devrient, name of a Ger. family of

actors, particularly Ludwig D. (1784-1832), who was noted for his Shakespearean rôles, and his three nephews, Karl August (1797-1872), Philip Eduard (1801-77), and Gustav Emil (1803-72). The last was noted for his Hamlet which he played in London and Dresden. Otto D. (1838-94), the son of Philip Eduard, was also noted for his adaptation of Goethe's *Faust*, 1876. Other plays by him were *Tiberius Gracchus* (1871) and *Gustav Adolf* (1891). Max D. (1857-1929) was the son of Gustav Emil and followed in his father's profession.

De Vries, Hugo (1848-1935), Dutch botanist, *b.* at Haarlem, educated at Leyden and Heidelberg, and under Julius Sachs at Würzburg. After holding various educational posts in Germany, he accepted the professorial chair of botany in Amsterdam, where he applied himself to the problems of evolution as they affect plant life. In his botanical research work he was influenced by the Mendelian theories, and originated the theory of mutation. He made special use of the (*Eurotia lanuaciana*, or evening primrose, which now grows profusely in Europe, though originally a native of America. See essays in *Berichten der deutschen botanischen Gesellschaft*; and his prin. work, *Die Mutationstheorie*, 1901-03.

Dew (Old Eng. *deaw*), the moisture found on the surface of the earth during the night and early morning, particularly after a hot day, and produced by condensation of the vapour of the atmosphere on contact with the earth cooled by radiation. The old theory, dating from the earliest times, was that D. fell from above; it was Dr. W. C. Wells, of London, in his *Essay on Dew* (1814), who promulgated the above theory of radiation. He went on to say that for every definite pressure and temp. of the atmosphere there is a definite quantity of water-vapour which can be kept in suspension until it comes in contact with some cool substance, and is itself cooled below a certain temp., when the vapour will condense. This point of temp. is called the 'dew-point.' In 1885 Altken by experiments discovered that while undoubtedly some of the moisture called D. was the result of condensation of the atmosphere, the 'greater part' is formed from moisture 'just risen from the earth or to the surface of plant leaves.' During the night, when evaporation ceases to a great extent, the vapour still rising from the ground is either condensed at once on its cold surface, or is trapped by the grass or plant-leaves which have cooled even faster than the surface of the ground. D. can be formed only under certain conditions; wind prevents the atmosphere from remaining sufficiently long in contact with the earth to cause condensation, and a cloudy sky prevents it by checking radiation. When the temp. of objects with which the vapour comes in contact falls below freezing point, the D. is condensed into a solid substance and is called 'hoar-frost.' The average ann. deposit of D. near London is 1 to 1.5 in.

Dewar, Sir James (1842-1923), Scottish chemist and physicist, *b.* at Kincardine-on-Forth. He early developed a taste for music, and made violins. Educated at Dollar Academy and at Edinburgh Univ., where he assisted Lyon Playfair. Also studied at Ghent and later was demonstrator of chemistry at Edinburgh, and lecturer in the Dick Veterinary College. In 1875 became Jacksonian prof. of Natural Experimental Philosophy at Cambridge, and in 1877 was made F.R.S. and Kullerian prof. of chemistry at the Royal Institution, London. Among numerous other honours, he received the Rumford medal of the Royal Society in 1894, was the first holder of the Hodgkin's gold medal of the Smithsonian Institution, Washington, and the first Brit. scientist to be awarded the Lavoisier medal of the Fr. Academy of Sciences (1904). He was co-inventor with Sir Frederic Abel of cordite, made valuable experiments in spectroscopy and investigated the physiological action of light; but his 'low temperature' discoveries form his most valuable contribution to science. Besides being the first to demonstrate before a public audience the liquefaction of oxygen and air, he invented an apparatus by which liquid oxygen by the pint can be produced, devised vacuum-jacketed vessels (now known universally as thermos flasks) for the storage of liquid gases, first collected liquid hydrogen (in 1898), and finally (1899) succeeded in solidifying this gas as he had previously (1886) solidified oxygen. His experiments showing the gas-absorbing properties of cooled charcoal led, during the 1914-18 War, to the invention of antidotes to poison-gas. He was knighted in 1904; and died at the Royal Institution, London. See also BEILBY; CARBONISATION.

Dewas, two native states and tn. of Central India, governed by the descendants of the two brothers, Punwar Maharrattas. The cap., D., is situated 20 m. N.E. of Indore. The state of the senior branch (749 sq. m.) has a pop. of 77,000; of the junior branch (419 sq. m.) one of 70,000.

Dewberry, or *Rubus coccineus*, is a species of Rosaceae nearly related to *R. fruticosus*, the bramble. It receives its name from the fine waxy secretion which covers the black shining fruit and somewhat resembles dew. The fruit resembles the bramble in appearance, but is somewhat coarser and more acid, and the plant is also called the running briar or blackberry.

D'Ewes, Sir Simonds (1602-50), chronicler, was called to the Bar, but never practised. An M.P. in 1640, he was expelled from the House when Pride's purge was applied. A conceited pedant, a Puritan, and a moderate Royalist, he collected a number of historical records, which proved invaluable to Selden, but he is best remembered by his autobiography and letters, ed. by Halliwell (Halliwell-Phillips) in 1845, which form a contemporary review of public events up to 1636.

De Wet, Christian Rudolph (1854-1922), Boer general and statesman, *b.* at Farm Leeuwkop, Orange Free State, served in

the first war (1880-81) between the Eng. and his countrymen as a field cornet. From 1885 to 1897 he was a member of the Orange Free State Volksraad, and when the S. African War broke out in 1899 he became general and commander-in-chief of the Free State forces, fighting at first under Cronje in the W. He proved himself perhaps the most formidable of all the Boer leaders in guerrilla tactics. After capturing Sanna's Post, near Bloemfontein, and gaining soon afterwards the victory at Reddersburg, De W. showed himself a master in devising sudden manœuvres, falling unexpectedly on detached Brit. columns, and destroying a number of weakly garrisoned outposts. In 1902, whilst the negotiations for peace were in progress, he came to England with the other commandants, and in the same year pub. his narrative of the campaigns, the Eng. trans. of which is entitled *Three Year's War*. In 1907 he was elected a member of the new Parliament of the Orange Free Colony and also minister of agriculture. In the Closer Union Convention of 1908-9 he was a delegate. An ardent Nationalist at heart, he chose the picturesque rôle of the Dutch patriot rather than join the greater cause as a S. African. He gave expression to his views in 1911, when he joined General Hertzog, who was pursuing a separatist policy, and therefore seceded entirely from the S. African Party. He became an active member of the Nationalist Party, and the outbreak of the First World War gave him the opportunity of expressing his extreme views in an active form, for he headed a revolt against the gov. He was captured by Botha in Dec. 1914 and brought to trial on charges of high treason, on many of which he was convicted. He was sentenced to six years' imprisonment and fined £20,000. After being in captivity for a year, he was released on giving an undertaking not to engage in political agitation. He died at Bloemfontein.

De Wette, Wilhelm Martin Leberecht (1780-1849), Ger. theologian, b. at Ulla, near Weimar, came under the influence of Herder and later studied theology under Paulus. Prof. of theology at Heidelberg (1807-10) and Berlin Univ. His fearless and yet spiritual criticism of the Bible has earned for him a position aloof alike from such pure rationalists as Paulus and from the school of orthodox writers and supernaturalists. His chief works are *Commentar über die Psalmen* (1811), *Ueber Religion und Theologie* (1815), and *Einleitung in das Neue Testament* (1836).

Dewey, George (1837-1917), Amer. admiral, b. at Montpelier, Vermont, U.S.A. Graduated at the Amer. Naval Academy in 1858. He served with the Mediterranean Squadron until the outbreak of the Civil war, when he was made commander-lieutenant in charge of the sloop, *Mississippi*. He was in the fleet commanded by Adm. Farragut when the latter forced the passage between Fort St. Philips and Fort Jackson which guarded the entrance to the Mississippi some 70 m. below New Orleans. He also took part in

the action by which Farragut captured that great S. city and port. After the war D. was made commander in 1872 and captain in 1884. In 1877 he was an instructor at the Naval Academy. He was made a commodore in 1896, and when the Sp.-Amer. war broke out was in command of the fleet in Asiatic waters. He received secret orders to proceed to the Philippines and engage the Sp. fleet, which was lying in Manila Bay. Under the cover of darkness on the night of April 30, D. sailed his fleet of nine ships through without being discovered. The ten Sp. ships, under Adm. Montojo had the protection of the guns of Cavite, a tn. near Manila. The battle which ensued soon after dawn was short and decisive for the weight of metal was on the side of the Amers. By early afternoon the Sp. fleet was a mass of smoking ruins, and hundreds of Spaniards were dead or wounded. Not a single Amer. ship was disabled nor a single sailor killed. The news astonished the U.S.A., and D. became a popular hero. D. and his fleet participated in the capture of Manila. After the war was over, D. returned home, and was given a triumphant welcome. He was promoted admiral, and Congress gave him a sword of honour. He served on the first Philippine commission in 1899, and in 1901 was president of the court of inquiry into the controversy arising out of the naval battle of Santiago. See J. Barrett, *Admiral George Dewey*, 1899.

Dewey, John, Amer. philosopher; b. Oct. 20, 1859, at Burlington, Vermont; son of Archibald S. D. Educated at univ. of Vermont; Ph.D., Johns Hopkins, 1884. Prof. of Philosophy at univ. of Minnesota, 1888-89; of Michigan, 1889-94; of Chicago—where he was also director of the School of Education—1894-1904; and since then at Columbia Univ. where he was prof. of philosophy and later prof. emeritus. He has been termed a pragmatist: but his is not the pragmatism of Wm. James; it is more like the pragmatism of Peirce, and is more generally called instrumentalism. In Sept. 1929 he presided at the inauguration of a League for Independent Political action—intended to supply a new Labour party in Amer. politics. Works include: *Psychology* (1887), *Leibnitz's New Essays* (1888), *Critical Theory of Ethics* (1894), *Study of Ethics* (1894), *Psychology of Number* (1894), *The School and Society* (1899), *Studies in Logical Theory* (1903), *How We Think* (1909), *The Influence of Darwin on Philosophy*, etc. (1910), *German Philosophy and Politics* (1915), *Democracy and Education* (1916), *Reconstruction in Philosophy* (1920), *Human Nature and Conduct* (1922), *Experience and Nature* (1925), *The Public and its Problems* (1927), *The Quest for Certainty* (1930), *Art and Experience* (1934), *Logic, the Theory of Enquiry* (1938), *Freedom and Culture* (1940).

Dewey, Melvil, see CATALOGUES AND CATALOGUING.

Dewey, Thomas Edmund (b. 1902), Amer. lawyer and politician. He was educated at the univ. of Michigan and studied law at Columbia Univ. In 1925

he entered the legal profession, becoming in 1931 assistant to the U.S. attorney for the S. dist. of New York, and four years later he was appointed special prosecutor for the Investigation of Organized Crime in New York. In this capacity and in the more important position of district attorney for New York, to which he was appointed in 1937, he was prominently associated with the suppression of racketeering. He took an active part in the presidential campaign in 1940 on behalf of Wendell Wilkie, the Republican candidate, and his speeches during the campaign were pub. In the same year under the title *The Case against the New Deal*. In 1942 he was elected governor of New York, and his administration has been notable for its drive against inefficiency and corruption. His success led to his nomination as Republican candidate in the presidential election of 1944. He polled over 40 per cent. of the votes but lost the election to President Roosevelt by some three and a half million votes. In 1948 he was again defeated, by Roosevelt's successor President Truman. See R. Hughes, *Thomas E. Dewey*, 1944.

De Windt, Harry (1856-1933), Eng. explorer and journalist, acted as aide-de-camp to his brother-in-law, Rajah Brooke of Sarawak from 1876 to 1878. From 1887 to 1894 he divided his time between reaching France by land from Peking, travelling on horseback to India, via Persia from Russia, and inspecting the mines and especially the prisons of Siberia. In 1895 he was chosen Eng. delegate at the Penal Congress in Paris. His effort to cross from New York to Paris by land, undertaken in 1896 for the *Pall Mall Gazette*, ended in wreckage on the Behring Straits, but in 1901-2 he successfully accomplished the journey the other way round (Paris to New York) for the *Daily Express*. Was special correspondent of the *Westminster Gazette* in 1906, in the Balkans and Russia, the sequel being the illuminating book entitled *Through Savage Europe* (1907). Pub. also *My Restless Life* (1908), *A Woman in Black* (1912), *Russia as I Know It* (1916).

De Winter, Jan Willem (1750-1812), Dutch admiral, b. at Kampor. Entered navy at twelve. In 1787, fled to France. With Fr., re-entered Holland 1795; entrusted with reorganisation of Dutch Navy. Defeated by Brit. Adm. Duncan at Camperdown, Oct. 11, 1797; prisoner in England till Dec. Dutch plenipotentiary, France, 1798-1802. Reappointed to command of navy, subdued Tripolitan pirates. Marshal of France. Commander of sea and land forces of Holland under the Bonapartes. Died, Paris, June 2, 1812.

De Witt, Cornelius (1623-72), famous Dutch burgomaster and patriot, brother of J. de W. (q.v.), b. at Dort, of which he became burgomaster at the age of twenty-seven. Also a member of the states of Holland and W. Friesland, in which capacity he accompanied De Ruyter on his naval expeditions. It was through his influence that his more famous brother

became pensionary of Dordrecht. He supported his brother's policy with great ability and courage, notably when he sailed with de Ruyter after the proclamation of the 'perpetual edict'—of which he disapproved—abolishing the hereditary office of stadtholder. But after the defeat of the Dutch fleet the partisans of the House of Orange excited the hatred of the people against the two brothers, and Cornelius was arrested on a false charge of conspiring to poison the prince of Orange. Killed at The Hague in 1672, after rendering great service to his country as its chief magistrate for some twenty years.

De Witt, Jan (1625-72), Dutch statesman, b. at Dort, the son of Jacob de W., a burgomaster of Dort and deputy to the states of Holland, from whom he inherited his republican principles and hatred of the house of Orange. In 1650 he was elected pensioner of Dort, and opposed unsuccessfully the war against England. The disasters of the war made his pacific policy so popular that in 1653 he was elected grand pensionary of Holland for a period of five years, and was re-elected in 1658 and 1663. In the meantime William II., the Stadtholder, had died, leaving only an infant as heir, so that de W. was able to turn from his opposition to the family of Orange to international politics. In 1654 he negotiated a treaty with Cromwell with a secret proviso that no member of the House of Orange should be made stadtholder. On the accession of Charles II. to the throne of England the treaty of peace was rendered void, and in spite of de W.'s efforts for peace, war broke out again between the two countries in 1665. De W. conducted it with vigour and skill, and on the death of Adm. Opdam personally took command of the fleet, and by his diplomatic skill contrived the treaty of Breda (1667) and the formation of the triple alliance between Holland, England, and Sweden (1668) to frustrate the designs of Louis XIV. in Holland. Louis, however, bribed Charles II. to desert the alliance, and in 1672 suddenly invaded the United Prov. The action was too sudden to render preparation possible, and the people blamed de W., and appointed the young prince of Orange commander of the forces. Jan de W. thereupon resigned his office of pensionary. His brother, Cornelius, had been tried and acquitted on a charge of conspiring against William, and Jan de W. went to meet him on his release. An infuriated mob burst into the prison, probably at the instigation of their enemies, and murdered both brothers.

Dew Ponds, found on the upper reaches of the chalk hills in the S. of England and in a few other localities. They are used as a source of water supply for cattle, and it was once thought that they were entirely dew-, not rain-fed. See Gilbert White, *Natural History and Antiquities of Selborne*, (1789). However, this theory is rather doubtful, though artificial D. P. or reservoirs are sometimes constructed, it being necessary to fill the basin with water at the start.

Dewsbury, mkt. tn., municipal and pari. bor. in the W. Riding of Yorkshire,

England, on the R. Calder, 8 m. S.S.W. of Leeds, in the heart of the woollen district. Among the public buildings are the par. church of All Saints, with remains of early Eng. architecture (rebuilt in the eighteenth century), tn. hall (1888), St. Augustine's Grammar School, a covered market, and a theatre. Coal is worked in the neighbourhood, and there are iron foundries, and machine, dyeing, and glass works. The chief manufs. are blankets, carpets, druggets, and worsted yarn. D. is a tn. of great antiquity, and, according to tradition, Paulinus preached Christianity to the heathen Saxons on the site of the par. church in A.D. 627. The fourteenth-century court house of the rectory manor is used as a par. hall; Crow Nest Park is 73 ac. in extent. Pop. 54,000.

Dexter, see under **HERALDRY**.

Dexter Breed, see under **CATTLE**.

Dexter, Henry Martin (1821-90), Amer. Congregationalist minister. He was pastor of a church in Manchester, New Hampshire (1844-49), and later at the Berkeley Street church in Boston (1849-67), but also found time to edit the *Congregationalist* (1851-90) and the *Congregationalist Quarterly* (1859-66). Furthermore, he was the author of many treatises, chiefly on Congregationalism (1865-85).

Dextrine, or **British Gum**, the soluble or gummy substance obtained from starch by the action of diastase or certain acids on starch, or by heating starch to 392° F. (200° C.). D. and starch are related in structure, and both possess the empirical formula $C_6H_{10}O_5$. D. receives its name from its power of rotating the plane of plane polarised light to the 'right,' i.e. in a clockwise direction as viewed through the eyepiece of the polarimeter (q.v.). Pure D. is an odourless, whitish substance. It does not reduce Fehling's solution. It is often used as a substitute for gum-arabic for stiffening materials, sizing papers, and thickening ink; also for postage stamps and adhesive labels.

Dextrose, also called glucose, grape-sugar, and diabetic sugar, a carbohydrate of the formula $C_6H_{12}O_6$. It occurs in honey, grapes, in the body fluids of the animal kingdom, and in the urine of diabetic patients. It forms about 0.15 per cent of normal arterial blood. The sugar of grapes consists largely of D. as the fruit ripens, but when quite ripe it becomes 'invert' sugar, that is, equal quantities of D. and levulose. Pure D. crystallises in six-sided plates; it melts at 86° C., and loses its water of crystallisation at 110° C.; it is soluble in water but only slightly soluble in alcohol. Invert sugar or saccharum is used in the brewing industry. It is prepared by treating cane or beet sugar with dilute acid. The excess of acid is removed with chalk, and the product concentrated to a thick syrup. D. by itself is prepared from starch, which is treated with boiling dilute acid. The product is first a mixture of dextrin and maltose and then becomes D. In Britain the starch used for the manuf. of D. is usually (in normal times) sago, rice, or maize; in Germany, potatoes; and in

America, maize. D. is also used as the sweetening factor in jams, etc.

Dey (Turkish *dai*, a maternal uncle). Form of address originally given to elderly men and taken by the janissaries as the title of their commanders, a commanding officer of the janissaries frequently becoming governor of the prov. in which he served. The name was given to all rulers of Algeria (before the Fr. conquest), and was extended to Tripoli, and to Tunisia in the form 'bey.'

Dezhnev, or **East Cape**, most easterly point of Asia, situated at the entrance to Behring Strait in 190° E. A distance of about 56 m. separates it from Cape Prince of Wales on the Amer. shore.

Dhalac, **Dahalac**, or **Dahlak**, group of is. in the Red Sea, situated 30 m. E. of Massawa, Eritrea. They number three larger is., with numerous rocks. The chief, named Dhalac, was in Rom. times celebrated for its pearl fisheries. Pop. about 1900, of Abyssinian origin.

Dhar, stato in the prov. of Malwa, Central India. The tn. of D. is the cap., 35 m. S.W. of Indore. It contains several fine half-ruined mosques. Pop. 20,000.

Dharma-shastra, the title given to the whole code of Hindu law, but more especially to that collection of law received directly from a divine source by the sages of Manu, Tajnawalkya, and others. It is divided into three parts: *Acharya*, rules of conduct and practice; *Vyachara*, the administration of justice; *Prayachitta*, penance.

Dharmasala, hill-station in the Kangra dist. of the Punjab, India. It stands on a spur of the Dhaulala Dhar, and is surrounded by scenery of extreme beauty. The station was devastated by an earthquake in 1905, in which the barracks collapsed and buried a large number of the Gurkha garrison with their women and children. Pop. about 7000.

Dharwar, dist. and tn. in the prov. of Bombay, India. The dist. covers an area of 4536 sq. m. Cotton and wheat are the chief products, the former being of great importance. The cap. is D., with manuf. of silk and cotton cloth. A college in arts and science was opened here in 1912; there are also training colleges for teachers of both sexes, and Anglican and R. C. churches. The dist. jail is partly organised for juveniles on the Borstal System, the first of its kind in India, and there is a mental hospital. Pop. 36,000.

Dhaulagiri, or **Dhwalagiri**, peak of the Himalaya Mts., once regarded as the loftiest, but now known to be the third in height. It is 26,826 ft. above sea-level and is situated between Nepal and Tibet, in lat. 29° N. and long 82° 30' E.

Dhole, species of wild dogs (*Cyon* *decemcanis* and *C. alpinus*) found in packs in many parts of India. It is somewhat larger than the jackal, differs from the true dogs (genus *Canis*) in having fewer teeth, is fiercer and cannot often be tamed.

Dholpore, or **Dholpur**, native state of Rajputana (now Rajasthan, q.v.) India, having an area of 1200 sq. m. The dist. is very fertile. The cap. of the state, founded in the eleventh century, is also called D.

and is situated on the Chumbuh, 34 m. S. of Agra. The High School is housed in a building originally built as a mausoleum. In its vicinity, about 3 m. to the E., is an artificial lake upon whose banks are 114 temples. Pop. of state 230,000; of city 17,000.

Dhow, the regular Arab trading vessel of the Arabian Sea, and E. African coast; formerly used more particularly for the slave trade. It is generally from 150 to 200 tons burden, with a very long yard, and a single mast with a lateen sail. The language to which the word belongs is unknown.

ARAB DHOW

Dhrangadra, native state and tn. in the prov. of Bombay, India, situated in the division of Gujarat. The cap. D. is about 74 m. W. of Ahmedabad. Pop. state 90,000, tn. 20,000.

Dhuleep Singh (1837-93), a maharajah of the Sikhs, son of Runjeet (Ranjit) Singh, proclaimed in 1843. After repeated attacks on Brit. ter., D. S. was defeated at the Battle of Gujrat in 1849 and deposed. He became a Christian, married a Ger. lady, and took up his abode in England. In 1882 he demanded money of the Brit. Gov. The demand was refused, and he issued a proclamation to his former subjects and started for India. He was detained at Aden and publicly abjured Christianity, actually within the residency. In 1887 he returned to Europe and travelled through Russia, trying to find someone to take up his claim against England. In 1890 he was pardoned, but decided to remain in Paris, where he died.

Dhulia, tn. of India, in the prov. of Bombay. It is the cap. of the Khandesh dist., and is situated 128 m. S.E. of Surat. There are textile manufs. and an extensive trade in cotton. Pop. 30,000.

Dhulipnagar, or Bannu, see EDWARD-ABAD.

Dhunchee (botanical). Bengal hemp, a long strong fibre used in making cordage. It is derived from *Sesbania aculeata*, an E. Indian annual herbaceous plant of the family Fabaceae.

Dhwalgiri, see DHAULAGIRI.

Diabase, group of rocks consisting of augite and triclinic felspar with iron oxides, to which are sometimes added apatite or olivine. Owing to the weathering of these rocks, the augite, which is black, speedily changes to chlorite and urath, which cause the rocks to assume a green colour, whence its old name of green-stone is still sometimes used. The terms diabase and dolerite are used for different facies of the same set of rocks, the former being really a weathered form of the latter. Popular names for D. are trap, toadstone, and whin. They form excellent stones for road-mending, and are found in the N. of England.

Diabelli, Antonio (1781-1858), Austrian composer, b. at Vienna; also founder of a firm of music publishers. He is chiefly remembered by the fact that a waltz composed by him was used by Beethoven as the theme of his *Thirty-nine Variations on a Theme by Diabelli* (Opus 120).

Diabetes, a metabolic disease, the chief symptom of which is an excessive discharge of urine. There are two distinct varieties: *diabetes mellitus* (mel, honey), in which the urine contains large quantities of sugar, and *diabetes insipidus*, which is characterised by a chronic excess of ordinary urine. The tissues of a normal individual have a limited power of storing and utilising sugar; any condition which interferes with this power of the tissues may produce diabetic symptoms to a greater or less extent. The latest researches seem to point to the failure of the pancreas to produce insulin (*q.v.*), as the cause of chronic glycosuria, or *diabetes mellitus*. The function of insulin is to stimulate the liver to regulate blood sugar, excess sugar being stored in the liver as glycogen; in the absence of insulin, the concentration of blood sugar rises, until finally it appears in the urine. In some cases actual disease of the pancreas is reported, but in other cases D. exists with apparently healthy pancreas, and it is known that the disease can also be caused by abnormalities of the thyroid and adrenal glands. Heredity is an important factor. Dwellers in cities are more liable than country folk, men more than women, Jews more than other races living under the same conditions. D. in individuals under middle age is a particularly serious condition, in older people it yields more readily to treatment, though cures are rare. The symptoms are continual thirst, deficiency in perspiration leading to a harsh and dry condition of the skin, skin eruptions, and discharges of urine up to as much as thirty pints a day. On evaporating the urine crystals of sugar are found. The disease is most dangerous from the possible complications. Wasting of the tissues occurs and phthisis or pneumonia may attack the patient; other possible by-effects are boils, gangrene, and cataract. Disturbance of fat metabolism causes the formation of poisonous ketone bodies and diabetic coma. The most effective mode of combating the disease is a dietary which excludes all starchy foods and those containing sugar. Gluten

bread, bran cakes, and almond biscuits should take the place of ordinary bread; green vegetables, fat of meat, and cream should be taken; but no sudden change should be made in the dietary, and carbohydrates should be resumed if there are any signs of drowsiness, as diabetic coma is an ever-present danger. Insulin must be injected if dieting is insufficient to keep the blood sugar normal and to prevent its presence in the urine. *Diabetes insipidus*, or polyuria, has the same general effects on the system without the excretion of sugar characteristic of *diabetes mellitus*. It should be treated by a full diet and hygienic conditions and by the injection of pituitrin, an extract of posterior pituitary extract. See R. D. Lawrence, *The Diabetic Life*, 1931; O. Leyton, *The Diabetic's Vade Mecum*, 1939; R. D. Lawrence, *The Diabetic A.B.C.*, 1940. See also BANTING.

Diablerets, noted mt., or secondary mt. group, of the Bernese Alps, Switzerland, situated between the De Vaud and Valais cantons. The highest point reaches 10,650 ft. It consists of four peaks, composed of limestone resting on soft shale beds, which easily become disintegrated, and fall.

Diacetylmorphine, see HEROIN.

Diaconus. See HILARY.

Diadochi, Wars of the (323-281 B.C.), arose over the problem of dividing Alexander's empire among the D. (or Successors) — former generals and companions of Alexander. The chief among them were Antigonus, whose ambition was to rule the whole empire, Antipater, regent of Macedonia, Lysimachus, Seleucus, satrap of Babylon, and Ptolemy of Egypt. After Antipater's death his son, Cassander, murdered Alexander's widow, Roxane, and her infant son. Each of the D. then assumed the title of king, and the wars between them were resolved into a coalition of Seleucus, Ptolemy, Lysimachus, and Cassander against Antigonus and his son, Demetrius. Demetrius was successful in Greece, but Antigonus was finally defeated and killed at the Battle of Ipsus (301 B.C.). Later Cassander died, and Demetrius became king of Macedonia. Lysimachus, king of Asia Minor, was betrayed into believing his son, Agathocles, a traitor, but by murdering him he involved himself in a war with Seleucus, and was defeated and killed at Coron (281 B.C.). Ptolemy had died in 283, and Seleucus, the last of the D., relinquished his possessions, but was assassinated.

Diadumenianus, Marcus Opilius Antoninus, son of the Rom. emperor Macrinus, A.D. 217. His father bestowed the title of Caesar on his son at Antioch in the following year. The father was defeated in A.D. 218 by Elagabalus, and the son, who was still a minor, was put to death. Owing to the bestowal of the title of Caesar and his medals which bear it, D. is sometimes reckoned among the emperors.

Diageotropism, see GEOTROPISM.

Diaghilev, Serge Pavlovich (1872-1929), producer of Russian ballet, was b. at Perm in Novgorod prov. He studied law and music; and especially interested himself

in old Russian art. In 1899 he founded *Mir Iskusstvo* (the World of Art). D. held an unsuccessful exhibition of Russian painting and sculpture in Paris in 1906. In 1908 he was in Paris giving concerts and opera, and again in 1909 with opera and ballet. The ballet made a sensation — especially *Scheherazade* by Bakst and Fokine, music by Rimsky-Korsakov, the production of which in London in 1911 revolutionised Eng. stage-dancing. Altogether, he produced over forty ballets and opera. Died at Venice. See lives by A. Haskell, 1935; S. Lifar, 1945.

Diagnosis, in medicine, is the method employed to identify a disease. It includes an inquiry into the past medical hist. of the patient and sometimes of his family, as well as an examination of his symptoms and general physical state. In addition, the practitioner will take into consideration any relevant knowledge of environment, habits of life and psychological characteristics. Information acquired in these ways is supplemented by physiological tests, X-ray examinations, chemical and bacteriological investigation of the blood, urine, etc., and of the results of measurements of blood pressure, heart action and the like, with suitable instruments. Correct diagnosis is a matter of the greatest general importance, since failure to identify a disease or to recognise it at an early stage may lead to unfortunate results. Even before the rise of science in the last century and a half, diagnosis had been carried to a high degree of accuracy, but the modern physician has such an array of carefully collated material, scientific information and appliances at his disposal, that he need not rely as much upon his own personal experience. In doubtful or difficult cases, recourse should be made to specialists, since proper treatment of a disease can be made only when the disease has been definitely identified. Training in diagnostic method is an essential part of the medical student's course. It should be mentioned that recognition of symptoms is a difficult problem, completely beyond the layman except in very simple instances. Self-treatment is consequently to be deprecated, as likely to cause more harm than good.

Diagonal Scale, a mathematical scale consisting of a set of parallel lines drawn on a ruler with other lines crossing them at right angles and at equal distances from each other. The extreme div. of the divs. so formed is then further subdivided into a number of equal parts, and other lines drawn obliquely across the parallels through the points of intersection. With the aid of compasses, lines can be laid down by such a scale of any required length, down to the two-hundredth part of an inch.

Diagoras, of Melos, surnamed the Atheist, a Gk. poet and philosopher of the fifth century B.C., said to have been a pupil of Democritus of Abdera. He was accused of impiety, more especially of criticising the Eleusinian Mysteries, and in 411 B.C. was condemned to death in Athens (Aristophanes, *Clouds*, 425 B.C.)

He fled to Corinth, and probably died there. Besides his work on the mysteries, he wrote lyrics and some philosophical treatises, none of which are extant.

Diagram, in mathematics is a figure serving to illustrate a definition or to aid in the proof of a proposition. In its more general sense it is a drawing to illustrate the structure of scientific apparatus, engines, machines, buildings and so on, as opposed to a 'picture' to which emotional significance or artistic value is attached. The value of a diagram lies in its power of conveying essential information at a glance; when the diagram is drawn to scale, this information may be quantitative as well as qualitative. Weather charts, temp. and pressure curves, road maps, etc., are very largely diagrammatic. An *indicator diagram* shows the effective work done by an engine. Constitutional formulæ in chemistry are conventionalised diagrams of what is believed to be the corresponding molecular structure. Biological diagrams bring out the features of biological importance in the objects drawn.

Dial. The literary organ of the Transcendental Club, of New England, U.S.A., in the formation of which Club Emerson took a leading part (see EMERSON). Sarah Margaret Fuller (q.v.) was the first and only editor (1840), with George Ripley as assistant editor. The D. was a paper for cultured readers, which discussed questions of theology, philosophy, music, art and letters; and its pages contained much verse. Among its best known contributors were Emerson, Thoreau, and Louisa Alcott. The public, however, disliked its peculiar and abstruse opinions, especially those in the *Orphic Sayings* of Louisa Alcott, and though Emerson succeeded in keeping the paper alive for a short while after Sarah Fuller relinquished the editorship, it ceased to exist in 1844.

Dialect (Gk. *διαλεκτικός*, conversation, or manner of speaking), in its widest sense the name applied to branch languages springing from a common root, as the Romance tongues, Fr., Ital., Sp., sprang from a common Latin root. But the term is popularly used to express the divergence of some local form of speech from the generally accepted or 'literary' form. It is quite wrong to speak of such local forms as 'corruptions' of the accepted forms. The anc. Gk. tongue was divided into Attic, Doric, Ionic, and Æolic Ds. Modern Gk. is derived from the Attic form, in which the works of Thucydides were written, while Herodotus wrote in Ionic; no one will say that the tongue of Herodotus was a corruption of that of Thucydides. The origin of D. is not in corruption at all, but is the result of descent from a different form; in old England, as in old Greece, the country was inhabited by different races; the dispossessed Celts were driven into the mts., while the Saxons, Jutes, and Angles spread over the land. From a variety of causes the D. which survives as modern literary Eng. is the Midland, that spoken by a branch of the Anglian tribes, but the D. forms are not corruptions of the Mid-

land Ds., but the direct descendants of the Celtic, the Saxon, the Northumbrian, and other forms of speech. Eng. itself, for that matter, is merely a D. of the Teutonic tongue, modified and enriched by Norman-Fr., Lat., and many later additions from classical and scientific sources. After the A.-S. settlement of Britain, the language of the country was roughly divided into six main forms of local speech, again divided into many small groups, which still prevail with characteristic variants from the accepted language, the Southern, Western, Eastern, Midland, Northern and Lowland Scots. Modern provincial Eng. has been carefully studied, its origin, where possible, traced, and its locality recorded in the papers of the Eng. Dialect Society (1873-96). Upon these papers Prof. Skeat, of Cambridge, largely based his Eng. dialect dictionary, the first vol. of which appeared in 1898. He was assisted by Prof. Wright, of Oxford, who classified the various Ds. and obtained a unique collection of phonograph records to preserve the idiom, with its correct accent and intonation, of Eng. rustic speech in different localities. Sir J. A. H. Murray has done a similar work for the Ds. of Lowland Scotland, in *Dialect of the Southern Counties of Scotland* (1873). For further information, see A. J. Ellis, *Existing Phonology of English Dialects*, 1889; the works of Prince Louis-Lucien Bonaparte on Eng., Basque, Fr., and especially Italian Ds.; J. Winkler, *Dialektik*, 1874, for Low Ger. forms; and for hybrid Ds., S. Haldeman, *Pennsylvania Dutch*, 1872.

Dialectic, a term in logic generally applied to verbal fencing and abstract arguments without practical value, and frequently merely the clever statement of fallacies to make them pass for truth. The term was used in the Socratic philosophy to show the inadequacy of popular beliefs; Plato used it for the highest kind of thought connecting itself with the true nature or idea of things, while Aristotle limited it to a probable deduction from probable reasoning, as opposed to a scientific or demonstrative reasoning or proof. The Stoics divided logic into 'D.' and 'rhetoric,' and from their time D. is sometimes used as synonymous with logic. In modern philosophy the name has been used in several senses; Hegel uses it in its original Socratic sense, while Kant uses it in general for the doctrine of fallacies, for the uselessness of the attempt of reason to overcome the principles which govern phenomena.

Diallage, one of the pyroxene group of minerals characterised by its lamellar or foliated structure. The name formerly included 'bronzite,' from which it is very hard to distinguish it. Its colour is generally brown, but sometimes grey or green, and has a metallic lustre on surface of the broken crystals.

Dialogue, a conversation between two or more persons, reported in literary form and with a greater unity and continuity of subject than characterise an ordinary conversation. When joined to action the D. becomes a drama. It has always been

a favourite mode with writers who, wishing to convince their readers of the truth of an argument, present both sides of a question in the mouths of two characters, and conduct the conversation in such a way that one is finally convinced of the correctness of the other. The D. is of Gk. origin, having been adopted by the Gk. philosophers as the best way of conducting their investigations and conveying their instructions to their pupils. The Ds. of Socrates took the form of question and answer, so that the master by means of questions led the pupil to originate himself the ideas which he, the master, wished to convey to him. The form of D. adopted by Plato was modelled on the Sicilian 'mimes,' little two-character plays which were popular before his time, none of which is extant. Plato simplified it to pure argumentative conversations, or philosophical dramas, and used the form for all his philosophical writings except the *Apologia*. One of the greatest masters of this form of literature was Lucian (second century A.D.), the title of whose most famous collection of Ds., *Of the Dead*, was borrowed by two great Fr. masters of the form, Fontenelle (1683), and Fénelon (1712) in their *Dialogues des Morts*. It has also been used by Erasmus in Latin; Wieland, Herder, and Lessing among the Germans; Petrarci, Tasso, and Leopardi among the Italians. In England the most famous writers of non-dramatic D. are Berkeley in *Hylas and Philonous* (1713) and Lander in his *Imaginary Conversations* (1821-25).

Dialysis, the term in chemistry for the process discovered by Thomas Graham (1804-69), by which 'colloids,' such as silicic acid, can be separated from 'crystalline' substances, such as salt or hydrochloric acid. He found that if a solution of a crystalline substance, salt for instance, were placed in a 'dialyser,' a vessel provided with a bottom made of parchment or animal membrane, and the dialyser placed in a larger vessel of water, the salt would permeate the parchment, whereas a similar solution of a 'colloid' would not diffuse, remaining intact in the original solution. The process is performed more rapidly with an increase of temp.

Diamantina, riv. of Australia, also called Mueller's Creek, flowing from the high ground in the N. of Central Queensland in a south-westerly direction into S. Australia. In the dry seasons it dries up in the interior, but during the rains it flows into the N. end of Lake Eyre.

Diamantina, until 1838 Tejuco, mining tn. in the state of Minas Geraes, Brazil, built on a steep hillside, 3760 ft. above sea-level. It is the centre of a diamond dist. and gold is mined in its neighbourhood. It has manufs. of cotton-weaving, cigars, and diamond-cutting. It is the seat of a bishopric, and is the centre of a large commercial dist., famous for its wealth. Pop. of tn. 8000; of municipality 70,000.

Diameter, a term in geometry for the line which passes through the centre of a circle or a cone section, and which is terminated at either extreme by the curve.

Diamond, a form of crystallised carbon of very high value, which is usually regarded as the most precious of all stones. It is, however, not so valuable as the ruby. The D. is always found in crystals of the cubical system, and is found most frequently in the form of octahedrons, or rhombic dodecahedrons. The crystals are strongly striated and the cleavage is perfect. Contrary to general opinion, the D. is rather brittle and can be injured by the slightest fall. The stone has a lustre peculiarly its own, termed adamantine lustre. It has high refractive powers, the index for refraction being 2.4, and the angle of total reflection about 25°. The stone is highly phosphorescent, and will, after exposure to brilliant light, emit the rays to which it has been exposed and become self-luminous in the dark. Its specific gravity is just over 3.5, and its hardness is far greater than that of any other stone, and is indicated by 10 in the mineralogical scale. The chemical character of the D. was for a long time uncertain. During the seventeenth century it was held to be inflammable. Robert Boyle proved that when subjected to a high temp., part of it was dissipated, and finally, at the expense of Duke Cosimo of Tuscany, the Florentines proved it was combustible. Lavoisier later showed that the product was carbonic acid gas; finally, Smithsonian Tennant (1781-1815) demonstrated that the amount of carbonic acid gas produced equalled oxygen consumed. The composition of the D. was therefore determined to be pure carbon in a crystallised form. Experiments have also been made as to the action of heat on Ds., and Gustaf Rose showed that under certain conditions Ds. when subjected to a great heat were gradually converted into graphite. For a long time India was regarded as the only D.-producing country, and it is certain that the Indian gem was the only stone known to the ancients. The chief D. dists. of India are: the Golconda dist. in the Madras Presidency, the Sambulpur mines of the Central Provs., and in Bundelkund (q.v.). The D. production of India at the present time is not large. Brazil was not regarded as a great D.-producing country until 1727, when the Ds. were first noticed, having been used by the natives as counters in certain card games. These Ds. were, without reason, for a long time regarded as inferior to the stones of India. Formerly the State of Minas in Brazil was a famous centre of D. production, and it has been estimated that stones to the value of £12,000,000 have been taken from the D. fields since 1727. The States of Matto Grosso, Goyaz, and Bahia are now the chief centres of D. mining in Brazil, but the industry has suffered since the advent of mining in S. Africa. The black D. of Brazil is, however, largely used for diamond drills. In Europe Ds. have been discovered, but in no great quantity. Australia has also produced some, but these again are not of great importance. The most important D. fields are those of the Belgian Congo and of Kimberley, S. Africa, which were discovered quite by accident. Chief

among the Kimberley mines are those of the De Beer, the Du Toit's Pan and the Ragfontein, all controlled by the Diamond Corporation, Ltd., also the largest buyer of rough stones in the world. The largest individual mine, however, is the Mwadui, in Tanganyika (owned by Dr. J. T. Williamson) which employs 5000 Africans

S. African Government
PREMIER DIAMOND MINE, PRETORIA

and 100 Europeans, and was discovered in 1940. In the South African D. mines the average labour employed, including individual diamond digging, was (1938) about 4600 Europeans and 17,500 natives and coloured. There are also valuable D. mines in the Gold Coast, the Congo, Sierra Leone, and Angola. The most recent returns give the annual production in metric carats (gems and industrial stones) as follows (1946): Congo, 6,033,000; Gold Coast, 700,000; Union of S. Africa, 1,281,787; Sierra Leone, 559,229; Angola, 808,000; Tanganyika, 119,446; Brazil, 325,000. The value of Ds. owned throughout the world was stated to be £600,000,000 in 1918, one-half being owned by residents in the U.S.A. A number of the Ds. in existence at the

present time have remarkable histories. The largest of all known Ds. is the Cullinan D. found near Pretoria early in 1905. It weighs 3032 carats, or more than three times the weight of any known diamond. It is at present in the Brit. regalia. Another fine stone is the Orloff D. which figured in the sceptre of the Russian regalia. It was purchased by Count Orloff for Catherine II. of Russia, and is supposed to have been the eye of an Indian idol. The Pitt D. holds the second place. It was brought back from India by the grandfather of the famous Eng. statesman, Wm. Pitt, and sold by him to the Regent Orleans for £130,000. It is held to be the most perfect D. in the world. Amongst other famous stones may be mentioned the Florentine (133 carats), and the Koh-i-noor, the most famous of all the stones belonging to the Brit. crown. This stone, which weighs 106.5 carats, has a long and romantic history, and came into the possession of the Brit. Crown in 1850 after the annexation of the Punjab. Others are the Hope Blue and the Star of the South. The 'Vargas' D. (named after the President of Brazil, and said to be the third largest known in the world) was found in Minas Geraes in Oct. 1938. It was sold to a Dutch firm at 700,000 guilders. The chief centres of the D.-cutting and polishing trade are Antwerp, Amsterdam, and Palestine.

Diamond Necklace, The, a piece of jewellery made in Paris by the Court jewellers, Boehmer and Bassenge, in 1775, and intended for Madame du Barry, the favourite of Louis XV. Louis XV. died before the necklace was completed, and its price was beyond the reach of any purchaser (1,600,000 livres). Cardinal de Rohan, duped by an adventuress (calling herself Comtesse de Lamotte-Valois and pretending to be in the service of the queen) into believing that Marie Antoinette had expressed a desire for the necklace, bought it on credit. De Rohan, by the connivance of De Lamotte, was accorded an interview with the queen, personated by Demoiselle d'Oliva, in which she accorded him pardon for past offences and promised to pay for the necklace in instalments if he would act as security. Immediately on securing the necklace, De Lamotte and her husband disappeared and sold abroad the separate Ds. When the first instalment became due the jeweller obtained an interview with the queen and the whole truth was exposed. De Rohan and the girl Oliva were thrown into the Bastille, but acquitted after a sensational trial. De Lamotte and her husband were captured, the former branded as a thief, and the latter sent to the galleys for life. The question whether the queen and De Rohan were innocent in the matter and merely the dupes of De Lamotte was long debated, and resulted in an increased unpopularity for the queen. See T. Carlyle, *Miscellanies*, 'The Diamond Necklace', 1837; A. Lang, *Historical Mysteries*, 1904.

Diana, anc. It. goddess, identified by the Romans with the Gk. Artemis, whose

attributes she received. Her name is the feminine form of the Rom. Janus. She was the goddess of the moon and of light generally, and the protectress of slaves on account of the introduction of her worship into Rome by the plebeians, although, according to some accounts, Servius Tullius introduced the worship of D., and it was at first confined to the patricians. As the goddess of childbirth, she was worshipped as Lucina, and was regarded as the patroness of chastity, all her maidens being virgins. She is generally represented as the daughter of Jupiter and Latona, born on the is. of Delos. She was sometimes called the Huntress, and represented with bow and arrows. Other names for her were Phoebe and Cynthia. There was a magnificent temple to her at Ephesus and a grove at Aricia. See ARTEMIS.

Diane de France, Duchesse de Montmorency et d'Angoulême (1538-1619), natural daughter of Henry II. and Philippe Duc. She was twice married, first to Orazio Farnese, second son of the duke of Parma, and then to François, Maréchal de Montmorency. She was formally legitimised in 1547. She was a wise and prudent woman, and had great influence with her brother Henry III., whom she succeeded in reconciling to Henry of Navarre. She directed the education of Henry of Navarre's son, afterwards Louis XIII., and then retired into close seclusion.

Diane de Poitiers (1499-1566), beautiful Frenchwoman. In 1515 she married Louis de Brêze, Grand Seneschal of Normandy. Left a widow in 1531, she gained the affections of the king's son. On his accession to the throne as Henry II., in 1547, she exercised almost unlimited power, and was created by him Duchesse de Valentinois. On the king's death she was expelled from court by Catherine de' Medici (who took from her the beautiful Château de Chenonceaux) and died at the Château d'Anet. See Marie Hay, *Madame Dianne de Poitiers*, 1900.

Dianthus, a caryophyllaceous genus of beautiful plants which occur in temperate parts of Europe, Asia, S. Africa, and N. America. Most of them are perennial herbaceous plants, but a few are woody; they are distinguished from allied genera by the bracts under the calyx. *D. caryophyllus*, the clove-pink, a native of Britain, is a wild plant which has given rise to the cultivated carnation and the pink of the florists; *D. libanotis*, the Syrian pink, has feathered petals; *D. barbatus*, the sweet-william, is a beautiful hardy herbaceous plant of S. Europe; *D. chinensis* is a species cultivated in British gardens; while *D. deltoides*, *D. Armeria*, and *D. cæsius* grow wild.

Diapason, an anct. Gk. term for the musical interval of an octave. The name is given to the two foundation stops of an organ, the open and stopped D., and by the Fr. in 'diapason normal' as equivalent to 'pitch.'

Dispensicææ, a small natural order of dicotyledonous plants found in cold regions. *Diapensia lapponica* is a creep-

ing plant of tufted habit found in the Alpine and Arctic regions.

Diaper: (1) In textile fabrics, the name given originally to a rich silken fabric with a pattern of the same colour embroidered on it. It is now restricted to linen or cotton material with a simple pattern woven in it, generally of a geometrical design. (2) In Gothic architecture, a small pattern of a conventional nature, generally geometrical, but sometimes floral in design, used for the surface decoration of stone. The idea was probably taken from the diapered pattern of Byzantine silks, and was also used in glass painting and illuminated manuscripts. There are good examples at Westminster Abbey and at Bayeux Cathedral.

Diaphoretics, measures taken to promote perspiration. The function of perspiration is to carry away waste products of metabolism through the skin and to keep the body cool. In some feverish conditions perspiration often ceases, so that the skin becomes dry and the internal temp. is not prevented from rising. It is advisable in some of these cases to promote perspiration by means of hot air, as in the Turkish bath; hot vapour, as in the Russian bath; by taking hot drinks or drugs such as opium and certain aromatics.

Diaphragm (Gk. διάφραγμα, partition), a partition with a hole in it, which is used in landscape and portrait lenses as well as all optical instruments, such as the telescope, microscope, etc. It controls the rays of light, and throws up the image with greater clearness.

Diaphragm, or **Midriff**, the partition which divides the thorax from the abdomen. It is in the form of a dome, the lower parts consisting of muscle and the centre of a tendon; it is concave towards the abdomen and convex towards the thorax, where the central tendon forms a floor for the heart. It arises in front from the posterior surface of the ensiform cartilage; at the side from cartilages connected with the lower six ribs; behind from the lumbar vertebrae. It has three large openings: one for the œsophagus and pneumogastric nerves, one for the aorta, thoracic duct, and large azygos vein, and one for the inferior vena cava. When the muscular fibres of the margin contract, the convexity of the D. is lessened and the size of the thorax is increased. Air flows in to fill up the additional space, and this, together with other muscular movements, comprises the action of inspiration.

Diarbekr, cap. of the vilayet D., Asiatic Turkey, on a high mass of basalt rock on the r. b. of the Tigris, with a pop. of 98,000. Gold and silver filigree is made, and wool, mohair and copper ore are exported. D. is still surrounded with black basalt walls with four gates. It was fortified by Constantine in the fourth century, fell to Saladin in 1183, was conquered by Timoor in 1394 and by Sultan Selim I. in 1516. Three other vilayets were formed out of the V. of D. in 1923, Arghana, Mardin, and Severeck, leaving that of D. with a pop. of 215,000.

Diarrhid, or **Diarmait**, the name given to three Irish kings: the first was ruler over Níu Neill, and his father was called Fergus MacCabeill. He was slain in 555 by Columcille's kinsmen in revenge for his having hanged that individual. The second reigned from 658 to 665, whilst the third reigned over Leinster.

Diarrhœa, looseness of the bowels, resulting in copious ejections containing much fluid in which biliary secretions are often present. It is a symptom rather than a disease, and is specially characteristic of cholera, dysentery, and typhoid fever, and often accompanies liver disease, ulcerated bowel, and acute consumption. In other cases some temporary irritation of the intestines is the cause, such as may be produced by improper or unfamiliar food, putrid or poisonous substances in food, or catarrh as the result of a chill. Generally speaking, D. should be regarded as the natural effort of the bowel to get rid of irritating substances, and this tendency should be encouraged by mild purgative measures. D. is apt to continue after the predisposing cause has been removed, and as its effects are inconvenient and exhausting, astringents should be administered. During the acute phase of the attack, the patient should abstain from food and lie down as much as possible. Food of a light nature should then be taken: milk, arrowroot, toast, beef-julce, and white of an egg are suitable, while small doses of brandy form a useful stimulant. Opium is the most effective astringent, but its use is not always advisable: ipecacuanha, galls, iron and bismuth salts, chalk, and alum may be administered. Chronic D. is best combated by regulating diet. A patient with a constitutional tendency to looseness of bowel can tell from experience the diet which is suitable to his own case, and should avoid anything markedly different.

Infantile diarrhœa causes many deaths in the hot summer months. It may be avoided by strict attention to cleanliness. The milk should be sterilised and the bottle thoroughly cleaned after use. D. may also be caused by worms, tuberculosis, or teething. A tablespoonful of lime water to every three or four ounces of milk may cause it to be retained. In bad cases give four drops of brandy in a teaspoonful of warm water. Astringents should be given under the advice of a doctor. See also ENTERIC FEVER.

Diathrosis, term in anatomy applied to joints which have the power of free movement, such as the socket joint of the hip, or the hinge joint of the elbow.

Diary (Lat. *diarium*, from *dies*, a day), the book in which a daily record of events or observations made by an individual is written. The 'Ephemeris' of the Oks., which was the original name of the 'diarium,' was originally a memorandum of military records, tables of the heavenly bodies, or of accounts; it was not until after the Renaissance that the D. came to have any literary value. Since then it has often been of value to the historian, not only in its supply of facts often unrecorded in historical chronicles, but as a picture

of character and of the daily life of its writer's time. Among the most famous Ds. of Eng. literature are those of John Evelyn (1620-1706), Samuel Pepys (1633-1703), perhaps the most valuable and minute record in existence; Swift's *Journal to Stella* (1710-13), John Wesley's *Journal* (1703-91), Fanny Burney's *Diary* (pub. 1842-46). The D. of the Russian, Marie Bashkirtseff, created a great sensation in 1887, and that of Jules and Edmond de Goncourt in Paris in 1888. See A. Ponsonby, *English Diaries*, 1923.

Diastase, a species of ferment found in barley, oats, wheat, and potatoes after germination. It can be procured by placing a certain quantity of freshly germinated barley or ground malt in a mixture of three parts of water and one of alcohol, heated to 113° F. When obtained separately D. is a solid, white, tasteless substance, soluble in water and in weak alcohol. In solution at a temp. of 150° F., D. is powerful enough to break up starch first into dextrin and then into sugar, particularly the variety called 'Maltose.'

Diastole, see under HEART.

Diastylidæ, the typical genus of the Diastylidæ, a crustacean of the order Cumacea. *D. arenarius*, about one-fifth of an inch long, is found on the coasts of Georgia and Florida.

Diathesis, a condition of the body in which it is specially liable to certain diseases. The term is particularly applied to inherited or congenital predispositions which may, however, become observable only at a late period in life. In process of evolution, the human body has become a structure capable of adding to its substance by utilising food-material and of eliminating certain other substances, such as waste-products, bacterial and other poisons. While we can recognise certain sets of reactions as being typical of human bodily processes in general, it must not be forgotten that each individual has peculiarities of composition and structure. Certain constituents of various tissues may abound in a greater or less degree than the average, causing variations in chemical reactions which may appear inconsiderable taken separately, but in the sum of their effects may constitute a predisposition to being attacked by particular types of the agencies which threaten human health. Thus, there may be a constitutional lack of resisting power to the entrance of the tubercle bacillus. This condition is known as tuberculous D. The recognition of a D. is often important in connection with the treatment to be adopted for any morbid state, as it may indicate that certain remedial measures are best avoided in view of the patient's general condition. The tendency to some diseases may also be defeated by the adoption of a habit of life unfavourable to its development. The following are some of the chief types of D.: *Bilious D.*, one in which there is imperfect elimination of bile as a chronic condition; *calcareous D.*, a constitutional tendency to the formation of calculi or stones; *cancerous D.*, the imperfectly understood condition

where cancers are liable to form; *nervous*, or *psychopathic D.*, an extreme sensibility of the nervous system, generally accompanied by a tendency to derangement: *gouty, lithic, rheumatic, or uric acid D.*, a constitutional tendency to the accumulation of uric acid and urates in the body fluids and consequent liability to gout, rheumatism, etc.

Diatoms, a group of algae, also known as Diatomaceae and commonly called by botanists Bacillariae. These minute plants are invisible to the naked eye, and were first discovered by Loeuwenhook in 1702. Since then, no fewer than 10,000 species have been discovered. The D. exhibit a great variety of form, being either circular, disk-shaped, oval, or cuneate. They thrive best where they can obtain plenty of light and moisture, and are to be found mixed with other organisms on the surface of moist rocks.

Diatonic, a musical term derived from the Gk. use. In modern music it denotes the tones, intervals, and harmonies of the normal major or minor scale, as distinguished from the 'chromatic.'

Diavolo, Fra (1771-1806), It. brigand; nickname given to Michele Pezza, a famous It. outlaw, formerly a monk, appointed by Cardinal Ruffo to help recover Naples, which was invaded by the French in 1799. Made one of the leaders of the 'bands of the Holy Faith'; these bands consisted of peasants, convicts, and brigands, and they succeeded in thwarting the enemy's plans. Upon the accession of Joseph Bonaparte to the throne of Naples, a price was placed upon D.'s head, and he was eventually captured by some Frenchmen and shot. Auber's celebrated opera *Fra Diavolo* has immortalised the name of the brigand.

Diaz, Armando (1861-1928), It. soldier, b. at Naples, Dec. 5, 1861. Colonel in Tripoli war. Major-General, 1911. Director of Military Operations on outbreak of First World War. Lieut.-General, 1916. In 1917, commanded 23rd Corps on the Carso. After Caporetto, succeeded Cadorna as Chief of Staff. Victorious at Vittorio Veneto, Oct.-Nov. 1918. After Armistice, Inspector-General. Made Duca della Vittoria, 1921. Minister of war on estab. of Fascism. Resigned in 1924 with new rank of marshal. Died in Milan.

Diaz (or Novaes, or Dias), Bartholomeu (c. 1455-1500), a Portuguese navigator, famous chiefly for his discovery of the Cape of Good Hope. He resided at the court of King John II., where he came into contact with many scientific men. He was eager for adventures, and sent by the king on a further voyage of discovery along the W. African coast. On this journey he rounded the Cape of Good Hope and discovered Algoa Bay; he succeeded in finding 1360 m. of unexplored coast, but met with little recognition for his pains. Accompanied Vasco da Gama on one of his voyages.

Diaz, Don Juan Martin, see EMPECINADO.

Diaz, José de la Cruz Porfirio (1830-1915), president of the Republic of Mexico, b. at Oaxaca, sixth child and eldest surviving son of José de la Cruz

Diaz, a labourer, probably of mixed Span. and aboriginal strain, who died in 1833. Porfirio's mother was half-blood Indian. At fifteen he was placed in the local seminary to train for the priesthood; but in 1849 he refused to take orders, entering the legal profession instead. Took part in the 'War of Reform' set on foot by Benito Juárez, a governor of Oaxaca. Also took part in resisting the invasion of the Fr. and the Emperor Maximilian, and succeeded in entering Mexico City in 1867, when he resigned his command of the army and retired to his own native city. Disturbances soon arose in Mexico City, and at last D. was forced to come and set matters right. He entered Mexico City triumphantly in 1876, and was unanimously elected president, which post he held for eight terms; but in April 1911 he was deposed by the successful revolution of Madero, who succeeded him in the presidency. He died in Paris.

Diaz de Gamez Gutierrez, a Span. writer (c. 1379-1450). His prin. works is *Victorial*, first pub. with omissions (1782) under the title *Cronica de don Pero Niño*.

Diaz de la Peña, Narcisse Virgile (1808-1876), a Fr. painter, b. at Bordeaux of Spanish parents. First began painting on porcelain in a studio at Sèvres; later he painted figures richly attired in Oriental garb. Among his masterpieces may be included 'La Fée aux Perles,' 'Sunset in the Forest,' and the 'Storm.'

Diaz del Castillo, Bernal (1498-1593), b. at Medina del Campo, wrote a most faithful account of the conquest of Mexico under Hernan Cortes. Was himself one of the small band of faithful followers, and was consequently an eye-witness of the deeds of glory and brigandage narrated by him.

Diazo-compounds, a family of carbon compounds the first of which to be discovered was obtained by Peter Griess of Burton-on-Trent in 1858. They are characterised by the presence in them of the -N₂- group of atoms (hence the name, from the Fr. *azot*, nitrogen). The constitution of this group is sometimes -N=N- and sometimes -N≡N; in the latter case the compounds are known as *diazonium* compounds. Diazo-C. are most common in the aromatic (q.v.) sense, but aliphatic (q.v.) examples are known. Aromatic Diazo-C. are prepared by the action of nitrous acid upon cooled acidified solutions of primary amines. In the said state they are frequently very explosive, but this instability is less marked in solution, though even here they enter readily into numerous reactions and are therefore of great importance in synthetic chemistry. They are also used largely in the manuf. of drugs.

Dibdin, Charles (1745-1814), Eng. actor and dramatist, principally remembered to-day as a writer of sea-songs, the first of which, 'Blow high, blow low,' was introduced into *The Seraglio*. Many other songs were introduced into other plays and sketches long since forgotten. In all he wrote about 600 ray sea-songs, and it is by the best of these he takes his

place in Eng. letters. They have an excellent lilt, and some specimens of them may be found in anthologies. He wrote his autobiography, and called it *The Professional Life of Mr. Dibdin* (1803).

Dibdin, Charles Isaac Mungo (1768-1833), Eng. dramatist known as Charles D., Jr., who produced his plays for the most part at Sadler's Wells, of which theatre he was proprietor. He wrote over 300 pieces, including melodramas, farces, pantomimes, but only a few were printed. He was the illegitimate son of Charles D. (q.v.)

Dibdin, Laura Ormiston, see CHANT, MRS.

Dibdin, Thomas John (1771-1841), illegitimate son of Charles D. (q.v.), and, like his father, a writer of plays and songs, of which he is said to have written about 200 and 2000 respectively. Few among his numerous works have lived: among the best known are: *The Cabinet* (an opera, 1805), *Past Ten O'Clock* (a farce), the pantomime of *Mother Goose*, *The High-mettled Racer*, an equestrian piece for Astley's. He pub. his *Reminiscences* in 1827.

Dibdin, Thomas Fognall (1776-1847), nephew of Charles D. (q.v.), born at Calcutta; lost both parents when only four years old. He came to England and was adopted by an uncle. Chiefly famous as a bibliographer. Amongst other works he wrote: *Introduction to the Knowledge of Rare and Valuable Editions of the Greek and Roman Classics* (1802), *Bibliotheca Spenceriana* (1814-15), *The Bibliomania or Book Madness* (1809), *The Library Companion* (1825), *Reminiscences of a Literary Life* (1836), and *A Bibliographical, Antiquarian and Picturesque Tour in the Northern Counties of England and in Scotland* (1838). The famous Roxburghe Book Club was founded by him, and Earl Spencer was elected first president.

Dibon, or Dhibân, cap. of the Moabites, 540 B.C., off the shore of the Dead Sea, renowned for the discovery of the famous Moabite stone of King Mesha.

Dibothriocephalus Tapeworm, or **Bothriocephalus**, genus of Cestoda, or tapeworms, which belong to the *Platyhelminthes*. The species have 2 weak and flat suckers, the body is segmented, and the head has no hooks. *D. latus* is parasitic on man, and as its first stage occurs in fish it is found in countries where fish is not thoroughly cooked, as in Russia, Poland, Switzerland, and S. France. It may attain a length of 30 ft. *D. liguloides* occurs in China and Japan and grows to a length of 8 in.

Dibranchiata, the order of molluscs. It includes all existing Cephalopoda except the pearly nautilus, and is subdivided into the Decapoda, with eight arms and two tentacles, e.g. cuttle fish; and Octopoda, with eight arms only, e.g. the poulpe.

Dibrugarh, a tn. of India situated in Assam. It stands on the Dibru, and is the terminus of the Brahmaputra steamer navigation, and a railway terminus, and is one of the most attractive places in India. Its large European population have expensive industrial enterprises. In the

vicinity are petroleum springs and important coal mines. There are considerable tea plantations, and coal and tea are exported in large quantities. The tn. possesses sev. schools. Pop. 15,000.

Dicæarchus, Gk. peripatetic philosopher, the pupil of Aristotle and a friend of Theophrastus. He was b. a Messia in Sicily and fl. about 320 B.C. He wrote on history, geography, and philosophy, but only a few fragments of his works remain. The greatest of his writings were *Life in Greece*, discussing the moral, social, and political condition of the people, and *Lespiaci*, in which he tries to prove that the soul is mortal. The best ed. of the fragments of his work is by Fuhr (1841).

Dicæst, or **Dicæstes**, name given to those who served on the jury courts in Athens. They attained to the zenith of their power after the fall of Areopagus in the time of Pericles, 460 B.C. Any citizen thirty years of age or upwards was entitled to assume the duties of the dicæst, and the number of members varied from 1001 to 5001. The post was somewhat of a sinecure as the members were too much governed by party feeling and personal motives. They laid themselves open in consequence to the shafts of Aristophanes' satire in his comedy *The Wasps*.

Dice is the plural of the word 'die,' and comes from the Latin *dare*, to give. They are small ivory or bone cubes, the six sides of which are marked with black dots from one to six. These dots are so arranged that any two opposite sides on the cube always make up the number seven. Two D. are called a pair. They are used chiefly for gambling purposes, but they are also employed in backgammon and other games. D. boxes were made in ant. time of leather or wood or some equally suitable material, and so constructed that no trickery could be resorted to in the throwing of the D. Palamedes is said to have invented D. about the year 1244 B.C., but we have still earlier evidences of their use in Egyptian times. In the Brit. Museum, in one of the cases in the Egyptian gallery, is to be seen an ivory astragal, which belonged to the Queen Hatshepsut, 1800 B.C. The astragal, or knuckle, or hucklebone, was the name given to the bone in the hind leg of cloven-footed animals such as the sheep, goat, or antelope. D. corresponding to ours have also been discovered at Thebes. The astragal undoubtedly corresponds to the hucklebone which was used in the old game of 'chance bone,' which was played by children in old Brit. times. Again, this game of 'chance bone' finds a striking parallel in the game of hazard played by means of two D., in which the player who first throws is called caster, while his opponent is called setter. This game with D. was declared to be illegal in the reign of George II. By 13 Geo. 2. c. 10, 'all games invented or to be invented with one or more die or dice' were forbidden, backgammon or games on a backgammon board being sanctioned. The reason of this prohibition was not far to seek; D. throwing had singular attractions for a certain class of swindlers, and it was a very

common practice to use loaded D. This trick consisted in slightly weighting the sides of the D. bearing a small number. Gambling has existed among all nations in some form or another; the Gks. and the Romans made use of the astragal or talus, and loaded D. have been unearthed in Pompeii. The use of D. in England can be traced back to the earliest times, when the Britons learnt the practice of gambling from their conquerors the Romans and the N. nations.

Dicentra, genus of Papaveraceae in the sub-order Fumariaceae, consists of fifteen species of N. American and Asiatic plants. Sev. arb. favourite ornamental herbs in Britain, especially *D. spectabilis*, and *D. cucullaria*, or Dutchman's breeches.

Dicey, Albert Venn (1835-1922), Eng. jurist, b. at Claybrooke. In 1854, entered Balliol College, Oxford, where he took first class in classics in 1858. Called to Bar in the Inner Temple, 1863. In 1890 he was appointed Q.C. His prin. works are: *Lectures Introductory to the Study of the Law of the Constitution* (1885), *England's Case against Home Rule* (1886), *Lectures on the Relation between Law and Public Opinion in England during the Nineteenth Century* (1905).

Dichlorotrichloroethane, commonly known as D.D.T., a synthetic insecticide of the formula $\text{CCl}_2 \cdot \text{CH}(\text{C}_6\text{H}_4\text{Cl})_2$. It was first prepared in 1874 but its insecticidal powers were not observed until 1939. D.D.T. was widely used during the war of 1939-45 and was instrumental in preventing or checking typhus and other insect-carried diseases. It still finds extensive employment, but is being superseded by even more powerful insecticides such as Gammaxane (q.v.).

Dicholophus, see **CARIAMA**.

Dichotomy, in botany, a system of branching in which the main axis at its apex divides into two, and each of these branches divide again at their apices into two, and so on. When the two branches are equally vigorous, the D. is said to be bifurcate; if, however, at each div. one branch becomes more strongly developed than the other two more forms of D. occur; scorpioid, when the right and left branches alternately are the more vigorous and helioid, when always the right or the left is the stronger branch. In the two latter systems the successive bifurcations appear to form an axis on which the weaker branches appear laterally.

Dichroism, a property possessed by some doubly refracting crystalline substances of appearing of different colours when viewed in polarised light, the difference of colour depending upon the direction in which the luminous vibrations take place. The D. of crystals can be observed or tested by means of a simple instrument called a dichroscope or 'dichroscope.' It is simply a cleavage rhombohedron of Iceland spar with a weak magnifying lens. The crystal is held in a good light opposite one end of the instrument and on looking through it two images of the square hole are seen just touching each other. If the crystal is dichroic these will be of different colours

and the colours will change if the dichroscope is rotated between the fingers. The most remarkable dichroic substances are the magnesian mica from Vesuvius, the tourmaline and ripidolite, also the sapphire and ruby. The phenomena of D. are best seen in crystals with two axes of double refraction, notably in folite which crystallises in six- or twelve-sided prisms; these prisms, when seen along the axis, are of a deep blue colour, but when viewed in a direction perpendicular to it, assume a yellowish brown colour. Tourmaline is another notable example, being blood-red when viewed along the axis, but yellowish-green when viewed at right angles to it.

Dichroite, see **CORDERITE**.

Dick, James (1743-1828), Scottish philanthropist, b. at Forres in Morayshire, and at the age of nineteen went to the W. Indies, where he acquired a fortune, the chief portion of which he left for the benefit of parochial schoolmasters of Moray, Banff, and Aberdeen. The 'Dick Bequest' was reorganised in 1890, and placed under the management of thirteen governors.

Dick, James (1823-1902), b. at Kilmarnock, Ayrshire. He invented gutta-percha boots, and with his brother, Robert, set up a factory at Greenhead, Glasgow, for the purpose of making and selling boots and shoes. He also manuf. the balata belts which were used by the gold diggers in Johannesburg. He reaped a fortune, and gave a park to Glasgow and the Elmbank Institute to Kilmarnock, besides other benefactions.

Dick, Sir William Reid, Scottish sculptor, b. in Glasgow, Jan. 13, 1879, and studied at the Glasgow School of Art and in London. He first exhibited at the Royal Academy in 1908. In 1933 he became President of the Royal Society of Brit. Sculptors, and from 1934-41 he was a trustee of the Tate Gallery. His work includes a large number of portrait heads and busts, notably the bust of King George V. in the Mansion House, London, and of Lord Kitchener in St. Paul's Cathedral, also King George VI. and Mr. Winston Churchill. Of other work by him mention must be made of his Bronze Eagle for the R.A.F. Memorial in London and the Lion on the Menin Gate at Ypres. His statue of King George V. stands in Westminster, and at Coventry there is an equestrian statue of Lady Godiva by him. Since 1928 he was a member of the Royal Fine Art Commission, K.C.V.O., 1935; King's Sculptor in Ordinary for Scotland since 1938.

Dickens, Charles John Huffam (1812-1870), Eng. novelist, b. at Landport (Portsea), near Portsmouth (the house at which he was born was opened as a Dickens Museum in 1901). His father, John Dickens, a clerk in the navy pay office was then stationed at Portsmouth, where he lived in very precarious circumstances. Charles was the second of eight sons. In 1816 the family moved to Chatham, remaining there for some five years. About particular details of these early periods of his life but little is known. In *David Copperfield*, however,

the sketch of David's boyhood is in many points similar to his own, and Micawber is usually recognised as a sketch of his father. His education was of a most elementary nature, but, fortunately, his father possessed a small collection of the works of the old novelists, Smollett, Fielding, Goldsmith, and Defoe, together with *Don Quixote* and *Gil Blas*. The family fortunes soon began to decline. His father was careless and impecunious, and the family settled in a poor part of Camden Town. Then even the little education Charles had been getting came to an end, for his father's creditors refused to delay any longer, and consigned John D. to the Marshalsea Prison. His mother

CHARLES DICKENS

tried to support herself for a time by teaching children, and young Charles was sent to work in a blacking warehouse at Old Hungerford Stairs. The description of this period of his life is given in *David Copperfield* with a clearness and bitterness which showed how deeply these two years of humiliation affected the sensitive boy. He spent Sundays with his parents at the Marshalsea. These years, however, supplied him with much of that wealth of knowledge of low life, of the street, of the prison, and the poor, of which he was afterwards to make such marvellous use. In 1824 his father was enabled to pay his debts and Charles spent another two years at school, a private establishment at Hampstead, parodied as Salem House. In 1827 he entered the office of Mr. Blackmore, a solicitor, where he remained for over a year. His early ambition was still active, and his application great. He spent hours in reading at the Brit. Museum and in mastering Gurney's shorthand. His natural powers of observation were also used to the best advantage, as his delightful sketches of legal dignitaries of all ranks clearly show. His father was still in difficulties, but Charles now managed to make his entry into journalism as a parliamentary reporter.

In 1833 he made his first appearance as a creative genius. In the *Monthly*

Magazine for December of that year appeared the first of those sketches of contemporary manners, collected in 1836 under the title of *Sketches by Boz*. He also made some contributions to the *Evening Chronicle*. About this time the issue of sporting novels of a humorous character, embellished with plates far more important than the books, was popular. Messrs. Chapman & Hall were about to prepare a book of this kind dealing with the adventures of a club of Cockney sportsmen. Seymour, the famous rival of Crulkschank, had been engaged to provide the drawings, and D. was asked to write the letterpress. He pleaded his total ignorance of sport, and the plan was then changed to that of the Pickwick Club. On the suicide of Seymour, the sporting element was entirely dropped, and with 'Phiz' (Hablot K. Browne) as illustrator, D. succeeded in making *The Posthumous Papers of the Pickwick Club* an immortal work. The introduction of Sam Weller marks the beginning of his success. From the advent of this character the monthly parts were awaited with feverish anxiety, and even the adverse *Quarterly Review* was compelled to admit that the whole reading world was discussing the Pickwickians. In 1837 the work appeared in book form, and in the same year the new novelist set to work on the grim satire of *Oliver Twist*. It may be noted that thus early in his career D. laid his hand to the 'novel with a purpose,' and that here, as always, he uses the method of gross caricature, making use of satire which ever remains too ludicrous to become ill-tempered, and which, however true the note of indignation may be, never loses sight of the humorous element. Here, too, appears the pathos, inclined to sentimentality, and the deep melodrama which was to be a stain, if an unavoidable one, on so much of his later work.

At the beginning of the year 1838, while *Oliver* was not yet half finished, D. began the pub. of *Nicholas Nickleby*, a picturesque story pub. on the same lines as *Pickwick*, and commenced writing *Barnaby Rudge*. Much of *Nicholas* is poor and melodramatic, but some of the sketches are only a little short of his highest work. Mrs. Nickleby, partly drawn from his own mother, is one of the best characters, and the sketches of Dotheboys Hall and the travelling theatre are also noteworthy. On the completion of this work (1839) D. started a weekly periodical to be known as *Master Humphrey's Clock*, where *Pickwick* and the *Wellers* are again brought to life. In this periodical began *The Old Curiosity Shop*. In spite of the highly complicated plot this is perhaps the richest mine of Dickensian characterisation. The humorous sketches of Dick Swiveller and his bizarre surroundings are unexcelled, but, in spite of Landor and Jeffrey, the overdrawn pathos of Little Nell is almost universally condemned by critics. *Barnaby Rudge* (1841), under the influence of Scott, appeared in the same publication. Here again the plot is complicated, and the work is also noteworthy as being, with the exception of *A Tale of Two Cities*, the

only one in which D. dealt with the past. *Master Humphrey's Clock* then came to an end, and in Jan. 1842 D. started on his first Amer. tour. He was received everywhere with acclamation, so that his visit became a veritable triumph. However, he deeply offended Transatlantic feeling by the pub. of *American Notes* (1842), and on his return home he satirised Amer. democracy far more freely and effectively in *Martin Chuzzlewit* (1844), which is generally regarded as his greatest humorous work since *Pickwick*. It closes the great period of his observation and external caricature. Henceforward, almost all of his good work is autobiographical. Here, however, his delineation of London, particularly at Todgers's, forms an incomparable work, with Pecksnuff, Mrs. Gamp, Betsy Prig, and the Literary Ladies. Melodrama is again present with *Jonas Chuzzlewit*. In 1843 appeared *A Christmas Carol*, and the next two years were spent in a visit to Italy.

At the beginning of 1846 he took up the editorship of a newspaper, the *Daily News*, but soon afterwards relinquished this uncongenial post, and returned to Switzerland, where he commenced *Dombey and Son*. This work, publ. in 1848, was a great success, and entirely re-established his fortunes. It marks, however, the beginning of his falling powers, and contains in the death of Little Paul the great monument of D.'s sentimentality. In 1849 appeared *David Copperfield*, favourite of D. and of most of his readers. The earlier portions are best, for here the autobiographical note is the stronger. In 1850 D. started a weekly paper, *Household Words*, designed to form a training ground for aspiring authors, which was later continued under the title of *All the Year Round*. In 1852 came *Black House*, where he satirises the Courts of Chancery. Though containing the figure of Harold Skimpole, drawn from Leigh Hunt, it is somewhat dull and uninteresting. Two years later came *Hard Times*, where D. violently opposes the industrial doctrines of the Manchester school. It is clearer and more connected than his predecessor, but does not rank high among his works. Between these two, in 1853, had been pub. the vol. of *Christmas Stories*, containing 'The Christmas Carol,' 'The Chimes,' and other short works written at various times. To these must be put down almost the whole of the conventional idea of the secular or mid-Victorian Christmas, which is peculiarly English and Dickensian. It is important to notice that D. was the creator of this type, for he is generally associated with descriptions of Christmas in every mind. From 1855-57 *Little Dorrit* appeared, and here the loss of the old animal spirits and the spontaneous humour is grievously marked. By this time D. had finally taken up his residence at Gad's Hill in Kent, and an improvement is shown in *A Tale of Two Cities* (1859), which is genuine and powerful tragedy. It is the least characteristic of all his works, and is appreciated by many who do not relish his other books. Two years later comes *Great Expectations*, which

Swinburne and many other critics have judged the best of his works. His own life again furnishes many of the incidents, but the most notable thing is the improvement in art. His mastery of the difficult art of sustaining an atmosphere is also shown in his next work, *Our Mutual Friend*, published in parts during 1864-65. In spite of brilliant effects of characterisation, as in the case of Silas Wegg, falling powers are shown here, and the work has never been a popular one. In 1867 D. made a second voyage to America under pressure of pecuniary difficulties. He made an exhausting tour through the country, giving readings from his popular works. His effort was successful, and he returned home sufficiently reimbursed to set him at ease. He then retired to Gad's Hill, where he engaged himself on *The Mystery of Edwin Drood*, a work which he left unfinished. He died at Gad's Hill on June 9, 1870. The letters of D. to his wife, which number 136, were donated to the British Museum in 1899 by Mrs. Perugini, a daughter of D., on condition that they were not to be pub. during the lifetime of any of the children of D. The death of Sir Henry D. in 1933 following a street accident, released the Museum authorities from this stipulation. The letters which are bound and available for public inspection, contain nothing to throw any light on the differences between D. and his wife. Other letters were ed. by Georgina Hogarth and Mamie Dickens (1882, 1893), and by W. Dexter (1938). See J. Foster, *Life of Charles Dickens*, 1872-74, 1923; G. K. Chesterton, *Charles Dickens*, 1906; Sir W. Robertson Nicoll, *Dickens' Own Story*, 1927; R. Straus, *Dickens, a Portrait in Pencil*, 1928; Sir H. F. Dickens, *Memoirs of my Father*, 1928; E. Wagenknecht, *The Man Charles Dickens*, 1929; Osbert Sitwell, *Dickens*, 1932; Una Pope-Hennessy, *Charles Dickens*, 1945. See also G. Gissing, *Charles Dickens: a Critical Study*, 1898; Sir J. A. Hammerton, *The Dickens Companion*, 1910; G. K. Chesterton, *Criticisms and Appreciations of the Works of Charles Dickens*, 1911; W. G. Wilkins (ed.), *Dickens in America*, 1911; J. W. T. Ley, *The Dickens Circle: The Novelist's Friendships*, 1919.

Dickens Fellowship. This was founded in 1902 to encourage the study and discussion of Dickens' works, and to help to remedy those social evils which would have provided subjects for exploitation by Dickens. It issues a monthly magazine entitled *The Dickensian*, the first editor of which was B. W. Matz, and his successor, Mr. Walter Dexter. Dickens' children, Sir Henry F. Dickens, K.C., and Mrs. Kate Perugini, were both life presidents of the Fellowship; while many eminent men and women of letters to-day are members of the society. The first offices were rented in Whitcomb Street, but after various moves, the Fellowship was finally estab. at 'The Dickens House,' 48 Doughty Street, W.C. 1, where once Dickens lived and wrote. The house was acquired by the Fellowship as a permanent Dickens Museum and Library.

and as such presented to the nation : it is vested in a trust in which the London Co. Council, the Corporation of London, and the D. F. all participate.

Dickinson, Emily (1830-86), Amer. poetess ; b. on Dec. 10, 1830, at Amherst, Massachusetts, of an old-established Massachusetts family, of original Yorkshire stock. Her father, Edward Dickinson, a lawyer by profession, was of stern, jealous disposition, and remained an abiding influence in E. D.'s life until his death in 1874. She was, however, much in sympathy with him. She was educated at the Amherst Academy and the Mount Holyoke Female Seminary, and in 1854 visited Washington and Philadelphia. Soon after this, however, she became a voluntary recluse, never, save on two occasions, setting foot beyond her garden gate, and her renunciation is commonly supposed to have been caused by her father's opposition to her marriage. Her lover is unknown, although legend has been busy with his name, but it is now almost certainly authenticated that he was George Gould, a theological student, who five years after Emily's renunciation married another, and in 1862 was ordained. Having a sensitive mystical nature, E. D. composed her poetry in secret, and its existence was all but unsuspected. After her death, May 15, 1886, a collection of manuscripts was discovered by her sister Lavinia, and some unfortunately destroyed. The remainder were pub. in 1890 and were an immediate success. Her poems are short epigrammatic lyrics which may be grouped under such heads as Life, Love, Nature, Death. The verse has an exquisite and unusual music, her rhythms and her sensitive manipulation of words are peculiar to herself, and these qualities are combined with a rare sensibility and an original mind. In her perception of life emotion was at once followed by a newness of thought. With Emerson, whom she resembled in method, E. D. ranks as one of the greatest Amer. poets of the nineteenth century. Her collective letters were pub. in 1894 and *Complete Poems* in 1925, ed. by M. Dickinson Bianchi ; *Further Poems* appeared in 1929. See M. Bianchi, *The Life and Letters of Emily Dickinson*, 1924 ; J. Pollitt, *Emily Dickinson*, 1930 ; G. Taggard, *The Life and Mind of Emily Dickinson*, 1930.

Dickinson, Goldsworthy Lowes (1862-1932), Eng. author, was the son of Lowes D., artist. He was educated at Charterhouse and at King's College, Cambridge, where he later became fellow and lecturer. He was also a lecturer at the London School of Economics and Political Science. His works include : *The Greek View of Life* (1896), *The Meaning of Good, a Dialogue* (1907), *Justice and Liberty, a Political Dialogue* (1908), *Appearances, being Notes of Travel* (1914), *The European Anarchy* (1916), *The Choice before Us* (1917), *War : its Nature, Cause and Cure* (1923), *The International Anarchy, 1904-1914* (1926), *Goethe and Faust* (with F. M. Stawell, 1928), *After Two Thousand Years* (1930).

Dicksee, Sir Francis Bernard (1853-1928), Eng. painter. Educated at Henslowe's school, London, and studied painting under his father and at the Royal Academy. Gained the gold medal of that institute for his 'Elijah confronting Ahab and Jezebel in Naboth's Vineyard', 1876. He became A.R.A. in 1881 ; R.A. in 1891 ; and P.R.A. in Dec. 1924—when he was knighted. He belonged to the symbolic school of painters, and combined skilful draughtsmanship with subdued and tasteful colouring. Among his best works may be included 'Evangeline', 'The Symbol', 'Romeo and Juliet', 'Funeral of a Viking', 'The Magic Crystal', 'Paolo and Francesca', 'The Passing of Arthur', 'La Belle Dame sans Merci', and 'The Ideal'.

Dickson City, city of Lackawanna co., Pennsylvania, U.S.A., situated on the Lackawanna about 3 m. N.E. of Scranton in the anthracite region. Pop. 11,500.

Dickson-Poynder, Sir John, see ISLINGTON, BARON.

Dicotyledons, as distinguished from monocotyledons, constitute one of two large classes into which flowering plants are divided. One characteristic, from which the name is derived, is the presence of two (rarely more) cotyledons in the germinating seed. D. are subdivided into (1) Monochlamydeae, the members of which have flowers with a sepaloïd perianth or absent altogether, and often unisexual : to this belong the Urticaceae, Amentaceae, and other orders ; (2) Polypetalae, in which the flowers are hermaphrodite (i.e. contain both stamens and pistil), the perianth usually consists of calyx and corolla and the petals are free from one another ; (3) Gamopetalae, with hermaphrodite flowers, and petals joined.

Dictamnus Fraxinella, see DITTANY.

Dictaphone, see TALKING MACHINES.

Dictator (Lat. *dictare*, to command), the title given to an official of the Rom. republic whose earlier title was *Magister populi*. The office, as the earlier title suggests, was originally instituted in times of military crisis ; the first D. was appointed in 501 B.C., according to Livy, on account of a crisis in the war with the Latins. It was a temporary revival of the power of the kings with some limitations. One of the conditions usually enforced was that a D. should previously have held the office of consul. He was to be nominated by a consul, although in later practice it was the senate who indicated the nominee. To emphasise his superiority over the consuls, the D. was preceded by twenty-four lictors, instead of twelve, bearing the *fascies*. In a later period the appointment of a D. was not only practised in times of military stress, but of constitutional crisis as well, and for criminal jurisdiction ; this was the 'administrative' D., and he held his office for six months. Ds. appointed for minor purposes, to hold the elections, to conduct the games, and to preside at the festivals, were expected to resign their office as soon as they had completed their business. The other officers were not suspended when a D. was appointed ; they simply became subordinate to him and continued their

duties as his officials. In early times the D. had absolute power over the life and death of the citizens, but that power was limited by the *Lex Valeria* (300 B.C.). From the beginning his absolute power was checked by his being compelled to apply to the senate for money, and by having no authority outside Italy. Originally the office was confined to the patricians; C. Marcus Rutilius was the first plebeian elected in 356 B.C. The last regular D. elected was M. Junius Pera in 216 B.C. The office, as revived by Sulla in 82 B.C., was only similar in its bestowal of almost absolute power. He had himself elected 'for the estab. of the Republic,' and he held the office for three years. The dictatorship of Julius Caesar was even less provisional and constitutional. In 48 B.C. he was appointed for one year, in 46 B.C. this period of office was extended for ten years, and in 45 B.C. for life. After his death the office was abolished by Marcus Antonius in 44 B.C. In later times the title and powers of Ds. have been seized by usurpers and the heads of revolutionary movements, notably in the S. American States, in Haiti, San Domingo, and Mexico. It might have been thought that the steady advance of democracy along constitutional lines in general, and the particularly marked advance throughout the nineteenth century, would have precluded the possibility of the reappearance of any individual in the shape of a D. to bless or burden mankind. Yet such is the uncertainty in human affairs and so often does history repeat itself, that in Europe the period between the First and Second World Wars may justly be known as the age of the Ds. In 1922 Mussolini rose to supreme power in Italy and Mustafa Kemal in Turkey. Mussolini's example was followed in Spain by Primo de Rivera who set up a military directorate in 1923 with himself at the head. In Soviet Russia, on the death of Lenin, one chief power passed to Stalin, and it was largely by exploiting the fear of Bolshevism in W. Europe and appealing to an exaggerated nationalist sentiment that the two most powerful Ds.—Mussolini in Italy and later Hitler in Germany—consolidated and maintained their power. Lesser Ds. of the period were Marshal Pilsudski in Poland, Dollfuss in Austria, and Adm. Horthy in Hungary. The Fascist and Nazi dictatorship of Italy and Germany were swept away by the Second World War, and of the dictatorships set up on the same model before the war the rule of Gen. Franco in Spain alone survived. For further information, see separate articles under the names of those mentioned. See J. A. R. Marriot, *Dictatorship and Democracy*, 1935; A. Kohn, *Revolutions and Dictatorships*, 1939; *Essays in Contemporary History*, 1941.

Diets, mt. in Candia or Crete, one of the largest is. in the Mediterranean. The mts. of this is. are composed principally of free-stone or marble.

Dictionary, properly and most usually, a book containing a list of the words of some language arranged in definite order, usually following the alphabet, together

with explanations of these words. The term, however, has been generally applied to any work which professes to communicate information on an entire subject or entire branch of a subject, under words or heads arranged in alphabetical order. This alphabetical arrangement appears to be one distinctive mark of a D.; but it is also necessary that there should be some explanation or interpretation added to the words so arranged. Thus an index, in which words or titles are merely put down in alphabetical order, with nothing more than a reference to some page or passage appended to each, is not a D. When the phrase is actually quoted instead of a reference being given, the work is called a concordance. Further, although the order and arrangement of a D. be arbitrary, the work must profess some unity and completeness of design. As has been said, it must profess to go over a whole subject, or field of knowledge, of greater or less extent. Thus a mere list of miscellaneous particulars, even with explanatory remarks or comments annexed, is not a D., but a catalogue. A collection of plays or of pamphlets might be arranged in the order of the alphabet, but it would not on that account make a D. The earliest D. of which any portions are extant is *Δεξις* the *Onomasticon*, or Homeric Words, a lexicon to the works of Homer, written, according to Suidas, by Apollonius the sophist. Julius Pollux in the second century prepared an *Onomasticon* or Gk. D., with the words arranged in order of meaning. The most famous Gk. D., however, is that of Suidas (fifth century), giving an alphabetical list of words with details and illustrative quotations. It was first pub. at Milan in 1499. The first attempt at constructing a complete Arabic D. was made by Khalil ibn Ahmed of Oman about the middle of the eighth century, and his successors carried on his work till the end of the Middle Ages. Ds. of a kind are found in Sanskrit several centuries B.C., and special Ds. as well as literary compilations are also found in certain parts of the E. In Lat. lexicography, the earliest works of importance are those by M. Terentius Varro and the compilation of Pompeius Festus entitled *De Significatione Verborum*. In the eleventh and following centuries, note should be made of the D. of Papias, and the *Catholicon* of Giovanni Balbi. In the sixteenth century appears the first polyglot D. of Colepino, which in its later editions included eleven languages. The great classical Ds. of the present day are:—Greek: Liddell and Scott's *Lexicon* 8th ed. (1897); Pape's *Wörterbuch der Griechischen Eigennamen* (1845–50); Thayer's *Greek-English Lexicon of the New Testament* (1887); Thayer's revision of Sophocles's *Lexicon of the Roman and Byzantine Periods* (1870), and Contopoulos' *Modern Greek-English and English-Greek Dictionary* (1868); Latin: Doct's ed. of the *Totius Lexicon Latinitatis* (Trato, 1858–79); White and Riddle's *Latin-English and English-Latin Dictionary* (1862); Georges' *Deutsch-Lateinisches und Lateinisch-Deutsches Wörterbuch* (1880–1885); and the great work of the German

universities, the *Thesaurus Linguae Latinae* (1900-13). For Medieval Lat. recourse must be had to Du Cange's *Glossarium ad Scriptores Mediæ et Infimæ Latinitatis* (1772-84). Ds. have sometimes been divided into three main classes or descriptions: (i.) Ds. of words; (ii.) Ds. of facts; (iii.) Ds. of things; and although objections may be lodged against this method of distribution, it is sufficiently convenient for practical purposes.

1. *Dictionaries of Words*: This, as we have seen, is the original application of the word D., and the sense in which it is commonly understood when it stands alone. In this sense the word corresponds to the Gk. 'lexicon,' a word which seems to have been used by the Gks. in the modern sense. Some Ds. and vocabularies apply only to some particular author and work. The *Δέξας Ομηρικάς*, already referred to, was of this kind, and the Gk. classics have been well treated individually. Ds. of this kind usually confine themselves to the more difficult and unusual words, and are called *glossaries*, e.g. Tyrwhitt's *Glossary to Chaucer*, and the various Shakespearian glossaries.

2. *Dictionaries of facts*: This class comprehends Ds. of hist., biography, mythology, geography, archaeology, and all others that deal exclusively with things that have happened, or with facts that exist or have existed. Some of the old Gk. lexicons were Ds. of facts as well as of words: the lexicon of Suidas, for instance, is in the greater part made up of fragments of biography, hist., and geography, and often contains large extracts from various writers both extant and lost. The work of Stephanus Byzantinus, known as *Ἔθνη* or *Ἱστορίαι*, is chiefly a geographical and archaeological D., and is the oldest compilation of that description that exists. Its meagre details under each head assimilate it in some respects to an imperfect gazetteer. In modern times the number of Ds. that have appeared, purporting to give a view of a more or less extensive field of facts, has been very great. Besides the various historical, biographical, and geographical Ds., general and particular, and the bibliographical Ds., there are Ds. of antiquities, of architecture, of heraldry, of painting, of music, of botany, of law, of legal decisions, of commerce, of medicine, of surgery, of miracles, of dates, and of almost every other department of human knowledge.

3. *Dictionaries of things*: This division comprehends Ds. of all the abstract sciences, the mixed or applied sciences, the departments of criticism and the fine arts, and the whole range of metaphysical and moral speculation. It is true that most of these subject cannot be treated of without a reference to facts, but the facts here are not viewed simply as such, but either as subordinate to principles, or as modifying their operation. The remainder of this article will deal with the first class of Ds., and in these, in particular, much progress has been made during the century past. The present tendency towards completeness has led to the larger Ds. assimilating many of the peculiar

features of the smaller ones. Ds. dealing with equivalent words in different languages are generally small, since they are intended for beginners and details are few. Similarly, for convenience of reference, Ds. of synonyms, homonyms, etc., are generally kept distinct from the large works. The improvement of these works of reference has been particularly full and rapid in Great Britain. Progress is first seen in the idea of the aim of the work, and this may be seen by comparison with the works of the seventeenth century. The aim of Johnson's D. (1755) was to provide a final authority as to what words were admissible among correct writers and what meanings they were to bear. The lexicographer constituted himself the supreme arbiter in such questions. This idea continued to dominate Eng. lexicography until the time of Archbishop Trench, who was the first to apply sound philological principles to the subject and to emphasise the fact that the lexicographer must be, not the critic, but the historian of the language. The present conception of a D., which is finding its greatest expression in the *New English Dictionary*, has this philological aim in view of giving a full account of all words used in English from the middle of the twelfth century, a point fixed as the starting point of New Eng. It gives a historical survey of the changes of meaning which words have undergone, with quotations from writers of all times. It definitely originated from the suggestion of Archbishop Trench that some such work should be undertaken by the Philological Society, and its full title is the *New English Dictionary on historical principles, founded mainly on materials collected by the Philological Society*. The work was commenced under the editorship of Herbert Coleridge, who was succeeded by Dr. F. J. Furnivall. The publication was not commenced, however, until 1884, when the work began to issue from the Oxford Univ. Press under the editorship of Dr. (afterwards Sir) J. A. H. Murray. It was completed in 1928, and a corrected re-issue with introduction, supplement, and bibliography in 1933. The *Shorter Oxford Dictionary* by W. Little, H. W. Fowler, and J. Coulson, ed. by C. T. Onions, appeared in the same year. Great stress is laid on the etymological side of such a work, and in this department great accuracy has now been attained. The other dept., that of quotation, was already recognised by Johnson, though its use apart from the historical method is by no means so great. Since the great value of quotation is to show the various shades of meaning which may be given to a word by different writers at different times, and since etymology now gives a short history of a word from its first use to its last, it follows that the ideal can only be completely realised in a work of vast size and with a vast initial expense. It has, in fact, only been attained in the D. we have just discussed. The great pioneers of philological science were the first to introduce etymology into Ds. The introduction dates from 1854, when Jacob and Wilhelm

Grimm published the first vol. of the *Deutsches Wörterbuch*. Its main application in France was in E. Littré's *Dictionnaire de la langue française*, 1863-72, which was followed by various dictionaries, which might more properly be termed encyclopædias (*q.v.*) from the house of Larousse. Among other notable Eng. Ds. pub. in England may be mentioned Wyld's *Universal English Dictionary*, Skeat's *Etymological Dictionary* and reliable publs. by Chambers, Nuttall, Dent, Collins, Blackie, and Murray. In the U.S.A. the first D. of importance was Noah Webster's *American Dictionary of the English Language*, pub. in 1828. An outstanding philological D. was Whitney's *Century Dictionary* in 6 vols., 1889-91. Amer. Ds. in general use to-day are Webster's *New International Dictionary*, the *Standard Dictionary*, and, particularly for younger users, the *Thorndike Century Junior Dictionary* and the *Winston Simplified Dictionary*. See M. M. Matthews, *A Survey of English Dictionaries*, 1933.

Dictys Cretensis (of Crete), a native of Chios who is reputed to have followed Idomeneus to the siege of Troy and to have written an account of it. Lucius Septimius in the fourth century pub. an *Ephemeris* of the *Trojan*, which purports to be a lat. trans. of the (Gk. of Dictys. See N. E. Griffin, *Dares and Dictys*, 1907.

Didactic Poetry (Gk. διδακτικὴ = to teach) is poetry which openly expresses its intention of conveying knowledge or instruction. Aristotle considered that a didactic poem was no more than a treatise; but there are so many degrees of didacticism in poetry that while most didactic poems are very inferior as poetry some are great in spite of the didactic element, e.g. *Paradise Lost* is didactic in so far as it sets out with the dogmatic aim, 'to justify the ways of God to man.' The majority of notable Eng. didactic poems have a theological aim, e.g. the *Pæerie Queens*, which is essentially a vindication of Protestantism and Puritanism; and much of the poetry of Cowper, who fancied that the vehicle of verse might bring many to listen to truths (as he held them) which they would be disinclined to have stated to them in simple prose, is directed to theological tenets. The same poet's *Tirocinium* or *Review of Schools*, is yet more obviously didactic, being written to 'recommend private tuition at home.' Shelley again, in his more didactic poems, e.g. *Rosalind and Helen*, teaches that all the world is evil and will continue evil until some unknown conqueror shall appear and reform all evil. Thus poetry of very varying merit may be in greater or less degree didactic; but in a more restricted sense D. P. is rather that in which the precepts or teaching are not merged in exalted flights of poetic imagination but are set out dogmatically, as e.g. Tusser's (*q.v.*) *Five Hundredth Poyntes of Good Husbandrie* etc. In anct. poetry, the *De Herum Natura* of Lucretius (*q.v.*), a didactic poem on Epicurean philosophy, is the D. poem *par excellence*; and the *Georgics* of Virgil are also replete with precept, the Third Georgic containing prac-

tical precepts for farmers, and the Fourth giving much information about bees; but in both poets, though far more markedly in Virgil, the teacher is often dropped by the poet for the natural philosopher, speculating on the hidden reason of nature's operations. Bagehot, voicing the common opinion, thought that it was not the object of poetry 'to chill you with didactic icebergs,' but rather to select, idealise, purify and intensify the great features and peculiarities which make society as a whole 'remarkable and fancy-taking.' As poetry, D. P. is often commonplace, the matter not lending itself to the mode of expression which most appeals to the true poet, e.g. the precepts of the Ger. Minnesänger, Walther von der Vogelweide (*q.v.*) and Wolfram von Eschenbach, are often, in spite of the excellent moral lessons inculcated, told satirically.

Didcot, vil. of Berkshire, England, 4½ m. S. of Abingdon; an important railway junction and an Ordnance depot. Pop. 2000.

Didelphis, see *MARSUPIALS*.

Didelphys, see *OPPOSSUM*.

Diderot, Denys (1713-84), Fr. 'savant' and author, b. at Langres in Champagne. He was educated at the Jesuit College at Langres and the Collège d'Harcourt at Paris. He was intended for the Church, but on his expressing a distaste for it he was placed with a procureur in Paris to study jurisprudence. Evincing an equal distaste for the law, and refusing to return to his father's home, he was left in Paris to live by his wits. He tried many occupations, but continued at none—only defying starvation with his pen. He wrote anything and everything, indices, catalogues, advertisements, sermons, and trans. from Eng. His first important original work was *Pensées philosophiques* (1746) in which he set forth the doctrine of the band of free-thinking philosophers who arose at this time of reaction against the tyranny of the Church; the doctrine which he summed up in his own dying words: 'The first step towards philosophy is incredulity.' For his next work, *Lettre sur les aveugles*, he was imprisoned at Vincennes by order of the gov. On his release D. collaborated with D'Alembert as editor of a *Universal Medical Dictionary*, a scheme which later grew into the *Encyclopédie, ou Dictionnaire Raisonné des Sciences, des Arts, et Métiers*. The work was enormous, and owing to the retirement of D'Alembert, D. was sole editor for the greater part of the time. The first vol. was published in 1751, and the remaining sixteen, as well as eleven vols. of plates, in the years between 1751 and 1765. He embodied in his encyclopædia the philosophy which he had foreshadowed in the *Pensées philosophiques*, the dreary, rebellious philosophy of Atheism and revolt, a reaction against Jesuit predominance in the Church and tyranny on the throne, which he shared with his friend and great contemporary, J. J. Rousseau, and which was to lead to the Revolution. Among D.'s other works were the *Essay on Painting*, trans. and praised by Goethe; *Lettres sur les sourds et muets* (1751), *Pensées sur l'interprétation*

de la Nature (1754), *Code de la nature* (1755), the tales of *Jacques le Fataliste* (inspired by Sterne, 1897), and *Le Neveu de Rameau* (1805), the finest of his imaginative productions. This latter is a didactic novel profoundly criticising human nature and social life. *Les Bijoux Indiscrets* (1748), an extreme example of the coarser style which he sometimes affected; *La Religieuse* (1797), a novel directed against convent life; *La Promenade du sceptique* (1747); *La Révé d'Alembert* (c. 1755, not issued till 1830), *Lettres* to his mistress, Mlle. Voland, and his last work, *Essai sur la vie de Sénèque* (1778). The *Salons* (pub. posthumously), descriptions of the exhibitions of 1764-67, gave a strong impulse to art criticism in general, by establishing relations between art and literature, which previously had been largely dissociated. D.'s literary significance does not depend on any great work or works, but upon his versatility and universality and on that account he is of the highest importance in the hist. of eighteenth-century literature. In his last years he sank into a state of extreme poverty. Catherine of Russia, to relieve him, bought his library, but appointed him custodian and paid him fifty years' salary in advance. In 1773 D. visited St. Petersburg to thank the empress and returned to Paris only twelve days before his death. Collections of D.'s works were published by Nalgeon in 15 vols (1798), reprinted in 22 vols. (1821), and by J. Assolzat and M. Tourneux in 20 vols., 1875-77. See H. de Sainte-Beuve in *Portraits littéraires*, 1844; J. Morley, *Diderot and the Encyclopedists*, 1886; A. Collignon, *Diderot, sa vie, ses œuvres, sa correspondance*, 1895; J. Le Gras, *Diderot et l'Encyclopédie*, 1928; A. Billy, *Vie de Diderot* (with bibliography), 1943.

Didius Salvius Julianus, grandson of Salvius Julianus; reigned for only two months as emperor of Rome after Pertinax in A.D. 193. Distinguished in his earlier years for his industry and zeal. He won the throne of Rome through bidding the highest to the praetorian guards; the people would not brook this insult, and D. was eventually executed.

Dido, or **Elissa**, according to legend, was the daughter of Belus, king of Tyre, and the sister of Pygmalion, her successor. Pygmalion having murdered her husband, Acrabus or Sicheus (see Virgil), D. escaped with his treasures to Cyprus and thence to N. Africa, where she founded Carthage (Byrsa) on a piece of land bought from Iarbas, king of Libya. To escape from marriage with Iarbas, she built a funeral pyre and stabbed herself before her people. The version given by Virgil in the *Aeneid*, that D. stabbed herself after her desertion by Aeneas, the hero of Troy, is an anachronism, for three hundred years intervened between the legendary fall of Troy and the founding of Carthage.

Didon, Henri (1840-1900), Fr. preacher belonging to the Dominican order and influenced by his relations with Lacordaire and the theology of Aquinas. This influence was shown in his enthusiasm for a

reconciliation between philosophy and science. He was appointed to preach the funeral sermon over M^{onsieur} Darboy, the archbishop of Paris, who was murdered in 1871. His lectures on religion and science in Paris brought him into suspicion, and he was suspended, and had to seek retirement in Corsica. His most popular work was *Jésus-Christ*, pub. in 1890, and was the outcome of his visit to the Holy Land.

Didot, François (1689-1757), founder of a family of famous Fr. printers. Started in trade as bookseller and printer in 1713, and noted for his collection of the travels of the Abbé Prévost in 20 vols. (1747). *François Ambroise* and *Pierre François* made significant improvements in the arts of type-founding and paper-making. *Henri D.*, son of Pierre François, was celebrated for his microscopic eds. *Pierre D.*, son of François Ambroise, noted for his Louvre eds. of Virgil, Horace, and Racine. *Firmin D.* (1764-1836), his brother, distinguished as printer and type-founder, improving the point system of type sizes, which still bears his name (*Système Didot*); he also discovered the process of stereotyping, and published stereotyped eds. of the classics at a very reasonable sum. Other printers of note are his sons Ambroise Firmin (a Gk. scholar), and Hyacinthe, who worked together after their father's death. The former left a collection of MS. valued at two million francs.

Didsbury, tn. of Lancashire, England, situated on the Mersey. It is about 5 m. S. of Manchester, and forms a residential suburb for many Manchester people. Pop. 15,000.

Didymium, name given to a mixture of the two chemical elements *neo-didymium* and *praseodymium* before its dual nature had been ascertained.

Didymotichon, formerly called **Demotika**, tn. of Thrace, Greece, near the R. Maritza and the Sofia-Constantinople rly. Pop. 8200.

Didymus, (c. 63 B.C.-A.D. 10), Alexandrine grammarian and scholar; taught at Alexandria and then at Rome. Wrote many articles upon the Gk. poets and prose writers. His commentaries upon phrases and obscure words are helpful to students and grammarians.

Die, see **DROME**.

Diebitsch-Zabalkanski, Hans Friedrich Anton, Count von (1785-1831), Russian general. Made commander-in-chief of the Russian army, 1829. Chiefly famed for his passage of the Balkans, for which he received the titles of field-marshal and Count Zabalkanski.

Dieburg, tn. of Hesse, Germany, 8 m. N.E. of Darmstadt. Pop. 7000.

Diedenhausen, see **THIONVILLE**.

Diefenbach, Lorenz (1806-83), Ger. scholar, b. in Ostheim. Wrote an important work on Celtic origins called *Celtica* (1839-40), compiled the famous Lat.-Ger. *Glossarium Latino-Germanicum Medicæ et Infimæ Aetatis* (1857), a supplement to Du Cange's glossary (see *under* **DICTIONARY**); also a *Hoch-und-Nieder-deutsches Wörterbuch* (1885).

Dieffenbach, Johann Friedrich (1794-1847), Ger. surgeon, b. at Königsberg in Prussia. First studied theology, then became a volunteer. Finally entered the medical profession, and became one of the most famous surgeons of the day; was appointed prof. of medicine in the Univ. of Berlin (1840); was particularly successful in the art of forming new noses, lips, etc.

Diégo Garcia, is. dependency of Mauritius, in the Oil Is. group, in the Indian Ocean, in 7° 20' S. lat., and 72° 26' E. long., about 12 m. long by 6 m. wide. Has a good harbour and exports coconut oil, coconuts, copra, guano and salted fish. A large proportion of its 500 inhabs. are labourers from Mauritius. Lying, as it does, on the direct route from the Red Sea to W. Australia it is proposed to equip it as a calling place for a Commonwealth Reserve Air route. During the 1939-45 war its excellent anchorage was used as a refuelling base for naval vessels.

Die-hards, nickname in English politics which became current towards the end of 1918, when the Coalition Gov. under Mr. Lloyd George began to show signs of internal dissension, and to break up once more, as the electorate was already doing, into separate parties. Many Conservatives refusing their own present strength, desired to return to the original party system. The proposal to set up an Irish Free State with a Parliament in Dublin, revived many old controversies, and the extreme section among the Conservatives became more urgent in their demands for separation. At first the leaders of this movement were few in number and small in influence, and they were called D. almost in derision. But gradually their influence increased until at an important party meeting they found themselves to be in a majority of nearly three to one. The Coalition Gov. ceased to exist, and Mr. Lloyd George was succeeded in the premiership by Mr. Bonar Law.

Dielectric, or **Insulator**, according to Faraday, is the name given to those substances through which electrostatic induction takes place. When one body attracts another, viz. a molecule of dust, the action which takes place is called induction, and the intervening medium in which the action occurs is called the D. There are two kinds of D., the one is gaseous and includes air and all gases, the other is solid and includes such substances as glass, silk, vulcanite, resin, mica, and gutta-percha. Brass and all metals are good conductors of electricity, while porcelain, marble, slate, and stoneware are such bad conductors that they are used for insulating telegraph and telephone supports, or the bases of switchboards or stands, etc. In the same way the softer substances, silk, gutta-percha, and India-rubber, are used for insulating telegraph and telephone wires, or coils and wires in other electrical apparatus. The inductive effect of a given charge depends upon the D. surrounding the charged body, and the result obtained is called the specific inductive capacity. When hot, the power of a body is always diminished. Although air

is a D., should an electric spark pass through it, its insulating power at once breaks down, and it ceases to act as a D. In the same way solid Ds. lose their solidity and become cracked, if touched by an electric spark.

Diemen, Van, see VAN DIEMEN.

Diepenbeek, Abraham van (d. 1675), Flemish painter, b. at Bois-le-Duc either in 1596 or 1607. He became a pupil of Rubens, and afterwards studied in Italy. His drawing is sometimes defective, and his work is, at its best, but an imitation of Rubens; a copy of Rubens' 'Descent from the Cross' is D.'s finest work. He also illustrated Marolle's *Tableaux du Temple des Muses*.

Dieppe, seaport of France, in the dept. Seine-Inférieure, standing on the English Channel, 33 m. N. of Rouen. The tn. has a certain picturesqueness, with its high-roofed houses, and its streets running in lines parallel to the sea. Its castle used in modern times as a barracks, and the Church of St. Jacques date from the fourteenth and fifteenth centuries. The chief manufs. are cotton goods, lace, tobacco, and machinery. Shipbuilding is also carried on, and there is a regular service of steamers between this town and New-haven. The oyster culture and herring and mackerel fisheries are important. In normal times 800,000 tons of shipping enter and leave the harbour annually, which can berth 200 ships besides fishing-boats. It was a Protestant stronghold, but lost its importance after the Revocation of the Edict of Nantes in 1685. The tn. was the scene of fighting during the Second World War, notably during the Dieppe Raid (q.v.) of 1942. During the Ger. occupation it was bombed on a number of occasions, particularly in April and May 1944 before the Allied invasion of France. The tn. was eventually liberated on Sept. 1, 1944, by the Canadian First Army which was welcomed enthusiastically by the inhabitants after the Gers. had withdrawn. The port and installations suffered from bombing during the war and were partly demolished by the enemy before their retreat, but the tn. was not on the whole seriously damaged. Pop. 26,000.

Dieppe Raid, combined operations raid, carried out on the night of Aug. 18-19, 1942, by a force of 5,000 Canadian troops, a detachment of Amer. Rangers and some Brit. commando troops, embarked in naval vessels and transports and protected by warships and by a continuous fighter-plane 'umbrella' of the R.A.F. Its main purpose was to get information about the Ger. defences in the W. and on conditions to be expected in a large-scale assault on a strongly held Channel port. It was also hoped to compel the Ger. air force to give battle and thus to divert Ger. fighter-planes from the hard-pressed Russian front. Among the essential objectives were two powerful batteries of 5.9 c.m. defence guns at Berneval on the E., and at Varangeville on the W., of Dieppe, and a radiolocation station which played an important part in the Ger. attacks on Brit. channel convoys. The

most elaborate plans were made in advance, even to constructing models of the coastline with details gleaned from aerial photographs. The plan finally adopted was for landings to be made at over half a dozen points, preceded by a brief intense naval bombardment, followed by an attack of cannon-firing Spitfires and Hurricanes on the main defences. Tanks were to be put ashore to support the infantry in holding the garrison, while the selected objectives were being destroyed. The naval escort consisted of seven Brit. and one Polish destroyer and several motor gunboats and launches. But the raid did not go 'according to plan,' though it was by no means unsuccessful. The approach to the Fr. coast was betrayed through the ships running at 3.45 A.M. into some enemy armed trawlers, which, soon reinforced by other enemy ships, opened fire. The Brit. commander, however, decided to go through with the raid. Several craft disembarked men near Berneval in broad daylight, nearly 30 minutes late, and at once came under heavy fire. One commando made a sustained effort to destroy the heavy battery at Berneval but, being outnumbered, had at length to withdraw. At Varangeville, however, the assault parties succeeded—with mortar fire and aided by concentrated low-level attack by Spitfires, followed by a bayonet charge—at 7 P.M. in blowing up all six guns of the battery, but at great cost in casualties. For this exploit Capt. Porteous, who led the charge, was awarded the V.C. Despite heavy opposition, landing forces destroyed one other battery and the radiolocation station, besides inflicting heavy losses on the enemy and bringing away some prisoners. The assault on Dieppe itself was made by the Essex Scottish Regt. and the Royal Hamilton Light Infantry, but when they landed they at once came under fierce frontal and enfilade fire and numerous casualties were suffered by both regts. The twenty-eight tanks which were landed silenced the defences in places but could not give adequate support, since the anti-tank defences had not been overcome by the naval and air bombardment. The famous Canadian regt., the Fusiliers Mont Royal, came in as reserves, to reinforce the Essex Scottish, but they too suffered heavy losses, after getting ashore near the Casino, which, however, was taken. Pourville was taken by the S. Saskatchewan Regt., which unit accounted for many of the enemy. While the prin. objectives of the air operations was to support the landing parties, there in fact developed a great air battle. Between dawn and dusk Brit. aircraft destroyed 93 Ger. aircraft (including 43 bombers); a further 44 were probably destroyed and another 148 damaged. There is evidence to show that the Ger. loss may have been 170 machines. The Brit. loss was 98 planes. The results of the raid were of the highest importance but were purchased at a high price in lives. Of 5,000 Canadian troops engaged 3372 were killed, wounded or missing. The twenty-eight tanks were blown up by the Brit. forces before they re-embarked

nine hours after landing. See A. B. Austin, *We Landed at Dawn*, 1943.

Dierx, Léon (1838-1912), Fr. poet, who is chiefly noted for the following works: *Poèmes et poésies* (1864), *Œuvres choisies* (1867), *Poèmes d'un vaincu* (1871), *Poésies complètes* (1872). His *Oeuvres* were pub. in 2 vols. (1894-96).

Diesel Engine, internal combustion engine, using heavy oil as a fuel and introduced by Rudolf Diesel in 1897. Subsequently developed in various types by many engine manufacturers. It differed from earlier internal combustion engines in the method by which the fuel was fed into the cylinder. In gas and petrol engines the fuel was drawn into the cylinder during the suction stroke as a combustible mixture with the air; but in the D. E. the fuel was injected separately at the end of the compression stroke and no sparking plug or other ignition was necessary. The D. E. greatly increased the range of liquid fuels which could be used in internal combustion engines. See further under INTERNAL COMBUSTION ENGINE; MOTOR; RAILWAYS.—*Diesel Locomotives*.

Diesel, Rudolf (1858-1913), Ger. engineer, b. at Paris; prof. at Munich, inventor of the diesel engine—an internal combustion engine using heavy oil as fuel. He disappeared from a Harwich steamer while travelling to London.

Die-sinking, used in the process of stamping an impression on coins or medals. The steel to be engraved for the die is at first carefully prepared and then subjected to a process which softens it. It is next given over to the engraver, who, by means of small hard implements of steel, cuts the design which he requires, and which must be a reversed one. When this is finished it has to be subjected to another process which makes it extremely hard. It is then ready for use, and is known as the matrix. As, however, the process of engraving is very expensive, it is seldom that the matrix is used for the actual stamping process. Instead of this the impression is produced by considerable pressure in relief on a block of soft steel, which is known as the puncheon. The latter has to be hardened and it can then be used for conveying the design engraved on the matrix. Dies are also used in the manuf. of many other articles, as well as coins or medals. They are used in the manuf. of jewellery, such as clocks and watches, and also in stamping ornaments. The art of engraving dies dates from very early times, and very many ant. Gk. coins, which have been stamped in this way, are still preserved.

Dies Irae (Lat. Day of Wrath), a Lat. hymn on the Last Judgment (so called from its first words, based on Zeph. i. 14-18), composed by Thomas of Celano (d. 1255), a friar belonging to the order of St. Francis. This hymn was inserted by the Council of Trent as the sequence in the Requiem Mass. There are sev. Eng. trans. besides a paraphrastic rendering in Scott's *Lay of the Last Minstrel*. It is also the subject of a number of musical compositions, notably that by Berlioz in the *Symphonie Fantastique*.

Diest, tn. in Belgium, in the prov. of Brabant. It stands at the junction of the Rs. Demer and Bever. The duke of Marlborough took the tn. in 1705. There are numerous breweries. Pop. 9000.

Diet (Lat. *dies*, a day), term originally applied to a session or sitting of a body of delegates or dignitaries, and afterwards transferred to the bodies themselves. The word applied to both legislative and ecclesiastical meetings, hence the phrase 'diet of worship.' Compare also the famous 'Diet of Worms' held in Luther's time. Now the word is applied to assemblies held by the Ger. parliament.

Diet, the food of an individual considered as a whole particularly with regard

its nature to satisfy the physical needs of the inmates, but at the same time a certain degree of austerity is considered desirable, so as to minimise the attraction which might be felt by individuals disinclined to work for food.

The nutritive constituents of food are classified as proteins, fats, carbohydrates, water, mineral salts, and vitamins. There is no single article of food which contains all of these. *Proteins* are complete chemical compounds present in all living matter, and include such nitrogenous substances as form the body tissues. The chief are albumin (in white of egg), myosin (in meat), casein (in milk), globulin and fibrin (in blood), and gluten

Lucy Burdakin

Wm. Heinemann (Medical Books) Ltd.

TWENTY-FIVE CALORIES (APPROXIMATELY) IS YIELDED BY EACH OF THESE ARTICLES

Lettuce	Milk, 1½ oz.	Potato, 1½ oz.	Rhubarb, 19 oz.
Orange, 3 oz. (approx.)	Apple, 2½ oz.	Rice, ½ oz.	Banana, 1½ oz.
	Tongue, ½ oz.	Hazelnuts, ½ oz. (approx.)	
Cucumber, 9 oz.	Cheese, ½ oz.	Chocolate biscuits (2)	Sugar, 1 oz. (2 small lumps)

to its efficiency in maintaining the nutrition of the body. A *dietary* is an organised system of taking food, the various constituents, their amounts, and time of eating being established beforehand. *Dietetics* is a branch of medical science which deals with the composition of various foods and their effect upon the body. A dietary may therefore be established as part of the treatment of some morbid condition. This is particularly important in such diseases as diabetes where some constituents of ordinary food are likely to have a harmful effect owing to the disturbed metabolism of the body. In obesity satisfactory weight reduction may be achieved by a knowledge of food composition and the requirements of the body. In institutions, such as prisons and local assistance institutions and in public services, such as the army and navy, dietaries are necessary if only to regulate the actions of the officials immediately concerned in the distribution of the food supply. In prisons and local assistance institutions, the D. is dependent upon considerations of economy, efficiency, and discipline. The food must be sufficient in quantity and in

(in flour). First-class proteins are from animal sources: milk, cheese, eggs, meat, fish, etc., and second-class proteins are of vegetable origin: peas, beans, lentils, potatoes, etc. Of the protein necessary daily, 50 per cent. (about 1½ oz.) should come from 'complete' (animal) protein. Nuts also contain 'complete' protein. Protein must never be withdrawn from the diet for long, but the ration may be reduced to moderate proportions with beneficial results. Growing children and manual workers, however, require a larger amount of protein in their diet. *Fats and carbohydrates* supply the energy for the carrying on of vital processes. *Fats* include all animal fats such as suet, dripping, lard, bacon-fat, butter, cream, etc.; vegetable fats from olive oil, cotton-seed oil, nut butters, and margarine; and fish fats such as cod-liver oil, halibut oil, etc.

Mineral oils, as petroleum emulsions, though useful as internal emollients have no nutritive value, and if taken regularly may delay or even prevent the absorption of valuable constituents of food. Extra fat and sugar may be consumed with advantage in cold weather, or when extra

physical effort is made. Carbohydrates consist mainly of starches and sugar. Starches are present in considerable quantities in rice, potatoes, cereals, etc., and also in green vegetables, fruits, and nuts; glycogen might be called animal starch and is the form in which the body stores carbohydrates, and it is found particularly in the liver, muscles, and heart. Sugar is available in three forms: cane or beet sugar; lactose or milk sugar; and glucose and fructose from fruits and honey. The last two groups are to be preferred to the highly concentrated and refined white sugars, which, in solution, are an irritant to the tissues and may have a detrimental effect on the delicate lining of children's stomachs, and in adults it may even produce chronic irritation with serious consequences. The less refined products such as treacle, molasses, golden syrup and Barbados and Demerara sugar are to be preferred. *The salts* are sulphates, chlorides, phosphates, etc., occurring in animal and vegetable tissues, and usually supplemented by added sodium chloride, or common salt. There are numerous other mineral matters needed for normal growth and functioning of the body. The chief are: calcium, phosphorous, iron, magnesium, sodium, iodine, etc., and if one or other of these is lacking in the diet, ill-health or even death may result: goitre, or Derbyshire neck (also prevalent in Switzerland), can be prevented or sometimes cured by minute quantities of iodine taken into the body, from the sea air, from iodised salt included in the diet, or the addition of iodine in the water. The chief sources of mineral dietary elements are: milk, cheese, eggs, cereals, fruits, and vegetables. Vegetables should be fresh and either eaten raw or cooked in very little water to preserve valuable vitamins and minerals. *Water* is a solvent, and although most of our food contains fluid which supplies the body tissues and allays thirst, it does not supply the solvent which is necessary for the removal of waste matters from the system. A certain amount of pure soft-water (4-6 pints) should be drunk daily (tea and coffee are solvent fluids, but milk-made cocoa is not). A healthy diet should contain a certain amount of roughage, i.e., matter which acts as ballast and cannot be absorbed. This is present in the indigestible fibres of vegetables, fruits, wholewheat, and bran. *Vitamins* are substances of vital importance to life and growth and aid the body to resist infection. The best known are called (for the sake of simplicity) A, B, C, D, and E, each of which is indispensable, and one vitamin cannot deputise for another. Vitamin A (anti-rachitic) is necessary for growth, and gives protection against colds and bronchial affections. It is present in cod-liver oil, fish roe, egg yolk, butter, cream, suet, and fresh vegetables. Lack of this vitamin slows down or completely ceases growth, eye troubles develop, and rickets result. Vitamin B (anti-neuritic) is found principally in the seeds of plants, e.g., wholemeal wheat, rye, maize, whole

barley, whole rice, nuts, egg yolk, yeast, vegetables, fruits, peas, beans, lentils, carrots, potatoes, oranges; but not canned fruits or vegetables. A subsidiary vitamin, Vitamin B₂, or BB, is found in those foods, and also in the lean of meat, and through lack of it, people die of a disease called pellagra. Lack of Vitamin B causes beri-beri, a tropical disease, usually found in persons who live on polished rice. *Vitamin C* (anti-scorbutic) protects the body from scurvy but man must be deprived of this vitamin for several months before symptoms of this disease are apparent. A general feeling of depression, dizziness, irritability, etc., may, however, be due to incipient scurvy. Vitamin C is present in all fresh fruits and vegetables, particularly oranges, lemons, tomatoes, black-currants, and also rose hips. Rose hip tea is recommended on account of the remarkable richness of its vitamin C content. Vitamin C is the vitamin most easily destroyed by heat and oxidation; and through shortage of fresh fruit and vegetables it is likely to be absent from the diet in the winter and early spring. *Vitamin D* is generally found in the same foods as Vitamin A, but is distinct from it, and is essential for the calcification and normal growth of the bones. *Vitamin E*, necessary to fertility, is found in cod-liver oil, in various vegetable oils, and in whole wheat, oats, and lettuce.

The average man requires daily, 2700-2800 grms. of water; 30 grms. of salts; 70-150 grms. of proteins; 30-80 grms. of fats; and 340-570 grms. of carbohydrates. Man needs about 3000 net calories a day, but feeding by the theoretic caloric value of food presupposes perfect metabolism, whereas some foods are incompatible with others and should not be eaten together.

Metabolism may be defined as the sum total of all chemical processes which go on in the body, e.g., changes in the living cells providing vital processes and assimilating new material to repair waste. It is possible to measure the amount of heat produced by a man (after fasting for 15 hours and at rest) per square metre of body surface per hour, and this heat production, or metabolism, is known as *basal metabolism*, and the following table gives the average values in calories. A calorie is the amount of heat required to raise 1 kilogram of water 1° C.

Age	Basal Metabolism (Calories per sq. metre per hour)	
	Boys	Men
12-13	50	
20-50	40	
20-50		37

For example, the surface area of a normal man of about thirty years, height 5 ft. 8 ins., and weighing 11 stone, is 1.8 sq. metres; and the basal metabolism is therefore 40×1.8 calories per hour, i.e., 72 calories per hour. In twenty-four hours he produces 1728 calories, and this is the amount of heat produced basally, i.e., without food and at rest. Work will, of course, increase the metabolism, and the source of the increase must either be

his own tissues or his food. A diet can be calculated on the basis of the amount of work a man is to perform, but normally the organism regulates automatically (by means of appetite) the quantity of food. The amount of energy obtainable from a diet will depend not only on its quantity, but also on its make-up. The heat obtainable from a given food is called its calorific value. In 1933 a committee was appointed by the B.M.A. to determine the minimum diet for the maintenance of health and working capacity. It was agreed that, as about 10 per cent. of food is undigested and passed out of the body as waste matter in the faeces, the calorific value of food as purchased should be 3300-3400 calories for a daily requirement of 3000 calories for the average man. The food needs of the adult male are taken as the measure of unity; a woman or child requiring a fraction of this. This fraction is known as the 'man-value.' For example, a child of six to eight years requires six-tenths of the calories of the adult male, but these should, of course, be derived mainly from milk and dairy produce. For tables showing the approximate number of calories required for the average child and adult see FOOD AND FEEDING.

A normal diet should be varied, palatable, and contain sufficient calories in certain proportions made up of proteins, fats, and carbohydrates. In addition, fresh fruits and green vegetables should be taken daily to ensure an adequate supply of vitamins and mineral constituents. Solvent fluids must be included, and also roughage to act as ballast for the elimination of waste products. (See COOKING, FOOD AND FEEDING, etc.) See also R. H. A. Plimmer, *Analyses and Energy Values of Foods*, 1921; V. Knages, *Things that count in Diet*, 1928; V. A. Plimmer, *Food, Health, Vitamins*, 1928, 1940, and *Food values at a Glance*, 1935; R. Diethylamine, one of the three types of

amines (*q.v.*), produced by the action of ethyl halides on ammonia in alcoholic solution. It is colourless and inflammable, soluble in water, and boiling at 57.5°. It is a basic substance and forms salts with acids. Formula: $(C_2H_5)_2NH$.

Dietrich, Johann Wilhelm Ernst (1712-1774), Ger. landscape and genre painter, b. at Weimar. First instructed in the art by his father, then studied under Alexander Thiele. His pictures were exhibited in the art galleries at Dresden, Paris, and London; and he secured the patronage of the kindly Count von Bruhl.

Dietrich of Bern, see THEODORIC THE GREAT.

Dieulefit, small tn. in the dept. of Drome, France, and famous in the sixteenth century as a resort of the Calvinists. Pop. 2500.

Dieuze, or Duze, tn. in the dept. of Moselle, France. A mine near the tn., in activity since early times, still yields rock salt. D. also manufs. chemicals. Pop. 3000.

Diez, Friedrich Christian (1794-1870), Ger. philologist, b. at Glessen in Hesse-Darmstadt. Appointed Prof. of Modern Literature in 1830 at the univ. of Bonn. His most important works are his *Grammatik der Romanischen Sprachen* (1836), and his *Etymologisches Wörterbuch der Romanischen Sprachen* (1853); these two works may be said to have laid the foundation for the study of all the Romanic languages. An Eng. trans. of the introduction to the former work was made by Cayley in 1863. Other important contributions made by D. to literature are: *Die Poesie der Troubadours* (1826), and *Leben und Werke der Troubadours* (1829).

Difference and Finite Differences, in mathematics mean the excess of one quantity over another. This fundamental meaning of the term is almost lost in the higher parts of mathematics from the association of it with a methodised theory, derived from the consideration of the differences presented by successive quantities which follow a regular law. Summation of a series by the method of finite differences is a calculus of differences employed in problems involving interpolation or relating to annuities. By the operation of taking differences in this sense, we may find the rational integral function of the number of terms in a series or the general term of a series, when a certain number of the terms of the series are given. That is to say, the regular law of the series not being known by inspection, we proceed to take the first order of differences, viz. by subtracting each term from the term which immediately follows it and so forming a new series called the series of the first order of differences; then by repeating the process we get the series of the second order of differences, and so on until a series of regular or known form is arrived at, e.g. take the series -1, -3, 3, 23, 63, 129, ... and let a_n denote the general term of the series, and n the number of terms in the series. The successive orders of differences are:

-2, 6, 20, 40, 66
8, 14, 20, 26, ...
6, 6, 6

That is, the third order of differences gives equal terms, and a_n , the rational integral function of n , may be assumed $= v + x_n + y_n + z_n$. Putting 1, 2, 3, 4 for n in succession, we find $v = 3$, $x = -3$, $y = -2$, $z = 1$, and that the general term of the series is $3 - 3n - 2n^2 + n^3$.

Differences, a term used on the Stock Exchange to denote the amount of variation between the price at which it is agreed to buy or sell securities on a fixed day and the actual market price of the securities when that day arrives. Bargains for D. are not recognised by the rules of the Stock Exchange, being contrary to the law of wagering or betting contracts. It is not always easy to determine when an agreement with a broker is a mere betting contract or speculation on D., as in *bona fide* agreements the general practice is to carry over on every settling day and pay the D. only. The best test appears to be to ascertain whether each of the parties could in any event call upon the other to carry out his contract.

Differentia, term in logic applied to the distinguishing characteristic which separates any two species of a genus. For example, the D. which separates the species man from the other species of the genus animal is the reasoning faculty.

Differential Calculus, see CALCULUS.

Differential Equation. An equation between two or more variables that contains one or more differential coefficients is called a D. E. The theory of D. E. deals with the solution of such equations, i.e., the elimination of the differential coefficients by integration e.g. $\frac{dy}{dx} = 3x^2$ is a

D. E. and by integration with respect to the variable x we obtain the equation $y = x^3 + A$, where A is any constant. The latter equation is called the solution of the D. E. D. Es. are of considerable importance in all branches of science; they may be divided into two classes, viz. (i) *Ordinary differential equation* which contains only one independent variable,

e.g. $\frac{d^2x}{dt^2} = -\mu x$, where x is the dependent and t the independent variable. This D. E. is true of all types of simple harmonic motion of a particle in a straight line, x is the distance of the particle from the centre about which it oscillates and t is the time. The solution of this equation is

$x = A \cos(\sqrt{\mu}t + a)$, where A and a are constants determined by the particular conditions of the S.H.M. under consideration. Another famous ordinary differential equation is

$$LC \frac{d^2e}{dt^2} + RC \frac{de}{dt} + e = 0,$$

that is true for all cases of the discharge of a condenser of capacity C , through a circuit of resistance R , and self-inductance L . The solution of this equation determines the charge e on the plates of the condenser in terms of the time t . This solution and its subsequent experimental verification forms the basis of modern wireless. (ii) *Partial differential equations*

which contain two or more independent variables, e.g.

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = 0,$$

where u is the dependent, and x, y, z , the independent variables. This equation is extremely important in the theory of electricity and in the theory of gravitational attractions. See H. T. H. Poggio, *An Elementary Treatise on Differential Equations and their Applications*, 1928; N. Miller, *Differential Equations*, 1935; E. G. C. Poole, *Linear Differential Equations*, 1936.

Differential Forms, branch of mathematics that deals with the theory of transformations of co-ordinates; a knowledge of differential calculus and the theory of functions is required before dealing with the subject. D. Fs find important application in geometry, dynamics and physics, and in particular in Riemannian geometry and in Einstein's General Theory of Relativity.

Differential Geometry, geometry of the more familiar curves such as the straight line, the circle, the plane, ellipse, etc., together with surfaces such as the sphere and the ellipsoid can be dealt with by the analytical methods of algebraical geometry. In general, however, the geometrical properties of curves and surfaces vary continuously from point to point and when we wish to investigate such properties it is necessary to employ the analytical methods of the differential calculus (*q.v.*) that is capable of dealing with infinitesimal and continuous variations. D. G. is the branch of geometry that deals with such problems, just as algebraical geometry deals with geometrical problems that may be solved by algebraic analysis. See J. E. Campbell and E. B. Elliott, *A Course of Differential Geometry*, 1926; E. L. Ince, *The Principles of Descriptive Geometry*, 1935.

Differentiation in biology, describes the gradual increase in complexity of an organism. In a simple unicellular organism, all the life functions are carried out by a single cell. In such a multicellular plant as the filamentous green *Alga spiroyra* all the cells are exactly similar, and each can, at necessity, lead an independent existence. As the evolutionary scale is ascended, however, we find first that special cells are set apart for special functions, and later that this differentiation results in the appearance of specialised multicellular organs and tissues. Roughly, it is true to say that those organisms that show the greatest degree of differentiation are the most highly evolved. The reverse process to differentiation is known as *dedifferentiation*, a good example of which is seen in cancer tissue.

Diffraction, in light, a modification which light undergoes in passing the edge of a body by which the rays appear to be bent and to invade the shadow. One of the strongest arguments used by Newton in his defence of the corpuscular theory of light transmission as opposed to the wave

theory was that the latter did not explain shadows. If light from a small source is obstructed by an opaque body, it was said, a shadow with sharp outlines is produced, thus showing that light travels in straight lines. On the other hand, sound, which it was admitted travelled by waves, is only slightly affected by obstacles, as the impetus originated by the vibration makes its way round the edges of the obstacles. The argument falls because a small source of light does not produce a shadow with a well defined edge, and, on the other hand, sound may be cut off by an obstacle, if the obstacle be large enough. The difference is accounted for by the fact that sound waves are often several feet in length, and are therefore not affected by small obstacles, while the mean length of light waves is one fifty-thousandth of an inch. Suppose monochromatic light to proceed from a narrow slit towards a screen, and that an obstacle with a sharp edge be placed so that a portion of the light proceeding from the slit is cut off, it is found that, instead of there being a definite boundary line between illumination and darkness, a series of dark lines appears parallel to the edge of the geometrical shadow, becoming narrower and closer and more indistinct as they recede from the edge. At first these lines were explained by the interference of waves coming from the source with those reflected from the edge of the obstacle, but it was shown that the sharpness of the edge is immaterial. It was Fresnel who first proposed the theory of D., which states that each element of any wave-front proceeding from a given source acts as a source of vibration itself, and sends out secondary waves. When the wave front reaches an obstacle, some of these secondary sources are destroyed and the resulting effects on the screen are due to the interference of the waves from the remaining sources. Some of the waves reinforce each other, and some being in a different phase on account of the slight differences in distance of the screen from the point on the spherical wave-front, tend to counteract each other. The resultant effect is a series of bands merging into each other, alternately bright and dark. When the source is red light the bands are wide; when the source is violet the bands are narrow, owing to the shorter wave-length. When white light is used the bands are superposed, and a series of prismatic colours is produced. If light from a small source be allowed to pass through a narrow slit in an opaque screen, and then observed through a telescope behind the screen, a bright band of light will be seen, and on each side a series of alternately bright and dark bands gradually becoming less distinct as they recede from the middle band. If red light be used, the bands of illumination and of darkness will be broad; they will be narrower if green is used and so on. If white light is used, the colours are not exactly superposed, but a series of spectra will be seen, the violet being nearer the central band. If a grating composed of a parallel series of fine wires close together be used, the

spectra will be seen with increased brilliance, and the closer such a grating can be made, the more brilliant will be the effect. D. effects by reflected light can be seen by cutting a series of fine grooves on a plane surface. The beautiful colours of mother of pearl are due to the striated nature of the surface and not to any absorptive powers inherent in the substance. Thus if a moulding of such a surface be taken in sealing-wax, the same colour effects are produced. D. spectra are preferable in many cases to prismatic spectra, as the nature of the material used is of no consequence, so that the bands of the spectrum take up their true position. *See also* LIGHT.

Diffusion, term in chemistry applied to the mixture of two substances without chemical combination. Gases possess the property of D. more than liquids (*e.g.* diffusion of oxygen and nitrogen in the air), but some metals may be diffused under pressure at a high temperature. *See also* CHEMISTRY and SOLUTIONS.

Diffusion, Circle of, *see* CIRCLE.

Digamma (Gk. δ and γ αμμα) was the name given to the sixth letter in the auct. Gk. alphabet, found only in inscriptions. The name was given on account of the likeness which its form (F) was said to be to a double gamma. Its sound corresponded roughly to the sound of our letter 'W.' It had disappeared from Gk. by the time of the Homeric poems, but although not written its influence can be traced in them, as, judging from the metre, some of the words seem to have had a sound which was afterwards lost—thus $\epsilon\pi\omega\rho$ was $\epsilon\pi\epsilon\omega\rho$. This letter was introduced into the Lat. language, where it lost its original sound and became *f*.

Digby, co. and tn. of Nova Scotia, Canada, bordering on the Atlantic. The surface is varied with mts., rivs., and lakes. Coal, copper, and silver are found. The cap., Digby, is a port, situated on Digby Neck, 45 m. S.E. of St. John, and is noted for its herring fishery. Pop. of co. 20,000, and of tn., 1200.

Digby, Sir Everard (1578-1606) Eng. knight, was brought up a Protestant, and held office in Queen Elizabeth's household, but becoming a Catholic he embraced the cause of James I., by whom he was knighted. He was at the head of a party whose design was to await news of the success of the Gunpowder Plot, and then immediately to take arms. He was executed in St. Paul's Churchyard.

Digby, Sir Henry (1769-1813), Eng. admiral. He captured (1799) a Span. frigate, a Fr. corvette, a privateer, and sev. other vessels, and at the battle of Trafalgar was in command of the *Africa*.

Digby, Sir Kenelm (1603-55), Eng. naval commander and writer. In 1627 he set out for Gibraltar on a privateering expedition, capturing several ships and gaining a victory over the Fr. at Scanderon. He spent the next few years in furthering Rom. Catholic interests in England, and after being summoned before Parliament on account of his proposals to Charles I., was imprisoned and released on condition that he went to France. During

his stay abroad he carried on negotiations with the pope, and after coming back to England in 1649 was compelled to go abroad again at once. On his next return in 1655 he was in close communication with Cromwell. Among the many books which he wrote are *Observations upon Religio Medici* (1643), *Observations on the 22nd Stanza in the 9th Canto of the 2nd*

SIR KENELM DIGBY

Book of Spenser's Faerie Queene (1643), and *Private Memoirs of Sir Kenelm Digby*. Written by himself, ed. by Sir H. N. Nicolas, and pub. in 1827. See E. W. Bligh, *Sir Kenelm Digby and his Venetia*, 1932; J. F. Fulton, *Sir Kenelm Digby*, 1937 (with bibliography).

Digby, William (1849-1904), Eng. journalist and E. India agent and merchant. He advocated an extension of self-gov. among the natives of India and founded the Indian Political Agency for distributing information in England about the Indians. His works include *The Famine Campaign in S. India, 1876-8* (1878), and *'Prosperous' British India* (1901).

Digest, see CORPUS JURIS CIVILIS and JUSTINIANUS.

Digestion, process by which food is rendered soluble and diffusible, so that its nutrient constituents can be absorbed into the blood and lymph, and later assimilated by the tissues. D. takes place in the alimentary canal, which starts at the mouth, continues as the pharynx, œsophagus, stomach, intestines, and rectum, and ends at the anus. In the mouth occur mastication and salivation. The purpose of mastication is to crush and grind the food into small particles. The saliva is poured into the mouth from three pairs of glands named parotid, submaxillary, and sublingual. The parotid gland secretes a clear saliva, the other two a sticky saliva containing mucin. The

saliva effects the solution of such substances as salt and sugar and moistens the food so that it can be rolled by the tongue and palate into a soft bolus. Saliva also has an important chemical action, for by means of an enzyme called *ptyalin* cooked starch in the food is converted into maltose, a kind of sugar. When the food is sufficiently masticated, it is pushed backwards by the tongue and urged rapidly into the gullet or œsophagus and thence into the stomach by a series of muscular movements known as peristalsis. The stomach is entered by the cardiac orifice which relaxes to admit the food and then closes. The mucous membrane of the stomach is lined with columnar epithelium, in which are embedded little pits called the gastric glands. From these glands gastric juice pours when they are stimulated by the approach of food. The muscular coat of the stomach produces movements which churn the food and tend to urge it towards the intestine. The pylorus (Gk., a gate-keeper) or orifice leading from the stomach, only opens in response to an acid stimulus, and as the food received from the gullet is alkaline owing to the presence of salivary secretions, it remains in the stomach until thorough admixture with the gastric juice has rendered it acid. Gastric juice contains hydrochloric acid and an enzyme called *pepsin*, by which the proteins in the food are converted into peptones and a second enzyme, *rennin*, which coagulates milk. The stomach proceeds to discharge its contents into the intestine about half-an-hour after the commencement of a meal, though it takes about three hours to empty itself. The intestine secretes a juice called *succus entericus* or intestinal juice; and two other secretions, pancreatic juice and bile, enter by their ducts, which open into the duodenum, or first part of the small intestine. Pancreatic juice contains three enzymes: *trypsin*, which attacks proteins more completely than gastric juice, converting them into amino-acids; *amyllopsin*, which converts starch into maltose, thus taking over the function of salivary juice whose activity is stopped in the stomach; and *lipase*, which splits the fats into glycerin and fatty acid. Bile by itself has no digestive action, but it aids the action of lipase. The intestinal juice contains the following enzymes: *enterokinase*, which is concerned in the production of trypsin; *crepsin*, which aids trypsin in the breaking up of peptones; and enzymes which convert maltose and other sugars into glucose. Covering the surface of the mucous membrane of the small intestine are a large number of small prominences called villi. These increase the surface for absorption by which the products of D. of protein and carbohydrate diffuse into small blood-vessels lying immediately under the epithelium. The glycerin and fatty acid are carried into the central lacteal or lymphatic vessel, and are again united into small globules of fat. The amino-acids from the proteins are carried in the blood-stream to repair and build up the tissues; any excess is converted by

the liver into urea, which is sent to the kidneys to be disposed of. The tiny globules of fat pass into the thoracic duct, whence they find their way into the bloodstream and ultimately into the tissues, where they produce heat by oxidation or are stored up in the form of adipose tissue. The sugar is temporarily stored in the liver as glycogen and given out as glucose when required. The small intestine is 22½ ft. long and the passage of the food occupies about four hours. It then travels more slowly through the 4 ft. of large intestine, taking from twelve to eighteen hours to reach the rectum. During this time water is absorbed and the waste residue is gradually compressed into a compact mass into the rectum and finally is expelled by the anus. *See also* ENZYMES.

Diggers' Conference, body formed by the Bendigo gold-diggers of Victoria in Jan. 1854, which had for its object the supersession of the ordinary gov. The chief ground of complaint among the diggers was the licence system and they also demanded representation on the Legislative Council of Victoria. When in Sept. 1853 the New South Wales Legislative Council seriously proposed to abolish the licence fees the miners of Bendigo naturally expected that Victoria would follow the lead. The Victorian Gov., however, instead of doing so, passed a new Act greatly reducing the fees and legalising miners' customs. This partly restored order but it was evident that the goldfields contained men who were opposed to any peaceable settlement. Hence the formation of the D. C. But though the movement for a Congress came to nothing, the events of the next few months formed a crisis in the hist., not only of Victoria, but of Australia. The most notable of these events was the affair of the Eureka Stockade in the time of governor Sir Charles Hotham. This affair is sometimes described as the only 'battle' which ever took place on Australian soil. *See further under* BAL-LARAT; EUREKA STOCKADE.

Digges, Leonard (d. c. 1559), Eng. mathematician, b. at Barham, Kent, and educated at Univ. College, Oxford. He was the author of *A prognostication of right good effect* (1555), *A Book named Tectonicon, briefly shewing the exact measuringe all maner lande* (1562), *A Geometrical Practise, named Pantometria* (1571), and *An Arithmetical Militaire Treatise named Stratagicos for the Profession of a Soldiour* (and Thomas D., 1572).

Digges, Thomas (1515-95), Eng. mathematician, was the son of Leonard D. In 1582 he began the repair of Dover harbour and two or three years later he was one of a party of explorers in the Antarctic with the special object of searching for the lands of the 'Cave of Cathala'.

Digit (Lat. *digitus*, a finger), a word used to signify any symbol or number, from 0 to 9. Thus 4629 is a number of four Ds. Originally, the term was only applied to the actual numbers 1, 2 . . . 9, but by practice has come to signify the characters of the numbers.

Digitalin, a poisonous alkaloid, is obtained from *Digitalis purpurea*, the foxglove and kindred plants.

Digitalis, a genus of European and Asiatic Scrophulariaceae, is known in Britain chiefly by *D. purpurea*, the purple foxglove. The leaves contain an active principle of a poisonous nature which has a strong effect on the action of the heart and is therefore valued in medicine. *D. grandiflora* is a cultivated species with yellow flowers; *D. lutea* grows in the woods of France and Germany, and *D. ferruginea*, with roundish rust-coloured flowers, in Asia and S.E. Europe.

Digne, Fr. tn. and the cap. of the dept. of Basses-Alpes. The tn. is situated on the R. Bléonne, and contains a cathedral and public library. It has hot springs. Pop. 7000.

Dignities, *see* NOBILITY; ORDERS OF KNIGHTHOOD; TITLES.

Digod, *see* DIGOA.

Digoin, tn. of France in the dept. of Saône-et-Loire, situated at the junction of the Loire with the Canal du Centre. There are manufs. of earthenware. Pop. 6700.

Dihydroxysuccinic Acid, *see* TARTARIC ACID.

Dijon, Fr. city, the cap. of the dept. Côte-d'Or, and originally the cap. of Burgundy. It is situated on the canal of Burgundy, where the Ouche and the Suzon join, and is a railway centre on the Paris-Lyons railway. It is the seat of a bishop, a univ. tn., and possesses a library, natural hist. museum, an academy of art, botanical gardens, and a *lycée*. The commerce of D. is considerable, most of it consisting of the trading in Burgundy wines. Its manufs. are very varied, among them being wines, biscuits, preserves, mustard, oils, motor-cars, copper wares, hardware. D. is next to Paris and Rouen in riches of works of art and especially in anct. and medieval churches, some of which are St. Philbert, St. Bénigne, Notre Dame, St. Jean, and St. Etienne (now the chamber of commerce). Notre Dame possesses the famous clock of Jacquemart, brought by Philip the Hardy from Courtrai in 1382. There are many richly adorned old houses; the splendid Palais de Justice and the palace of the Dukes of Burgundy, in which is the tn. hall and the richest museum in Fr. outside Paris, the famous library is in the former Jesuit College. It was the magnificence and wealth of the dukes of Burgundy that made the fortune of D., of which it was the cap. from the twelfth century to 1477. St. Bernard, Bossuet, Charles the Bold and many other famous men were born here. During the Second World War D. became an important communications centre for the Ger. occupying forces, and the strong resistance maintained there was overcome by the U.S. Seventh Army on Sept. 11, 1944, when French forces with the American Army entered the town. Pop. 100,600. The arron. of D. has a pop. of 174,000.

Dikoa, or **Digoa**, tn. of the N. Cameroons, under Brit. mandate. It lies in a fertile plain. Pop. 15,000.

Dikran, *see* TIGRANES.

Dilemma, a kind of argument which offers a choice between two alternatives, both equally disagreeable. The two alternatives are called the 'horns' of the D., for if the adversary escapes the one he will be caught on the other. A classical example of D. is Aristotle's Athenian mother's advice to her son: 'Do not enter into public affairs: for if you say what is just, men will hate you; and if you say what is unjust, the gods will hate you.'

Dilettanti, Society of, club founded about 1733 by a number of gentlemen for the purpose of social intercourse and for the study, as amateurs, of antique art. Funds having accumulated, the society sent out in 1834 an exploring party (under Chandler, Revett, and Pears), and later a second expedition, to collect details and make drawings of the most important monuments of antiquity. These expeditions brought back material for sev. vols. pub. by the society: *Ionian Antiquities*, *Specimens of Ancient Sculpture*, *Unedited Antiquities of Attica*, *Portfolio of Greek Architecture*, etc.

Diligence, the name given to a public conveyance of the nature of a stage coach. See COACH AND COACHING.

Diligence: (1) In Scots law: (a) A term nearly equivalent to *execution* in the Eng. law. It includes the various means by which the person may be seized and imprisoned or the property attached and disposed of, for the purpose of enforcing payment of a debt or performance of any civil obligation. (b) A warrant to enforce the attendance of a witness, or the production of writings. (2) In Eng. law the term diligence may be used in the law of bailments to indicate the degree of care which a person to whom goods are entrusted must exercise in the custody of the goods to escape liability for loss or damage to them.

Dilke, Charles Wentworth (1789-1864), Eng. journalist, in early life devoted himself to the pursuit of letters. In 1814-15 he issued a continuation of Dodsley's *Old Plays*, and became a regular contributor to the reviews. His connection with the *Athenæum* began in 1829, and in the following year he became editor and proprietor. Having made a success with this paper, he was offered the management of the *Daily News*, then in low water, and he directed the fortunes of that paper from 1846 for three years. Towards the end of that period he began to contribute to the *Athenæum* articles on Junius and Pope, which were in 1875 collected and pub. by his grandson.

D.'s grandson, **Sir Charles Wentworth Dilke**, second *Baronet* (1843-1912), travelled much in his youth, and gave the world the benefit of what he had learnt in the colonies in *Greater Britain* (1867). He entered Parliament in the next year as a Radical. An effective speaker, and with much knowledge of the subjects upon which he delivered himself, he soon became a prominent figure in the House of Commons. In 1880 he was appointed under-secretary of foreign affairs, and he conducted efficiently the business of his

dept. until 1885, when Gladstone was forced to resign. As a result of a citation in a divorce suit, he decided to retire from public life and occupied his leisure in the composition of *Problems of Greater Britain* (1890), in some senses a sequel to his *Greater Britain*. Later, he was nominated as a parliamentary candidate for the Forest of Dean in 1892, and that constituency for the rest of his life returned him to Westminster. In the House of Commons he confined himself henceforth to questions of foreign and imperial affairs, upon which he was a recognised authority.

Dilke, Lady, née Emilia Frances Strong (1840-1904), a writer on art, daughter of Major Strong of Oxford, wife first of Mark Pattison, then of Sir Charles Wentworth D. On the advice of Ruskin she became a student at the Art School, S. Kensington, in 1859. She studied much in France, gathering material for her books, among which are: *The Renaissance of Art in France* (1879), *Claude Lorraine* (written in Fr. 1884), *French Painters* (1899), *French Architects and Sculptors* (1900).

Dill, an aromatic umbelliferous plant, closely related to the parsnip. The fruit is employed medicinally as a carminative in the form of dill water, or *aqua Anethi*, and is also used as a condiment. The sowa D., or *Peucedanum Sowa* of Bengal, has a fruit which is often used in curries.

Dill, Sir John Greer (1881-1944), Brit. soldier, b. at Belfast, N. Ireland, Dec. 25; educated at Cheltenham and Sandhurst. He served in the S. African war in 1902, and at the beginning of the First World War he was appointed a brigade major. He later served at the H.Q. of the Canadian Corps, and from 1917 onwards he was Chief of the Operations Branch with the rank of colonel. D.S.O., 1915; C.M.G., 1918. He was promoted to brigadier in 1928 when he went to India, and major-general in 1930. In 1931 he became Commandant of the Staff College, Lieutenant-General, 1936. On the outbreak of the Second World War he went to France in command of the First Corps of the British Expeditionary Force, but returned to England in 1940 to become Vice-Chief, and later Chief, of the Imperial General Staff. The formation of the Commandos (g.v.) in 1940 owed much to his inspiration and vision. In 1941 he vacated this post on reaching the age of 60, and was promoted to the rank of field-marshal. The same year he left for Washington for special duties on the Combined Chiefs-of-Staff Committee. He was present at the Casablanca Conference and also travelled in the Far East on a special mission as representative of the Prime Minister, Mr. Churchill. He died at Washington, Nov. 4, 1944. K.C.B. 1937; G.C.B. 1942. Awarded the U.S. Distinguished Service Medal.

Dilleniaceæ, an order of Dicotyledons, consists chiefly of tropical shrubs and trees, most of which bear yellow flowers and have leathery leaves. The bushes help to form the Australian scrub, the trees are found in woods in tropical India, the woods of Brazil have several kinds, usually of climbing or trailing habit.

Typical genera are *Dillenia* and *Hibbertia*, the latter containing *H. volubilis*, a showy twiner with offensive-smelling flowers.

Dillenius (Dillen), Johann Jakob (1684-1747), Ger. botanist who came to England on the invitation of Sherard, and settled in Oxford, becoming the first Sherardian Professor of Botany. He ed. Ray's *Synopsis stirpium Britannicarum* (1724), and wrote *Hortus Elthamensis* (1732), *Historia Muscorum* (1741), and many botanical papers.

Dillingen: (1) Ln. of Bavaria, Germany, on the Danube, 24 m. N.W. of Augsburg. There are sev. churches and monasteries and a thirteenth century castle. Pop. 7000. (2) Tn. in the Rhineland with large iron works. Pop. 10,000.

Dillmann, Christian Friedrich August (1832-94), Ger. orientalist and theologian, the first authority on the Ethiopic languages. He was b. at Illingen in Württemberg, and studied under Heinrich Ewald at Tübingen. During 1846-48 he visited the libraries of Paris, London, and Oxford, studying their Ethiopic MSS; those of London and Oxford he catalogued. Chief works: Ger. trans. of parts of the Ethiopic Bible, *Grammatik der Äthiopischen Sprache* (1857), *Commentar zum Hiob* (1869), and *Vorlesungen über Theologie d. Alten Testaments* (1895).

Dillon, John (1851-1927), Irish politician, M.P. for E. Mayo (1885-1918); one of the leaders of 'Young Ireland.' He first entered the House of Commons in 1881 as member for Tipperary; he was then a supporter of Parnell. In the same year he was twice arrested for inciting to boycotting. He was one of the pioneers of the 'Plan of Campaign' and the Land League. After six months' imprisonment in 1888 he went to Australia and New Zealand collecting funds for the National Party, then was again imprisoned in 1891. He declared against Parnell in 1891 and became leader of the United Nationalist Party and chairman of the Irish National Federation from 1896 till 1900—when John Redmond became leader of the reunited party. D. accompanied Redmond to Buckingham Palace in July 1914, on the occasion of the conference on the gov. of Ireland. When Redmond died D. succeeded him as leader. His party was virtually extinguished by Sinn Féin in Dec. 1918. He died in a London nursing home.

Dillon, Wentworth, see ROSCOMMON, EARL OF.

Diluent, a medicinal agent which dilutes the blood and the secretions of organs. Water is the commonest substance used for the purpose and acts by increasing all the secretions, especially those of the skin and kidneys, thus aiding in the disposal of waste products in the system. The internal use of water in this way forms part of the practice of *hydropathy* (q.v.).

Diluvial Formation, see under GEOLOGY.

Di Manes, see MANES.

Dime (Lat. *decima*, a tenth, through Old Fr. *disme*), a small silver coin of the U.S.A.; its value is 10 cents, or one-tenth of a dollar.

Dimension, in geometry, a direction

or mode in which extension may be measured. A point, having no magnitude, has no D.; a line has one D., length; a surface has two Ds., length and breadth; a solid has three Ds., length, breadth and thickness. The motion of a point generates a line, the motion of a line generates a plane or surface, and the motion of a plane generates a solid figure. Proceeding to an analogous motion of a three-dimensional solid, the concept of a figure of four Ds. has been obtained, and thus arises a branch of geometry dealing with non-existent figures.

In algebra, terms formed by the multiplication of a quantity by itself are called 'squares,' and terms generated by the product of three similar factors are called 'cubes' by analogy from the geometrical concepts. Equations containing terms of one degree or D. are called linear, those containing terms of two degrees or Ds. are called quadratic, and those containing terms of three degrees or Ds. are called cubic. It is to be observed, however, that the symbol x^2 does not represent a surface, or x^3 a volume, and in graphical representation the functions x^2 , x^3 are represented by lines; x^2 , in fact, represents a number merely, but if a preliminary statement be made that x represents the number of units of length in a certain straight line, then obviously x^2 represents the number of units of area in a square, each of whose sides contains x units of length.

In physics, symbols are used to represent quantities measured in terms of units of length, area, volume, time, mass, velocity, force, etc. For the sake of brevity and simplicity, such equations as $s = vt$ (space = velocity \times time) are used. The employment of such an expression does not mean, for instance, that velocity is multiplied by time, if that has any meaning at all, but that the numerical measure of the space traversed is obtainable by multiplying the numerical measure of the velocity in terms of the unit of velocity by the numerical measure of the time taken in terms of the unit of time. Of the units used in mechanics, those of length, time, and mass are fundamental, that is, we cannot explain them by reference to anything else. The units of area, volume, velocity, acceleration, force, etc., are derived units; that is, they can be explained by reference to one or more fundamental units. The quantities used as fundamental units are chosen arbitrarily. If we are speaking of an interval of 2 hours, and use 1 hour as the unit of time, the interval would be represented by the number 2; if 1 minute were the time-unit, the interval would be represented by the number 120, and so on. Suppose $[X]$, $[Y]$, $[Z]$ be 3 units in which any physical quantity can be measured, and let x , y , z be the numbers of those units which represent a certain amount of the quantity, then $x[X] = y[Y] = z[Z]$, whence $x:y:z = 1/[X]:1/[Y]:1/[Z]$; that is to say, the number expressing the amount of any quantity is inversely proportional to the unit chosen for its measurement. Many writers use the centimetre as length-unit, the gramme as mass-unit, and the second

as time-unit, but the foot as length-unit and pound as mass-unit are still often employed. If m represents the number of grammes and m' the number of pounds in a given piece of matter, then $m[M] = m'[M']$, or $m = [M']m'/[M]$. The ratio $[M']/[M]$ is the number of grammes in a pound, or 453.59, and this ratio may be employed in transferring the measure of any mass from one system of units to the other.

The measure of density is indicated by the equation $d = m/v$, where m represents the number of units of mass and v represents the number of units of volume. If $[L]$ be the unit of length, and a rectangular parallelepiped be supposed whose length is $l[L]$, breadth $l'[L]$, and height $l''[L]$, its volume will be $ll'l''[L]^3$. Now, if $[V]$ be the unit of volume, and if there be v units of volume in the parallelepiped, then $[V]v = ll'l''[L]^3$. But l, l', l'' and v are mere numbers, therefore $v = ll'l''$, and $[V] = [L]^3$. Now, returning to the equation for density we get $[D]d = [M]m/[V]v$, or $[D]d = [M]m/[L]^3v$, whence $[D] = [M]/[L]^3$. The ratio $[M]/[L]^3$ is the D_s of the unit of density in terms of the fundamental units of mass and length. Again, for velocity we have the equation $s = vt$. This means $s[L] = v[V]t$, $\therefore v[V] = s[L]/t$, where v, s , and t are mere numbers and $[V]$ is the unit of velocity. Therefore $[V] = [L]/[T]$. That is to say, the unit of velocity has D_s 1 in length and D_s -1 in time. Similarly from the equation $s = \frac{1}{2}ft^2$ we obtain $s[L] = \frac{1}{2}[F]t^2[T]^2$, where $[F]$ is the unit of acceleration and s, f, t^2 and $\frac{1}{2}$ are mere numbers. Therefore $[F] = [L]/[T]^2$ or $[L]/[T]^2$. The unit of acceleration has therefore D_s 1 in length and D_s -2 in time. The D_s of other physical units may be similarly explained.

Dimethyl Ketone, see ACETONE.

Dimidiation (Lat. *dimidio*, to halve), in heraldry, term denoting the cutting of two coats of arms in half and joining the dexter half of the one to the sinister half of the other.

Diminishing Return. Law of diminishing return is one of the elementary laws of the science of political economy (q.v.). John Stuart Mill stated, perhaps exaggeratedly, of this law that it is the most important and in its different phases perhaps the most commonly misapplied law in political economy. In respect of a piece of land (say an acre) the law states that after a certain point, other things remaining the same, the returns to successive applications of labour and capital will continuously diminish. The law applies of course to all other productive agents. Its peculiar value in the case of land arises from the fact that the quantity of land is limited and the better qualities still more limited; so that while capital and labour may go on increasing, land cannot so increase and any increase of the produce must be at an increasing cost, or in other words the return per unit diminishes. The law of diminishing return is of great value in its wider applications to the economic study of rent, population, value, incidence of taxation, etc.

Dismissory Letters (Lat. *dimittere*, to dismiss), a letter in which a bishop consents to the ordination by another bishop of a candidate for holy orders of his diocese.

Dimorphism (Gr. *dis*, twice, and *μορφη*, shape or form): 1. A term applied in zoology and botany to the appearance of an organism in two different forms. The dimorphic organisms are fundamentally identical in structure and in origin. Thus, the bee is dimorphic in the female sex, the fertile queen and the barren worker presenting the two forms. The same phenomenon is seen in the 'nutritive' and 'reproductive' forms in colonies of hydroids. The two sexes present such widely different forms in some of the insects and crustaceans that they seem to belong to quite different genera—this is sexual D . Butterflies are subject to 'seasonal' D . Among flowers, the varieties of the primrose offer good examples of dimorphic forms. 2. In the mineral kingdom a body is said to be dimorphous when it is capable of crystallising according to two different systems geometrically incompatible, the chemical composition of the dimorphic bodies being identical. Carbon, sulphur, phosphorus, calcium carbonate, and mercuric iodide are well-known examples. Carbon appears under one form as the diamond, and under another as graphite, with the following widely contrasting sets of properties: the diamond is colourless, transparent, has an adamantine lustre, is the hardest of all substances, a non-conductor of electricity, has a specific gravity of 3.52, and crystallises as octahedra; graphite is grey, opaque, has a metallic lustre, is exceedingly soft, a fairly good conductor of electricity, has a specific gravity of 2, and forms hexagonal crystals belonging to the rhomboidal system. Yet both have the same chemical composition, and both yield carbon dioxide when burned in oxygen; the diamond becomes graphite if heated in the electric arc. The difference between them is caused by different arrangements of the atoms in the crystals, as was shown by the X-ray method of crystal analysis invented by Sir William Bragg and his son Sir Laurence Bragg. Red mercuric iodide when heated changes into rhombic plates, which the slightest friction changes into octahedral crystals, the colour changing at the same time from yellow to a brilliant scarlet. Sulphur yields transparent amber-coloured octahedra under one treatment, prismatic crystals under another. The terms *trimorphism* and *polymorphism* indicate this phenomenon when the same organism or substance presents three or more different forms.

Dimsdale, Thomas (1712-1800), Eng. physician, whose work as an inoculator brought him world-wide fame: his *Thoughts on General and Partial Inoculation* was trans. into many languages. The Empress Catherine of Russia bestowed upon him a barony and a considerable pecuniary reward for the successful inoculation of herself and her son.

Dinajpur, dist. and tn. of W. Bengal, India. The area of the dist. which is flat and fertile, is 4126 sq. m. with a pop. of

1,700,000. Rice and jute are the chief crops. The tn. of D. is 220 m. N. of Calcutta. Pop. 14,000.

Dinan, Fr. tn. of the dept. Côtes-du-Nord and cap. of the arron. of D. It stands on the Rance, about 14 m. S. of St. Malo, being built on the summit of a hill, and at the spot where a high viaduct crosses the river. The tn. itself is picturesque, as some of its old walls and gates still remain. Its castle, which dates from the fourteenth century, is also well preserved. A great many of the old streets still exist, being characterised by their winding and narrow thoroughfares and their wooden houses. The churches of St. Malo and St. Sauveur are both of interest, the latter possessing an epitaph to the effect that it contains the heart of Bertrand du Guesclin. D. exports cattle, coal, and wood. Pop. 12,700.

Dinant, picturesquely situated tn. in the prov. of Namur, Belgium, on the Meuse, and cap. of the arron. of D. Manufact. of metal ware, called Dinanderie, spiced bread called 'couques de Dinant,' woollen goods, marble quarries, etc. It was sacked and destroyed by Charles the Bold in 1466, taken by the Fr. in 1554, and burnt and terrorised by the Gers. in 1914. On Aug. 15 of that year the Ger. advanced guards seized the citadel of D. and crossed to the left bank of the Meuse. Two hours later a Fr. brigade retook the town and drove the Gers. back across the riv. Pop. 7000.

Dinapur, Dinapore, or Danapur, tn. of Bihar, India, situated on the Ganges, 5 m. from Patna, to which it is joined. It is in two parts, Dinapur, and Dinapur Nizamut. Total pop. 31,000.

Dinarchus (Gk. Δυναρχος) (c. 361-291 B.C.), was the last of the ten (Gk. orators, and was b. at Corinth. He studied oratory at Athens under Theophrastus and Demetrius Phalereus. His fame as an orator began about 336 B.C., owing to the fact that the other Gk. orators had died. The height of his power, however, was during the administration of Demetrius Phalereus (317-307 B.C.).

Dinard (anct. Dinard-Saint-Enogat), tn. and watering place on the N. coast of France, situated in the dept. of Ille-et-Vilaine. It was occupied by the Gers. during the Second World War, and liberated by the Amer. armies on Aug. 15, 1944. Pop. 9000.

Dinaric Alps, that part of the Alpine system which joins the Julian Alps with the Balkan range. The main chain lies N.W. to S.E., and divides Dalmatia from Bosnia and Herzegovina. It also separates the basin of the Sava from the dist. drained by the Narenta, Kerka, and other rvs. flowing into the Adriatic. The highest summits are under 7000 ft.

Dindigul, or Dindigal, tn. of Madras, India. It is about 30 m. from Madura, and has a citadel on an isolated rock, from the top of which Hyder Ali threw his prisoners. There are several tanneries, a large cotton ginding factory, and tobacco factory. Pop. 31,000.

Dindings, The, strip of land in the Malay Peninsula on the S.W. coast of

Perak, 22 m. long, and comprising also the island of Pangkor. It lies between lat. 4° 20' N. and long. 100° 32' E. Formerly included in Penang, but retroceded to Perak, partly for convenience of customs collection and partly in recognition of the loyalty of the Sultan of Perak to the Brit. Crown. Poolo Dinding is covered with thick woods, and is noted for its great beauty.

Dindorf, Karl Wilhelm (1802-83), Ger. Hellenist and philologist, b. at Leipzig. He resigned a professorship at Leipzig Univ. in order to give all his time to literary work, especially to the preparation (with his brother Ludwig and Hase), of a new ed. of Stephanus's *Thesaurus Lingue Græcæ* (Paris, 1831-65). His philological researches into the text of the Gk. classics, especially that of the dramatists, have contributed greatly to its accuracy and clearness. He ed. a number of these classics, including an ed. of Demosthenes (7 vols.), *Poetae Scenici Græci*, and eds. of Aristophanes, Sophocles, Euripides, Aeschylus, and Homer, and of Polybius, Dion Cassius, and other Gk. historians.

D'Indy, Paul, see INDY.

Dindymene, see CYBELE.

Dingaen, see under ZULUS.

Dingaen's Day, Dec. 16, the anniversary of the decisive defeat of Dingaan, a Zulu chief, by a small force of Boers under Pretorius in 1838. The cause of the conflict thus brought to a close was the massacring by the Zulus of a party of Boer settlers. The particular event in which this yearly celebration and public holiday originated has fallen into oblivion, but on this day the anniversary of the proclamation of Boer independence in 1880 is celebrated, and it is looked upon as a day of thanksgiving for the spread of white civilisation in S. Africa.

Dingelstedt, Franz Ferdinand, Freiherr von (1814-81), Ger. poet, dramatist, and novelist. His *Lieder eines Kosmopolitischen Nachtwächters* (1870) caused a disagreeable sensation on account of the liberal principles expressed in them. He wrote a successful tragedy, *Das Haus der Harnvedt*, a society novel, *Die Amazone*, sketches of travel, and adapted Shakespeare and Molière to the Ger. stage.

Dingey, or Dinghy (Maharatta *dingī*), the name of a small boat used in Calcutta, etc.), a small row-boat usually supplied to a ship as an extra boat for common uses.

Dingle, par. and seaport of Eire in co. Kerry. The tn. is situated on the N. side of D. Bay, 30 m. S.W. of Tralee. It is the most westerly town in the Brit. Isles and is sheltered by hills on three sides. The harbour is practically useless, but the fisheries are important, and the curing of mackerel employs many of the inhabs. D. is said to have been founded by the Spaniards, who frequented the shores on account of its fisheries. Pop. 2000.

Dingley Tariff. The D. T. Act (named after Nelson D. (1832-99), the Chairman of Ways and Means Committee) was passed in 1897 in McKinley's first term. It embodied the Republican doctrine of high protection coupled with reciprocity.

There were provisions for reciprocity arrangements with other countries which paved the way for possible reductions by a commercial treaty. In 1930 the D. T. was replaced by the Tariff Act.

Dingo (*Canis dingo*), the warrigal, or wild Australian dog. It is a strong, short-legged dog, sandy-coloured, and not unlike the European fox, being about 40 in. in length, its tail measuring an additional 11 in. It works havoc upon flocks and poultry, and even after it has been tamed, seldom abandons its predatory habits. Its fossilised remains have been

Dinnington, coal-mining tn. of the W. Riding of Yorkshire, England, 8 m. S.E. of Rotherham. Pop. 7000.

Dinoceras, extinct genus of amblypodous mammals, consists of huge, semi-plantigrade animals, of which the fossil remains occur in N. America. In spite of the fact that the species rivalled the elephant in size, they possessed the smallest brain of any mammal. The limbs were heavy, and had well-developed bones; five short digits occurred on each foot. On the head there were three pairs of bony processes.

CRETACEOUS ARMoured DINOSAUR (JURASSIC PERIOD)

A reconstruction of *Stegosaurus ungulatus*

discovered with those of kangaroos and extinct Australian mammals. This has given rise to the opinion, held by Sir Frederick McCoy, Mr. Ogilvy, and others, that the D. must be an indigenous species of Australian fauna. But the existence in Java and India of a pariah dog, very similar in character to the D., has caused others to think that the D. was originally introduced into Australia by Caucasians from Ceylon or Malay.

Dingwall, parli. bor. and tn. of Scotland, and cap. of the counties Ross and Cromarty. It is situated on Cromarty Firth, 18 m. N.W. of Inverness. A small shipping trade is carried on, and there is a good harbour. The fisheries are important, and there is a corn mkt. Pop. 2500.

Dinka, see DENKA.

Dinkelsbühl, tn. of Bavaria, situated on the R. Würnitz, 40 m. N.W. of Donauwörth by rail. It is a medieval tn. with completely preserved walls and towers of the fifteenth century, tn.-moat and gable houses, old tn. hall of 1300. St. George's church is one of the finest late Gothic in S. Germany. Pop. 5000.

Dinocrates, Macedonian architect of the time of Alexander the Great, who rebuilt the temple of Ephesus, which had been destroyed by Erostratus. He was also employed by Alexander in the building of Alexandria.

Dinornis, see MOA.

Dinosaurs, an order of fossil reptiles which are confined to the Mesozoic age. The crocodiles of the present age and the birds of the div. Ratitae are the nearest to them in general characteristics. The characteristics of these animals were somewhat varied. Some had very small forelimbs, the hind-limbs being much longer, while some of them seem to have pursued the same method of locomotion as the kangaroo. Others again were provided with a long tail. The pelvis resembled that of birds in its structure, and the number of toes on the hind feet varied from five to three. The animals of this order were mostly land animals, and included both carnivorous and herbivorous species. Their size varied very much, some of them attaining enormous proportions—their length reaching 70 ft. or 80 ft. and their

height 10 ft. or more, while others were quite small. D. lived during the Triassic, Jurassic, and Cretaceous periods, their remains being found in those strata in Europe, Asia, Africa, America, and Australia. Dinosaurs is subdivided into Sauropoda, Theropoda, and Predentata. Sauropoda: the species in this div. are herbivorous and include some of the largest animals that have ever existed, and some of the oldest of the D. Brontosaurus, Atlantosaurus, and Diplodocus are included in Sauropoda. Theropoda: the species in this subd. have serrated teeth, hollow bones, and fore-limbs shorter than the hind-limbs, showing a tendency to an upright walking gait, most of them having moved like kangaroos. Predentata: these animals were herbivorous, either quadrupeds or bipeds, with a predentary bone on the end of the mandible. Under this subd. are included Ornithopoda, having three-toed hind-limbs and hollow bones and a bipedal means of locomotion. See H. N. Hutchinson, *Creatures of Other Days*, 1894; O. C. Marsh, *Dinosaurs of North America*, 1896; F. A. Lucas, *Animals of the Past*, 1901; W. E. Swinton, *The Dinosaurs*, 1931.

Dinotherium, extinct genus of Proboscidea to which the living elephants belong, but differs from these animals in many features. The incisors were prolonged into long tusks on the lower jaw, but curved downward; the skull was more primitive, and the bulk much more vast. Examples of the D. have been found in the Miocene of Europe and Asia.

Dinslaken, tn. of Rhineland, Germany, 25 m. N. of Düsseldorf, with coal mines and iron works. Pop. 27,000.

Dinton, park in Wiltshire, England, nine miles from Salisbury, on the Northern slope of the Nadder Valley. Philipps House, owned by the National Trust, was formerly the house of the Wyndham family and was completed in 1815 by Jeffrey Wyatt in the neo-Grecian style, of which it is a very successful example. It stands on rising ground beneath a screen of fine beech trees. Hyde's House, close to the church, was built in the Wren manner, probably about 1725, and incorporates Tudor portions. It is in the older house on the site that Edward Hyde, afterwards Lord Chancellor Clarendon, is said to have been born.

Dinwiddie, Robert (1690-1770), a Lieutenant-governor of Virginia. He entered into conflict with the Fr., against whom he sent Maj. George Washington. Built Pittsburg Fort. He was recalled on serious charges.

Diocesan Court, one of the ecclesiastical courts, a consistory. In every diocese of the Christian Church there is a D. C. presided over by the commissary or chancellor who acts as vicar-general for the bishop. Ecclesiastical cases arising within the diocese are here tried. Formerly their jurisdiction was much wider, but at the present day matrimonial, testamentary and even ecclesiastical cases, etc., being tried in other tribunals, the court is mostly concerned with points of order.

Diocese (Gk. *διοικησις*, housekeeping, management, province), a dist. under the ecclesiastical jurisdiction and care of a bishop. In Demosthenes the word is used for the treasury or finance dept., in Cicero it is applied to the three dists. of Cilyra, Apamea, and Synnada (added to Cilicia, 56-50 B.C.); D., from its original meaning 'administration,' coming to mean the part so administered. The term was primarily used in the civil administration of the Rom. empire, Constantine the Great dividing it into 13 Ds., which were subdivided into 120 provs. These Ds. (of which Oriens was the largest, Britain the smallest) were governed by praetorian prefects, proconsuls, or vicars, the provs. by rectors or exarchs. The word in its present ecclesiastical signification was not in common use till about the ninth century, *parochia* (parish) being the more usual term up to that time. Constantine (A.D. 306-337) made the ecclesiastical and political divs. correspond, the ecclesiastical Ds. being under a patriarch, the political under a praetorian prefect. Later D. came to mean a single metropolitanate or prov. instead of a group, and finally merely the sphere of jurisdiction of any bishop. In England an Act of Parliament is necessary to create fresh Ds. In 1836 the Ecclesiastical Commissioners Act created the Ds. of Ripon and Manchester. England and Wales have two ecclesiastical provs., Canterbury and York, subdivided into 33 Ds. In the Catholic Church Ds. are erected by the Pope in consistory. See J. Bingham, *Origines Ecclesiasticae*, 1840; P. Hinschius, *Das Kirchenrecht der Katholiken und Protestanten in Deutschland*, 1869-97; A. Baudrillart and others, *Dictionnaire d'histoire et de géographie ecclésiastique*, 1912-36.

Diocletian, Caius Valerius (A.D. 245-313), Rom. emperor, b. in Dalmatia, the son of obscure parents; entered the army and served with much success under Aurelian and Probus, later accompanying Carus on his Persian expedition, and at his death in 283 becoming commander of the Imperial Guards of Numerianus, son of Carus, who succeeded his father together with his brother Carinus. In the same year Numerianus was assassinated by Aper, and D. was proclaimed emperor by the army of the E. at Chalcedon, where he was then serving. Carinus had already been proclaimed in Italy, and a battle took place at Morgus in Moesia in which Carinus, after nearly gaining the victory, was killed, and D. remained sole claimant. In 286 he assumed as his colleague in the empire Marcus Aurelius Maximianus, and gave him the title of Augustus. Maximianus took charge of European affairs, and D. of the East with his cap. situated at Nicomedia. In 292 Galerius and Constantius Chlorus were also adopted as colleagues, and took up the gov. respectively of Thrace and Illyria (Galerius); and Gaul and Spain (Constantius). D. superintending Asia and Egypt, and Maximianus Italy and Africa. D. retained supreme command, and the arrangement resulted in great prosperity. In 297 a peace was concluded with Persia. In 303 D., under

the influence of Galerius, issued a severe edict against the Christians, the persecution of whom has left a stain on his memory. After a long illness in 304, he abdicated in favour of Galerius in 305, and retired to Salona in Dalmatia. He ranks high both as a general and a statesman. See also under ROMAN HISTORY.

Diodati, Giovanni (1576-1619), Calvinist theologian, b. in Geneva, whither his parents had fled from Lucca. He was distinguished during the Reformation as a preacher, and as a professor of Hebrew and Theology. Trans. the Bible into Ital. and Fr. A nephew of his, Charles, was a schoolfellow and friend of Milton, and wrote an elegy on the death of the poet.

Diodon, see GLOBE FISH.

Diodorus (surnamed Siculus), a Gk. historian, b. in Agrigum in Sicily, and lived in the time of Caesar and Augustus. His idea was to write a history of all nations from the very early times to his own day. The work entitled *Bibliotheca Historica* consists of forty books in three sections, the first dealing with times previous to the Trojan War, the second ends with the death of Alexander the Great, and the third with Caesar's Gallic wars. Only fifteen of these have come down to us. The work, however, is characterised by a want of order and critical power, and misunderstanding and distortion of fact to adorn a tale, and often also to point a moral, have disguised the historical kernel of this great compilation which, however, is valuable as a collection of materials the sources of which are lost. On Babylon, for example, D. is as detailed as Herodotus, though less reliable.

Diodorus of Tarsus, a biblical commentator, native of Antioch. He was one of a succession of eminent men taught at Antioch by the aged Eusebius of Emisa, himself a pupil of Eusebius of Cæsarea. He became Bishop of Tarsus in A.D. 378. He made commentaries on the books of the O.T. D. had great influence over Chrysostom and Theodore of Mopsuestia.

Diogenes (c. 412-323 B.C.), Cynic philosopher of Sinope in Pontus. He was the son of Iccias, and on account of the latter's dishonest actions D. had to leave Sinope and take up his residence in Athens. After much persistence, in spite of constant harsh rebuffs, he became the pupil of Antisthenes, and laid down for himself an excessively austere rule of life, subjecting himself to every kind of self-mortification, and legend asserts that he lived in a tub, though the truth of this statement has been very much questioned. While on a voyage to Ægina, D. was seized and sold as a slave in Crete, and after being bought by Xenias he became the tutor of his children. It was during this time that he is reported to have met Alexander the Great, causing the latter to remark that if he were not Alexander he would like to be Diogenes. The philosopher is said to have died at Corinth on the same day as Alexander. His system of philosophy had a practical basis, and he ridiculed all men whose pursuits were not aimed at some practical end. See J. B. Mayor, *Sketch of Ancient Philosophy*, 1889.

Diogenes Laërtius, Gk. author who lived probably towards the close of the second century A.D., though little is known about his exact date. He wrote the lives of the philosophers in ten books (Eng. trans. by C. D. Yonge, 1853), which has been of great value to later writers on the subject. At the same time he made bad use of his information, as his work is not a methodical compilation nor is it an authority on philosophy, though it has preserved some interesting facts. See R. Hope, *The Book of Diogenes Laërtius*, 1930.

Diogenes of Apollonia, Gk. philosopher of the fifth century. He was a pupil of Anaximenes, whose doctrine, that air is the source of all being, he revived and propagated. According to this philosophy, all other substances are derived from air—which gives also life and soul to all things—by a process of condensation and rarefaction, in which mind and matter alike share.

Diognetus, Epistle to, Gk. Christian work of the second or early third century of our era. In character it is an 'apologia,' propounding and answering questions as to the God and faith of the Christians. Its unknown author appears to have been familiar with the teaching of St. John and of St. Paul.

Diomedes, or **Diomedes**, son of Tydeus, a hero at the siege of Troy. After the death of Adrastus, whom he succeeded as king of Argos, he led eighty ships against Troy. Homer represents him as bold and enterprising, a favourite of Athene, with whose help he wounds Ares and Aphrodite. With Odysseus he undertakes many adventures, including the stealing of the palladium from the acropolis of Troy. He was worshipped as a hero in Greece and in parts of Italy.

Diomedes Islands, group of three small is., situated in Behring Strait, about half way between the two continents of America and Asia. The group consists of Ingalik and Imaklit Is. and Fairway Rock.

Diomedes, see ALBATROSS.

Dionaea Muscipula, the Venus' flytrap, a genus of Droseraceæ. The leaves form a small rosette on the ground, and are composed of a lower winged part and an upper expanded part fringed with teeth. Inside the upper part are numerous tiny digestive glands, and three long, delicate, hair-like organs. If one of these organs be touched by an insect the sides of the leaf collapse, the teeth interlace, and as the captive decomposes its products are absorbed by the plant.

Dion Cassius (Cocceianus) (A.D. 155-c. 230), Gk. historian, b. at Nicæa in Bithynia. In A.D. 180 he went to Rome, and when Pertinax became emperor, D. was made prætor, A.D. 193, which office he took up in the reign of Severus in A.D. 194. He was also made consul about the year A.D. 220, and again in A.D. 229, and after this he retired to Nicæa, where he spent the rest of his life. D. wrote several histories, among them one of Rome from the earliest times.

Dion Chrysostomus ('the golden-

mouthed'), Gk. orator, b. at Prusa in Bithynia, near the middle of the first century A.D. He received a good education and travelled considerably when young. After leaving Rome, owing to Domitian's hatred of philosophers, he is said to have visited Mysia, Thrace, and other places, disguised as a beggar. He returned to Rome under Trajan, and after visiting Prusa went back to Rome, where he died about A.D. 117. There is a good ed. of his orations by Reiske.

Dion of Syracuse, son of Hipparinus, and a native of Syracuse, b. at the beginning of the fifth century B.C. His sister married Dionysius the Elder, and he himself married her daughter. This Dionysius showed the greatest confidence in D., but his son, Dionysius the Younger, disliked him and refused to be guided by him, probably because their ways of living were so different, as D. was a man of stern life, whereas Dionysius was exceeding dissolute. He was therefore banished to Athens, but he succeeded in 357 B.C. in defeating Dionysius the Younger and in conquering Syracuse. The Syracusans, however, objected to his strict rule, and as the result of a conspiracy he was murdered in his own house in 353 B.C.

Dione, one of the Titans, mother by Zeus of Aphrodite. Homer represents her on Olympus welcoming and consoling her daughter who has been wounded before Troy.

Dionne, Narcisse Eutrope (1848-1917), Canadian historian, b. at Saint-Denis de la Boutellerie. He was educated at Sainte-Anne's College, the Quebec Grand Seminary and Levis College, and obtained his medical degree at Laval Univ. in 1872. After a short career as a physician, he adopted journalism as his profession, and his erudition and historical research into the early days of Quebec gained him the librarianship of the Quebec Legislature in 1892. He wrote biographies in Fr. of Jacques Cartier (1889), Samuel Champlain (1891-1906), C. F. Painchaud (1894), and others. His works also include: *Quebec et Nouvelle-France* (1905-12), *Les Ecclesiastiques et les royalistes français réfugiés au Canada, 1791-1802* (1905), *Galerie historique* (1899-13), *Les Canadiens-Français* (1914).

Dionne Quintuplets, five children, Yvonne, Annette, Emilie, Cecile, and Marie, born to Mrs. Elzire Dionne on May 28, 1934, at Callander, Ontario. Dr. Allan Roy Dafoe (1883-1943) attended Mrs. Dionne and achieved fame for his successful delivery of the five children.

Dionysia, the festival held in honour of Dionysus (Bacchus), the god of wine. These were Gk. festivals, and the Attic ones were four in number, the Country Dionysia, the Lenaea, the Anthesteria, and the Great Dionysia. The first of these feasts was celebrated in the month of December, accompanied with processions and dramatic performances. The second was a city festival, celebrated during the next month. The Anthesteria lasted for three days, the ceremonies including a visit to the temple of Dionysus in Limnae by the wife of the king, and a feast to dead souls, with a *libatio* to Hermes, and it was

said that during this festival the shades walked the earth. The Great Dionysia, the last of the four, consisted of a lyrical festival, followed by dramatic performances, and at the beginning of this festival the statue of the god was taken from the temple of the theatre. The

THE THEATRE OF DIONYSUS AT ATHENS

Dionysia were great public holidays. See R. P. Winnington-Ingram, *Euripides and Dionysia: An Interpretation of the Bacchae*, 1948. See also **BACCHUS**.

Dionysius, patron saint of France, see **DENIS**.

Dionysius the Elder (431 or 430-367 B.C.), a tyrant of Syracuse. Having by 405 B.C. constituted himself ruler of Syracuse, he made his position secure by a bodyguard of 1000 men, and by marrying the daughter of Hermocrates. In 397 B.C. he attacked the Carthaginians, and would have been defeated had they not been ravaged by a pestilence. After peace was made, D. turned his attention to the Gk. cities, and finally succeeded in conquering Rhegium, which had always been hostile. From this time to 367 B.C. his power was absolute, having jurisdiction over most of Sicily, and indirectly over a large part of Italy. Although his rule was tyrannical, D. did much for the benefit of Syracuse, both in making it a magnificent city and in encouraging literature.

Dionysius the Younger, a tyrant of Syracuse, succeeded his father, D. the Elder, in 367 B.C. Indolent in disposition, he rejected the counsel of Plato and followed the advice of dissolute people. He was compelled to leave Syracuse and went

to Locri, which tn. he ruled as a tyrant for some years. He returned to Syracuse, but was again compelled to depart to Corinth, having surrendered to Timoleon, 343 B.C.

Dionysius (surnamed **Halicarnassus**, from Halicarnassus, his bp.), Gk. scholar of the reign of Augustus. He went to Rome about 30 B.C., where, after long and profound study, he wrote 'in the pursuit of truth and honesty,' a hist. of Rome, with the express purpose of reconciling his Gk. compatriots to the yoke of their Rom. conquerors. The work is still a valuable source of information.

Dionysius of Colophon, Gk. painter who lived about 500 B.C. He was a contemporary and rival of Polygnotus of Thasos, and was nicknamed 'Painter of Men' (*Anthropographos*), because he aimed at portraying men as they really were, while Polygnotus gave his figures a touch of ideal or god-like beauty. He painted a portrait of Aristarchus carrying a figure of tragedy.

Dionysius the Areopagite, an almost legendary personage of whom little more is known than that he was converted to Christianity by St. Paul at Athens (Acts xvii. 34), and that he was a member of the court of Areopagus. Eusebius says he became the first bishop of Athens. He is said to have suffered martyrdom under Diocletian, some say in Athens, others say in Paris at Montmartre, and these hold that he is the patron saint of France, 'Denys' being the French form of Dionysius. The author of the works attributed to D. was probably a Syrian monk. The two most famous of these are the *Mystical Theology* and the *Divine Names*. Their teaching influenced the entire spirituality of the W. through St. Augustine and St. Thomas Aquinas.

Dionysius Thrax, or the Thracian, Gk. grammarian who lived about 100 B.C. He taught for some time in Rhodes and then had a school in Rome. He wrote the first scientific Gk. grammar, a work which was very popular, and highly valued in ant. times. His notes on the *Iliad* are included in the *Scholía Veterāna*.

Dionysius of Byzantium, Gk. poet of the second century. He wrote elegiac verses and an account of the navigation of the Bosphorus coast-line. Fragments of this work appear in various collections, e.g. in the *Geographi Minores* of Didot.

Dionysius (self-named in humility **Exiguus**, or 'the Little') (b. c. A.D. 500), Gk. theologian. He went to Rome and lived in a convent, where he made collections of the first fifty canons of the apostles, the canons of ten councils, and of thirty-eight decretals of the popes, all of which were recommended for use in 800 by Charlemagne. He introduced the method of counting the years from the birth of Christ instead of from the death.

Dionysius (surnamed **Periegetes**, 'the describer of the earth'), Gk. poet who lived probably in the early days of the Rom. empire. He wrote a *Descriptio Orbis Terrarum* in 1186 hexameter verses. His work, founded on that of the first scientific geographer, Eratosthenes,

caused him to be considered by the later Gks. as the geographer *par excellence*. See Bernhardt's *Geographi Graeci Minores*.

Dionysius Cato, author of a work entitled *Dionysii Catonis Disticha de Moribus ad Filium*, which has been called a 'catechism of morals.' It consists of a preface, a series of injunctions such as *parentum ama, diligentiam adhibe*, etc., followed by 144 moral precepts. There has been much speculation as to the authorship and date of the work. It is frequently mentioned by Chaucer, and it seems to have been used as a school-book in the Middle Ages.

Dionysius Epiphanes, see ANTIOCHUS.

Dionysus, see BACCHUS and DIONYSIA.

Diophantine Equations, so-called after Diophantus, a Gk. mathematician, who probably lived in the third century A.D. Diophantus pub. a work called *Arithmetica*, that included arithmetic and algebra. This book contains several problems that have been too difficult for any mathematician to solve. The type of problem may be illustrated by the following simple example. In how many ways can a Rugby team score nine points? If x is the number of tries scored, y the number of goals, z the number of dropped goals, p the number of penalty goals then $x + y + z + p = 9$. Such an equation is known as a D. E. In this case we can have $x = 3, y = 0, z = 0, p = 0$; $2, 0, 0, 1$; $1, 0, 0, 2$; $0, 0, 0, 3$; $0, 1, 1, 0$, i.e. five ways in all. The difficulty in solving such problems is that each one must be worked out *ab initio*, as there are no recognised algebraical principles that lead to their solution.

Diophantus, Gk. writer of Alexandria. His date is a matter of conjecture, some writers giving the fifth century, and others some time earlier. He was a writer on algebra, and his *Arithmetica*, of which six books are preserved, treats of numbers algebraically. There are one or two eds. of D.'s work, and several paraphrases. See T. L. Heath, *Diophantus of Alexandria, A Study in the History of Greek Algebra*, 1910.

Diopside (Gk. *δίς*, twice, twofold, and *ὄψις*, appearance) a variety of pyroxene, containing no alumina. It is composed of silica (55.7), magnesia (18.5), and lime (25.8).

Diopsis, a dipterous (two-winged) insect given by most entomologists as the type of the family Diopsidae in the group of *Muscode Acalyptata*.

Dioprase, or Emerald Copper Ore, a rare ore of copper found by analysis to consist roughly of 38 per cent silica, 50 per cent copper oxide, and 12 per cent water. It occurs in beautiful green transparent or translucent crystals, similar in appearance to emeralds.

Dipter (Gk. *δίς*, through, and *πτερόν*, to see), the unit of refractive power of a lens, having a focal length of one metre. The ratio of one metre to its focal length is the expression of the numerical power of a lens in Ds. A lens of +1 D. is a convex lens having a focal length of one metre, of +2 Ds., a focal length of half a metre, etc. See LENS.

Dioptrics, that part of the science of optics which deals with the refraction of rays of light when passing through media such as glass and water. It treats particularly of the laws governing the refraction of light by lenses.

Diorama, see PANORAMA.

Diorite, a granitoid rock found in abundance in Germany and N. America, rarely in England, but frequently in the Scottish Highlands and Galloway. D. is composed essentially of felspar and one or more of the ferro-magnesian minerals, such as hornblende, augite, biotite, or hypersthene. In colour it is greyish-white to almost black. Ds. from Guernsey are much valued as a road-metal in the S. of England.

Dioscorea, the chief genus of Dioscoreaceae, is noted for its farinaceous tubers which are largely cultivated as food in the tropics and are known as *yams*.

Dioscoreaceae, family of monocotyledonous plants. They nearly all grow in the tropics, but *Tamus communis*, the black bryony, a common climbing plant of hedges, grows in Britain; many are nutritious and others are highly dangerous.

Dioscorides Pedacius, or **Pedanius**, Gk. physician (Διοσκόριδης). He is supposed to have been a native of Anazarba in Cilicia and to have lived in the first or second century A.D. His chief work was a treatise on the *Materia Medica*.

Diosouri, see CASTOR AND POLLUX.

Dioscurides, gem engraver who lived about the time of Augustus, whose seal he engraved. He is one of the four engravers recorded by Pliny.

Diosgyör, tn. of Hungary, situated in the prov. of Borsod. In the vicinity there are coal mines. Pop. 7500.

Diosma, genus of herbs, inhabiting the Cape of Good Hope. The plants are heath-like, with white or red flowers, and belong to the family Rutaceae, which also includes the orange. *D. crenata* and *D. serratifolia* contain a volatile oil, and the leaves have an aromatic taste. By the Hottentots they have long been in use medicinally.

Diosod, tn. and com. of Rumania 22 m. S.S.E. of Debrecen, Hungary. Pop. 8000.

Dip, the angle which a magnetic needle makes with the horizon when the vertical plane, in which it moves coincides with the magnetic meridian. The total magnetic force acting upon a magnetic needle may be resolved into two components, one acting horizontally and the other vertically. When the needle is suspended so as to move in a horizontal plane, as in the mariner's compass, the horizontal force tends to make it lie along the magnetic meridian, but the vertical force has an inconsiderable effect. When the needle is suspended so as to move in a vertical plane at right angles to the magnetic meridian, the horizontal force can only act in the direction of the axis of suspension, and therefore the needle is only affected by the vertical component, and so stands vertically. When, however, the horizontal component is free to act, the needle takes up a position at an angle to

the horizon which increases as the position of the needle approaches the magnetic pole. The D. is subject to secular variation and in London has decreased from a maximum of $74^{\circ} 42'$ in 1723 to $67^{\circ} 9'$ in 1900.

Diphtheria (διφθερία, a skin or membrane), an acute infectious disease characterised by the formation on a mucous membrane, most commonly that of the pharynx (throat), of a yellowish false membrane. The disease was first specifically described and named by P. Brétonneau, of Tours, in 1826. In 1883 Klebs and Löffler identified the bacillus. The hist. of the micro-organism outside the human body is not well known. It appears to be ever present in a dormant state in the soil of all European and most Amer. countries, and is often found in the throats of subjects who present none of the characteristic symptoms. Some individuals seem to be altogether immune, while others take the disease in a very mild form. It commonly attacks children with fatal results, and may occur in scattered cases or as a widespread epidemic. Transmission appears to be by direct contact with an infected person, or by approaching him when he is coughing, or using a drinking utensil infected by him. The early symptoms are a sore throat and a general feeling of uneasiness, such as might accompany a bad chill. A swelling of the glands of the neck and an inflamed condition of the tonsils next make their appearance; the temperature rises, and the beginning of the false membrane is seen in yellowish patches. These gradually spread and unite to form a firmly adherent membrane with the appearance of wet parchment. If removed, it leaves a raw ulcerated surface on which it speedily re-forms. When not checked, the exudation spreads upwards and downwards, invading the nasal passages and the lower respiratory passages. There is great pain and difficulty in swallowing and the obstruction caused by the membrane may lead to death from asphyxia unless a new airway is provided by passing a metal tube directly into the trachea (windpipe) through an incision made in the patient's neck for the purpose (*tracheotomy*). At the same time, the effects of the bacterial poisons in the blood are to be noticed. The heart becomes weakened, albumin is present in the urine, and progressive anemia is observed. The poison has a marked effect upon the nerve tissues, causing temporary and local paralysis, which may persist for some time after the other symptoms have been suppressed. The paralysis often affects the soft palate and pharynx, causing the food to be returned through the nostrils, or the eye may be affected, causing disturbances of vision. Recovery is a lengthy process, and the period of convalescence demands great care in consequence of the recrudescence of some of the early symptoms or of possible complications, to which the weakened state of the D. patient renders him liable. The antitoxin mode of treatment overshadows all others; in fact, no other has been

productive of good effects. The serum is obtained from a horse which has previously been inoculated with a mild culture of *D. bacilli*. The animal elaborates a substance which combats successfully the bacterial toxin and henceforth becomes immune from the poison. The serum withdrawn from the animal is injected subcutaneously into the *D.* patient, usually with the prompt cessation of the most exhausting symptoms. Injection of the serum is also recommended as a preventive measure for persons likely to come in contact with *D.* cases, and although a slight

Diphthong (Gk. δι, double; φθόγγος, sound), a compound sound, composed of two vowel sounds joined to form one sound distinct from either of the two original. There are four sounds in Eng. which are pure Ds. These are $i = a + i$, as in the word aisle; $u = i + u$, as in the word duke; $oi = au + i$, as in joist; and $ou = a + u$, as in south. Many vowels written as double ones in Eng. are not Ds. in sound.

Diplegia, Infantile, see BIRTH-PALSY.

Diploidscope (Gk. διπλός, double and σκοπεῖν, to see, view), an optical instrument

Keystone

DIPLODOCUS

Diplodocus Carnegii (Upper Jurassic): a representation in a Canadian park

swelling of the joints has been observed in persons so inoculated, no permanent harm has ever been traced to the treatment. *D.* has not altogether shared in the general decline in the prevalence of epidemic diseases induced by superior sanitary conditions. There seems to be a periodic rise and fall in the numbers of cases recorded, and some attempt has been made to connect its prevalence with periods following upon a long drought, but without arriving at any satisfactory conclusion. There is no doubt, however, that when it does become virulent, it spreads with great rapidity by means of the contact of children in school. Good results have recently been obtained in protecting children from *D.* by immunisation. Sev. injections of *D.* toxoid are given, i.e. of the toxin which has been rendered less harmful by treatment e.g. with formalin; mixtures of toxoid and antitoxin are also used. The Schick test has been devised as a means of ascertaining which children are naturally immune from *D.*, and also as a method of diagnosing the disease in its early stages.

for indicating the passage of the sun or of a star over the meridian, and used for the purpose of determining the correct time by transit observations. It consists of a triangular prism which has two silvered planes and one (in front) unsilvered; one of the silvered planes coincides with the plane of the meridian. The coincidence of the two images formed by a single and double refraction of the prism records the transit accurately if the adjustment is correct. Steinhell's 'transit prism' grew out of the work of Bloxam, Dent, and Plössel on the *D.*

Diplodactylus, a genus of lacertilian reptiles, is closely related to the *Gecko* in the family Gekkonidae. The generic name *D.* ('double fingered') is derived from the two plates at the end of each digit, between which the claw can be retracted. A common example of these lizards is *D. vittatus*, and all the species are found in Australia.

Diplodocus, genus in the order Sauropoda, of the Dinosauria. The species were enormous reptiles about 80 ft. in length, with an abnormally long neck and

tail and small head, about one-thirtieth the size of the body. The vertebral column consisted of 15 cervical vertebrae, 11 dorsals, 4 sacrals, and at least 37 caudals. The generic name *D.* ('double beam') refers to the peculiar arrangement of the chevron bones underneath the caudal vertebrae, whereby protection was afforded to the caudal blood vessels when the tail was dragged along the ground. The high position of the external nares (nostrils) and the long tail indicate that it was probably aquatic, but the limbs are plantigrade and wholly terrestrial. The teeth are slender and cylindrical, arranged in descending order of size from the front of the mouth. *D. longus* and *D. carnegii* have been found in Upper Jurassic of Wyoming.

Diplomacy, the term applied to the art of conducting the affairs of one country with regard to those of another, owing to the intercourse which must take place between countries or states. This right of employing diplomatic agents belongs to those states only which have absolute power of their own and are not dependent on some other country. But all Brit. dominions are empowered to appoint their own different diplomatic representatives in foreign caps. and many have now done so. In England, nominally, the power to adjust relations with other countries rests with the king, but it is actually managed by others, the chief of whom is the secretary of state for foreign affairs. These officials may be either ambas., the actual representatives of the sovereign, envoys, or *chargés d'affaires*. When a man is in foreign ter., acting as a diplomatic agent for his country, he is judged by the laws of his own land, and only those laws can touch him. He has also a certain rank by reason of his commission, and ambas., as representatives of the sovereign, have an extremely high one. It has always been a custom, also, to adopt one language as a medium for diplomats—the one now used being Fr. See also DIPLOMATIC SERVICE, BRITISH.

Diplomatics (Gk. *διπλωμα*, (1) anything folded, or (2) a licence, from *διπλός*, double), the science of diplomas or of anc. writings, literary and public documents, letters, decrees, charters, codicils, title-deeds, court-rolls, chartularies, etc., which has for its object to decipher old writings, to ascertain their authenticity, their dates, signatures, and the general circumstances of their making. By the light of the internal evidence afforded by old public or private records, much may be inferred with respect to the customs and manners of former times, but although *D.* may be looked upon as a means to that end, it is also a science in itself, and one which requires no little degree of skill in application to attain results of any permanent value. The deciphering of anc. writings is generally known in these days by the name of palaeography (*q.v.*), a science the importance of which is now so universally recognised that most civilised countries of the day have instituted chairs of palaeography in various seats of learning. From this specialisation in one

particular direction of the general science of diplomas, it becomes necessary to distinguish the function of *D.* as being concerned to-day, not so much with deciphering as with preservation, co-ordination, and classification of old documents to facilitate the work of the palaeographer, and with the particular duty of ascertaining their authenticity, not only from the internal evidence vouchsafed by the palaeographer, but from any reliable external source of verification, and particularly from the form itself of any particular diploma or document. Sooner or later in the progress of civilisation it becomes necessary for a nation, not only to adopt set forms in documents, for the custody of its public Acts. Yet it was not before the Middle Ages that the European nations as a whole attained to anything like the precision of the anc. Romans in this respect. In England the preservation of both public and private documents was left rather to the discretion of those bodies or persons who were more personally affected by those documents than to officials—like the present keeper of the Public Record Office—whose duty lay towards the nation as a whole. Various courts from an early date kept records of decisions or grants made in such courts inscribed on the court rolls; the chancery very early kept a record of all royal grants in the shape of charters, privileges, and immunities, together with writs of process, and the chancery rolls from the beginning of the thirteenth century are both full and complete; and there are also to be found countless deeds of conveyance of real property, not only in the Public Record Office, but in the archives of municipalities, private families, and in the Brit. Museum.

The science of *D.* is one which is largely concerned with the investigation of forms. In this direction it is curious to notice how far the anc. Romans were in advance of mediæval Europe, and how remarkably deficient they were in the power to make use of their archives. In point of mere form, the Romans would appear to have attained such precision and directness of statement that in the Middle Ages all the advancing nations employed the set styles of the Rom. documentary system. This may have been due partly to the fact that a great part of Europe inherited its legal system directly from the Rom. civil law, but it is more probably to be accounted for by the fact that the few who could write, and the still fewer who could compose a formal document, had acquired the necessary learning through the Church of the Holy Rom. Empire. After the revival of learning and the passing of the dark ages, grants, charters, ordinances, proclamations, and all manner of official or public documents were composed in Lat., and whether avowed or not, there can be but little doubt that the Renaissance gave, not only the language, but the forms of the Romans, to all manner of documents. Diplomas in the particular sense of royal charters or grants of privileges all reveal, in the earlier stages of their history, a striking uniformity of

style and arrangement—a style which in the title and preamble to a modern Act of Parliament in England has by no means disappeared. The Fr. diplomas of the Carolingian and Merovingian periods, much after the style of Rom. lawyers, who were accustomed to mingle statements of the law with moral, religious, and philosophical reflections, generally began with an invocation, followed in order by the full name and style of the monarch, a preamble explaining shortly, or at considerable length, the motives, moral or religious, of the grant; the subject-matter of the grant; penalties against all who should infringe the privilege or immunity granted to the donee; and the signature of the monarch, and, in Lat., the date of the grant. Later, an added security to authenticity was given by the use of seals. In the earliest periods, the Roms. employed the term *diploma* to signify nothing more than a letter of licence to use public conveyances, the letter itself being inscribed on two leaves, or double tablets, hence the name. Subsequently the term embraced all public grants. Apart from the destruction of a great number of copies of brazen tablets by the burning of the capitol, and the depredations of the invading Gauls, there is, according to Mommsen, no dearth of documents from the early Rom. times. The sacred records of the Samnites, it is known, were inscribed on linen rolls, and there is evidence of the existence of written lists of the Rom. magistrates, books of oracles, clan registers, and Alban and Rom. calendars. No such documents are extant, but they were kept in the Rom. archives and would have fulfilled the purpose of instructing future generations but for the deficiencies of Rom. historians of the succeeding age. In England the medieval historians were not slow to avail themselves of the information derivable from anct. charters. Much, however, has been lost of the hist. of W. Europe between the time of Charlemagne and the twelfth century.

On the continent of Europe the science of D. would appear to have dated from the revival of learning in the Middle Ages, when, as a consequence of the recognised importance of documents in verifying facts and establishing the existence of rights, both public and private, the value of diplomas as evidence was defended by a Benedictine monk named Mabillon in a work entitled *De Re Diplomatica* (1681). Such a work with its scientific analysis of the principles to be employed in investigating diplomas was of especial value at a time when the practice of forging diplomas and other documents was as constantly resorted to as it had been in the time of the forged capitularies of Benedict the Levite and the false decretals of the Pseudo-Isidore (see Pollock and Maitland's *History of English Law*), the latter being a collection of elaborate mosaics made up out of phrases from the Bible, the fathers, genuine canons, genuine decretals, and the West Goths Rom. Law Book, the whole designed to establish the superhuman origin of ecclesiastical power and

the sacrosanctity of the persons and property of bishops. The monks, too, were accustomed to falsifying charters of grants of land, and they were justified in many instances, inasmuch as their title rested on prescriptive possession. Having, therefore, no deeds or charters to prove a perfectly lawful ownership of church lands, they set to work to produce such charters in set form. There were, however, wholesale forgeries of papal bulls and church briefs at the end of the twelfth century in England, and a science which can lay claim to detecting ingenious forgeries in anct. records necessarily does much to ensure a respect for anct. institutions which have been evolved from a long line of unimpeachable precedents.

See C. Toustain and D. Tassin, *Nouveau Traité de diplomatique*, 1750–65; B. Thorpe, *Diplomatarium Anglicum Ævi Saxonici*, 1865; E. A. Bond, *Facsimiles of Ancient Charters in the British Museum*, 1873–78; F. Leist, *Urkundenlehre*, 1893; G. F. Warner and H. J. Ellis, *Facsimiles of Royal and other Charters in the British Museum*, 1903.

Diplomatic Service, British. Great Britain is represented abroad in regard to its international interests by diplomatic agents and occasionally by consuls, though these latter are in general concerned exclusively with the interests of Brit. subjects resident abroad. The former include *ambassadors* or *envoys* who are officials permanently accredited to the court of a foreign state, and *chargés d'affaires*. A *chargé d'affaires* is either one who acts as deputy for an ambassador during the temporary absence of the latter, or one who is accredited as Brit. representative to some foreign court of minor importance. Ambas. are appointed by an derive their authority from sealed letters of credence (see CREDENTIALS) under the sign-manual addressed to the sovereign or president of the country to which they are accredited, and from instructions under the sign-manual to themselves personally. Consuls may represent Great Britain in its international relations only when expressly vested with diplomatic powers. Ambas. are assisted by various other attendants known as *attachés*. These latter have to serve a probationary period, after which they become eligible for appointment as third secretaries. First and second secretaries constitute an intermediate class between third secretaries and counsellors. *Counsellors* in the D. S. are appointed to all embassies and to the legations at Peking, Téhéran, and Cairo. All the members of the D. S. are expected to take their turn in whatever part of the world their services may be required, and every counsellor, secretary, or attaché, whether married or unmarried, must be prepared to go to the post at which the requirements of the public service demand his presence and to which he may be appointed. As announced by the Gov. in March 1946, women are now admitted to both the Diplomatic and Consular Services on equal terms with men. There is, however, a general marriage bar which the Foreign Secretary has power to waive

in exceptional circumstances. See T. H. S. Escott, *The Story of British Diplomacy*, 1908; Lord Ponsonby, *Democracy and Diplomacy*, 1915.

Diplopia, see under EYE.

Dipnoi (Gk. $\delta\iota$, twice; $\pi\nu\sigma\iota$, breathing), or **Dipneusti**, a sub-class of fishes, is of great interest for its many peculiar features, some of which are typical of amphibians. The D. are all extinct but for three genera, the *Ceratodus* (q.v.), of Queensland, *Protopterus*, of Africa, and *Lepidosiren*, of America, but many fossils belonging to the group have been discovered, all either Palæozoic or Mesozoic. The importance of the possession of a double-breathing apparatus is seen in *Protopterus* and *Lepidosiren*, both of which have gills as well as two lungs. They are mud-fishes which live in tropical swamps; when the water is abundant they breathe by means of their gills, when it has dried up by means of their lungs. *Ceratodus*, however, lives in the deep pools of rivers, and it is not known definitely that the power of its single lung is ever tested.

Dipper, or **Water-Ousel**, the popular term for passeriform birds of the genus *Cinclus*. Both wings and tail are short, the beak is fairly short and straight, and the general colour of the bird is brown, the throat and part of the breast being white. It inhabits streams of Europe, Asia, and America, feeding on molluscs and insects, and is a good diver. *C. aquaticus* and *C. albicollis* are Brit. species.

Dippers (religious sect), see DUNKERS.

Diprotodon, genus of kangaroo found in fossil state in Australia; it is characterised by a peculiarity of dentition.

Dipsacaceæ, order of dicotyledonous plants which is nearly allied to the Compositæ. *Dipsacus sylvestris* is the common teasel found on waste ground in Britain, and *D. fulanum* is the fuller's teasel which has hooked bracts, and the prickly fruit-heads are used in finishing woollen cloth.

Dipsas, genus of Amblycephalidæ, are snakes which have much in common with the family Colubridæ. The members of the genus are found in S. America and are harmless, though in appearance they resemble poisonous species.

Dip-sector, astronomical reflecting instrument, similar to the sextant in principle, for ascertaining the dip of the horizon. In 1803 Wollaston described in the Bakerian lecture a D. of his invention; Troughton constructed these instruments.

Dipsomania, see under ALCOHOLISM; **DRUNKENNESS**; **INBERIATES**.

Diptera (Gk. $\delta\iota$, two; $\piτερον$, wing), large order of insects, of which over 40,000 species have been classified, but are not believed to nearly represent all of the species which are in existence. They are distinguished from other insects by the presence of one pair of wings, though in a few cases, e.g. the flea, these are absent or rudimentary, and the hind-wings are frequently represented by two pin-like, knobbed processes called halteres. The wings are never very large, they are transparent and membranous. The flattened

head is united to the body by a long and very flexible neck, the divisions of the thorax are greatly fused, the mouth-parts are adapted for piercing or suction, and often have a retractile proboscis. The metamorphosis of the flies is complete, the larva being usually a maggot which has no thoracic legs and only a minute head; the organs it contains differ completely from those of the mature creature, and in undergoing its metamorphosis the contents of the body break down into a creamy substance from which the new organs of the adult are developed. It is usually only the females which have blood-sucking habits, and their larvæ are nearly

DIPTERA

A, Egg, magnified ten times; B, larva, magnified four times; C, puparium magnified four times; D, horn-fly (*hematobia serrata*), Europe, magnified eighteen times.

always aquatic. The D. are divided by most zoologists into five groups, the Nemocera, Brachycera, Aschiza, Schizophora, and Pupipara, and the Aphaniptera, or fleas, are usually included among them, though sometimes they are allotted the dignity of an order to themselves.

Dipterocarpaceæ, order of dicotyledons, contains over 300 species, most of which are trees. The calyx enlarges greatly during the ripening of the fruit, which is usually a nut. All the species produces such substances as resin and oil: *Dryobalanops camphora*, a kind of camphor, and *Dipterocarpus tr. nervis*, a resin which is made into plasters for ulcers in Java.

Dipterus, oldest known fossil genus of dipnoid fish in the family Ctenodontidæ.

Diptych, two tablets made of carved ivory, etc., and united by leather hinges; their inner surface was covered with wax. The Romans wrote in them the names of the consuls and principal magistrates. They were also used in monasteries, to contain the names of the bishops and benefactors. The name is applied to pictures and bas-reliefs covered by two carved or painted shutters.

Dipyre (Gk. $\delta\iota$, two, and $\piυρ$, fire), silicate of alumina and lime, which, when subjected to heat, first becomes phosphorescent and then fuses: it occurs as a transparent, tetragonal mineral in the Pyrenees.

Dirac, Paul Adrien Maurice (b. 1892), Eng. mathematician; educated at the Univ. of Bristol and Cambridge. He was a fellow of St. John's College, Cambridge, and in 1932 was appointed Lucasian Prof. of Mathematics. In recognition of his valuable work in connection with quantum mechanics, he was in 1933 awarded the Nobel Prize (with Edwin Schrödinger). His *Principles of Quantum Mechanics* was pub. in 1930.

Dirce, wife of Lycus, King of Thebes. She was dragged to death by a wild bull, to whose horns she had been bound by Amphion and Zethus, sons of Antiope, the divorced wife of Lycus.

Dircks, Henry (1806-73), Eng. civil engineer and author, inventor of the optical illusion 'Pepper's Ghost.' As an apprentice in a mercantile firm he studied mechanics, chemistry, and literature, and later became a practical, then a consulting engineer, and member of the Brit. Association. He wrote *Popular Education, Inventions and Inventors, Scientific Studies*, etc.

Direct Action. A phrase that came into popular use in England about the year 1910, chiefly in relation to labour unrest and the Women's Suffrage Movement. Like many slogans invented in times of agitation, it has no precise definition, but varies, according to the mood and character of the user, from a small local strike to a violent national uprising. For some years before the 1914-18 War, an increasing distrust of gaining their ends by constitutional methods was steadily growing among wage-earners at home and abroad; while such bodies as the Independent Workers of the World and the Syndicalists were increasing their activities and urging swifter methods of change. Growing international uneasiness, the tension in Ireland, the Agadir (*q.v.*) incident and the revolution in Portugal were symptoms of a growing willingness to appeal to force, and in the increasingly war-like atmosphere the plea that the workers should use their numerical superiority in a more direct manner than had been done theretofore attracted serious attention.

Direct and Retrograde, terms used in astronomy to indicate the apparent motions of a planet as seen from the earth. Its motion is said to be D. when it is progressing from right to left towards its eastern elongation and R. when it is travelling towards its western elongation, apparently in the opposite direction.

Direct Current, see under ELECTRICITY SUPPLY; ELECTRIC GENERATOR.

Director, in law, see COMPANY, and PUBLIC PROSECUTOR.

Directorium, or **Ordo**, a list printed every year by authority of a Roman Catholic bishop; it contains directions to ecclesiastics as to the office for each day.

Directory, alphabetical list or index giving various kinds of information. Most useful in Great Britain is the Post Office Directory, compiled for dists.; the largest is the London one, which contains information under the following headings: 1. *Court D.*: names of people occupying private houses, arranged alphabetically,

but persons having any rank or title precede others of the same name. 2. *Official D.*: names of persons holding any gov. or law office. 3. *Street D.*: names of the prin. streets of London, with their terminals and intersections with other streets named, and a selection of the inhaab. 4. *Law D.*: list of judges and official staff of all the courts and of the police force. 5. *Parliament D.*: list of all peers of the United Kingdom, members of the House of Peers, members of the House of Commons and names and places for which they sit. 6. *Postal D.*: All information connected with the transmission of letters, parcels, etc. 7. *City, Municipal, Parochial, and Clerical D.*: gives a large amount of miscellaneous information. 8. *Commercial D.*: list of wharves, booking-offices, railway-carriers, etc. 9. *Banking D.*: list of bankers, etc. 10. *Suburban D.* The Post Office also pub. the *Telephone D.* There are also various Ds. compiled by individuals, e.g. Perry's *Mercantile Guide*, Kelly's *Customs Tariffs*, Stubbs's *Manufacturers*, Macdonald's *English D. and Gazetteer*, Crookford's *Clerical D.*, *The Medical D.*, Willing's *Press Guide*, and *Who's Who*. There are also Ds. for the cos. and provincial cities and tns. Ds. are pub. in all countries of the world. All these are to be found at any good reference library.

Directory (1795-99), the name given to the gov. of France which followed the fall of the Convention or Terrorists and which ruled from Oct. 27, 1795, until its overthrow by Napoleon and the Abbé Sieyès on the 18th Brumaire (*i.e.* Nov. 9) 1799: The constituent bodies of the D. were the Council of Five Hundred, and the Council of the Ancients and the D. proper or *directoire exécutif* were elected by the former council from a list presented by the latter council. The members were Barras, Carnot, Légeux, Latourneur, and Rewbell. The D. gave its name to the *directoire* style of dress and furniture.

Directory of Public Worship, collection of rules for public worship drawn up by the Westminster Assembly of Divines in 1644. It was accepted by the General Assembly of the Church of Scotland and by the Scottish Parliament in Feb. 1615. It appears in vol. v. of *The History of the Puritans*, by D. Neal (1732-38).

Dirge (Lat. imperative *dirige*, direct thou), the first word of the opening antiphon used in Rom. Catholic offices for the dead, thus the term is applied to a piece of music which is suitable for funeral ceremonies.

Dirhem, Arabic silver coin equivalent to about 45 grs. The Fr. gramme is now called D. in Turkey. See DRACHMA.

Dirigible Balloons, see AERONAUTICS; AIRSHIPS; BALLOONS.

Dirk, proper name for the dagger of the Scottish Highlander. It was worn either within the vest or with the pistol at the belt. The blade was some five inches long, and separated by a 'shoulder' from the short, cylinder-shaped handle, which was usually of horn or wood, and was often richly carved. It is worn to-day only with ceremonial Highland dress.

Diræ, see EUMENIDES.

Dirschau, see TZEZU.

Dirt Beds, see PURBECK BEDS, and GEOLOGY.

Dirt-track racing, sport of riding motor cycles round tracks made of loose earth. First introduced in Great Britain from Australia in 1927.

Dis, see HADES.

Disability, term in law which is applied to a person who is not allowed to do a particular thing. This D. may be due to physical causes, as in the case of those mentally deficient, or to the fact that a person is under age, or to a point of law, as in the case of an alien.

Disability Pensions, see DISABLED PERSONS; PENSIONS.

Disabled Persons. After the first World War the resettlement in civil life of men disabled during the war became a national problem. In 1915 an appointments board, under the ministry of labour, was constituted to place disabled officers and men. During the war and for some time after the Armistice disabled officers and men were given a course of training to fit them for civil employment in those cases where they could not follow their previous employment. To encourage employers to absorb the disabled the King's National Roll was inaugurated by Royal Proclamation in Aug. 1919. Those who engaged D. P. in the proportion of five per cent of their total staff of employees were given a certificate and were entitled to use a special seal on their business stationery. Such organisations as the Brit. Legion, St. Dunstan's Hospital for the Blind, etc., did good work for D. P. War-disabled men, through the operation of the Joint Substitution Board, were given preference over other applicants for work in Gov. Departments. At the beginning of the Second World War it was anticipated that the largely voluntary organisation which had existed up to that time of the resettlement of D. P. would prove inadequate. In 1941 the ministry of labour and national service set up a number of vocational training and rehabilitation centres, and under an interim scheme officers of the ministry undertook to place D. P. in suitable employment. At the same time an inter-departmental committee was appointed to inquire into the whole question of resettlement and rehabilitation. The committee's report was pub. in Jan. 1943 (White Paper Cmd. 6415), and legislation was introduced later the same year. As a result the Disabled Persons (Employment) Act, 1944, became law on March 1, 1944. For the purposes of this Act a disabled person is defined as one who on account of injury, disease or congenital deformity is substantially handicapped in obtaining or keeping employment, or in undertaking work in his own account, of a kind which apart from disablement would be suited to his age, experience, and qualifications. The Act applies to Brit. subjects of either sex over the age of sixteen, and in certain conditions to non-Brit. subjects also. The ministry provides vocational training or industrial rehabilitation courses at centres run as a

gov. charge, or arranges for suitable courses to be taken at technical colleges and institutes. In this case the fees are paid by the gov. The ministry may also pay the expenses incurred by those attending such courses, or contribute towards them. The ministry maintains a register of D. P. Registration is voluntary. Employers are obliged under the Act to employ a quota of registered D. P. The quota for any particular employer is determined by the ministry and bears relation to a standard percentage fixed for general application in consultation with employers' and workers' organisations. Special percentages are fixed for certain industries, as necessary. In certain types of employment vacancies are exclusively reserved for registered D. P. only. In the administration of the Act the minister of labour is assisted by a national advisory council.

Disarmament. Strenuous but hitherto fruitless attempts have been made since the war of 1914-18 to secure some mitigation of the pre-war evil of unrestricted competition in armaments, beginning at the peace negotiations at Paris in 1919. International principles were laid down in the covenant of the League of Nations to that end. Article VIII. opened with the statement that 'members of the League recognise that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations.' It then went on to entrust the council of the League with the task of formulating plans for the reduction of armaments and the supervision of the manuf. of munitions.

In Feb. 1921 the council appointed the Temporary Mixed Commission for the Reduction of Armaments, and that body considered the possibility of extending to land armaments the naval ratios adopted by the Washington Conference (*q.v.* (see also NAVY; SEA POWER); but eventually it reported to the League assembly that no scheme could be effective which did not provide some form of national security as a *quid pro quo* for the reduction of national armaments. The assembly adopted this principle in the Resolution (XIV.) framed by Lord Robert Cecil and M. de Jouvenel; and thereupon the Commission began to draft a general treaty of Mutual Guarantee or Assistance which the League adopted in 1923. The treaty was rejected by Great Britain on the ground, *inter alia*, that it would tend to revive military alliances within the League.

During the period 1920-23 the only effective agreements for the limitation of armaments were negotiated outside the League, and of these the most important was the Five Power Pact signed at Washington in 1922, by which the U.S.A., Great Britain, France, Italy, and Japan agreed on a limitation of cap. ships and aircraft carriers for fifteen years in the ratio of 5:5:1:66:1:66:3. The maximum tonnage per country and per vessel was also fixed. This Pact opened the way to the later naval conferences. In 1924 an

attempt was made to find a solution in the historic Geneva Protocol (*q.v.*). This document purported to rule out absolutely the legality of war except in certain cases; but again the Brit. delegates rejected the solution, because it did not provide for the reduction of armaments and repeated the Fr. attempts, made in 1919 and 1923, to turn the League into an 'International Body' which should command an international force. Another solution was provided by the Locarno treaties (*q.v.*) which conduced to a measure of stability in Europe until Germany denounced them in 1936.

During 1926-27 the League appointed a Preparatory Commission on D. preliminary to a World Conference. As regards land armaments, it made an attempt to limit the effectives of the sev. signatories and to cover arms and ammunition by budgetary limitation, but reached no unanimity. The ensuing Coolidge Conference on naval disarmament broke down, it being clear that the Fr. solution of a maximum total tonnage only, and the Brit. insistence on a maximum tonnage for each 'category' (*i.e.* for capital ships, carriers, submarines, etc.) were irreconcilable. In Jan. 1930 the Five Powers (Great Britain, U.S.A., France, Italy, and Japan) once more sent their delegates to a conference to consider the further limitation of naval armaments. This conference twice broke down. It resulted, however, in a Three-Power Pact by which Great Britain, the U.S.A., and Japan would lay down none of the replacement cap. ships of 35,000 tons each which they were entitled to build under the Washington Treaty during 1931-33 inclusive; and the U.S.A., Great Britain, and Japan undertook to proceed at once with the reduction of their cap. ships in numbers to 15, 15, 9, respectively, instead of waiting until the expiration of the Washington Treaty. Japan, however, subsequently denounced the Washington Treaty with the result that a further conference was called in London in 1935. Japan seceded from the Conference on the refusal of the other powers to agree to a 'common upper limit,' but in the spring of 1936 the remaining parties signed a tripartite treaty for qualitative limitation (*see* NAVY; SEA POWER).

On March 12, 1931, the Franco-It. naval agreement was pub., providing that each signatory might build two cap. ships up to 23,333 tons with 12-in. guns, up to the end of 1936, subject to scrapping a battleship for each new one; cap. tonnage of each signatory to be raised to 181,000 as against 175,000 in the Washington Agreement; each might complete aircraft carriers up to 34,000 tons; no further laying down of cruisers of more than 6.1-in. gun class; limitation of small cruisers to maximum replaceable before 1936. At a conference held at Geneva in Feb. 1932, M. Tardieu, then Fr. premier, presented a plan for the creation of an international army, and declared that the acceptance of this principle must be preliminary to reduction of armaments by France. This plan was, however, sidetracked, and Sir

John Simon opened with the Brit. proposals (Brit. Draft Disarmament Convention of March 1933), which included the prohibition or limitation of arms of an offensive character, the abolition of chemical warfare and of submarines, the reduction of the size of ships, and calibres of guns, and the establishment of a permanent D. commission. America and Italy supported these proposals. America also put forward a schedule for computing the military needs of every nation on the basis of its requirements for defence and the maintenance of internal order. Italy added the abolition of capital ships and tanks, and drew a precise distinction between qualitative and quantitative D. In April the general committee passed a resolution according to which certain offensive weapons were to be selected, the possession or use of which should be absolutely prohibited or prohibited to individual States and internationalised. Later, President Hoover presented proposals which included the abolition of chemical warfare, tanks, large mobile guns, bombing aeroplanes, and a closer definition of the 'defence' and 'police' components previously outlined by the Amer. delegate. More precise Brit. proposals, submitted in July, included the reduction of the size of battleships to 22,000 and cruisers to 7000 tons, with corresponding reduction of gun calibres. Submarines were to have a maximum size of 250 tons, mobile land guns a maximum calibre of 6.1 in., and tanks were to be restricted to lighter types. A resolution was passed embodying the general sense of these proposals and the other main proposals in vague terms. The U.S.S.R. was generally in disagreement with the conference, being in favour of complete D. all round as the only genuine basis for security; while Germany refused to accept any resolution which did not recognise the equality of status for all nations. In June 1933 a Pact was signed by Great Britain, Germany, France, and Italy by which these nations undertook (*inter alia*) to make every effort to ensure the success of the D. Conference. But as a general policy, D. received its first very serious set-back in 1934.

The Geneva Conference (which opened early in 1932) virtually developed in 1933 into a re-armament conference, owing to its resolution sanctioning 'parity of armaments' for Germany. As a result both of the divergence of opinion at this conference and of the rise of Hitler to power in Germany there was marked increase in armaments in most countries, and even the U.S.A. embarked on a greatly augmented programme. It became evident that there was no prospect of the acceptance of the Brit. Draft Disarmament Convention of March 1933, and negotiations on it were so fruitless that in Oct. of that year Germany resigned from the League of Nations. Early in 1934 the Brit. Gov. issued a Memorandum stating that it was ready to yield to the Ger. demand for a short-service army of 300,000 men but held out for the prohibition of 'para-military' forces by constant super-

vision, and repeated its earlier proposal for the abolition of military aircraft, subject however to adequate supervision of civil aviation to prevent misuse for military purposes. Not only Germany, but Japan, the U.S.A. and Russia were opposed to any system of international supervision or control of their armaments. Then followed fruitless negotiations between Fr. and Ger. in the course of which Fr. pointed out that in the period 1920-32 her budgetary credits for national defence had been reduced by £30,000,000 while Germany had carried out a programme for increasing her armaments to a level far above that authorised by the treaty of Versailles. It was ascertained in 1936 that Germany in the previous seven years had expended \$14,000,000 on rearmament. France flatly declined to accept any convention unless Germany re-entered the League and unless there were included a pledge of common action against the aggressor. In April 1934 Germany made known her intentions regarding her air armaments—a programme in which France saw a direct menace to her liberty. In May the general commission of the Disarmament Conference met in Geneva, the chief feature of which was the Amer. proposal to negotiate 'a universal pact of non-aggression' on condition that the U.S.A. took no part in European political negotiations or settlements nor used its forces for such settlements—a proposal which was a mere repetition of the Kellogg Pact. The Russian Gov., however, through Litvinov, rejected this proposal and favoured security and a practical system of guarantees—a counter proposal to which Sir John Simon returned an emphatic negative; and on June 11 the commission adjourned *sine die*. In 1935 Great Britain concluded an agreement with Germany under which the latter country was permitted to build up a navy to one-third of the strength of the Brit. Navy. In 1936 Great Britain decided on an all-round increase of armaments (see White Paper issued in March, 1936), her action being hastened by the uncertain situation which prevailed in Europe, through the militant policy of Italy, the denunciation of the Locarno Treaty by Germany, and the aggressive policy of Japan in the Far East. Furthermore, Japan claimed parity with Great Britain and the U.S.A. for her naval armaments.

No further serious attempts at D. were made, and the international situation steadily deteriorated, culminating in the outbreak of war in 1939. At the conclusion of the Second World War, the world was confronted with the weapon of atomic power, and the problem of controlling it, and the related question of D., again came to the fore. The subject was actively discussed at the General Assembly of the United Nations which met in New York in the autumn of 1946. The question of a troop census of all nations was debated, but only when this was abandoned was it possible for the political committee of the United Nations to draw up a resolution for presentation to the general assembly. This resolution was adopted

by the assembly by acclamation on Dec. 14, 1946. By its terms an early general regulation and reduction of armaments and armed forces was recognised. It also contained a recommendation that the Security Council should expedite practical measures to this end, to be generally and not unilaterally observed, together with provision for an international convention for the control and inspection of armaments and armed forces. The prohibition of atomic and all other major weapons of destruction, both present and future, was stated as an urgent objective. As a result of this resolution, the responsibility for formulating detailed D. proposals devolved upon the Security Council. See B. H. Williams, *The United States and Disarmament*, 1931; J. W. Wheeler Bennett, *Disarmament and Security since Locarno*, 1925-31, 1932; *Disarmament: a review of the Acts of the League of Nations and of Governments of Deliberations and the Trend of Public Opinion and Action relating to World Disarmament Conference of 1932* (Disarmament Committee, Geneva), 1932; G. Engely, *The Politics of Naval Disarmament*, 1932; H. Kirchhoff, *Heat Disarmament*, 1932; L. Blum, *Peace and Disarmament*, 1932; N. M. Sloutzki, *The World Armaments Race 1919-39* (Geneva Research Council), 1941.

Discharge, see BANKRUPT; ELEC-TRICITY; ABSCESS.

Discharge, Arch of, in architecture, an arch built in the masonry or brickwork above the lintel. Its object is to transfer the pressure from above to the points of stability on either side. It can generally be distinguished from the stone or brickwork in which it is built merely by the position of its stones. The earliest example is found in the Great Pyramid, consisting of two stones resting against each other above the lintels of the entrance. The A. of D. was used in Gk. and Rom. architecture.

Discharge (military), the release of a serving soldier from further obligations of military service under the terms of his enlistment. In the Brit. Army a soldier on enlistment undertakes to serve the Sovereign so long as his services are required within the period for which he agrees to serve. At the end of the agreed period he may claim his discharge unless a state of war exists or the reserves are called out on permanent service. If he is serving overseas, his period of service may be extended by twelve months. The Crown has the right to discharge a soldier before he has completed his legal period of service, and the grounds for discharge, e.g. medical unfitness, misconduct, inefficiency, services no longer required on reduction of establishment, are laid down in the King's Regulations. A soldier may also purchase his discharge, and the amount varies from £20 to £100 according to the conditions and length of service. He is not, however, permitted to purchase his discharge under four years if liable for service under the Military Training Act of 1939. All men discharged from the Army are given a certificate of service unless discharged for misconduct.

Disciples of Christ, see CAMPBELL, ALEXANDER.

Disciplina Arcani (Lat., 'discipline of the secret'), a term used in the seventeenth century to describe the system of reserve practised by the Christian Church during the first few centuries, by which the mysteries of the faith were concealed from unbelievers and the unbaptised. No trace of it is found till the end of the second century, and it began to die rapidly at the end of the sixth century. Strong traces of it remain in the Gk. liturgy. Baptism and the Eucharist were considered as the great Christian mysteries, and the latter was divided into a 'Liturgy of the Catechumens' and a 'Liturgy of the Faithful.' The latter included the consecration and communion, and from it the unbaptised were excluded. See works, *De Disciplina Arcani*, by Schelestrate (Rome), 1685, and Tentzel, 1692.

Discipline, see ARMY; MILITARY LAW.

Disco, is, on the W. coast of Greenland. It is 70 m. long and about 50 m. wide. Godhaven is a harbour in the S. of the is.

Discoboli, or Cyclopteridae, the family name of the acanthopterygious fishes known popularly as lump-suckers from the frequent presence of a sucking disc formed from the united ventral fins. *C. lumpus*, the cock-and-hen paddle, and *L. vulgaris*, the sea-snail, are found on Brit. coasts.

Discoidea, see ECHINODERMATA.

Discount, amount of money deducted from a certain sum when that sum is paid before it is due. There is true or theoretical D., and commercial or banker's D. The former, which is practically not used at all, is the difference between the present worth of the bill and its face value or future worth. Thus the D. on £104 due one year hence at 4 per cent per annum is £4. Tradesmen and bankers, however, adopt a different method of computation. They reckon the simple interest on the face value of the bill. Thus if a bill of £110 is due a year hence at 10 per cent., the banker deducts simple interest on £110 at the given rate, i.e. £11, instead of £10 as in true D. D. is also applied to stock if the actual purchasing value is below that of the nominal value; thus if £100 stock can be bought for £95 cash, it is at D. of 5 per cent.

Discovery, legal term denoting disclosure by a defendant in an action of certain facts, documents, or deeds, which the plaintiff obliged him on oath to discover to the court so as to make good his case. Similarly the defendant may call on the plaintiff for a 'discovery.' To obtain D. of all the documents in an opponent's possession, application must be made to a master in chambers and the applicant must first pay £5 into Court to the 'Security for Costs Account.' On the hearing of the application the master will order disclosure of 'discovery' only so far as he deems necessary either for disposing of the action or for saving costs. No party need produce any document which relates solely to his own title to property, nor any documents which, if produced, would tend to incriminate him.

Discovery Committee, Colonial Office committee which was formed in 1923 with the primary object of attempting to place the whaling industry on a scientific basis. Its other objects were to render service to navigation by conducting a hydrographic survey of the whaling areas, to inquire into the resources of whaling regions from the point of view of fisheries, and to add to scientific knowledge of the sea. For this work the royal research ship *Discovery I.* made investigations in the vicinity of the Falkland Is. between 1926 and 1927 and the research ship *William Scoresby*, and the royal research ship *Discovery II.*, a steel-built boat, made sev. voyages in Antarctic waters since that time. The chief investigations were directed to a study of the habits and haunts of whales, their rate and location of breeding, and related topics, with the view of securing data for regulating the industry. This had become an urgent matter owing to the increasing possibility of the extermination of the whale, and is of especial importance to the Falkland Island dependencies, where whaling is almost the sole industry and a lucrative one. The *Discovery I.* found that distribution was governed largely by that of the small creatures on which the whale feeds, and that therefore if large tracts are found in which these creatures are scarce, no accumulation of whales can be expected. Direct evidence as to migration of whales is sought by marking whales with numbered darts, which, when returned from whaling stations, show the course travelled. Whale-marking has been carried out by the *William Scoresby* by means of darts fired into the back of the whale.

At the end of 1930 the D. C. reported that the *Discovery II.* had carried out a complete investigation and hydrographical survey of the S. Sandwich Is., this being the first official visit made since the is. were declared Brit. Ter. by Letters Patent of July 21, 1908. Thus the ship has rounded off a chapter of Antarctic hist. associated with the historic names of Cook and Bellinghausen. In 1936 the *Discovery II.* devoted from her third voyage of research to the Antarctic in order to rescue the Amer. explorer, Lincoln Ellsworth. In 1949 the D. C. was reorganised as part of the National Institute of Oceanography.

Discus (Gk. *δίσκος*, disk), a circular plate of stone (or metal), in ant. times from 8-12 in. in diameter, weighing 4-5 lb., used for hurling from a fixed mark to the greatest possible distance as a gymnastic sport and exercise among the Gks. and Romes. Disk-throwing was included with jumping, foot-racing, spear-throwing, and wrestling in the *pentathlon* of the Olympic Games. The D. was held in the athlete's right hand, leaning against the forearm, and thrown like a quoit. Sometimes a kind of spherical quoit was used similarly, with a thong passed through a hole in it. A copy of Myron's famous 'Discobolus' is in the Brit. Museum (according to Gardiner the attitude is not strictly correct), and also in the Vatican and the Palazzo Lancellotti at Rome there are

copies. The bronze statue in Rome was presented by Mussolini in 1939 to Hitler, but in 1948 was reclaimed by the It. Commission sent to Germany to find It. masterpieces which fell into the hands of the Gers. and is now restored to Rome. As used in modern times the D. is made of birch wood, with a metal centre piece. It weighs about 4½ lb. and

MYRON'S DISCOBOLUS
A copy in the British Museum

is thrown from a circle of 7 ft. The world record throw, 180 ft. 2½ in. was made in 1946.

Discussion, term in Rom. law, denoting the exhaustion of all legal means by the creditor to enforce payment from the principal debtor before taking proceedings against the person secondarily liable, i.e. the surety. In Scots law the term is also used in 'D. of heirs', the proceedings against the heirs for debts contracted and left unpaid by the deceased.

Disease Carrier, see CARRIER (DISEASE).

Diseases, Notification of, see NOTIFICATION.

Diseases of Animals Act, see CONTAGIOUS DISEASES (ANIMALS) ACTS.

Disestablishment, the annulling of the special status, and privileges which a particular religious communion has enjoyed by favour of the State. Disendowment, a usual concomitant, is, however, separable in idea from Disestablishment. The disassociation of Church and State as a combination may be considered a Brit. religious movement; while politically it is to some extent a 'liberty and equality' concept of the Fr. Revolution. In France the Rom. Catholic Church was disestablished during the Revolution, reinstated

by Napoleon in 1801, and the union was repudiated unilaterally by the State in 1906. In Great Britain the Church of England as established in Ireland, where the people were largely Rom. Catholics, was disestablished by a Bill of 1869 which came into force in 1871. The archbishops and bishops ceased to possess the right to seats in the House of Lords, and the rights of patronage were abolished. In the case of private patronage, compensation was made, and all offices which carried personal precedence with them were retained for life. Attempts to introduce a Welsh Disestablishment Bill began in 1895. The Liberal attempt in that year failed, but in 1909 another Bill was introduced as a result of the findings of the Royal Commission appointed in 1906. The Bill was finally passed by the Commons in the early part of 1913. In the following year it passed into law to come into operation in 1915, but the outbreak of war in 1914 led to the postponement of the measure, and it was not until 1920 that the Welsh Church was disestablished. In Scotland, where the people are mainly Presbyterian, the two great div. of the Scottish Church—Estab. and Free (or United Free)—coalesced in 1929 on a unique basis, viz., complete independence of the State in all spiritual matters and internal gov., along with a definitive transference of the anct. endowments to the United Church. In 1927, a movement of a voluntary nature took place in the Eng. Church in India that might be regarded as akin to disestablishment. But although the Indian Church separated in many official particulars, it still recognises Canterbury as the mother see. European republics of recent times such as Germany, Portugal, Poland, Czechoslovakia, follow the example of the eldest republic, Switzerland, in adhering to Cavour's principle of a 'free church in a free state.' In the U.S.S.R. the Soviet gov. was at the outset hostile to organised religion, and the Orthodox Church was consequently disestablished and disendowed. See also CHURCH.

Disfranchisement, see ELECTIONS.

Disinfectants, agents used to kill disease germs with the object of preventing the spread of infectious diseases. There are three classes of substances used to counteract bacterial action, whose functions overlap to some extent; they are antiseptics (q.v.), D., and deodorants. Antiseptics act by destroying the germs or neutralising their poisons; deodorants act by disguising the smell or changing the composition of noxious gaseous products without necessarily destroying germs; but D., which are usually applied to clothing, furniture, etc., must, in order to be effective, destroy all germs associated with the disease to be combated. The process of disinfection generally commences with the destruction of organic masses, as excreta and discharges, as soon as possible, and the burning of all inexpensive or much-soiled articles of clothing, and proceeds to subject all articles suspected of contamination to the action of some chemical or physical agent of a germicidal nature. When the articles are placed in

a sealed room, an effective disinfecting agent is formalin, which has a particularly penetrative power, but has little action on colouring matter or metals other than iron. Sulphur dioxide was formerly much used, but the penetrative power is less than that of formalin, and there is some doubt as to the dry gas being an effective germicide, though many vermin are readily destroyed by it. The application of considerable heat is the most effectual method of disinfection known. When applied in the form of hot air there is danger of scorching articles of clothing; but steam, at a temp. of about 120° C. and a pressure of 5 lb., has no harmful effects on colours and fabrics. Public disinfecting stations have usually two chambers; the clothing, etc., is placed in a cage mounted on wheels so that it can be run from the steam chamber to the drying chamber, where the articles are handled by a different staff and conveyed in different wagons from those connected with the collection of contaminated articles. Liquid D. are used for cleansing articles in constant use in sick-rooms, for treating drains and sinks, etc. The manganates and permanganates of sodium and potassium, chloride of lime, carbolic acid, corrosive sublimate, etc., are used for this purpose. D. lose their power when much diluted, and the vapour of carbolic acid, though its odour gives a sense of security, has no particular germicidal effects. In recent years the range of disinfectants has been widely extended by chemical research, and some of the new varieties, such as hexahydroresorcinol, are 300-400 times as effective as carbolic acid.

Disinfecting Stations.—By various Acts of Parliament, notably the Public Health Act, 1875, it is incumbent upon sanitary authorities to cleanse and disinfect houses and their contents if they are likely to cause or spread disease. Bedding, clothes, and similar articles which are extremely likely to do this are removed to D. S. and disinfected at the public expense. If necessary they are totally destroyed, in which case compensation is given. The usual agent in D. S. is steam. Local authorities have power to disinfect persons also who through filth, disease, or vermin are a danger and a nuisance to the public.

Disjunction, in logic, the relation of the sev. terms of a disjunctive proposition, which is the statement of alternative possibilities. It is a matter of dispute among logicians whether the disjunctive form necessitates the mutual exclusiveness of the alternate predicates. A disjunctive judgment is one of the form 'A is either B or C' when either the statement 'A is B' or 'A is C' must be true. See *Well-ton's Logic*, II. l. 209.

Dislocation, or Luxation (loosening), in surgery, the displacement of one bone from another with which it is articulated (commonly called 'putting out of joint'). Usually the result of an accident, but may be caused by disease or be congenital (occurring before birth). Displacements may be partial or complete. They are classified as 'simple' when the skin is unbroken, 'compound' when there is a

wound. A complicated D. is a displacement of a bone, accompanied by severe local lesion of the soft parts or fracture of the bone. The process of righting a D. is called 'reduction.' Reduction of recent luxations is comparatively easy to doctors, but in old and long-neglected cases it involves an operation which may be followed by bad consequences for the patient. Since the introduction of anaesthetics treatment is much easier. Manipulation has, since 1870, largely replaced the method of traction or extension. Ds. are rare in infancy or old age. They usually take four to six weeks to heal. The shoulder is the joint most frequently dislocated, or the hip in the lower extremity.

Dismal Swamp, large marsh about 500 sq. m. in extent in Virginia and N. Carolina, U.S.A. There are many trees growing there, mostly cypress and cedar. It is being gradually reclaimed, canals having been cut through it, the longest of which connects Chesapeake Bay and Albemarle Sound.

Disna, or Dissna, tn. of White Russia, situated at the junction of the Disna with the Dwina. Pop. 8000.

Disney, Walter Elias (b. 1901), film producer, born in Chicago. Worked on a farm and, later, in an ambulance corps in France during the First World War. He studied drawing in Chicago and in 1923, went to California. His first great film success was *Mickey Mouse*, which he introduced in a number of short film cartoons together with Minnie, Pluto the dog, Donald Duck, and other animal characters. His first full length cartoon was *Snow White and the Seven Dwarfs* (1937), based on the well-known fairy tale by the brothers Grimm. His next was Colliodi's *Pinochio*, an Ital. classic, and other full length films followed, notably *Fantasia* (1940) *Saludos Amigos* (1941), and *Song of the South* (1947) —D.'s first production to include live performers.

Dison, tn. of Belgium in the prov. of Liège, with woollen manfs. Pop. 11,000.

Disorderly House, see under **NUISANCE**.

Dispart, in gunnery, the difference between the radius of the base ring at the breech of the gun and the ring at the swell of the muzzle. An allowance for D. is necessary in determining the beginning of the gradations on the tangent scale. The line which is drawn from the circumference of the base to that of the muzzle is known as the line of metal; the angle subtended by the D. at the base of the gun is equal to that which, in a vertical plane passing through the axis of the bore, would be contained between the latter and the line of metal. A special D. sight, raised in the centre of the gun between the trunnions, is used when the line of metal gives a large D.

Dispensation, in a wide sense, may be taken to mean the licence of a sovereign power exempting a particular person from any obligation imposed by the law. In Great Britain the Bill of Rights abrogated the assumption of this power by the Crown, and though it survives in the shape of the prerogative of pardon and, more indirectly, in acts of indemnity, it is

exercised in a strictly constitutional manner. In a narrower technical sense D. means the granting of a licence or the licence itself to do what is forbidden by a canon of the Church, or conversely, to omit something which is commanded. In the Rom. Catholic Church Ds. may be granted by the legislating authority or any superior authority: thus the pope, his legates and those deputed by him may dispense from any merely ecclesiastical laws, but not from the divine or natural law, or in such a way as to injure the rights of third persons. A Rom. Catholic bishop may dispense from his own diocesan laws, or, under a faculty from the pope, from universal laws of the Church. In England the archbishop of Canterbury formerly had a considerable dispensing power, but it is now exercised chiefly in the shape of special licences for marriages. Bishops can still grant Ds. to clergymen from the law against holding pluralities and residence away from their parishes.

Dispenser, person skilled in preparing medicines from prescriptions. To practise as a D. a person must first have passed examinations held under the auspices of the Pharmaceutical Society and he must also be registered under the Pharmacy Acts. The practice of dispensing was not treated as a distinct profession from that of the doctor before the seventeenth century. A modern D. must possess wide knowledge and a considerable degree of skill.

Dispersion, in optics, the decomposition of light into rays of different refrangibility. The light we receive from the sun is commonly called white light, but it can be shown that white light consists of various coloured rays. If a pencil of the sun's rays is allowed to pass through an aperture in the shutter of a dark chamber, it will form an image of the sun on a screen placed to receive it. If, however, a prism of flint glass be interposed horizontally, the ray appears to be spread out and is received on the screen as a series of colours at some distance from the position of the previous image. The explanation is that the light is refracted or bent on entering the glass and again on leaving it, and as some of the components of white light are more easily refrangible than others, they take up different positions on the screen. It is usual to distinguish seven colours: violet, indigo, blue, green, yellow, orange, and red, of which violet is the most refrangible and red the least. When prisms of different materials are used, spectra are formed of different lengths, but having the same colours and usually in the same order. When artificial light is thus dispersed through a prism, all the colours of the spectrum may not be seen; but the colours are found in the solar spectrum, and in the same order. If the artificial light is yellow, for instance, the dominant colour in the spectrum will be yellow; and such colours as blue, indigo, and violet may be very faint or missing altogether. If the light from the dispersing prism is caught on a concave mirror, so that the rays can be brought to a focus again, the combined rays will produce a

light similar to that of the source, thus showing that the colours are simply components of the original light. The composition of white light can also be demonstrated by colouring a disk in sectors with the same colours in the same proportions as they appear in the solar spectrum, and then rotating the disk rapidly so that the retina retains the sensation of all the colours at the same time; the result is something approaching to white light.

Anomalous dispersion.—Some substances produce spectra in which the colours are seen in unusual positions. If a prism be made enclosing one of the aniline dyes it is found that the extent of refraction is greater for some of the colours of longer wave-length than for colours of shorter wave-length, so that the order of the colours is different from that in an ordinary spectrum. This shows that refrangibility does not necessarily depend upon wave-length, at any rate for substances with special absorptive properties.

Displaced Persons. People who were uprooted from their homes during the Second World War, either as forced labourers or prisoners of war, by the Nazis, and those who were in exile from Soviet-occupied ter. By the end of 1945 the Allied Armies and the United Nations Relief and Rehabilitation Administration (UNRRA) (q.v.) had between them returned over 5,000,000 D. Ps. to their homes. But there still remained at that time over a million of these unfortunate persons, chiefly Poles, Ukrainians, Yugoslavs and refugees from the Baltic States, who were unwilling or afraid to return to their home countries, owing to the Communist control of them. UNRRA maintained these refugees for over a year but by the autumn of 1947 most of them were still in camps in Germany, Austria and Italy. In Dec. 1946 the General Assembly of the United Nations voted by thirty-five to five to establish an International Refugee Organisation (I.R.O.) The I.R.O. was to come into being when fifteen nations whose contributions represented 75 per cent of the proposed budget of over £10,000,000 had signed the constitution. This condition was fulfilled in May 1947. The I.R.O., created in July 1947, took over the work of relief from UNRRA after the latter had been dissolved. The major part of its funds had to be devoted to keeping the refugees alive on a subsistence food standard and less than 18 per cent of their budget could be allocated to helping D. Ps. to begin new lives. Of the 205,000 D. Ps. resettled in seventy-three countries in 1948 the United Kingdom took more than a third, the rest being taken by Canada, Belgium and the U.S.A.—in that order. Subsequently the U.S. decided to accept 200,000, Congress having asked for thousands of skilled workers for Amer. industry, plus a large proportion of experienced farmers. The Amer. Bill excludes Jews and others who were not D. Ps. as at Dec. 22, 1945 or, in other words, D. P. status depends on having been taken into a D. P. camp by that

date. Of the 25,000 Canada took during 1947, the schedule asked for 2300 farm workers and sugar beet workers, 2300 garment workers, 3000 domestic servants, 3000 construction and railway workers and many thousand miners. Belgium, faced with a labour shortage in the mines, admitted 18,000 D. P. miners. The U.K., filled similar shortages with the 69,800 refugees it absorbed. Among the 598,445 people who still remained in the camps in Jan. 1949 over half were classified as employable, one-third were skilled workers, one-fourth farmers and one-eighth constituted the professional group. Among the women there were railroad conductors, blacksmiths and boiler-makers, housekeepers and midwives. The bulk of 11 Ps. remaining at Jan. 1949 were Poles (146,000), Balts (134,000) and Ukrainians (91,000). The rest represented fifty-seven different nationalities. The large number of Jews was rapidly reduced during 1949 by emigration to Israel. Encouraged by America's change of heart, many other countries increased their quotas. Australia began with a total of 1200 a year but later agreed to take 200,000 over a period of years, spending £1,000,000 on housing to permit possible further expansion. Canada announced that it would admit a total of 100,000 immigrants; Brazil raised its total to 15,000; France took only 16,000 in 1948 but allowed the 3000 refugees who crossed its frontier every month to stay. The largest contributors to the I.R.O. budget of 1948 of 160 million dollars were the U.S.A. which gave 71 million dollars and Great Britain with 23 million. Despite difficulties, such as the embargo on intellectuals and professional persons and the need for training and learning a new language, I.R.O. expected to complete its task by the middle of 1950—except for a 'hard core' of 148,000 D. Ps. This number includes not only the sick and old but the healthy members of their families who refused to leave them.

Displacement, see TONNAGE.

Displayed, see under HERALDRY.

Disposition, in Scots law, is the name given to any writing by which the proprietor of a feu (fee or heritable estate in land), or of a personal right in any property heritable or movable, or of incorporeal heritable property (such as a reversionary right), makes over his property to another. Strictly, the transference of a personal right is specifically known as assignment, in contradistinction to D. Many changes have from time to time been made in the essentials of a form of D. Since the Conveyancing Act, 1874, the customary scheduled form, after the formal parts, assigns the rents and binds the person disposing to relieve the disponee of all feu-duties, casualties (q.v.), and public burdens, and to consent to the registration of the D. The creation of a new feu as opposed to transmission of a feu is by charter and not by D. The usual form of family settlements of heritable property in Scotland is by D.

Disputation, exercise of argumentative skill very common in the old univ., a

question being raised which some would attack and others defend. Among famous Ds. may be mentioned those between Knox and Kennedy (1562) and Land and Fisher (1623).

Disraeli, Benjamin, see BEACONSFIELD, EARL OF.

D'Israeli, Isaac (1766–1848), Eng. man of letters, at an early age determined, in spite of parental opposition, to become an author, and in the end, after a severe struggle, he had his way. His first work, a *Defence of Poetry*, in verse, was pub. in 1790, and in the following year he issued the well-known *Curiosities of Literature*. This was so successful that further vols. were issued by him at different periods of his life, in 1793–1817, and 1823. *Calamities of Authors* appeared in 1812, and *Quarrels of Authors, or Some Memoirs for our Literary History* in 1814. Two years later he wrote an *Inquiry into the Literary and Political Character of James I.*, and between 1828 and 1831 he pub. his *Commentaries on the Life and Reign of Charles the First, King of England*, at once his most ambitious and his best work. In 1817, in consequence of a quarrel with the synagogue, D'I. withdrew from the congregation, and in that year he caused his children to be baptised. Many years later, in his *Genius of Judaism* (1833), he wrote enthusiastically of the Jews in early days, but claimed for himself to have outgrown the superstitious practices still adhered to by his contemporaries. See Benjamin Disraeli's preface to *The Works of Isaac D'Israeli* (1858–9), vol. I.

Diss, tn. of Norfolk, England, situated on the Waveney, 20 m. S.W. of Norwich. It was formerly noted for the manuf. of worsted and hemp cloth. There are malting works and breweries, also manuf. of brushes, etc. John Skelton, the author, was a native of the tn. Pop. 3500.

Dissection (cutting apart) is used to represent those processes of separation of the parts of a body which are necessary to show their formation and their relationship to each other. It is, therefore, a branch of Anatomy (q.v.), and so one of the divisions of the science of Biology (q.v.). Although of great importance in all its branches, it is in connection with human anatomy that it has its greatest value. Democritus and, later, Hippocrates, are supposed to have had some knowledge of it, but Aristotle was the real founder of the art of D., although his work was almost certainly confined to the D. of animals. Erasistratus (250 B.C.) was probably the first to dissect human bodies, performing his work on the bodies of criminals. The progress, however, was slow, owing to the overwhelming prejudice which existed and still exists against the practice of dissecting human bodies. The consequent difficulty in obtaining subjects caused anatomists to have to rely, in the main, upon D. of lower animals, but in 1832 the Anatomy Act was passed, which provides that the bodies of unclaimed dead shall be handed over to the medical schools. The practice usually adopted is forcibly to inject a hot mixture of wax or paraffin and vermilion into one

of the large blood vessels. Sometimes it is necessary to inject the same liquids into the veins and lymphatics. The body is then kept in preservatives until such times as it is required. In its deeper branches it becomes a most intricate subject, requiring special care and preparation. Under the microscope, by D. and differential staining, etc., it is possible to study the cellular structure of organs. Pathology depends to a great extent upon the study of Ds. of diseased subjects, while surgery and embryology are also deeply indebted to D. See ANATOMY, VIVISECTION.

Disseisin, see SEISIN.

Dissenters, see NONCONFORMITY.

Dissociation, in chemistry, is the term applied to the reversible decomposition of a substance by heat. Thus nitrogen dioxide has the formula N_2O_4 at ordinary temps. but on heating it splits up into molecules of NO_2 ; these recombine on cooling, forming N_2O_4 again: $N_2O_4 \rightleftharpoons 2NO_2$. To indicate the reversibility of the change the reversed arrows \rightleftharpoons are used instead of the sign of equality =. At high temps., water-vapour dissociates into hydrogen and oxygen: $2H_2O = 2H_2 + O_2$. Similarly ammonium chloride vapour is found not to consist of NH_4Cl molecules but of a mixture of ammonia, NH_3 , and hydrochloric acid, HCl , dissociation having taken place: $NH_4Cl \rightleftharpoons N.H_3 + HCl$. If dissociation results in the formation of an increased number of molecules, increase of pressure hinders D. If, however, there is no increase in the number of molecules, pressure is without effect, as, for example, in the action $2HI \rightleftharpoons H_2 + I_2$, the dissociation of hydrogen iodide.

Electrolytic D. refers to the separation from one another of the ions of electrolytes when dissolved in water or some other solvent. Thus when solid sodium chloride, consisting of an assemblage of positively charged sodium ions and negatively charged chlorine ions, is dissolved in water, the ions separate from one another and become mobile.

Dissolution (of Parliament), see PARLIAMENT; (of partnership), see PARTNERSHIP.

Dissonance, see under MUSIC.

Distaff, stick or staff, to which material for spinning, as cotton, flax, etc., was fixed, in the method of spinning by hand. The D. was held under the left arm, and the fibres, as they were drawn from it, were spirally twisted with the right hand. During the process of spinning, the thread was wound round a revolving reel.

Distemper (fr. *détrempe*, lt. *tempera*), originally any fluid medium for mixing with pigments, later restricted to glutinous substances, such as size, white or yolk of egg, gum-water, fig-tree sap, honey, etc. The pigments were ground up with these and water and applied to a smooth surface of dry plaster (not damp as in the case of frescoes), usually spread on wood or canvas. D. painting was known in Egypt, Babylon, and Nineveh very early, and used by the Gks. for interior decoration. Till replaced by the oils of the Van Eycks, it was the ordinary method of

painting in the highest depths of art. In Italy its use continued till 1500 and early Flemish artists constantly employed it. When treated with oil-varnish such paintings are hard to distinguish from oils. They are precise in form and outline, and the rapid drying of the colours prevents blending of tints. It is still used for scene-painting and in preparing wallpaper.

Distemper, disease which affects young dogs and cats, generally between the third and sixth months of their age. It consists of an infectious microbic inflammation of the mucous membranes of the respiratory passages. Treatment consists in relieving the stomach and bowels by aperients, and in keeping the animal warm and dry, on a light diet of bread and milk. See also under DOG.

Disthene Rock, see ECLLOGITE.

Distich, see under METRE.

Distillation, process which consists of converting a solid or liquid substance into the gaseous form and afterwards condensing the vapours to a liquid form, in order

DISTILLATION

From a sixteenth century book

to purify the substance or separate its components. The process was known to the ancients, who devised ingenious forms of apparatus. The essential parts of a distilling apparatus are a retort or still, in which the substance to be distilled is heated to vaporisation, a condenser, in which the vapours are cooled to a liquid form, and a receiver, in which the condensed liquid, or 'distillate,' is collected. The temp. at which a substance boils depends upon the pressure exerted upon it, and therefore it is necessary, in the case of liquids which decompose at a temp. below their boiling-point, to reduce the pressure so that they may boil at a suitable temp. The simplest form of distilling apparatus consists of a glass retort communicating with a receiving flask by a straight tube gently sloping downwards and enclosed by a wider tube through which cold water is run, entering at the lowest point and

leaving at the highest. To present a larger surface to the cooling action of the water, the condenser is often flattened or twisted into a spiral form, or 'worm.' A long, wide glass tube or air condenser may be used for liquids with high boiling points.

Another method sometimes employed is that of *Steam D.* Thus aniline, a liquid which boils at 184° C. under atmospheric pressure, if mixed with water and heated, distills off together with water, when steam is passed through the mixture, and by condensing the mixed vapours, the two immiscible constituents aniline and water are obtained. This method is particularly useful for the purification of tarry and dirty preparations in which one of the components happens to be volatile in steam.

Fractional distillation is a process which aims at separating components of the original liquid which have different boiling-points. This is achieved by using a dephlegmating column (*see DEPHLEG-MATOR*). In the distillation of coal tar, the dehydrated material is heated in a wrought-iron cylinder fitted with a thermometer, and the vapours are condensed in cast-iron cooling-pipes laid so as to have a continuous fall to the receivers. As the process continues, the temp. rises and the less volatile substances are driven off until only the pitch remains as residue. The distillate is collected in fractions at different stages of the process, and such substances as 'first runnings,' 'light oil,' 'middle oil,' and 'heavy oil' are differentiated. These are afterwards separately fractionated. The distillation of alcohol from a malt wort is an important stage in the preparation of whisky (*see COFFEY'S STILL*). The distillation of seawater to procure water for drinking purposes is of importance in considering the equipment of ships, and all big liners carry apparatus for this purpose.

In large-scale operations two types of D. are employed, the continuous and the discontinuous. In the continuous method the liquid to be distilled is fed into the still at a constant rate as D. proceeds, and conditions are so arranged that the cooling of the vapours and the heating of the liquid in the still are carried out at as steady a rate as possible. By the continuous method, large amounts of material can be dealt with. In the discontinuous method, which is more suitable for small-scale operations, the distillation of a quantity of liquid is allowed to proceed until it is at an end. The process may then be repeated with fresh supplies of material. The method has the advantage that plant construction is simple, and costs are low. *See J. Keilly, Distillation, 1936.*

Distinguished Conduct Medal (D.C.M.), awarded to warrant officers, non-commissioned officers and men of the Brit. regular army.

Distinguished Flying Cross (D.F.C.), instituted in 1918 as a decoration for officers and warrant officers in the Royal Air Force for acts of gallantry when flying in active operations against the enemy. The Air Force Cross (A.F.C.), 1918, was

instituted for bestowal to airmen as in the case of the D.F.C., but for acts of courage or devotion to duty when flying, although not in active operations against the enemy. The Distinguished Flying Medal (D.F.M.), 1918, and the Air Force Medal (A.F.M.) were designed for warrant officers and non-commissioned officers for equivalent services as for the D.F.C. and A.F.C. respectively. The bestowal of the above four decorations was extended in 1941 to members of the Fleet Air Arm.

Distinguished Service Cross (D.S.C.), was instituted in 1914 in substitution for the Conspicuous Service Cross (1901) for bestowal on all officers of the Brit. navy below the rank of lieutenant-commander and on warrant officers.

Distinguished Service Medal (D.S.M.), was instituted in 1914 for chief petty officers, men and boys of all branches of the Royal Navy and for non-commissioned officers and men of the Royal Marines, and for all other personnel holding corresponding positions in the service afloat. In 1942 its bestowal was extended to men of the Mercantile Marine.

Distinguished Service Order (D.S.O.), this order was instituted by royal warrant on Sept. 6, 1886. It is an order of military merit and was founded in order to recognise special services of officers in the Brit. navy and army and later was extended to officers of the air force and mercantile marine. It has only one class, and holders of this order carry after their names the letters D.S.O. Its numbers are unlimited and the companions of the order rank next in precedence after the companions of the fourth class of the Royal Victorian Order. The decoration itself consists of a white and gold cross with a red enamelled centre which bears the imperial crown surrounded by a laurel wreath. The ribbon is red, with blued edges. *See also DECORATIONS.*

Distomum, *see* LIVER-FLUKE.

Distraint, *see* DISTRESS.

Distress, taking of goods or cattle out of the possession of a wrongdoer into the custody of the party injured, for the purpose of procuring satisfaction for the wrong committed. The most usual injury for which a D. may be taken is that of non-payment of rent. But the remedy may also be resorted to for the payment of taxes, rates, and duties, as well as to obtain compensation for damage done by cattle wandering over one's grounds. As between landlord and the tenant a D. cannot lawfully be made after the tenant tenders to his landlord the full amount of the arrears. Various statutes and judicial decisions have resulted in the exemption of a large number of things from D. Some of these are *absolutely* privileged, e.g. fixtures; things in actual use; wearing apparel and bedding of the tenant, of his family, and the tools of his trade to the value of £5; machines used in cotton, woollen and silk manufs.; goods delivered to the tenant in the way of his trade; and, in the case of tenants under the Agricultural Holdings Act, hired machinery and breeding stock. Some things, like the tools of a man's trade be-

yond £5 in value, are privileged only if there be other sufficient distrainable goods on the premises. By an Act passed in 1908 the goods of an under-tenant who pays a rent equal to the full annual value of the premises or part of the premises occupied by him are exempt from D. for the rent due from his lessor to the superior landlord; and by the same Act the goods of a lodger and those of any other person not being a tenant of the premises, or having any beneficial interest in any tenancy of the premises or any part thereof, are also exempt from D. in respect of the rent due from the tenant to his landlord. Goods comprised in a hire-purchase agreement (except in the case of machinery on an agricultural holding) or in a bill of sale or belonging to the husband or wife of a tenant, are not exempt from D. No D. can be taken until the day following the day on which rent is made payable, and it must be taken between sunrise and sunset. No previous demand for the arrears is necessary in the absence of express agreement to that effect. Under the National Insurance Act, 1936, D. must be postponed in the case of a tenant who is an insured person where a doctor certifies that a D. would endanger his life. D. is usually levied through a certificated bailiff armed with a D. warrant. Goods distrained may be sold at the end of five days, and after notice to the tenant. By the Limitation Act, 1939, goods may not be distrained in recovery of rent which is in arrear more than six years, unless it has been during that time acknowledged by the tenant in writing to the landlord or his agent. See F. A. Enever, *History of the Law of Distress*, 1931; J. P. Eddy, *The Law of Distress*, new ed., 1939.

Distribution, see ECONOMICS.

Distribution, Statutes of. Acts which settled the distribution of an intestate's real and personal estate. They are now all repealed by the Administration of Estates Act, 1925, which, *inter alia*, changed the rules of intestate succession which had become familiar from their long estab. References to any S. of D. in a deed of gift or will coming into operation after the end of 1925 will be construed as references to Part IV. of the new Act, and references in such an instrument or will to statutory next-of-kin will be construed—unless the context otherwise requires—as referring to the persons who would take beneficially under the provisions of the new Act. The old rules of intestate succession are of merely historical interest to-day, though reference to them might well be necessary in tracing title to real property. For present day rules of intestate succession, see SUCCESSION, INTESTATE.

Distribution of Animals and Plants, see GEOGRAPHICAL DISTRIBUTION.

Distribution of Electricity, see ELECTRICITY SUPPLY.

Distribution of Terms. In formal logic, by 'distribution' of a term is simply meant 'taking it universally,' or referring to all parts of it. In the 'opposition of proposition,' the 'universal negative' distributes its predicate, whereas the

universal affirmative and particular affirmative do not. These distinctions are important, because the validity of any argument or syllogism will usually depend on the sufficient distribution of the terms occurring in it. In 'conversion of propositions,' i.e. in the transposition of subject and predicate, no term must be distributed in the Converse unless it was distributed in the Convertend, e.g. the converse of 'all metals are elements' is not 'all elements are metals,' but 'some elements are metals'; but that of 'no metals are compounds,' is 'no compounds are metals,' because, in this latter example, all the terms are distributed.

Ditchling Beacon, point on the S. Downs, 6 m. N. of Brighton, in Sussex, England. It is 813 ft. high and crowned by ant. earthworks. It was purchased by the Brighton Bor. Council in 1918. Nearby is Ditchling village.

Dithmarschen, or Dittmarsh, North and South, region in Germany, W. of Holstein. It is low and marshy, giving rise to malarial fever, but has dykes to prevent inroads of the sea. Incorporated in Holstein, 1559, incorporated with the Danish Crown, 1773; annexed to Prussia, 1866, as part of the prov. of Schleswig-Holstein, and in 1946 incorporated in the *Land* of Schleswig-Holstein as part of the British zone during the occupation of Germany after the Second World War. Pop. 100,000.

Dithyrambus (δῑθύραμβος), originally a surname of Dionysus (Bacchus) of uncertain etymology, later applied to a hymn sung in his honour to the accompaniment of flute or lyre, together with a dance around the altar. The subject was usually the birth and life of Dionysus, later other themes were added. The artistic choral or antistrophic form was supposed to have been developed out of the earlier passionate hymns for one or more singers by Arion at Corinth (or possibly Naxos, c. 620 B.C.). Out of the mournful dithyrambs rose the grand ant. Gk. tragedy. At Athens there were yearly contests between dithyrambic choruses (usually fifty men, dressed as satyrs, representing Dionysus' companions) at the Greater and Lesser Dionysia, Panathenaea, and other great festivals. The prize was an ox, later a tripod. Though they flourished till after Aristotle's time, but few fragments remain. Pindar was said to have been trained by Lasus of Hermione. This lofty and vehement style of lyric poetry degenerated later into bombastic extravagance, and 'dithyramb' was applied somewhat contemptuously to any lyric of unrestrained frenzy and excitement, such as might be written during intoxication. The nearest approaches to dithyrambic verse in Eng. are Leigh Hunt's trans. of Rudl's *Baccho in Toscana*, c. 17 (1825); Dryden's *Alexander's Feast* (1698); still better examples being the *Bacchic Songs of the Swedish Bellman* (1791). See A. W. Pickard-Cambridge, *Dithyramb, Tragedy, and Comedy*, 1927.

Dittany, name applied to plants of various orders, the word being derived from a Cretan mountain on which they flourish.

Both the D. of Crete, *Origanum dictamnus*, and the D. of the United States, *Cunila Mariana*, are members of the order Labiate, but the bastard common D., *Dictamnus albus*, also known as *fraxinella*, belongs to the Rutaceae.

Dittersdorf, Carl Ditters von (1739-99), Austrian composer and violinist, b. at Vienna, studied under Ziegler and Bonno, and soon became one of the leading violinists of his time. In 1761-4 he was in the Court orchestra at Vienna. Contemporary with and of the same school as Mozart, his works were overshadowed by those of the latter composer. Wrote a score of operettas, mostly humorous, the best known of which are *Doctor und Apotheker* (1756), *Liebe im Narrenhaus* and *Hicronymus Knicker* (1757), and the oratorios, *Isaak* (1767) and *Esther* (1773). A number of his instrumental works have been repub. Also pub. *Die Grenzen d. Komisch u. Heroisch. in d. Musik*. His *Selbstbiographie*, dictated to his son before his death, was pub. in 1801. See C. Krebs, *Dittersdorffiana*, 1900; L. Riedinger, *Karl von Ditters als Opernkomp. 1814*.

Ditton, Humphrey (1675-1715), Eng. mathematician. He studied theology, and was a dissenting minister at Tonbridge for some years. He owed his election as mathematical master at Christ's Hospital to the influence of Sir Isaac Newton. William Whiston and he invented a method for discovering long, which was approved by Sir Isaac Newton.

Diu, Portuguese is. at Gujerat, India. It is 7 m. long, and resembles part of the coast to which it runs parallel. The tn. of D., situated at the E. end of the is. is surrounded by a wall, and is mostly in ruins. Formerly it was of considerable commercial importance with a slave mkt. In 1535 it came into the possession of the Portuguese. It was occupied by the Arabs of Muscat in 1670 and retaken by the Portuguese in 1717, and is now of importance only for its five salt-works. Pop. 15,800.

Ditzen, Rudolf, see FALLADA, HANS.

Diuretics, medicinal agents which stimulate an increased flow of urine. This is often desirable when from any cause the supply of urine is diminished, or when it is required to promote increased excretion to carry off morbid products circulating in the blood, or, as in dropsy, to aid in the removal of watery collections. Ordinary water, taken in large quantities, is an effective D. Digitalis and squill act by stimulating the heart movements and causing an increased blood pressure. Alcohol, turpentine, and cantharides stimulate the kidneys, but their irritating action renders their use inadvisable. Caffeine acts both as a cardiac stimulant and as a renal stimulant, and is a particularly effective diuretic.

Diwan (Persian, *deran*), word common to many Oriental languages, meaning master-roll, counting-house, register of payments (cf. Fr. *douane*, custom-house), council, court of justice, *sofa*. In the sense of a 'collection of poems' Goethe used it in his 'West-östlicher Diwan,' and the Persians spoke of the D. of Saadi or

Hafiz. The Turkish D. was the great council or supreme judicial tribunal of the empire ('*Divani humayun*') at Constantinople. The word dates from the caliphate of Omar (A.D. 634-44). In the sense of low, cushioned seats or sofas, ranged against the walls as in Eastern reception-rooms, for which it was also commonly used, it became known in Europe in the eighteenth century. Ds. were especially fashionable about 1820-50. The D. being without side, head, or tail boards, is now widely used as a couch or bed.

Divanleh, see DIWANIEH.

Diver, see DIVING.

Divergency, **Divergent** (in mathematics), see under SERIES.

Divers, or **Colymbidae**, the name of a family of water-birds which forms with *Podicipedidae*, the grebes, the tribe *Colymbiformes*. The species are all marine,

DIVER

with short tail-feathers and webbed feet. During the breeding period they live inland and the female lays two eggs which hatch into down-covered chicks. The Brit. species are the inconspicuous *C. septentrionalis*, or red-throated D.; *C. glacialis*, the great northern D.; *C. Adamsi*, the white-billed northern D.; and *C. arcticus*, the black-throated D. The birds inhabit the temperate regions of both N. hemispheres.

Dives, name of the rich man spoken of by Christ in His parable of the rich man and Lazarus in Luke xvi.

Dives-sur-Mer, watering-place of N.W. France, in the dept. of Calvados, and situated on the Dives, 15 m. N.E. of Caen and 8 m. S.W. of Deauville. It has metal indus., but was formerly an important seaport. William the Conqueror sailed from D. in 1066 for England. Pop. 5400.

Divide (geography), see WATERSHED.

Dividend (Lat. *dividendus*), literally a sum or quantity to be divided, especially applied in commerce to the annual or half-yearly interest payable on public funds or the National Debt, and on some other loans and debentures. The profits

of joint-stock companies (banking, railway companies, and others), paid periodically to each stockholder or shareholder, are also called 'dividends.' They are usually fixed at a certain rate per cent. In the case of 'cumulative dividends' it is agreed that, if at any time they are not paid in full, the difference shall be added to the following payment. D. is also the term applied to the sum of money apportioned to creditors from the realised assets of a bankrupt's estate. It may mean either the whole sum divided or the proportion or share falling to each creditor. These Ds. are commonly reckoned at so much per pound of the claims (as 8s. in the £1).

Dividing Range, see under AUSTRALIA.

Divi-divi, or *Casalpinia coriaria*, species of Leguminosae which occurs in S. America and the W. Indies. The pods are of economic importance, being used in tanning.

Divination (Lat. *divinatio*), the art of obtaining the knowledge of future things by some supernatural means, or by some system outside the ordinary bounds of reason. D. was generally regarded in the classical world as the revelation of the gods, though it was sometimes argued that divine revelation was not essential. Roughly, methods of D. may be divided into two classes, those in which some particular objects are made use of, as in the case of astrology and those in which the divine will is revealed directly to the human spirit, as in the case of dreams. Perhaps astrology would rank first among these methods. It pretends to tell, by the relations of the stars, the futures of states and individuals. It reached its highest stage about the seventeenth century. The system of D. by dreams (*oneiromancy*) is extremely anct., and has been received by Christian, Pagan, and Jew. The dreams may be interpreted either literally or by contraries. The casting of lots (*sortilège*) was common in anct. times, and has survived now merely as an appeal to blind chance. A somewhat similar method is that of *bibliomancy*, by which a book is opened at hazard and some one or two lines selected at random. These lines are supposed capable of interpretation so as to give advice for the future. Of this kind were the *sortes virgilianae*. In the case of *harpuspication*, or the examination of entrails, the proceedings are far more elaborate, as the institution of the Rom. College of Augurs shows. The time and all the incidental circumstances must be propitious before a good result can be obtained. In the case of D. by *augury* and *omens* this is not so necessary. *Pyromancy* is a method of D. from the behaviour of fire. Somewhat similar is D. by examination of tea leaves. *Crystallomancy* makes use of concentration of the mind induced by crystal gazing. *Cheiro-mancy* or *palmistry* pretends to tell the future of an individual by the lines of his hand.

Divine Right, the belief that kings are the direct representatives of the Deity, and as such are to receive the obedience due to God's viceroy on earth. They themselves

owe obedience to Him alone, and are relieved from all responsibilities towards their subjects. James I. of England insisted on D. R. as a principle, which was carried to extremes by the supporters of his son. Charles I.'s claim to this D. R. was the direct cause of the royalist and parliamentary struggles of the seventeenth century. The idea did not really lose its hold until after the suppression of the rebellion of 1745 in England, and till the great Revolution in France. The doctrine was supported by Sir Robert Filmer in England and in a modified degree by Bossuet in *Politique tirée de l'écriture Sainte*. It was opposed by John Locke in his *Two Treatises of Government* (1690), and by J. J. Rousseau, *Contrat Social* (1762). See J. N. Figgis, *Theory of the Divine Right of Kings*, 1896, and *The Divine Right of Kings*, 1914; and J. MacKinnon, *The Growth and Decline of the French Monarchy*, 1902; A. M. Hocart, *Kingship*, 1927.

Diving. In Indian seas the art of D. has been practised from very early times. Before the introduction of mechanical aids, D. was the only means of obtaining the pearls, sponges, and corals to be found in such oceans, and there is no doubt that great skill was shown by the natives. When all allowances are made, however, slightly over three min. is the limit of time during which a naked diver can remain under water. Persons who habitually engage in D. suffer severely from the constant strain on the lungs. The attention of inventors was very early turned to the discovery of some means by which the diver could remain longer under water. The earliest invention was the D. bell, of which the principle is very simple. If an inverted jar be sunk in a vessel of water, the air contained therein excludes the water from the interior. Since air is compressible the water gradually rises up the sides of the jar as the depth of water increases; so that at a depth of 33 ft. the air would be compressed into half its original bulk. The D. bells of the first makers were strong, heavy vessels, generally formed of wood girded with iron hoops. The great drawback to these early forms of D. bells was that they had to be raised to the surface at frequent intervals for fresh supplies of air, and consequently their sphere of utility was very limited. It was not until 1778 that Smeaton devised a type of bell which contained all the elements of the present appliances. In repairing the shoeing of Hexham Bridge, Smeaton contrived a bell to which he attached a force-pump; this was the first time that the force-pump had been used for such a purpose. The modern D. bell is usually of a rectangular shape, and weighs about five tons. The air-supply pipe, connected with a force-pump, is screwed on to the top, which is supplied with windows of thick glass; the bell is fitted with seats inside, and is worked in water up to a depth of 35 ft. The invention of the D. dress was very gradual, and many persons contributed something to it, but Siebe did more than any other to improve it. In

1829 he invented the 'open' D. dress, which consisted of a helmet and waterproof jacket. The air pumped in at the helmet was allowed to escape below the jacket, and hence it was called 'open.' The great drawback to this dress was that it obliged the diver to remain in an upright or gently stooping posture. Siebe accordingly invented the close dress in 1857, and this type is now in general use. It consists of a waterproof costume of strong twill and india-rubber, covering the whole body except the head and hands. The helmet is made of tinned

lost treasure. The difficulties of the work were such that dependence on air from above was not desirable and an apparatus was used that enabled the diver to purify the air by carrying oxygen, stored in bottles, which made him independent of outer supplies. Up to this time the lowest depth at which a diver was able to work was about 200 feet, and even from this depth it was necessary to ascend by slow and tedious stages, if he would avoid ill effects; but recently Neufeldt and Fuhrke of Kiel, Germany, invented a diving dress capable of standing the pres-

A DIVER AT WORK IN A PRACTICE TANK

Fox Photos

THE DEEP SEA DIVING OUTFIT

copper, and fitted with three strong plate-glass windows in front. The middle eyepiece is made so that it can be unscrewed, in case the diver wishes to speak or rest without removing his helmet. The air is supplied from a pump by means of a vulcanised india-rubber pipe which is attached to an inlet valve in the back of the helmet; the outlet valve is also fixed to the back. The escape valve is in some patterns regulated by the diver, but more commonly if an adjustable valve is desired, a self-righting pattern is used. A life line is attached to the diver's waist for signalling purposes. The boots of a diver are heavily weighted, with leaden soles, and weigh about 20 lb. each; additional weights are attached to the shoulders when required. The First World War gave a strong impetus to D., as many of the ships that were sunk by submarines contained gold and other valuables estimated in some cases to be worth millions of pounds. Where these vessels lay upon a sea-bed that was not in very deep water and in places easily located the divers were remarkably successful, sometimes recovering practically the whole of the

sure of 25 atmospheres, in which divers have already worked at as great a depth as 515 ft., and for which it is claimed that their tasks can be carried on at as low a depth as 750 ft. This dress consists of an envelope of steel and aluminium.

Divining Bell, see DIVING.

Divining Rod (known also as *Virgula Divina*, *Baculus Divinatorius*, *Caduceus*, or *Mercury's Wand*, *Aaron's Rod*, etc.), a forked branch usually of hazel, willow, or rowan, or sometimes artificially made, or a Y-shaped metallic rod (iron, brass, or copper), by means of which water or minerals may be discovered beneath the earth's surface by certain persons apparently possessed of the requisite powers. The rod suspended by its two prongs (often between the balls of the thumbs), and held thus in front of the holder, twists, or quivers suddenly when the exact spot is reached, bending down towards the concealed mine or spring. This belief is very old; *Agricola*, *Sperlingius*, and *Kirchmayer* all believed in the occult powers of the magic wand, but the modern use of the divining-rod by 'dowsers' should not be confused with the auct. wand. An-

other use was to discover the authors of a crime, as used by Jacques Aymer in the case of murder and robbery at Lyons, 1692. The divining rod of hazel or willow was used by prospectors for metals in the Hartz Mts. of Germany in the fifteenth century, and the custom was adopted in the next century in Cornwall where it persisted until recent times. Some diviners use a polished stone held at the end of a string like a pendulum instead of a D. R. The stone revolves quickly or slowly, clockwise or anticlockwise, thus, it is claimed, transmitting its message to the holder. See H. Mayo, *On the Truth Contained in Popular Superstitions*, 1847, 1851; A. Laug, *Custom and Myth*, 1884; J. Mullins, *The Divining Rod*, 1891; B. Tompkins, *Springs of Water*, 1925; T. Besterman, *Water Divining*, 1938; H. de Franco, *The Elements of Dowsing*, 1948.

Divinity, see Theology.

Division, unit of the army which contains all branches of the service, and which is usually under the command of a general. The name is also applied to other sections of the army, but in general use its name implies as above. It may also be regarded as a section of the army which is capable of acting independently of the rest of the army. Its numbers, whilst theoretically fixed, differ very considerably under the conditions of active service. Three infantry Ds. are united together to form the chief basis of an army corps. Brit. infantry D. consists roughly of 350 officers, 10,000 men, 2100 horses, 20 guns, and 400 wagons or the armoured-car equivalents of cavalry, together with a tank unit. There are three infantry brigades in an Eng. Army D., but in the Dominions there are four, and a D. in, e.g., the Australian Army, runs to at least 16,000 men on active service. The name, as has been pointed out above, is given to other sections of the army. Two brigades of cavalry, or at home four, are called a cavalry D. The name is applied to a lieutenant's command in the artillery, and the garrison artillery of the whole country was grouped into Ds., which comprised regulars, special reserve, and territorials under the new territorial scheme. These Ds. were formed in the military dists. into which the whole of the country is divided. The term D. applies also to the navy. The fleet is divided up into two or more Ds., each of which is divided into subdivisions. Each subdivision is commanded by a flag-officer.

Division of Labour: 1. In political economy a phrase used by Adam Smith, and since become current, to denote the separation of the aggregate labour necessary to produce any one complete manuf. into various distinct processes, and the assignment of each of the processes to a different labourer or body of labourers. D. of L. may be said historically to have begun with the specialisation of industry, or the earliest separation of different trades and employments from one another. The modern application of the term D. of L. to the specialisation of processes, as distinct from specialisation of industries,

is no more than an extension of the same essential conditions. The effect of D. of L. is a proportional increase in production, the great increase of the quantity of work, which the same number of people are capable of performing, being by Adam Smith referred to three causes: (1) The increase of dexterity in every particular workman; (2) the saving of time which would be lost by passing from one kind of work to another; and (3) the invention of many labour-saving devices or machinery by reason of workmen becoming thoroughly familiarised with their own particular operations; to which has been added (4) remuneration of different agents at different rates in lieu of paying for the easy and difficult labour at an equal rate, a result which would follow from all the work being done by one man. But there are many serious countervailing disadvantages: (1) Deadening of the faculties from their constant concentration on a single operation, involving as a corollary the inadaptability of the average workman to any other form of work; (2) the impairment of the physique of workmen, due partly to monotony of work, and partly to the herding together of great numbers of operatives in large industrial centres. But the passing of the Factory Acts, the collective action of trades unions in securing an amelioration of the conditions of labour, and, in a less degree, to private munificence of particular employers in the provision of healthful dwellings, has in a measure counteracted the physical drawbacks of D. of L.

2. In biology the physiological D. of L. in the organs of the same individual body, with an accompanying diversification of structure. In the protozoa, or most primitive animals, there is no D. of L., the individual being composed of one vital unit or cell, which consequently performs all the various functions of motion, nutrition, propagation, etc. In the second cardinal division of the animal kingdom, the metazoa or multicellular animals, the lowest forms contain at least two sets of cells, each adapted to the performance of distinct functions, and consequently there is at least a binary D. of L. Higher in the scale the subdivision becomes even greater, until all the essential functions are performed by different organs.

Divorce, dissolution of the bonds of marriage by legal process. By Eng. law, prior to the Matrimonial Causes Act, 1857, the actual dissolution of the marriage tie, a *D. a vinculo matrimonii*, could only be obtained by Act of Parliament, and the courts could only grant a decree of judicial separation, *a mensa et thoro*, i.e. from board and bed, such as had formerly been granted by the ecclesiastical courts. Decrees of nullity, however, could be granted. The div. of the Supreme Court of Justice, known as the Probate, Admiralty, and Divorce Div., has jurisdiction in all matrimonial matters, and can grant decrees in suits for D., judicial separation, nullity, and restitution of conjugal rights.

Grounds of Petition.—A petition may be presented either by the husband or the

wife for (a) adultery; (b) desertion without cause for at least three years; (c) cruelty; (d) incurable unsoundness of mind of respondent—but respondent must have been continuously under treatment and care for at least five years immediately preceding the petition. A wife may petition on the ground that her husband has, since marriage, been guilty of rape, sodomy or bestiality (save for these grounds husband and wife are on equal terms in applying for D.). A petitioner who also has committed adultery must seek the court's discretion, otherwise the petition will fail. In relation to the court's discretion in such cases the decision in *Blunt v. Blunt* 1943 is important. It was there decided that the chief considerations to be taken into account as warranting the exercise of the discretion in favour of a petitioner are: (i.) the position and interest of any children of the marriage; (ii.) the interest of any party with whom the petitioner has been guilty of misconduct, with special regard to the prospect of their future marriage; (iii.) the question of reconciliation if the marriage is not dissolved; (iv.) the interest of the petitioner, and in particular that the petitioner should be able to re-marry and live respectably; and (v.) the interest of the community at large, to be judged by maintaining a true balance between respect for the binding sanctity of marriage and the social considerations which make it contrary to public policy to insist on the maintenance of a union which has utterly broken down. Petitioner may also sue the co-respondent for damages. There is no exact legal definition of 'desertion'; but it implies the leaving the other spouse without consent (*Hard v. Hard*, 1858). Refusal to obey an order for restitution of conjugal rights is constructive desertion. 'Cruelty' includes danger to life or limb, or to health, bodily or mental. Prior to the Matrimonial Causes Act, 1937, the court was bound to satisfy itself that the petitioner had not 'connived at or condoned' the adultery but under the above Act petitioner must satisfy the court that 'there has been no collusion, connivance or consent'. The Act does not, however, state how the court should exercise its duty of inquiry, though it would seem that if the court is not satisfied, it should, before dismissing the petition, either ask for witnesses to be called who might be able to assist, or call on the King's Proctor. But even if the respondent were called, he (or she) could not be compelled to answer any question tending to show that he (or she) had committed adultery, unless he (or she) chose to admit it or gave evidence in denial. There is no narrow definition of 'collusion' but it exists where the originating of the petition is founded on an agreement between the parties or their agents.

A petition for *judicial separation* may be presented on any grounds on which a petition for D. might have been presented or on the ground of failure to comply with a decree for restitution of conjugal rights or on any ground on which a decree *a mensa et thoro* might have been pro-

nounced. Where the court grants the decree it is not, since the Act of 1937, obligatory for petitioner to cohabit with respondent. The grant of the decree does not bar presentation of a petition for D. upon substantially the same facts.

Nullity.—A marriage is void *ab initio* where the parties cannot or have not contracted a valid marriage—e.g. a bigamous marriage, a marriage induced by fraud, or a marriage within the prohibited degrees of affinity. Prior to the Act of 1937, non-consummation for physical or mental defect was the sole ground on which a regular marriage was voidable. New grounds of nullity, since the Act of 1937, are: (i.) non-consummation owing to wilful refusal of respondent to do so; (ii.) that either party, at marriage, was of unsound mind or a mental defective; (iii.) that respondent has suffered venereal disease in a communicable form; (iv.) that respondent was at the time of marriage pregnant by some person other than the petitioner. Generally speaking, however, grounds ii., iii., and iv. will not nullify the marriage unless the petitioner were ignorant of the facts at the time of marriage and, in any case, proceedings must be begun within a year; nor will the court grant a decree unless it is satisfied that marital intercourse with the consent of the petitioner has not taken place since the discovery by petitioner of the existence of the grounds for a decree.

Parties may legally marry again after a decree of D. is made absolute; i.e., until 1946, six months after the decree *nisi* has been pronounced, if the King's Proctor has not successfully intervened on the ground of collusion, etc. As a result of the report of the Denning Committee on Procedure in Matrimonial Causes, the period between decree *nisi* and decree absolute has been (as from August 6, 1946) reduced from six months to six weeks; for once the object of the six months' interval was kept in mind it was difficult to justify the delay except in cases where further investigation of the *bona fides* of the petitioner's case was necessary. Many cases that come before the courts are so plain that any further investigation is superfluous. The reasons why the period of six weeks was selected were twofold: (i.) it is sufficiently long for the King's Proctor to exercise his function, but not so long as to be an undue burden on the innocent petitioner; (ii.) it is the time limited for appeal to the Court of Appeal, so that it can apply in all cases defended or undefended where the time limit for appeal has expired without an appeal having been lodged; and finally the recommendation by the Committee had the advantage that it could be effected without an Act of Parliament. The parties may not, however, marry if a decree for judicial separation only is granted. No petition for D. may be presented during the first three years after marriage unless the judge allows it on the grounds of 'exceptional hardship' suffered by petitioner or 'exceptional depravity' of respondent. These two grounds are entirely within the court's

discretion, and, in determining an application, the court must have regard to the interests of the children.

Separation orders may be made (Summary Jurisdiction Act, 1895) by courts of summary jurisdiction after conviction of the husband for aggravated assault, for desertion, persistent cruelty, neglect of maintenance, resulting in living apart and (Licensing Act, 1902) habitual drunkenness. In Scotland, adultery or desertion for four years is a ground for divorce for either party, and a party may not marry the person with whom adultery has been committed.

In 1926 an Act was passed to make unlawful the pub. in newspapers of unwholesome details of divorce cases; and under that Act only the following details may be reported: names, addresses, and occupations of parties and witnesses; concise statements of charges; points of law; and the judge's summing up. The effect of the Act has been to stifle reports for the most part, especially as points of law are of no interest to the great majority of newspapers. In regard to procedure, the Administration of Justice Act, 1920, provided a cheaper and more convenient method of obtaining D. in undefended cases, and also made special provision for those who petition as poor persons. As the chief difficulty of many persons in the provinces lay in taking proceedings a long way from their places of residence, a real hardship was thereby removed in a large number of cases. As to evidence the *cause célèbre* of *Russell v. Russell* (1921), estab. that statements relative to access or non-access which are calculated to affect the legitimacy of issue are not admissible in evidence. This ruling has practically eliminated the chief evidence on which numerous decrees had previously been granted and opposes new difficulties to petitioners who may have been absent from their usual places of residence even for long periods. Another important judicial decision was that of Lord Merivale in *A. v. A.* (1928), (45 T. L. R. 19) to the effect that the court would refuse to sanction the practice of resorting to hotels to estab. a *prima facie* case for dissolution of marriage. In *P. v. P.*, another case also decided in 1928, the same judge exercised his discretion in favour of a petitioner who was also a guilty party, it being held that the circumstances were such as to allow relief to be granted.

Alimony.—While a D. suit is in progress, the husband is liable to provide his wife with alimony or maintenance. The amount is usually one-fifth of his income. After a D. has been pronounced, the court fixes permanent alimony. This is often at such an amount as will make up the wife's income to one-third of the joint incomes but the court has a wide discretion in this matter.

So far as statistics are concerned, it is evident that the rate of D. has increased considerably in recent years. In 1880-82 the number of divorces and annulments of marriages in England, Wales, and Scotland, was 366. In 1929 it had risen to 4013, being an increase of 800 on the pre-

vious year and the highest figure then on record. In 1937 the total was 5335 and the number has tended steadily to increase since then: 1938, 7038; 1939, 7211; 1940, 8495; 1941, 7146; 1942, 8666; 1943, 11,315; 1944, 14,048; 1945, 15,030. In 1946 no fewer than 31,457 Ds. were granted in England and Wales. A large number of these were childless unions, and an analysis of the figures suggests the stabilising influence of offspring. Statistics show that many divorced persons soon form other unions and that these re-marriages of the divorced occur largely in the early twenties. Consult *Phillips on Divorce*, 1939; *William Lacey, on Divorce*, 1940; and *Rayden, on Divorce*, 1949.

Divorce in the U.S.A.—In the U.S.A. there is no federal law of D., nor any jurisdiction of the Federal Courts, the different states have their separate laws, and there are forty-eight different jurisdictions. S. Carolina provides no means of obtaining a legal D.; adultery, cruelty, or desertion are the grounds in practically all states. In thirty-nine states imprisonment is a ground, in thirty-eight drunkenness, in twenty-two neglect of maintenance. In some of the states other causes for divorce are insanity, venereal disease, addiction to drugs, and impotence. Restrictions on D. are greater in the E. states and lesser in the W. states. The rate is lowest in the Southern states of Louisiana, New Mexico, and Arizona, where Rom. Catholic influence is strong. Some of the states grant D. for comparatively trifling reasons, e.g. incompatibility. The prevalent opinion in Great Britain on the subject of D. in the U.S.A. is that the rate of D. to marriage is so high that Amer. family life is in serious jeopardy. This opinion, largely based on the wide circulation given by the Press to all cases concerning Amer. film 'stars,' is no doubt exaggerated; but as compared with the rate in Great Britain the Amer. rate is certainly high: assuming e.g. approximately 411,000 marriages (1916) in Great Britain and 31,457 divorces, the rate per 1000 marriages is about 7.33; assuming 2,300,000 marriages in the U.S.A. in 1946 and 620,000 divorces, the rate per 1000 is about 269.56. On the other hand, the rate varies considerably in the different states: e.g. while it doubled in Nevada in 1927, as compared with the year 1926, it declined by over 33 per cent in Vermont. These variations, however, merely corresponded to changes in the law, which in the former case reduced the period of residence necessary to secure a final decree and increased it in the latter state. In Nevada only three months' residence is required. Hence people of means flocked there to secure their decrees. In Reno the famous 'divorce mill' of the state, 2000 decrees were granted annually. Amer. statisticians are at pains to point out that marriages have greatly increased in the U.S.A., and that the divorce rate should be based not on the total population, but on persons of marriageable age, which, however, varies with individual opinion. During the

11 years 1936-46 there were 17,565,000 marriages and 3,739,000 divorces in the U.S.A. For the country as a whole, therefore, there were 4.9 marriages for every divorce reported. The number of marriages between 1936-45 was fairly evenly maintained at an average of 1,526,500 but the number of divorces rose from 236,000 in 1936 to 502,000 in 1945.

Diwan, see **DIVAN**.

Diwanieh, or **Divanieh**, tn. of Asiatic Turkey, situated on the r. b. of the Euphrates, about 95 m. S.E. of Bagdad, a strategic military post. Pop. 335,000.

Dixcove, tn. in the Gold Coast Colony, W. Africa. It is situated N.E. of Cape Three Points. Pop. 1000.

Dixie, name popularly applied to the S. states of the U.S.A. There are various explanations of the origin of the word. The S. states were those S. of the Mason and Dixon line, and Dixie is supposed to be a corruption of Dixon. Another story has it that it came from the paper money printed in Louisiana before the Civil War. Owing to the number of people of Fr. extraction living in the state, the paper money had one side inscribed in Fr. 'Tend-dollar bills therefore had the Fr. word for ten, which is 'dix.' In popular nomenclature the bills became known as 'Dixies.' And Daniel Emmett gave it immortal currency in his famous song 'Away down South' which to this day is the favourite tune in the S. states.

Dixie, Lady Florence (1857-1905), Eng. author and explorer, the daughter of the Marquis of Queensberry, b. in London. In 1878-79 she explored the wastes of Patagonia and acted as war correspondent of the *Morning Post* in the Boer War of 1880-81. It was mainly through her efforts that Cetewayo was released and sent back to Zululand. She was an ardent advocate of women's rights. In 1875 she married Sir Beaumont D. Among her writings are: *Across Patagonia* (1880), *In the Land of Misfortune* (1882), and *Aniwee; the Warrior Queen* (1880), and numerous poems.

Dixie Highway, Amer. road extending from Lakes Michigan and Huron to Florida and by a branch through Nashville, Tennessee. It is 1930 m. long in its W. and 2169 in its E. div. Dixie Overland Highway runs from Savannah, Georgia, to San Diego, California, is 2660 m. in length and passes through Columbus, Meridian, Vicksburg, Dallas, El Paso, and Phoenix.

Dixmude (**Dixmulden**), Belgian tn. in W. Flanders, 15 m. S. of Ostend. Has a trade in linen, chicory, butter, and cattle. Pop. 3,500. During the First World War it was in the battle line almost throughout the operations on the W. Front. Situated on the R. Yser, about midway between Ostend on the N. and Ypres on the S., its position exposed it to much bombardment and the tn. was almost destroyed. A Franco-Belgian force maintained hold on the tn. in 1914, after which the appropriate sluices were opened and a large flooded area kept the opponents apart. The Belgians entered the tn. again in Sept. 1918.

Dixon, city of Illinois, U.S.A. and the cap. of Leo co. It is situated about 97½ m. W. of Chicago. There are tanyards, and manufs. of boots and shoes; there are also extensive flour mills. Pop. 10,000.

Dixon Entrance, strait on the W. coast of N. America, situated between Queen Charlotte Is. (Brit. Columbia) and the Prince of Wales Is. (Alaska). It is 100 m. long, and an average of 70 m. in breadth.

Dixon, George (1820-98), Eng. educational reformer. From 1867-76 he was Liberal member of parliament for Birmingham, and from 1885-98 Liberal Unionist for the Edgbaston div. It was largely through his efforts that Birmingham secured Aston Hall and Park. He was largely responsible for the foundation of the National Educational League (1868).

Dixon, Henry Hall (1822-70), Eng. sporting writer who used the pen-name of 'The Druid,' b. in Cumberland and educated at Rugby and Trinity College, Cambridge. He began to write regularly for the *Sporting Magazine*, and pub. three novels in it, *The Post and the Paddock* (1856), *Silk and Scurlet* (1858), *Scott and Sebright* (1862). Other writings were: *Field and Fern*, an account of the herds and flocks of Scotland (1865), *Saddle and Siroin*, of those of England (1870), and *The Law of the Farm*, a legal treatise (1858). See F. Lawley, *Life and Times of 'The Druid'*, 1895.

Dixon, Richard Watson (1833-1900), Eng. poet and churchman, b. in London, and educated at Birmingham and Pembroke College, Oxford, where he joined the 'Birmingham group' of the Pro-Raphaelites, including Morris and Burne-Jones. He was ordained in 1858 and was successively vicar of Hayton, Cumberland, and Warksworth, and honorary canon of Carlisle. His first two books of verse, *Christ's Company* and *Historical Odes*, were pub. in 1861 and 1863; *Mano*, an historical poem in terza rima, which won the prize of Swinburne (1883), *Odes and Eclogues* (1884), *Lyrical Poems* (1887), and *The Story of Eudoca and her Brothers* (1838). His prose works include a life of his father (1871) and *History of the Church of England* (1878-1902). See Lt. Bridges, *Selected Poems and Memoir*, 1909; C. C. Abbott (ed.), *The Correspondence of Gerard Manley Hopkins and Richard Walter Dixon*, 1935.

Dixon, William Hepworth (1821-79), Eng. writer and traveller, b. at W. Ancoats, Manchester. He began his life as a clerk in his native city. His series of papers in the *Daily News* on 'The Literature of the Lower Orders,' and 'London Prisons,' attracted attention. In 1849 he pub. *John Howard and the Prison-World of Europe*, which attained great popularity. In 1851 appeared *William Penn*, in which he refuted the charges brought by Macaulay against the eminent Quaker. A visit to the United States in 1866 was followed by *New America* (1867) and *Spiritual Wives* (1868).

Dizful, tn. of Persia in the prov. of Khuzistan. It is an important mkt. and

makes cotton goods. In the vicinity are the ruins of Susa. Pop. 30,000.

Djezzar, Ahmed (c. 1735-1804), surnamed 'The Butcher' on account of his cruelty, b. at Bosnia and became the slave of All Bey in Egypt. He rose to be Governor of Cairo, and finally Pasha of Acre and Damascus, in which position, with the help and advice of Sir Sidney Smith, he successfully defended Acre for a month (1799) against Napoleon.

Djibuti or **Jibuti**, Fr. tn. and port on the Gulf of Aden, S. of Tadjura Bay, in E. Africa, cap. of Fr. Somaliland and terminus of the railway via Dire Dawa to Addis-Ababa in Abyssinia, of which it is the outlet on the Indian ocean. Following the Fr.-It. armistice in 1940 a Franco-It. armistice came to D. on Sept. 2, 1940, to arrange terms between Italy and Vichy France, by which Italy secured full rights in the port of D. and along the Fr. section of the railway. The Fr. surrender of D. isolated British Somaliland and thereby facilitated its capture by the Italians. Early in 1941, however, Brit. forces advanced on the railway and by summer of that year D. was under close blockade. On 28 Dec. 1942 Fr. Somaliland joined the Allies.

Djidjelli, tn. of Algeria in the dept. of Constantine. Exports cork, wine, and sardines. Pop. 11,400.

Djinn, see JINN and DEMONOLOGY.

Djizzak, see DZHIZAK.

Dmitrieff (Dimitriev) Radko (1859-1919), Bulgarian general who served with the Russian army during the 1914-18 War. He commanded the army which unsuccessfully besieged Przemyśl during Sept.-Oct. 1914; his losses were very severe—70,000 casualties. At the Battle of Cracow (Nov. 1914) he showed great skill as a leader, and succeeded in driving back an Austro-Hungarian army. In the Battle of Dunajec-San (q.v.) in the spring of 1915 he commanded the Third Army, and suffered another heavy reverse at Gorlice-Tarnow, where an Austro-German force made a very wide break in his line and captured over 50,000 prisoners. He tried to hold up the enemy at the Lupkow Pass, but failed, and as a consequence Brusilov's (q.v.) army was also compelled to withdraw. After the Russian revolution he was murdered by the communists at Piatigorsk.

Dmitriev, Ivan Ivanovitch (1760-1837), Russian statesman and poet, b. in Simbirsk. He served for some time in the army, but soon left it for the Civil Service. From 1810-14 he served as minister of justice under the Emperor Alexander. He occupied himself with literature during his leisure moments, and after his retirement in 1814. Among his poems are songs, odes, satires, tales, epistles, and his fables, partly trans. from La Fontaine and Florian, are among the best in the language.

Dmitrievsk, tn. of the Ukrainian S.S.R. with coal mines and metal and chemical industries. Pop. 54,000.

Dniepropetrovsk (formerly Ekaterinoslav) (1) region of the Ukraine, bounded on the N. by Poltava and Kharkov, on

the E. by the ter. of the Don Cossacks, on the S. by the Sea of Azov and Taurida and on the W. by Kherson. Its area is 21,500 sq. m. and its pop. about 3,500,000. Its surface is mostly steppe and its soil is the fertile black earth which yields large grain returns. The chief iron deposits of the Ukraine are found in the W. part of the region, and considerable and varied manufs. are carried on. (2) City in the Ukraine and cap. of the region of the same name, situated on the Dnieper. It is one of the greatest Ukrainian centres for iron working. It was a lovely old-fashioned type of Ukrainian city, and had broad avenues, beautiful trees and handsome old buildings and homes. The new buildings are typically modernish and are for the most part apartments and workers' dwellings. The principal factory is a steel-tube manuf. plant employing (1940) 9000 men and is engaged in turning out pipes and tubing and other forms of finished steel products and seamless pipes. Its open-hearth steel capacity was (1940) 440,000 tons. It has also manufs. of agric. machines, tractors, ball-bearings, machine tools, railway wagons, tobacco, soap, and tanneries. D. was taken by the Gers. in 1941 and reoccupied by the Russians on Sept. 27, 1943. Pop. c. 400,000.

Dnieper, or **Dnyepyr**, third largest European riv. after Rs. Volga and Danube, rising on the Valdai plateau in the region of Smolensk, flowing past Mogilev, Kiev, Dniepropetrovsk, Kherson, and other important tns., entering the Black Sea at Dnieper Iliman (estuary or gulf), E. of Odessa. Its chief tribs. are Rs. Berezhina, Pripyet or Pripyat, Ingulets, and Teteriv on the r. b., Rs. Sozh, Desna, Sula, Psol, Vorskla, Orel, and Samara on the left. Steamers ply between Orsha and Dniepropetrovsk, and Zaporozhe and Kherson. The rapids (porogs) below Dniepropetrovsk hinder navigation considerably. Length about 1400 m.; navigable from Drogobuzh. Quantities of corn, timber, hemp, and other goods are shipped on the D. and its tribs. It is connected with the Baltic by Rs. Dvina, Niemen, and Vistula, and their uniting canals Berezhina, Oginski, and Dnieper-Bug. The anc. name was Borystheneis, later Danapris (Turkish, Uzl); it is marked on medieval maps as Elicl, Luosen, or Lerene. There are important fisheries in the estuary. At Kiev the riv. is ice-bound for about three months in the year, and there is a bridge across: at Smolensk the waters are frozen for about half the year. In summer the river is 35 ft. deep at Kiev, and often rises much higher, to over 50 ft. in the spring floods. The width varies from under 470 to 2300 yds. The D. played a large part in the making of Russia before the Mongolian invasions (thirteenth century), and later in the life of Little Russia. Near its mouth was the Milesian colony of Olbia, estab. for trading with the interior. Great battles were fought on the D.'s banks in the Second World War. The Gers. crossed the riv. in 1941 but, at the turn of the tide of war in 1943, they were standing, back again, on the middle

and lower D. with a switch line to the sea of Azov through Melitopol to cover the Crimea. The Russians, however, quickly broke the Melitopol line, cut off the landward approaches to the Crimea and broke into the Great bend of the D. making rapid progress towards Krivof Roc. By the end of the year the Russian were forcing the Gers. to abandon their last hold upon the D. above Kremenchug, the month of Dec. being characterised by the success of the Russian offensive on the middle and lower D. The Gers., in their retreat, left strong formations on the middle and lower D. but early in the next year (1944) the Russian armies of the Ukrainian sectors fell upon their formations and inflicted on them a bloody defeat. For details of these battles see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Dniester, or **Dnyestr**, riv. of S. Russia, rising in the Carpathians and flowing into the Black Sea 40 m. S.W. of Odessa. It separates Bessarabia from the Ukraine (Podolia), and in its course passes Sambor, Halicz, Khotin, Mohilev, Bender, Akerman, and other important places. Its chief tribs. are Rts. Stryi, Reut, Botna, on the r. b., R. Sereth on the left. Navigation begins for steamers at Khotin: near Yempol, where it crosses the granite ridge of S. Russia, the rapids make navigation very dangerous. It is about 800 m. long; 180 to 350 yds. wide and 3 to 17 ft. deep. It ships much timber and corn, especially from Odessa. The ancient name was Tyras or Danastria (Turkish Turlia). Its mouth in the Black Sea is called Dniester Liman. In the invasion of Russia the Ger. crossed the D. soon after the invasion was launched in June 1941 but the Russians crossed the riv. on a 30 mile front on March 19, 1944. For details of these battles, see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.

Dobb's Ferry, small tn. of New York, U.S.A., situated in Westchester co. The reputation of the tn. rests chiefly on its historical connection with Washington, Clinton, Rochambeau, and other leaders of the War of Revolution. It is now a residential suburb of New York City. Pop. 6000.

Dobell, Sydney Thompson (1824-74), Eng. poet and critic, b. at Cranbrook, Kent. In 1836 his father, a wine merchant, removed to Cheltenham, with which D. was connected for the rest of his life. The influence of his grandfather, Samuel Thompson, brought him into contact with the 'Free-thinking Christians.' In 1850 under the *nom de plume* of 'Sydney Yendys' he pub. *The Roman*, which met with great success. *Balder* appeared in 1854; *Sonnets on the (Crimean) War*, in which he was assisted by Alexander Smith in 1855; *England in Time of War* in 1856. D. belonged to what has been called 'the spasmodic school' of poets. The undoubted charm of some of his lyrics and the value and originality of some of his thoughts are often marred by excess of metaphor and a general dreariness and nervelessness only relieved by bright

'spasmodic' flashes. See J. Nichol, *Poetical Works of Dobell*, with Memoir, 1875, and the collection of his prose works under the title *Thoughts on Art, Philosophy and Religion*; selected from the *Unpublished Papers of Sydney Dobell*, by the same writer, 1876; and Emily Jolly, *Life and Letters of Sydney Dobell*, 1878.

Döbeln, tn. of Saxony, Germany, in the prov. of Leipzig, situated on an is. formed by the Mulde and the Mühlgraben, 41 m. N.W. of Dresden by rail. Noted for iron foundries and manufs. of metal and wooden wares. Pop. 24,700.

Doberan, or **Dobberan**, tn. and watering place in the former grand-duchy of Mecklenburg-Schwerin, Germany, on a small riv. flowing into the Baltic, about 9 m. from Rostock. It has a Gothic church (1300-1368), a former Cistercian Abbey with many art treasures, and the tombs of numerous princes of Mecklenburg. It has been much frequented on account of its radio-active steel springs. Pop. 7000.

Dobereiner, Johann Wolfgang (1780-1849), Ger. chemist, b. at Bug near Hof, in Bavaria. In 1810 he was appointed professor of chemistry, pharmacy, and technology at Jena, where he made the acquaintance of Goethe. He is chiefly famous for an invention known as 'Dobereiner's Lamp,' in which he demonstrated that spongy platinum in presence of oxygen can ignite hydrogen; a process which has been used in many self-igniting coal-gas burners. He obtained the crystalline compound of alcohol with ammonia, and discovered furfural. His works include treatises on pneumatic chemistry (1821-25), and the chemistry of fermentation (1822). He was one of the first to try to group elements according to their atomic weights, thus helping to prepare the way for Mendeleev's Periodic System. He also discovered the catalytic effect of manganese dioxide upon the decomposition of potassium chlorate by heat.

Dobree, Peter Paul (1782-1825), Eng. classical scholar and critic. At Trinity College, Cambridge he became an intimate friend of Porson, and in 1823 was appointed regius professor of GK. After Porson's death D. was commissioned to edit the pub. of his notes on GK. authors, and brought out the *Plutus* of Aristophanes in 1820 and all Porson's *Aristophanes*. In 1822 he pub. the *Lexicon* of Photius, and left an ed. of Demosthenes unfinished at his death.

Dobrainka, tn. of Russia, about 50 m. N. of Chernigov. Pop. 10,000.

Dobritsh, see BAZARDJIK.

Dobromierz, see HOHENFRIEDBERG.

Dobrowsky, Josef (1753-1829), Slav philologist, b. at Gjermet, near Raab, in Hungary, of Bohemian parents. In 1792 he was commissioned by the Bohemian Scientific Society to travel all over Europe in search of the MSS. which had been scattered during the Thirty Years war. Among his works are: *Scriptores Rerum Bohemicarum* (1783-84), *Ausführliche Lehrgebäude der böhmischen Sprache* (1792), and *Institutiones Linguae Slavicae dialecti veteris* (1822). See life by F. Palacky, 1833.

Dobrudja, dist. of Rumania and Bulgaria. It is a low tract of Quaternary alluvium which stretches for a distance of 140 m. along the Black Sea. It rises in Sacar Bair to a height of 7765 ft., but the mean elevation of the dist. is only about 500 ft. During the First World War Rumania, after declaring war on Austria-Hungary, Aug. 27, 1916, at once advanced into Transylvania on a front of 350 m. while holding the Dobrudja with a comparatively small force. Later, the Austrians, who had been taken by surprise, reinforced by Ger. troops, advanced into the Dobrudja under the Ger. field-marshal, Mackensen, on Sept. 4, and Turtucain fell to them on Sept. 6. Ten days later Silistria was also taken and a new Russo-Rumanian defensive line was constructed between Rasova and Tuzia in the Dobrudja. The Rumanians continued to lose ground in their new sector until the second week in Nov. 1916, when they retook Hirsova. But this success was not consolidated, they were overwhelmed on other fronts, and fighting in the Dobrudja generally came to a standstill. It was prematurely agreed among the govts. of the Central Empires and those of their allies that the eventual disposal of the D. should be in the hands of Germany and Bulgaria, the new understanding being that Bulgaria should regain what she asserted had been taken from her by the Western Powers after the last Balkan War; but as the ultimate victory was with the Entente, Rumania retained the ter. In the Second World War, however, Rumania ceded the S. D. to Bulgaria by the treaty of Craiova, Sept. 7, 1940, Bulgaria gaining thereby the provs. of Durostor and Caliacra, an area of about 3000 sq. m. The D. was over-run by Ger. troops in March 1940 and was occupied, with all Bulgaria, until 1944. The N. part of the D. fell to the Russian armies with the capture of Galatz on Aug. 27, 1944. Constanza fell to them on Aug. 29. These captures, however, were from Ger. troops, for Rumania had accepted armistice terms on Aug. 23, and had joined the Allies. The peace treaty of 1947 confirmed the retention of S. D. by Bulgaria. See R. Vulpe, *La Dobroudja à travers les siècles*, 1939; B. Newman, *Balkan Background*, 1944.

Dobson, Frank (b. 1887), Eng. sculptor in bronze, born in London, son of Frank D., artist. Studied art from boyhood in London sculptor's studio and later in Cornwall. Exhibited in Venice, Dresden, Stockholm, Wembley, Paris and New York. His best sculptures include, 'The Man Child,' 'Morning,' 'Susannah' (bronze), Standing Figure (bronze), and a number of portrait busts, including a bronze bust of the Earl of Oxford and Asquith, and a brass head of Sir Osbert Sitwell, some of which are in the National Gallery of British Art, Tate Gallery, and Manchester City, Glasgow, and Leeds Art Galleries. A.R.A. 1942. Wrote *Pencil and Colour Drawings*. See *Frank Dobson*, ed. R. Mortimer, 1924.

Dobson, Henry Austin (1840-1921), Eng. poet, critic, and biographer, b. at

Plymouth; entered the Board of Trade in 1856; became a first-class clerk in 1874, and principal clerk in 1884, which last position he retained until his retirement from the service seven years later. It was, however, as a man of letters rather than a gov. official that Austin D., as he usually subscribed himself, achieved fame. At an early age he came before the world as a poet; and he issued several books of verse: *Vignettes in Rhyme* (1873), *Proverbs in Porcelain*, (1877), *Old World Idylls* (1883), and *At the Sign of the Lyre* (1885). His collected poems were pub. in 1897. One of the greatest living authorities on the Georgian period, D. wrote mainly on that era, his principal works being monographs on Fielding (1883), Steele (1886), Goldsmith (1888), Horace Walpole (1890), Hogarth (1891), Richardson (1902), Fanny Burney (1903); and *Eighteenth Century Vignettes* (three series, 1892, 1894, 1896), and *At Prior Park and Other Papers* (1912). *The Complete Poetical Works* were ed. by A. T. A. Dobson, 1923, and a collected ed. of D.'s essays was issued in the World's Classics, 1923-26. See life by A. T. A. Dobson (1928).

Dobson, William (1610-46), an Eng. portrait and historical painter, b. at Oxford; apprenticed as a boy to Peake, a picture-dealer. Van Dyck befriended him, and he became his pupil and imitator, succeeding him as court painter to Charles I. D. painted portraits of Charles I., the Prince of Wales, Prince Rupert, and sov. courtiers. Examples of D. in the National Portrait Gallery, London, are: 'Francis Quarles,' 'Eudymion Porter,' and others. There are also three at Hampton Court. 'The Decollation of St. John,' is one of his best historical works.

Dobson, William Charles Thomas (1817-1898), Eng. artist, b. at Hamburg. His paintings were mainly on historical and scriptural subjects, including 'Tobias and the Angel,' 1853; 'The Charity of Dorcas,' 1854; 'The Holy Innocents,' 1858; 'The Good Shepherd'; and 'St. Paul at Philippi,' 1873, in the Diploma Gallery.

Docetæ, or **Docetism** (Gr. *dokein*, to appear), a name given in the early church to a group of heretics who believed that during His residence on earth, Christ had no real but only an 'apparent' or phantom body. The doctrine originated in the Gk., Oriental, and Alexandrine theory that 'matter' is essentially impure and imperfect, therefore the union of the divine spirit with matter was impossible. It appears in its most developed form among the Gnostics and Manichæans, and its believers were divided into three groups: those who held that the body of Christ was a real, earthly body, but had no essential connection with His divine nature; those who declared that His human body was a mere phantom, a delusion (Marcion, the Ophites, and Manichæans); and those who declared that it was an ethereal body, descended with Him from heaven (Valentinus, Basilides). The theory precludes the idea of the virgin birth and the Crucifixion, or holds them to be only 'phantoms.'

The docetic doctrine appears among the Priscillianists and the Bogomils, and also among a small faction of the Anabaptists. See Gnosticism; also Dorner's *System of Christian Doctrine*, 1880, and Harnack's *History of Dogma*, 1894-99.

Dochart, riv. and loch of Perthshire, Scotland. The riv. carries off the surplus waters of the loch, and flows in a N.E. direction for 13 m., finally entering Loch Tay at Killin. Salmon, pike, and trout are plentiful in the stream.

Dock, common name of many perennial tap-rooted species of *Rumex*, a genus of Polygonaceae, to which belongs also the

often minimised by locks which receive the vessel at the D. level, and then, by letting water out, drop it to the outside level. The depth given to a D. depends upon the depth of the channel by which it is approached. But owing to the great improvements made in the dredging system, the channels leading to most important ports have been deepened considerably, and in building a new D., the probability of any such improvement would be taken into account. The depth of channel available for vessels is reckoned from the high-water of the lowest neap tides. The period of time over which vessels can

sorrel. *R. crispus*, the curled dock, *R. obtusifolius* the broad leaved dock, and *R. Britannica*, the greater water-dock, are all species found in Britain as weeds, and the leaves are used by children as a cure for nettle stings.

Dock, in marine and riv. engineering, a space or structure in or upon which ships may be placed to discharge or load cargo, or to undergo repairs. There are two main classes of Ds.: the wet D., with which the tidal D. may be classed, and the dry D., with which the floating D. may be considered.

A *wet dock* is a basin in a sheltered position, where vessels may lie alongside quays, which are fitted with proper appliances for taking on or discharging cargo. It adjoins the sea coast or a tidal riv., and is closed with gates so that the water in it may be retained at a uniform level when the tide has gone down. Quays usually surround the D. as much as possible, as it is of importance to secure as large a quay area as possible. The disadvantage of the wet D. is that vessels are able to enter or leave it only at high tide when the water outside and inside is at the same level. This disadvantage is

daily enter the D. depends upon the range of the tide. The approach channels to some of the S. Wales ports are inaccessible at low tide, for they are then nearly dry. It is in places where the range of tide is very great that the wet D. is used in preference to the tidal D. Liverpool, England, which possesses one of the finest D. systems in the world, is a case in point. Here the difference in level is over 30 ft., while in the Thames also it is some 20 ft. As a general rule it may be said that where the difference is more than 12 ft., wet Ds. are a necessity. The Liverpool D. system was developed greatly at the end of the nineteenth century, and the D. area is now some 1100 acres. The largest Ds. are the Canada (18 ac.), the Langton (18½ ac.), and the Alexandra (17½ ac.), with its branch Ds., area 44½ ac. The West Float Dock, with a water area of 52 ac., is the largest on the Birkenhead side of the riv. The Port of London Ds. cover an area of 4247 ac. with a water area of 722 ac. and provide 48 m. of quayage. The King George V D., connected with the Royal Albert D. and the Royal Victoria D., together form the largest sheet of enclosed dock water in

the world. The system is known as the 'Royal Docks' and affords 11 miles of berthing accommodation for shipping. The total area of these three Ds. (including land for extension) is 1102½ ac., water area, 247 ac., length of principal entrance, 800 ft., width of principal entrance, 100 ft., depth of principal entrance 45 ft.; and quays, 12½ m. These great Thames Ds. are 40 m. from the sea and only 5 m. by road from the heart of London. Other important London Ds. are the London, St., Katharine's, Surrey Commercial, E. India, W. India, and Millwall. The E. India Ds. have a total area of 67½ ac., water area, 31½ ac., length, width and depth of principal entrance, 300 ft., 80 ft., and 31 ft. respectively, and quays, 1½ m. The Tilbury Ds.—the first Ds. in the Port of London on approaching from the sea, are 24 m. from the Thames Estuary. They consist of a main D. and 3 branch Ds. Their total area is 725 ac., water area, 104½ ac., length, width and depth of principal entrance lock, 1000 ft., 110 ft., and 45 ft. respectively, and quays, 4 m.

A *tidal dock* is a basin similar to that described above, but open to the harbour waters, so that the level of the water in the D. rises and falls with the tide. Ds. of this kind are suitable where the difference between low and high tide is small. This state of things prevails on the shores of the Mediterranean and the Atlantic coast of N. America, and as examples of such Ds. we may cite those at Marseilles, Genoa, and Naples in the Mediterranean, and the Atlantic Ds., Brooklyn, in the U.S.A. Wet and tidal Ds. are usually constructed on low-lying land near the estuary of a river. The D. is here somewhat sheltered, and the excavation of the basin is facilitated by the lowness of the land. The river acts as an approach channel, and if, as in the case of the Albert and Victoria Ds., and Chatham dockyard on the Medway, described above, a sharp bend in the riv. be utilised, upper and lower entrances are easily provided. Other notable examples of Ds. formed on low-lying land adjoining a tidal riv. with consequently a sheltered approach are those at Liverpool, Hull, Southampton, Belfast, Antwerp, Rotterdam, Hamburg, and St. Nazaire. In the Mediterranean ports, where the basins are actually in the sea, breakwaters, as at Marseilles, are built to act as shelters. Examples of sheltered Ds., constructed on low-lying land bordering the shore and with direct access to the sea are Swansea, Hartlepool, Barrow, and Bombay.

Dry, or graving docks are basins of particular shape, which can be shut up, and from which the water can be pumped so as to leave the vessel's hull dry for repairs, repainting, cleaning, etc. The dry D. has access to the sea from one end only, and this end is furnished with gates, or caissons, fitted with sluices, so that all the water may be drained away; but when it has access to a wet D. the water must of course be pumped out. The other end is generally shaped round in the form of a ship's bows. On the face the walls are stepped, the steps being known as 'altars.' The bottom is heavily paved,

and slopes downwards from the centre so as to allow any water left in the D. to drain out. These Ds. were formerly constructed of timber in America, but they are now universally constructed, as formerly in Europe, of masonry, brickwork, or concrete. The 'altars' are lined with granite blue-bricks, or specially strong concrete, and additional steps and means of access are provided for the men to ascend and descend. Along the centre line of the D. bottom are keel-blocks, upon which the ship settles as the water is pumped out. When brought into the D., which is of a length and depth sufficient to receive the largest vessels frequenting the port, it is placed carefully in position over the keel-blocks, and shored up with timber shores resting on the steps, which retain it in an upright position as it settles down. The King George V Graving D., Southampton, opened by King George V. in 1935, is the largest dry D. in the world. It is 1200 ft. by 135 ft. The largest London dry D., out of thirty-three, is the Tilbury, which is 846 ft. long, 70 ft. wide at the entrance, and 35 ft. deep. The size of the Canada D., Liverpool, is 925 ft. long, 94 ft. wide at entrance, and 31 ft. deep at high water.

Floating docks have been built in late years to serve the same purpose as graving Ds. They have certain very obvious advantages, but these are counterbalanced by grave disadvantages. The advantages plainly are: (1) that the D. can be built in the cheapest and best place, no matter how far distant this may be from the place at which the D. is needed. Thence, it can be towed to its destination; (2) it can be moved from one port to another, or from one part to another of the same port, as seems most convenient; (3) it usually costs less to work than a dry D., where the cost of pumping out the water is apt to be very great. The disadvantages are: (1) that the durability is so much less, a floating D. cannot be expected to last for more than fifty years; (2) the cost of maintenance is generally much higher; (3) it cannot be used for such large vessels as can the regular graving D. A sheltered site, with a considerable depth of water, is necessary for a floating D., which consists of a number of pontoons or watertight boxes, of which some form the bottom of the D. and others the two sides. The pontoons are divided into water-tight compartments, and for filling or emptying these compartments there is machinery in the side boxes. The machinery usually consists largely of steam-pumps. The lower boxes are at first filled with water so as to be well below sea-level. The vessel is then floated in, and carefully adjusted in position over the keel-blocks. The water is then pumped out from the watertight compartments, and the bottom of the dock rises, lifting the vessel with it. Shores are at the same time placed between the hull and the side walls to retain the vessel in position. This continues until the hull of the vessel is well out of the water. The repairs are made, the D. is sunk, and the vessel floated out. Stability is ensured by making the displacement of

that part of the D. below the bridge greater than that of the upper part of the D. plus the greatest vessel it could take. Floating Ds. are now almost all constructed of iron and steel, and are carefully overhauled at regular intervals. The difficulty of doing this has led to a notable improvement in form. Under the old system, the floating D. had itself to be brought into dry D. at regular intervals. Now, however, the floating docks are made self-docking. That is to say, they are constructed in three parts, so that if one of these requires cleaning it can be detached and dry docked on the other two parts as though it were itself a vessel.

Dock entrances and locks.—Access to a D. may be either by entrances or by a lock. The former, being so much the cheaper, is used when possible. Entrances consist of one or more pairs of gates at the opening of the D. These are fitted with sluices, closed by vertical sluice-gates, which are worked by hydraulic pressure. In the case of a dry D. opening on to the sea, these enable the water to be drained entirely away, and in this case they are supplemented by culverts in the side walls. In the case of a wet D. they serve to bring the water in the D. down to the level of that outside. These entrances are economical, not only in money but also in space, and it is much more easy for a vessel to pass through them. The disadvantage is that they are available for a comparatively short period of time daily, unless the difference between high and low water levels be very small. Locks, on the other hand, form a watertight compartment *outside* the D. itself. At each end they are fitted with sluice-gates, as are the entrances. They are constructed on the same plan as the locks on canals and rivs., but the scale is much greater and more elaborate. When it is required to pass a vessel out from the D. into the open channel, water is first passed through the sluices from the D. to the lock-chamber, so as to bring both to the same level. The gates between them are then opened, and the vessel passes into the lock-chamber. This pair of gates is then closed, and the other sluices are employed to bring the water in the lock-chamber down to the level of that outside. The outer gates are then opened and the vessel leaves by that entrance. The lock-chamber must be long enough to receive the largest vessels likely to need docking. The gates which close the entrances and locks are constructed either of wood or of iron, braced carefully so as to resist the pressure of the water. The leaves are constructed to meet absolutely truly in the centre, and the greatest care is also exercised to make the union of the heel-posts and side walls thoroughly watertight. Of woods, greenheart is the most suitable in salt water, as best resisting the action of the teredo. D. gates are sometimes made straight and sometimes segmental. Rollers are often placed along the floor to support the outer ends of the gates in very wide locks. Sliding or floating caissons sometimes take the place of gates.

Recent Developments.—During the years 1918–39 great attention was being given to the problem of approach and exit from Ds. at all states of the tide, in view of the enormous loss in earning power and the cost in interest and charges incurred by great liners and other shipping. The chief case in point is Liverpool, which had long been harassed by the bar that made her a closed port during many hours of the day and night. With the opening of the Gladstone D. in 1927 the disability was largely removed, for this D. can be entered at all states of the tide, the famous bar having been successfully pierced in circumstances that made a new record in the hist. of dredging. The Gladstone D. is about 60 acres in area, and has quays 3 m. in length. This D. is slightly exceeded in size by the King George V. D. (London), which was opened in 1921, and which constituted a first step in a scheme to develop the R. Thames on both N. and S. banks so that greater ships can be brought near to the City. The Immingham D. near Grimsby, completed in 1912, led to development of trade in the area served. The many natural advantages of Southampton for dealing with great ocean liners have been still further supplemented by additions of great lengths to D. sides. The speed and ease with which the largest ships in the world can berth and start in this port is one of its chief assets, and its modern improvements have made it the leading passenger port in the world. Among other developments in D. construction during this period were the Esquimaux D. on Vancouver Island, Canada, opened in 1926, which has a length of 1150 ft.; a D. of about similar length opened in Durban, S. Africa, in 1925; while extensions at St. Johns, Canada, include a D. opened in 1923, which is 1165 ft. long. Before the Second World War much public interest centred on Singapore in view of the construction of its naval base. For details of the building of the base and its loss in the Second World War, see, under SINGAPORE BASE and SINGAPORE. *History.* Singapore is one of the greatest natural harbours in the world. In 1905 the Brit. gov. acquired Tanjong Ds., which it supplemented eight years later by the construction of the King's D. at a cost of £400,000. See L. F. V. Harcourt, *Harbours and Docks*, 1885; C. Colson, *Docks and Dock Construction*, 1891; C. Greene, *Wharves and Piers*, 1917; A. H. Hunter, *Dock and Lock Machinery*, 1921; B. Cunningham, *Dock Engineering*, 1922; Report on *Marine Structures* by the U.S. National Research Council (1921); R. S. MacElwee, *Port Development*, 1925; F. N. Du Plat-Taylor, *Docks, Wharves and Piers*, 1928, 1934; D. R. Johnson, *Modern Dock Operation*, 1929.

Dock Dues, see TONNAGE DUES.

Dock Warrants, in England, are certificates given to the owners of goods warehoused in the docks. When goods are transferred the certificates are endorsed in favour of the purchaser, and thus become a warrant for the removal of goods. Under the Factor's Act of 1889, it is a

'document of title,' and any person lawfully in possession of it, although not the owner of the goods, by endorsement and delivery of it has the absolute right to all goods described in it. Warrants may be obtained for the whole or a part of the goods consigned. All D. W. require a threepenny stamp.

Dockyards, Government (In America called Navy Yards), in the fullest meaning of the term are the establs. where warships are built and repaired, supplied with stores, ammunition, and men, and put in a state of complete efficiency. As a fact, very few yards are so complete. In many of them there is no ship-building at all, while in many more although the frame of the ship is built in the gov. yard, the machinery and fittings are supplied from the workshops of some engineering firm. All Brit. dockyards are under the Admiralty, and governed by officers under an admiral-superintendent at the larger yards, and the captain-superintendent at the smaller. All Admiralty instructions with regard to the building or commissioning of ships are directly conveyed to the superintendent, as well as to the officers more nearly concerned with the carrying out of the instructions. The chief Admiralty official is the Controller of the Navy (third Lord of the Board of Admiralty) and below him are the Directors of Dockyards, the Director of Stores, and the Director of Naval Construction. The chief artisans of a dockyard comprise the engineers, shipwrights, platers, caulkers, joiners, smiths, sail-makers, rope-makers, and a large body of labourers. The scale of pay is determined bi-annually by a special board. The great dockyards of England are Portsmouth, Devonport, Chatham, Sheerness, and Pembroke Dock; of the empire, Malta, Gibraltar, Ascension, Bermuda, Simonstown, Haulbowline (Ireland), Hong Kong, Sydney, and Wei-wei-wei. New docks, practically identical with those at Rosyth, were completed in Portsmouth just before the outbreak of the 1914-18 war. The docks at Rosyth under construction in 1910 were still far from complete when the war began, but were continued under great difficulties during the hostilities. The necessities of the Navy during the war brought a number of new bases into existence. Scapa Flow became the chief naval headquarters, while Inverness, Harwich, and Dover were adapted as additional naval centres. After the Armistice, Rosyth, Haulbowline, and Pembroke ceased to be of importance, the two last being closed. From 1922 the plan to build naval yards and docks at Singapore occupied a big place in political controversy. Construction, which was begun in 1923, was stopped when the Labour Party took office in 1924, and during the twelve months of the financial year 1924-25 the scheme was delayed, but was restarted by Mr. Baldwin's gov. of the following year. See further under SINGAPORE BASE. The principal dockyards of France are at Cherbourg, Brest, Lorient, Rochefort, and Toulon; of Germany, at Wilhelmshaven and Kiel;

of U.S.A., Portsmouth, Charlestown, Brooklyn, Washington, and Mare Is.; of Italy, Spezia, Naples, and Venice; of Russia, Leningrad, Kronstadt, Sevastopol, and Nikolaiev.

Doctor (Lat., teacher), one who is skilled or learned in any branch of knowledge, or whose attainments entitle him to express an authoritative opinion. As a title or degree it is granted by univs. to those who have attained the highest qualification, and ranks above master; but the ranks vary, thus in divinity, law, music, etc., there are no masters, and the lower degree is bachelor; in other faculties such as arts, there are no Ds. In the fourteenth century the degree of D. was conferred in medicine, and in common parlance a 'D.' means a physician, or, quite generally, a qualified medical practitioner, whether he has taken the degree of D. in Medicine, M.D., or not. The first univ. degree of D. was granted at Bologna in the faculty of law, in the twelfth century. The faculties in which the degree is granted are too numerous to specify, and new faculties with the growth of specialisation tend to spring up. The univs. are accustomed to grant honorary doctorates to members of other univs., and to those who have distinguished themselves in a particular branch of knowledge, or who are prominent generally, such as distinguished statesmen, military and naval officers, scientists, artists, writers, etc. Of these honorary degrees those of D.C.L., Doctor of Civil Law, at Oxford, and LL.D., Doctor of Laws, at Cambridge, are perhaps of the highest distinction.

Doctors' Commons, the name formerly given to a society of ecclesiastical lawyers in London, forming a distinct profession for the practice of civil and canon laws, and also to the buildings erected by them, 1567, on St. Bennet's Hill, St. Paul's Churchyard, under Harvey, Dean of the Arches. The houses (so called from the 'community of board' of members of the college) were destroyed by the Great Fire, 1666, but restored in 1672. Advocates and thirty-four proctors (corresponding to attorneys and solicitors), all Oxford or Cambridge graduates duly admitted by the Archbishop of Canterbury, lived there, headed by a president (Dean of Arches for the time being). Incorporated by Royal Charter, 1763, but on estab. of the Divorce Court and Probate Court, the college was dissolved and the property sold, 1857, the various courts (Court of Arches, of Admiralty, of Delegates, Prerogative, Faculty, and Archdeacon's Court) being now open to the whole Bar. The buildings were demolished in 1867, but the old name still survives. In 1874 the Doctors' Commons Will Office was removed to Somerset House.

Doctrinaire, theorist who pays no regard to practical considerations, generally a political ideologist. The term is of Fr. origin, and was bestowed upon a group of politicians at the time of the Restoration (1815-30), who desired a constitution in France modelled according to historical principles and the monarchical system in England, and were opposed to absolutism

as much as to revolutionary principles. The leaders were Royer-Collard, Guizot, and the Duc de Broglie.

Doctrine, see **DOGMA**.

Dodabetta, highest mt. in Madras, is a peak in the Nilgiri Hills and is 8760 ft. high.

Dodd, Francis (1874-1949), Brit. artist, b. at Holyhead, son of a Wesleyan minister. Received his artistic training at the Glasgow School of Art and in Paris and Italy. A.R.A., 1927; R.A., 1935. A trustee of the National Gallery of Brit. Art (1928-35). As an official war artist he painted a series of portraits, 'Generals of the British Army,' during the First World War. His 'Interrogation of a German Prisoner' is in the Imperial War Museum. Among his best portraits are those of: 'The late Lord Cunliffe' painted for the Bank of England; a lady entitled 'Signora Lotto' purchased by the Manchester Corporation for the City Art Gallery in 1910; a 'Self-Portrait' now at the Fitzwilliam Museum; 'Geoffrey Dawson' former editor of *The Times*, and 'C. P. Scott,' former editor of the *Manchester Guardian*. He is well represented in the Tate Gallery by paintings of 'A Smiling Woman,' bought by the Chantrey Bequest in 1924, and 'Miss Dacre' and also a charcoal drawing of Edward Garnett. He also executed a number of water colours portraying some of the older London suburbs—Blackheath, Brixton and Dulwich. In 1941 an exhibition of his etchings, portrait drawings and oil and water colour paintings was held at the Municipal Art Gallery, Cheltenham.

Dodd, William (1729-77), man of letters, after distinguishing himself at Cambridge, and spending a short time in London as a man about town, took holy orders in 1751. He soon became a popular preacher, and attracted large congregations to the Magdalen House, of which he was chaplain from its inauguration in 1758. In 1763 he was appointed chaplain to the king, and soon after became tutor to Philip Stanhope, godson and heir to Lord Chesterfield. He became a noted person in Metropolitan society, but, living beyond his means, got into such straits that in 1777 he forged a bond for £4200 in the name of Lord Chesterfield. The forgery was discovered, and D. sent for trial, and condemned to death. Much influence was brought to bear upon the king to grant a pardon, but in vain. No less a literary personage than Dr. Johnson exerted himself on the prisoner's behalf. D. was hanged on June 27. Of D.'s many books, that best known is the vol. of selections entitled *The Beauties of Shakespeare* (1752), reprinted many times. Besides some contemporary anonymous memoirs, there is a biography by P. Fitzgerald, *A Famous Forger, being the story of the Unfortunate Dr. Dodd* (1865).

Dodder, name applied to sev. Brit. species of *Cuscuta*, a parasitic genus of Convolvulaceae. The plants twine round the branches of woody or other plants, strike minute suckers in their bark and thus obtain their necessary sustenance.

C. Europaea, the common or greater D., attacks heath, furze, nettles, hops, and other plants. *C. epillinum* is the flax D., *C. trifolii* attacks clover, and *C. epithymum*, the lesser D., takes as host sev. low-growing plants.

Doddington, George Bubb, 1st Baron, Lord Melcombe (1691-1762), son of Jeremiah Bubb, an Irish apothecary. In 1720 he took the name of D. on inheriting a fine estate from his uncle. In 1715 he was elected to Parliament, and was member for Bridgwater (1722-54). He was constantly changing sides, serving in succession Walpole, the Prince of Wales, the Duke of Argyll, and the Prince again. He was a patron of Young and Thomson, and wrote some poems himself, but he is only remembered through his posthumous *Diary* (ed. by H. P. Wyndham, 1784), which reveals the intrigues of his time and his own egotism. He was created Baron Melcombe in 1761.

Doddridge, Philip (1702-51), Eng. dissenting minister and writer. In 1729 D. opened at Northampton an academy for educating Nonconformist ministers. He formed a society for distributing Bibles to the poor, and paved the way for foreign missions among Nonconformists. His chief works are: *The Family Expositor* (1739-56), *Of the Evidences of Christianity* (long used as a text-book at Cambridge, 1743), *Rise and Progress of Religion in the Soul* (1745), *Course of Lectures* (pub. by Clarke, 1763), and hymns. See J. D. Humphreys (ed.) *Correspondence and Diary of P. Doddridge*, 1829-31.

Dodecahedron, in geometry, a solid enclosed by twelve plane faces, each solid angle being formed by three regular pentagons. In crystallography, a regular D. is an impossibility; in the cubic system are the right rhombic D. and the pentagonal D., which has irregular faces.

Dodecanese Islands. A group of 13 (originally only 12 were comprised in the group) It. is. in the Aegean Sea near the coast of Asia Minor. They were occupied by Italy in 1912, recognition of her title being given by Great Britain under the treaty of London in 1915. The is. are Kos, Patmos, Lipso, Kalymnos, Leros, Nisyros, Stampalia, Tilos, Calchi (or Kar-chi), Syme, Astypalaea, Scarpanto (or Karpathos), Kasos and Rhodes. Pop. 80,000. In Sept. 1939, Brit. aircraft and ships bombed and shelled It. bases in the D. Stampalia was bombarded by ships of the Brit. Mediterranean fleet on Oct. 2, 1940. Following Italy's surrender in 1943 Brit. forces struck at the D., occupying Cos, Leros, and Samos and piercing the ring of defences whose bastions were Rhodes and Crete. The is. were returned to Greece after the Second World War and were formerly incorporated in the kingdom in March, 1948. See also **ÆGEAN SEA AND ISLANDS AND ITALIAN FRONT IN SECOND WORLD WAR**.

Dodecatheon, genus of plants belonging to the order Primulaceae. They are hardy perennials, and easily cultivated in gardens with well-drained soil. The flowers, which somewhat resemble cyclamen, are variously coloured. *D. integrifolium* has

clusters of handsome, rosy-crimson flowers, *D. Jeffreyi* is reddish purple, *D. Media* is pale lilac. Various hybrids derived from crossing *D. Media* with other species are popularly grown; of these *D. m. lanceifolium* has large leaves and red flowers with yellow markings. Amer. cowslip is the popular name for the genus.

Dodge, Mrs. Mary Elizabeth Mapes (1838-1905), Amer. authoress, b. in New York. For some years she assisted Harriet Beecher Stowe and Donald G. Mitchell in editing *Hearth and Home*. In 1873 she was appointed editress of *St. Nicholas*. Besides numerous contributions to periodicals, she wrote, *Irrington Stories* (1864), *Hans Brinker or the Silver Skates* (1865), *Rhymes and Jingles* (1874), *Theophilus and Others* (1876), *When Life was Young* (1894); and the vols of poems: *Along the Way* (1879), and *Poems and Verses* (1904).

Dodge City, in Kansas, U.S.A., seat of a Ford plant, with railway shops, flour mills, etc. Five m. E. is the State home for disabled volunteer soldiers. Pop. 8400.

Dodgson, Charles Lutwidge, see CARROLL, LEWIS.

Dodman, The, lofty headland of S. Cornwall, England, 8 m. S. of St. Austell. It is now the property of the National Trust.

Dodo, extinct bird, in the family Dididae, next to the pigeon, was last known in 1681 in its living state. The bird was as large as a turkey, of unworldy

build, with short curly tail-feathers and rudimentary wings useless for flight; the bill was blackish in colour, forming at the end a horny hook, and the aborted keel also indicated its flightless condition. *Didus ineptus* was the species in Mauritius, *D. borbonicus* in Réunion.

Dodona (Δωδώνη), anot tn. of Epirus, Greece, near the base of Mt. Tamarus (Tmarus) on Thesprotia's borders (see Strabo vii., Pliny ii.). Said to have been founded by Deucalion (Herodotus ii. 99), it was the seat of the oldest Gk. oracle,

dedicated to Zeus. The oracle divined by the flight of pigeons, dice, the sound of a bronze bason, and the noise of the wind in the sacred oaks where the voice of Zeus was heard in the rustling of the leaves. The temple was destroyed during the war of the Aetolians and the Achaeans 220 B.C. It was rebuilt a little later, and in the second century A.D. games were celebrated there in honour of Zeus Naios. But Christianity soon transformed it into a church, and the bishops of Dodona sat at the Councils of the fifth and sixth centuries, at the end of which it ceased to exist. The remains were unearthed about 11 m. S.W. of Janina. The theatre is well preserved, and many valuable historical inscriptions were found.

Dods, Marcus (1834-1909), Scottish divine and theological scholar. In 1859 he was appointed professor of N.T. Exegesis in New College, Edinburgh, of which he became principal in 1907. Among his most important writings are: *Israel's Iron Age* (1874), *Mohammed, Buddha, and Christ* (1877), *On Genesis* (1882); *The Gospel according to St. John*, in the Expositors' Greek Testament (1897); *The Bible, its Origin and Nature* (1904). He also edited the Eng. trans. of Lange's *Life of Christ* (1864), and *Augustine's Works* (1871-76).

Dodsley, Robert (1703-64), Eng. author and bookseller, was in early life in domestic service as a footman. While so engaged, he wrote occasional verses and received encouragement from his employer, the Hon. Mrs. Lowther, and later the active patronage of Defoe. He pub. *Servitude* (1729), later reissued as *The Footman's Friendly Advice to his Brethren of the Livery* (1731), *A Muse in Livery* (1732), and other vols.; and in 1735 his dramatic satire, *The Toy-Shop*, was staged by Rich at Covent Garden Theatre. In the same year D., with capital supplied by Pope and other persons interested in him, set up as a bookseller at the sign of Talby's Head in Pall Mall. He continued throughout his life to write books and plays, but it is as a bookseller he is now best remembered. His first important venture as a publisher was in 1737 when he issued Pope's *First Epistle of the Second Book of Horace imitated*. In the following year he brought out Dr. Johnson's *London*. In 1759, joined by his younger brother James in the business—he pub. Goldsmith's *Polite Learning*, and in the same year he retired into private life, with an ample competence and a host of friends. It was James D., who, after having refused a first version of *Tristram Shandy*, brought out Sterne's masterpiece, purchasing the copyright of the first two vols. for £250, and of the third and fourth vols. for £380. See R. Straus, *Robert Dodsley, Poet, Publisher and Playwright*.

Dodsworth, Roger (1585-1654), Eng. antiquary. He collected materials for a hist. of Yorkshire and an Eng. baronage, and pub. in collaboration with Sir William Dugdale, a *Monasticon Anglicanum*, 1655 and 1661. The MSS. he left to Lord Fairfax, who bequeathed them to the Bodleian Library at Oxford.

Dodwell, Henry (1642-1711), Eng. theologian and chronologist. In 1688 he was elected Camden prof. of hist. at Oxford, but was deprived of his post on refusing to take the oath of allegiance to William and Mary in 1691. His theological works are of far less value than those on chronology, among which are: *A Discourse Concerning Sanchoniathon's Phœnician History* (1681), *De Veteribus Græcorum Romanorumque Cyclis* (1692), and *Annales Thucydides et Xenophontei* (1702). See F. Brokesby, *Life of Mr. Dodwell with an Account of his Works*, 1715.

Doe, John, and Roe, Richard, see under **FLECTION**.

Doenyo Egere, see **KENYA, MOUNT**.

Dog, term designating a quadruped of the domesticated variety, *Canis*, which may be extended to include wild Ds., jackals, foxes, wolves, etc.

Origin.—Darwin believed the D. to be descended from two species of wolves, *Canis lupus* and *Canis latrans*, as well as from certain European, Indian, and African canine species, and from the jackal. The arguments in favour of the wolf origin are that the D. and wolf will interbreed with each other, and that the progeny thus obtained will again breed with either the D. or the wolf, whereas most hybrids are not fertile. On the other hand the domesticated D. is in one feature very different from the wild Canidæ. The pupil of its eye is round, whereas in the wolf the pupil is placed obliquely, and in the fox and jackal perpendicularly.

Chief Characteristics.—The dog is digitigrade, fissiped, with slender legs, the fore feet having five toes, the hind feet four, with non-retractile claws. The head is small, the muzzle pointed, but the shape of the head differs greatly in various species. The neck is short and thick-set. The teeth usually consist of six incisors, two canines and eight premolars in all, but the numbers vary. The upper jaw has four molars and the lower has six. The vertebrae of the tail vary in number, and some species have no tails. The tongue is smooth. The mammae are sometimes four, sometimes five on each side. The period of gestation is sixty-three days. There are four to eight, occasionally as many as twenty, pups in a litter. The young are born blind and remain so for about ten days. The average age of a D. is from ten to fourteen years, though some live to be twenty. The D. has a very acute sense of smell, and an extraordinarily keen intelligence. It has probably more highly developed mental qualities than any other animal. By nature it is carnivorous, and in its wild state will combine to hunt out its prey. It will feed on birds or fresh meat; in cold countries it eats fish, and some kinds of Ds. will also eat crabs, reptiles, and insects. The Pariah D. of India feeds on carrion and offal, whereas the Chowchow of China is a strict vegetarian. (See V. W. F. Collier's *Dogs of China and Japan*, 1921.)

History.—The dog was, apparently, the companion of man from the very earliest time. Canine remains have been found in the Dan. kitchen-middens of the Neolithic period side by side with human remains. The Egyptians held Ds. in the greatest affection, almost veneration. The friezes of their temples were carved with figures of Ds., and many very early Egyptian monuments (dating from about 3000 B.C.) are decorated in like manner. The Jews, as we can see from the O. and N.T., regarded Ds. with the utmost contempt, as unclean beasts. This feeling was perhaps the natural outcome of seeing the worship bestowed upon them by the neighbouring tribes of Egyptians and Syrians. Assyrian sculptures represent two forms, a greyhound and a mastiff, whereas the Egyptians represent a wolf-dog, greyhound, turnspit, and a kind of terrier. The Egyptians worshipped Sirius, a star, which they called 'D. Star,' because of its faithfulness in appearing at a certain season to warn them of the approaching overflow of the Nile. The Ethiopians went still further, and elected a D. to be their king, whose growlings or howlings they received as directions of government. The Gks. used Ds. in battle as well as in the chase. 'Ds. of war' had spiked collars, and proved very valiant and dangerous fighters. Oppian, in his *Cynogelata*, is the earliest authority who mentions the use of Ds. for hunting. The Gks. had formerly used nets to ensnare animals, but later pursued their prey with Ds. The Romans divided Ds. into three classifications: (1) *Canes venatici*, or hunting-Ds.; (2) *Canes pastores*, or sheep-Ds.; (3) *Canes villatici*, or watch-Ds. The hunting-Ds. were further divided into *pugnaces*, who attacked the quarry, *nare sagaces*, who tracked it out, and *pedibus celeres*, who overtook it. Early Britain was renowned for its bloodhounds, which, according to Strabo, played an important part in the Gallic wars. During the Middle Ages, Ds. were used in England chiefly in sport. King John had a pack of other hounds. Bull-Ds., then called Butchers' Hounds, were used for catching cattle, and in the popular sport of bull-baiting. Juliana Berners (fifteenth century) made out the following list of domestic Ds.: 'A Grehound, a Bastard, a Mengrel, a Mastif, a Lemor, a Spanyel, a Raches, a Kenettys, a Teroures, a Butchers' Hounds, a Dunghylle Dogges, a Tryndel-taylles, a Pryckeryd Currys, and small Ladyes' Poppees.' Ds. have taken a useful part in exploration, from the time of Columbus' discovery of America (1492) down to the Arctic expeditions of recent years. Among the most famous Ds. in hist. are the bloodhounds who attacked William Wallace of Scotland when fleeing from the English; the mastiffs of the Knights of Rhodes, who could smell out a heathen Turk in whatever disguise; and the D. who woke up William the Silent on the eve of the attack at Mons to warn him of approaching danger.

Dogs in literature.—Ds. are present in the mythology and folklore of the earliest peoples. In this connection should be

mentioned Fingal's favoured companions, Bran and Luath; Cavall, 'King Arthur's hound of deepest mouth,' and Hodain, of the Tristrem and Ysolt story. In Gk. mythology we have Argus in the *Odyssey*, Ulysses' faithful D., who recognised his master after an absence of twenty years. Such another D. was Mæra, who, by his prolonged howling, directed Erigone to the spot where her father, Icarus, had been murdered. Mæra was placed among the stars by Zeus, where he was known as Procyon ('little dog') or *Icarus Canis*. Another faithful D. in story is the Dog of the Seven Sleepers, who accompanied his masters to the cave in which they were confined, and stood on guard by their side for 300 years, without moving, eating, drinking, or sleeping. Mohammed admitted him into paradise under the name of Katmir. In folk-lore Ds. have often been credited with mysterious knowledge of spiritual things, and have sometimes been uncanny friends of such a magician as Cornelius Agrippa. It was a rabbinical superstition that Ds. howl at death. They were, too, depicted as terrible monsters, such as the snarling, many-headed Cerberus, who guarded the entrance to Hades on the further side of the Styx. Among the Ds. noted in Eng. literature are Pope's Bounce, Byron's Boatswain, Scott's Maida, Dandie Dinmont in *Guy Mannering*, Mrs. Browning's Flush, John Brown's Rab and his Friends, Gelder, the dog of Llewellyn. (Consult 'The Dog in History and Folk-lore' in J. J. King's *Sketches and Studies, Descriptive and Historical*, 1871.)

Uses of Dogs.—The earliest races made a friend and companion of the D. No other animal shows such affection and gives such faithful service. Ds. have been and are used in the hunt, for coursing, and retrieving game. They are also valuable for collecting sheep and keeping the flock together, and are useful guards and watchers to keep off thieves. In the Arctic regions Ds. drag sleighs and other vehicles across the snow. They have frequently saved people from drowning, and from suffocation in snowdrifts. Barry, the famous St. Bernard, saved forty lives. Ds. are also employed as messengers, and for tracking criminals, for scouting, for ambulance work, and leading blind persons.

Classification.—The various breeds of Ds. have increased greatly since the early part of the nineteenth century, owing to careful breeding—by crossing, selecting, and interbreeding, new varieties can be 'manufactured.' Many classifications have been made of Ds., though there is no generally accepted one. Cuvier recognised three main divisions—Mâtins, Spaniels, and Hound-dogs. Youatt enlarged this arrangement as follows: 1. Those with more or less elongated heads, with parietal bones widest at the base of the skull, gradually approaching each other as they ascend, and with the condyles of the lower jaw on a line with the upper molar teeth, e.g. the Irish Wolfhound, Greyhound, etc. 2. Those with heads moderately elongated, and with the

parietals diverging as they ascend thus enlarging the cerebral cavity, e.g. the St. Bernard, Newfoundland, Sheep-D., Spaniel, Setter, etc. 3. Those with more or less shortened muzzles, large frontal sinews, and elevated and diminished cranium, e.g. the Terrier, Bull-D., and many toy Ds. Fitzinger divided Ds. into 180 different classes. A very practical classification is that of Rawdon B. Lee (in *Modern Dogs*, 1897), into sporting and non-sporting Ds. These two great divisions have been defined by F. C. S. Pearce in the *Kennel Club Stud Book* (1874), and were defined in further detail by that club in 1900, so that there might be no misunderstanding on the part of intending exhibitors. Gun-Ds. and terriers are included in the classification of sporting breeds, and toys under non-sporting.

Breeds of Dogs.—The Kennel Club has registered 92 different varieties of Ds. But, with the free interbreeding of various types, many intermediate species occur, which account for the 185 types differentiated by naturalists. Numerous foreign Ds. have been imported into the United Kingdom, the Dachshund, the Schweisshund, and a breed of Mastiff, from Germany; the Chesapeake Bay D., and the Boston Terrier from America; the Chow from China; the Japanese Spaniel from Japan; the Poodle from France, and many others. These, and Brit. Ds. are dealt with in separate articles.

Wild dogs.—Among the wild Ds. may be included the Wolf (*Canis lupus*), the Fox (*genus Vulpes*), and the Jackal (*Canis anthus*, *Canis aureus*, etc.), which are considered in special articles. Other wild Ds. may be divided into four groups, African, Amer., Asiatic, and Australian.

(1) *African wild dogs.*—Two types of wild D. occur in S. Africa. The Hyæna D. (*Canis or Lycaon pictus*), or Cape Hunting D., is about the size of a wolf, and varies in colour, generally having large, irregular patches of black, yellow, and white. It is found in the region of the Cape and through the eastern belt of Africa as far as Kordofan. It runs in packs, and is semi-nocturnal, semi-diurnal. It is very swift-footed, and has three different and most curious cries. The Long-eared Cape D. or Fox (*Otocyon*, or *Alagalotis lalandii*), stands about as high as a fox, and has a bushy tail about 2 ft. long. Its ears are very large and quite out of proportion to its head; they are held very erect. It has six more teeth than has the average D.

(2) *American wild dogs* include the Canasassi, or Crab-eating D. (*Canis cancrivorus*) found in a region of S. America, extending from Orinoco to La Plata; the Bush D. (*Ichthyon Venaticus*), found in Brazil and British Guiana; it is short-limbed, and varies in colour from red round the head and shoulders to black in its hind-quarters; the *Canis Azarae* found in the region of the Andes; it is a solitary animal, which comes out at night to seek its prey, in colour, yellowish, or reddish-brown verging to black.

(3) *Asiatic wild dogs.*—The Pariah D. is

very common in the E. where it moves about in bands, acting as scavenger and feeding on offal. The Dhole, also called Kolsun, and Buansuh (*Canis dukhunensis*, *Canis Primoris*, *Canis rutilans*) is found in various parts of India. It is rather larger than the jackal, and has a full, rather long tail. It hunts in packs of about fifty, and is absolutely fearless in attack. Its habits are nocturnal, and it has a very keen scent. A similar kind of D. (*Canis Alpinus*) is found in the Himalayas and in parts of Tibet and Siberia. In general, the Dhole is untamable, though it has sometimes been employed for coursing and pig-sticking. The Raccoon D. (*Canis procyonoides*) occurs in N. China and Japan. It is so called (first by St. G. Mivart), because of its resemblance to the raccoon. It has a pointed muzzle, a short and bushy tail, and short, round ears. Its body is arched and its legs stumpy. Its coat becomes thicker and longer in winter, and in colour is yellowish and brown.

(4) *Australian wild dog*, or *Dingo* (*Canis dingo q.v.*), is the only higher mammal found in that country.

Wild Ds. can be and often have been tamed. In their natural state they hold ears and tail erect and do not bark. When tamed, they will fawn, crouch, wag their tails, and lavish affection upon the master in the manner of an ordinary domesticated D.

Inseases of dogs.—*Distemper* is an infectious catarrh of the mucous membranes in the eyes and nose. It generally occurs in Ds. between the ages of one and two years, but may attack a D. at any age. The first signs are feverishness, loss of appetite and depression. Complications may ensue and the skin is sometimes attacked. Nourishing food, such as gruel, milk, beef-tea, eggs, minced meat, etc., and careful nursing in a warm room are essential. The eyes should be frequently bathed in a solution of boracic acid, creolin and water. *Rabies* (hydrophobia) is contagious and may be transmitted by means of a bite. The disease has often been prevented from spreading by muzzling every D. within a certain area, and is fortunately unknown in the United Kingdom. The symptoms, however, are set forth on the reverse of every licence form issued. *Mange* may be common (or sarcoptic), or follicular. The former is very contagious, and is caused by a parasite which spreads generally, the D. giving off an offensive odour. It is treated with sulphur ointment to the bare patches the remainder of the coat being dusted with flowers of sulphur. Follicular mange does not spread so rapidly, the parasite burrowing under the skin. The D. is irritable and restless but does not scratch. It is treated by washing with sulphur soap, but in severe cases it may be necessary to shave the animal to expedite the cure. *Eczema*, also known as surfeit, or blotch, is a non-contagious skin eruption usually caused by irregular and unwise over-feeding, unclean conditions, or lack of exercise. The best treatment is to change the diet to a rational one, to keep

the D. very clean and give it plenty of fresh air and exercise. Medicine must frequently be given internally, and the affected parts should be dressed. In all cases of serious canine illnesses a veterinary surgeon should be consulted.

Law as to dogs.—In the United Kingdom no person may keep a D., over six months old, without a licence. The licence is obtainable at any post office, costing 7s. 6d., and must be renewed annually. Ds. used solely for tending sheep and cattle, and for leading the blind, may be kept without a licence, certificates of exemption being obtainable from the commissioners of Inland Revenue. Any one found keeping a dog, not under these heads of exemption, without a licence, is liable to a penalty of £5. If a D. bites or attacks a person, on its second offence the owner is liable to an action for damages. The court may decide that such a D. should be killed. Dog-stealing, setting traps for Ds., injuring or killing Ds., etc., are offences punishable under criminal law statutes. Stray Ds., if not taken into homes for the purpose, may be adopted or sold, or killed by members of the police force. The accidental killing of a dog on the roads must be reported to the police. Consult F. Lupton, *The Law Relating to Dogs*, 1888.

Glossary of technical terms.—*Apple Head*, a head rounded on top; *blaze*, a white mark or streak on the head; *blue*, applied to shades of grey; *brisket*, the front of the chest; *brush*, the tail—usually applied to collies or sheep-Ds.; *butterfly nose*, a spotted nose; *button ear*, where the tips of the ears fall over, covering the orifice; *cat foot*, a rounded, high-knuckled foot; *chops*, the pendulous underlip of a bull-D.; *cloudy*, stoutly built; *cobby*, compactly built; *couplings*, the part of the body between the shoulder blades and the hip joints; *cow hocks*, hocks that turn in; *dew claw*, extra claw; *develap*, loose hanging skin under the throat; *dish-faced*, when the nose is turned up and higher than the muzzle at the stop; *dudley nose*, a yellowish nose; *feather*, the hair on the legs and tail; *flag*, the tail, usually of a setter; *flews*, the hanging lips of a bloodhound and of some other breeds; *forearm*, the part of the foreleg that extends from the elbow to pastern; *frill*, long hair on the chest; *hare foot*, a long narrow foot, carried forward; *haw*, the red inside eyelid, showing in St. Bernards and bloodhounds; *hucklebones*, the tops of the hip joints; *leather*, the skin of the ear; *occiput*, the bony lump at the back of the head; *overshot*, the upper teeth projecting beyond the lower; *pastern*, the part of the leg below the knee; *pig eye*, small, sunken eye; *pig jaw*, an exaggeration of overshot; *pily*, applied to a soft, woolly coat; *roach back*, an arched back; *rose ear*, where the tips turn back, showing the interior of the ear; *septum*, the division between the nostrils; *snipy*, with a too pointed muzzle; *stiles*, the top joints of the hind legs; *stop*, the indentation below the eyes; *tupit ear*, an erect ear; *undershot*, the lower teeth projecting beyond the upper.

Dog shows and clubs.—The first club in England was formed by Lord Orford in 1776, at Marham Smeeth, near Swaffham. Though coursing meetings have been held since the time of Charles I., the first actual show took place in 1859 at Newcastle-on-Tyne, under the patronage of Mr. Pape and Mr. Shorthose. Sixty Ds. were exhibited, and the show was so popular that others were held in the same year at Birmingham and Edinburgh. Now that D.-breeding has become a lucrative business as many as 500 shows have been held in the United Kingdom in one year. The Kennel Club was founded in 1873 by S. E. Shirley, who held the position of president till his death in 1901. This club has had an enormous influence in improving the condition of various breeds, and in promoting the welfare of Ds. in general. It has been instrumental in putting a stop to cropping of ears (1889), to mutilating the membrane of the mouth, and in some cases to docking the tail. It controls the different shows, and practically rules the canine world. It defines the recognised breeds, and maintains a Breed register. Its own show was held in October at the Crystal Palace until that place was burned down in 1936, while another famous Dog Show—Crufts's—is held annually at the Agricultural Hall, London. Other well-known clubs are the Ladies' Kennel Association, and the Westminster Kennel Club. Most breeds of Ds. have their own particular club, such as the London Bulldog Society, the Dandie Dimont Terrier Club, the Gamekeepers' Association of the United Kingdom, the Pomeranian Club, etc. The chief foreign and colonial clubs are La Société Centrale (Paris), The Italian Kennel Club, The American Kennel Club, and the South African Kennel Club. A D. is valued by its points, so many marks being assigned to each. For example, a bloodhound is valued thus: Head, 20; ears and eyes, 15; legs and feet, 15; back and ribs, 10; chest and shoulders, 10; colour and coat, 7½; symmetry, 7½; flews, 5; neck, 5; stern, 5; tail, 100. Ds. vary considerably in price, as much as £1500 having been paid for a collie, and 1000 guineas for a bulldog. A fox terrier has more than once fetched 500 guineas, and a pointer 200. Ladies' toy Ds. may be of great value, and have been sold for their weight in gold.

Books on dogs.—GENERAL AND HISTORICAL: J. J. King, *Sketches and Studies, Descriptive and Historical*, 1874; R. B. Lee, *Modern Dogs*, 1897; H. Compton, *The Twentieth Century Dog*, 1904; A. J. Dawson, *Everybody's Dog Book*, 1922; W. H. Miller, *The American Hunting Dog*, 1926; E. F. English, *The Dog Owner's Guide*, 1933, 1938; C. G. Trew, *The Story of the Dog and his Uses to Mankind*, 1910; C. L. B. Hubbard, *The Observer's Book of Dogs*, 1945; and *Working Dogs of the World*, 1947; B. Vesey Fitzgerald (ed.), *The Book of the Dog*, 1948. BREEDING: F. Mayhew, A. J. Sewell, and F. W. Cousins, *Dogs and their Management*, 1910, 1934; R. Leighton, *The Complete Book of the Dog*, 1922, 1927; O. E. M.

Hollyer, *Dog-Keeping and Breeding*, 1926. SICKNESS: J. W. Hill, *Management and Diseases of the Dog*, 1900; L. Sewell, *Canine Distemper*, 1925; O. E. M. Hollyer, *Dog Ailments*, 1927; A. J. Sewell, *The Dog's Medicine Dictionary*, 1932; M. H. Clark, *First Aid to Dogs and Cats*, 1941.

Journals: Weekly, *The Field*, 1853; *Our Dogs*, 1895; and *The Dog World*, 1919. Monthly, *The Kennel Gazette*, 1880, and *Dogs*, 1916.

Dogbane, or *Apocynum*, the name of a genus of Apocynaceae which includes only three species. *A. cannabinum*, the Canadian hemp, and *A. androsamifolium*, or fly-trap, both grow in N. America, and are used in medicine.

Dog-days (*Dies Caniculares*), the hottest period of the year, generally reckoned now from July 3 to Aug. 11. Various dates, from July 3 to Aug. 15, were assigned for the first of the D. by the Gks. and Romans, and various periods of duration from twenty to fifty-four days. They were generally associated with the influence of Sirius, 'the dog-star,' and according to Pliny, began with its heliacal rising on July 19 (New Style). They were regarded by the ancients as the hottest and most unhealthy period of the year, and as being the direct cause of madness among dogs.

Doge (Lat. *dux*, leader), former title of the chief magistrate of Venice and Genoa; the first Venetian D., Paolo Lucio Anafesto, being elected A.D. 697 to replace the former seven tribunes. At first their powers were largely undefined; their attempts to make the office hereditary were checked (1032) by a declaration that the election of a D. Consort (son with father) was illegal. The privy councillors (*consiglieri ducali*) were appointed instead. In 1172 the Great Council of 470 members was formed as a check on the Ds. Sebastian Ziani, the first D. chosen from the candidates of this council, introduced the custom of wedding the Adriatic with a ring thrown from the ship *Bucentaur*. The office disappeared on the fall of the Venetian republic (1797). The Ds. of Genoa dated only from 1339. In 1528 restrictions were made on their power; in 1797, on Fr. occupation of Genoa, the office disappeared, and after a short restoration vanished for good in 1804. In Amalfi Ds. existed from 897-1350. The Ds. palace (Palazzo Ducale) at Venice is a Gothic building of the fourteenth and fifteenth centuries, and was a residence of the councillors and Ds. See P. Molmenti, *La dogaressa di Venezia*, 1884. (See illustration, p. 718.)

Dog-fish, name given to any member of the Scyllidae, a family of Elasmobranchs in the division Selachii. The species are marine, living in warm seas, and many fossil forms are found in the Jurassic and Cretaceous. There are two small spineless dorsal fins, a distinct spiracle, no nictitating membrane; the mouth is inferior, and the teeth are small. The females are oviparous and the egg cases are four-sided and large; in habit the fishes are predaceous. *Scyllium canicula* and

Sc. catulus, the small-spotted and large-spotted dog, are Brit. species of small size; *Stegostoma tigrinum*, the tiger-shark, attains a length of 15 ft. in the Indian Ocean *Pseudotriakis microdon* is a large shark found off the coast of N. America.

Dogger (Dutch *dogger*, codfish boat), vessel something like ketch, with two masts, and of about 80 tons burden, used in the cod and herring fisheries in the N. Sea.

Dogger Bank, extensive sandbank in the N. Sea, 50 m. from the nearest point on the Eng. coast. The average depth of the water above it is from 10 to 20 fathoms, but in some places there is only a depth of 6 fathoms. It is about 170 m.

London, 1691. He was highly thought of, both for his acting and his personal character, and was associated with Cibber and others in the management of Drury Lane and the Haymarket. He is chiefly remembered, however, as the founder of the prize of 'D.'s Coat and Badge' in 1713, in honour of King George I.'s accession. The prize consisted of a red coat with a large silver badge on the arm, and was competed for by Thames watermen who had completed their apprenticeship within the twelve months prior to the race. The race took place on Aug. 1, and the course was from London Bridge to Chelsea. Money was left to continue the prize, and the race is still held annually

THE DOGE'S PALACE, VENICE

Canadian Pacific

long by 65 m. broad, and is a famous fishing ground, probably obtaining its name from the Dutch *dogger*, a codfish boat. In 1781 the S. end of the bank was the scene of an indecisive battle between the Eng. and Dutch fleets under Admirals Hyde Parker and Zoutman. In 1904, during the Russo-Japanese War, a Russian fleet fired on the trawlers on the D. B. The excuse given was that there were Japanese torpedo boats among the trawlers. After protest lodged, a commission was appointed, which ordered Russia to pay compensation to the families of the victims. In the First World War the Battle of Dogger Bank was fought on Jan. 24, 1915, between Brit. and Ger. fleets, the former under the command of Admiral Sir David (later Earl) Beatty and the latter under Admiral Hipper. As soon as Hipper saw Beatty's fleet he made for Heligoland and the battle developed into a chase. The Ger. warship *Blücher* was hit very early in the action and sank. The *Seydlitz* and *Derfflinger* were also badly hit. The result of the fight was to impose the greatest caution on the Ger. naval authorities. See also HELIGOLAND BIGHT.

Doggett, Thomas (d. 1721), Eng. actor, b. in Dublin, who made his first appearance in D'Urfey's *Love for Money* in

under modified conditions. A list of the winners has been kept since 1791.

Dog Licence, see under DOG.

Dogma (Gk. *dogma*, from *dokein*, to seem good or true), a term which has passed through many meanings, and is now chiefly used in theology. The D. of a Gk. assembly was merely its decree, or that which seemed right and proper. Originally an opinion stated as a positive assertion, the truth of which had already been proved, it came to be applied to a belief derived from authority, and especially to doctrines of the church, concerning which no questioning was allowed. From meaning the essential doctrines of Christianity as contained in the Scriptures or writings of the fathers, it came to be considered as equivalent to 'assertion without proof' in English. In its continental use (Ger. *Dogmen*) it means 'doctrine,' with no censure implied, the science of Ds. having a separate professorship in the Protestant univs. of Germany. See C. G. A. Har-nack, *History of Dogma* (trans.), 1895-96; R. Seeberg, *Lehrbuch der Dogmen-geschichte*, 1895-1920; J. Tixeront, *Histoire des dogmes*, 1912-14.

Dogmatic Theology, the systematic statement of Christian doctrine, considering each article of faith in connection with others with which it is in apparent

relation. It deals, that is to say, with the actual abstract deposit of faith, and not with its relation to, and effect on, the life of the believer. Neither does it deal with doctrine from the point of view of history and development. The term is now of general use, though it did not become so until the seventeenth century. Previous titles for the subject among Protestant divines are *Thetic Theology* and *Positive Theology*. The earliest period of Christian doctrinal statement, comprised almost entirely of apologetics, may be said to end with Origen, who sketched out the main plan of the science. In the seventh century, it was brought to the highest level it has attained among the Gks. by John Damascene, and in the Middle Ages it developed greatly in the West. Important names are those of Anselm, Duns Scotus, and Thomas Aquinas. The period immediately following the Reformation produced many volumes of Protestant D. T., but thereafter Protestants showed themselves averse from D. T. until recent times when interest in the subject has been revived by the writings of Bishop Gore, A. Schweitzer (q.v.) and Karl Barth (q.v.). See J. H. Newman, *An Essay on the Development of Christian Doctrine*, 1845; W. G. T. Shedd, *History of Christian Doctrine*, 1881; A. Leclerc (trans. by Leigh Hunt), *An Introduction to Reformed Dogmatic* (1870), 1948.

Dogs, Isle of, Poplar Marshes, or Mill-wall, is situated on the l. b. of the R. Thames, England, opposite Greenwich. It has been suggested that the name received its origin from the lodging there of the king's hounds. The district is occupied largely by the W. India Docks.

DOG'S MERCURY

Dog's Mercury (*Mercurialis perennis*), weed of the Spurge family, (Euphorbiaceae), with creeping root-stock and erect unbranched stem bearing male and female flowers on separate plants. Although poisonous it was formerly used in medicine.

Dog's-tail Grass, or *Cynosurus*, genus of Gramineae which is represented in Britain by two species. *C. cristatus*, the crested D. G. or goldseed, is valued as a pasture-grass on account of the fineness and closeness of its herbage.

Dogstar, see *SIRIUS*.

Dog's-tooth Violet, or *Erythronium dens canis*, a species of Liliaceae which grows in a mild climate, and in Britain is often used for borders. The bulb has a toothed appearance, and the flowers are violet-colored; hence the name of the plant.

Dogtooth Ornament, in architecture, a moulding much used in medieval building from Late Norman to Early Decorated, and cut in projecting teeth. It is thought that it was introduced from the E. by the Crusaders; it first appeared in Europe about 1100. In later architecture the 'dogtooth' frequently becomes a four-leaved flower with the centre projecting, e.g. in Elgin Cathedral.

Dog-watch, nautical term. The first D. is from 4 p.m. to 6 p.m., and the second from 6 p.m. to 8 p.m. See *WATCH*.

Dog-whelk, popular name of *Nassa reticulata*, a Brit. gastropod mollusc; it is also applied to the near species of *Purpura lapillus*, the dog-periwinkle.

Dogwood, common name for the deciduous shrubs of the genus *Cornaceae*. The common D. (*Cornus sanguinea*) is familiar in Britain and has dark-red branches, pointed oval leaves and small purple berries. Yield a hard useful wood. *C. succinea* is a Scotch species. Some species produce a red dye.

Doherty, Reginald Frank (1874-1910) and **Hugh Lawrence** (1876-1919), lawn-tennis champions, sons of Wm. D., were b. in London—R. F., Oct. 16, 1874; H. L., Oct. 8, 1876. For ten years, 1897-1906, they were, successively in singles, and jointly in doubles, supreme. They were defeated by Smith and Riseley at Wimbledon in 1906.

Dohrn, Felix Anton (1840-1908), Ger. zoologist, b. at Stettin. In 1870 he founded the great zoological station at Naples, which within ten years became one of the most noted schools and laboratories of natural science in the world, and was the model for many later ones. D.'s early studies were almost entirely concerned with insects, and his later with marine invertebrates. He produced many valuable natural science works, including *Ursprung der Wirbeltiere* (1875), *Studien zur Urgeschichte des Wirbeltierkörpers* (1882), and *Die Pantopoten des Gulfs von Neapel* (1881).

Doiran, Battle of. One of the surprises of the 1914-18 War was the Allied offensive on the Macedonian front in Sept. 1918. The new allied Commander-in-Chief, the Fr. General d'Esperey (q.v.) planned this attack immediately he assumed command. The Bulgarian army occupied strong positions on the heights to the west of Lake Doiran, from which they dominated their opponents. After a preparatory bombardment the Brit. forces attacked the 'P' Ridge on Sept. 18, whilst Gk. troops attacked Doiran Hill.

After severe fighting General Sir George Milne, commanding the Brit. and Gk. forces, gained Petite Couronne, Dolran tn., and the lower slopes of Grande Couronne. On Sept. 21, on the Vardar front the Franco-Serbian offensive had reached the line Gradista-Boshava-Drugoil and the heights of Porta dominating the Varda, thus turning the flank of the enemy on the Brit. front and cutting his communications. This forced the Bulgarians to retreat on the Dolran front. By Sept. 22 the Bulgarians were in full retreat in great disorder on a front of 100 m. This collapse of Bulgaria exposed Turkey to attack on its W. flank and compelled it to cease offensive operations. The remaining forces of the Central Powers were now exposed to attack from the East, a factor which contributed to their decision to conclude an armistice.

Doisig, tn. and com. of Rumania, about 22 m. S.E. of Dobreszen. Pop. 8000.

Doit, or **Duyt**, small Dutch copper coin, in value equal to half an Eng. farthing. It was also a small copper coin, equal to one Scots penny, or one twelfth of an Eng. penny, current in Scotland in the time of the Stuarts.

Dolabella, Publius Cornelius, Rom. general and the husband of Cicero's daughter, Tullia; b. about 70 B.C., and one of the most notorious profligates of his age. He took the side of Caesar in the civil wars, and fought for him at Pharsalia, and accompanied him to Africa and Spain. On Caesar's death (44 B.C.) he seized the consulship and allied himself with Brutus and the conspirators, until he changed sides again when Antony offered him a higher bribe, the province of Syria. On his way there he plundered various cities in Greece and Asia, and murdered C. Trebonius, the proconsul of Asia, who refused to allow him to enter Smyrna. Cassius was sent to supersede him, and besieged him in Laodicea. To avoid capture D. ordered one of his soldiers to kill him (43). *See Cicero's Letters.*

Dola Sequanorum, *see* **DOLÉ**.

Dolce, **Lodovico** (1508-68), It. author and scholar, b. at Venice of a noble family. The circumstances of his life are not known, but he lived at Venice for the greater part, and it is believed in a state of poverty. His work consisted chiefly of trans. from the classics and of plays based on the classics. Of his trans. the chief were Homer's *Odyssey*, *The Battle of the Frogs and Mice*, Virgil and Ovid, and a Sp. trans. of Ariosto. He wrote four tragedies from Euripides, two from Seneca, and comedies from Plautus; and he also ed. the works of Petrarch, Boccaccio, and Dante.

Dolci (**Dolce**), **Carlo**, or **Carlinio** (1616-86), Florentine painter chiefly of religious subjects, pupil of Jacopo Vignali. He painted also portraits of the Imperial family at the Emperor's court. Among his best works are: 'Christ on Mount Olivet'; 'Holy Family'; 'Madonna and Child' (Pitti Gallery, Florence); 'St. John the Evangelist' (Berlin Gallery); 'Poetry', and 'St. Apollonia' (Corsini Palace, Rome); 'St. Cecilia', and 'The

Daughter of Herodias' (Dresden); 'St. Andrew' (Pitti Palace); 'Ecce Homo' (Munich); 'Adoration of the Magi' (Glasgow); 'La Madonna collo Stello'; 'Penitent Magdalen' (Munich); 'St. Veronica' (Dulwich); his own portrait (1674, Uffizi, Florence); portrait of Cardinal Ghisi (Alexander VII.). *See* life by C. Hay, 1908.

Dolcigno, *see* **DULCIGNO**.

Dol-de-Bretagne, Fr. tn. in dept. of Ile-et-Vilaine, 14 m. from St. Malo. The level, fertile dist., Marais de Dol, is protected from the sea's inundations by a dyke, 22 m. long, built in the twelfth century. D. has a fine thirteenth century cathedral of granite, with good glass, sculptures, and two fine porches. In 1793 the Vendéens defeated the republicans here. Pop. 4400.

Doldrums, regions of almost permanent calm situated in equatorial seas. They follow the sun's annual changes of declination but to a smaller degree, being never more than 5° N. or S. of their mean positions. *see* **WIND**.

Dole. A colloquial rather than official term which came into general use in Great Britain during the years that followed the end of the First World War. It denoted the out-of-work donation from 1919 paid to ex-service workers. This allowance varied from 20s. to 29s. for men and from 15s. to 25s. for women. In 1920, the difficulty and cost of having two separate systems of allowances for unemployment in operation side by side led to a new Act, which repealed all previous legislation and placed all unemployed persons on the same level. *See further under* **NATIONAL INSURANCE**.

Dole, Fr. tn., cap. of arron. in the dept. of Jura, on R. Doubs, 30 m. from Dijon. Anciently Dola Sequanorum, it faces the heights of the forest of Chaux, on a vine-clad slope. The Gothic church Notre-Dame belongs to the sixteenth century, and contains a beautiful chapel. In the seventeenth century was built the façade of the Jesuit church, now a chapel of the public college, and the Hôtel-Dieu with its watch-towers. There are iron and copper foundries; and the dist. has given its name to a semi-heavy red wine produced in D. and elsewhere. D. belonged to the Duchy of Burgundy until 1479, when Louis XI.'s army took it and burned it. Later through the marriage of Marie of Burgundy to the Archduke Maximilian it became an Austrian possession, but after being taken by Louis XIV. in 1668 and 1674, it was ceded to France in 1678 by the Treaty of Nimeguen. The winding streets are still lined with old houses built in the style of the Span. renaissance. It was the bp. of Pasteur. Pop. 18,200.

Dolerite, coarse-grained basaltic rock used for road mending and kerbstones. It consists of augite and plagioclase feldspar with the addition of olivine in some varieties, and of quartz in others. Variable quantities of hornblende, apatite, and biotite are often present.

Dolet, **Etienne** (1509-46), Fr. scholar of the Renaissance, b. at Orleans. He set up a printing-press in 1542, and was on

several occasions arrested for publishing heretical works. In 1544 he was imprisoned on a charge of heresy and was burned in the Place Maubert, 1546. See lives by Christle, 1880; Galtier, 1908; and Chassaingne, 1931.

Dolgelly, urban dist. of N. Wales, and the cap. of Merionethshire. It is situated at the base of Cader Idris, on the Aran and Wnion, 230 m. from London. In the neighbourhood is the Parliament House, in which it is said Owen Glendower held a parliament in 1404. *Dolgelly beds* are a series of rocks of the Upper Cambrian system well exposed near D. and Blaenau Ffestiniog and consisting of slates and shales containing characteristic trilobites. Pop. 2200.

Dolgorouki, Catherine Michailowna, Princess, the favourite of Alexander II., Emperor of Russia, to whom she was married (1880), after the death of his first wife Marie. She had been maid of honour to the empress from 1867-73. After her husband's death she went abroad, and at Geneva, in 1882 pub. *Alexandre II.; Détails inédits sur sa Vie intime et sa Mort*, under the name of 'Victor Laferté.'

Dolichocephalic, see under ANTHROPOLOGY.

Dolina, tn. in the Ukraine, formerly in Poland, possessing salt springs. Pop. 8000.

Doll, figure in the shape of a human being, used as a child's toy. Various derivations have been suggested of which 'idol' is the most probable. Others are *Norse daut*, woman, and the name 'Dorothy.' Ds. date from very ant. times, and were common in Egypt, Greece, and Rome. Early primitive people delighted in rude images carved out of wood or bone. To the negro a D. has a magical significance, and may be regarded variously as a mascot, a votive offering, or an idol. Wooden Ds. were introduced into England from the Netherlands, and were called 'Flanders babies,' or simply 'children's babies.' Since then the manu. of Ds. has greatly advanced, and the stiff wooden D. has been superseded by the stuffed sawdust D., with composition or wax head. Its features became more and more realistic. Hair was substituted for painted ringlets, joints were made; wire mechanism was introduced so that the D. could be made to close its eyes and utter sounds. See Lesley Gordon, *A Pageant of Dolls*, 1918.

Dollar, tn. in Clackmannanshire, Scotland, 6 m. N.E. of Alloa. It has an academy, founded in 1818, and endowed by Captain John McNab (1732-1802). It has a bleaching industry. An object of interest is the ruin of Castle Campbell. Pop. 1500.

Dollar (derived from the Ger. *thaler*), applied especially to the unit of the monetary system of the U.S.A. and Canada. Brought into common use in America about 1794. Since the Act of 1837, the silver coin has contained 371.25 grains of silver, 41.25 of alloy, total weight being 412.5 grains. Before this time the weight was 416 grains. Under the Act of 1873 trade Ds. of 420 grains (378 grains silver, 42 alloy) were coined

for the purpose of export to China and other Asiatic regions, not legal tender at home. There are paper as well as silver Ds. The D. mark \$ is written before the number, a sign whose derivation is much disputed. A D. contains 100 cents (approximately 5s.). Silver half and quarter Ds., and dimes (10 cents), are also issued; nickel half-dimes and copper cents. A gold coin of similar value (25.8 grains in weight; 23.22 grains of gold, 2.58 of alloy) was used from 1849-90. Though declared the standard of value in the U.S.A. in 1900, no fresh coins have been issued. The Brit. double florin (first struck 1887, now obsolete) about equalled a D. By 1600 the word was common in England for the Ger. thaler, a silver coin of varying value, current from the sixteenth century, and was especially used later for that worth, 3 marks (2s. 11d.). Sometimes used roughly as a slang term for crown (5s.). The par value of the currencies of member nations of the International Monetary Fund have been announced, since 1946, in terms of gold as a common denominator or in terms of the U.S. D. of the weight and fineness in effect on July 1, 1944.

Dollar Diplomacy, in Amer. politics a term specially associated with the Taft administration 1908-13. It means a systematic effort by the State Department to help Amer. capital to flow into areas abroad which it would not otherwise enter. Taft and his secretary of state, Philander C. Knox, pursued the D. D. most actively in the Far E., their chief motive being to promote trade and safe capital investment, their minor motive being to strengthen Chinese political integrity. In Theodore Roosevelt's administration, the Amer. consul-general at Mukden, apprehensive of Jap. penetration, came to the conclusion that if America put more money into the Far E. she could the more easily maintain the policy of the Open Door. The economic motive was also dominant in the application of D. D. to Central America, though a political purpose, the safeguarding of the Panama canal route, was also served. Knox thought that if Amer. capital flowed into Nicaragua and Honduras through Amer. bankers, traders, and railroad builders that would offset any possibility of European interference on the plea of economic depression and financial instability. When Woodrow Wilson became president (1913) he explicitly repudiated 'D. D.'. He himself, however, maintained it both in China and Nicaragua, co-operating with the bankers; but it has been generally condemned from his time and since the 1914-18 War is no more than a memory. Consult A. Nevins, *America in World Affairs*, 1942.

Dollfuss, Engelbert (1892-1934), Austrian chancellor, see under AUSTRIA—History.

Döllinger, Johann Joseph Ignaz von (1799-1890), eminent Ger. Catholic theologian, at Bamberg in Bavaria. He was educated at the gymnasium and univ. at Würzburg, and in 1822 was ordained priest. After lecturing for three years in

the Lyceum at Aschaffenburg (1823-26), D. was appointed to the chair of ecclcs. hist. and law at Munich. It has generally been assumed that during the early part of his career he was an ardent champion of Ultramontaniam in Germany, though even as a young man his views were by no means narrow. He was a friend of the leaders of the Oxford Tractarian movement—Pusey, Hope Scott, Manning, and others—and wrote vehemently against Protestantism in *Die Reformation* (1846), and *Luther* (1851). His visit to Rome (1857) worked a great alteration in his opinions. In 1861 he delivered certain lectures at Munich in which he declared his belief that the progress of the Rom. Catholic Church did not depend on the temporal sovereignty of the pope. He answered his assailants in *Kirche und Kirchen* (1861), and *Die Papstfabeln des Mittelalters* (1863). In 1864 Pius IX. issued his *Syllabus* condemning certain current philosophic systems, which was replied to anonymously by the pub. of *Janus*, written by D. in collaboration with Huber and Friedrich. When in 1870 the Vatican Council defined the doctrine of papal infallibility, D. headed a protest, and in 1871 addressed his famous letter to the archbishop of Munich, in which he refused to accept the doctrine. He was excommunicated, but several of the leading univ. of Europe expressed themselves in his favour by conferring on him honorary degrees. During the latter years of his life he endeavoured to bring about a union of the Christian churches which do not belong to the Rom. Communion. He was elected a president of the Munich Academy in 1873. His later pub. include *Quellenverk zur Geschichte des Konzils von Trient* (1876), and *Studies in European History* (Eng. trans.) (1890). See Lord Acton, *Döllinger's Historical Work* (in *Eng. Historical Review*, vol. v.), 1890; and life by J. Friedrich, 1899-1901.

Dollman, John Charles (1851-1934), Eng. painter. His most famous pictures are 'The Hunter' (1911), and a much earlier one, 'Les Misérables' (1886) which is now in the London Museum. His 'A Very Gallant Gentleman' (1914), a memorial to Captain Oates who perished with Scott in the Antarctic is in the Cavalry Club. D. had pictures in the Royal Academy almost without a break for sixty years.

Dollond, John (1706-61), distinguished London optician, by trade a silk weaver. He studied mathematics, astronomy, and optics, and was also a good linguist. In 1752 he became a practical optician in partnership with his son, Peter, founding the well-known firm of Dollond & Co., Ltd., in St. Paul's Churchyard. In 1758 his treatise on the dispersion of light, pub. in *Philosophical Transactions*, won him the Copley medal from the Royal Society. Its result was his invention of the achromatic telescope.

Dolman (Turkish *dolaman*), originally a long, loose garment with narrow sleeves. It was worn usually by the Turks, and was the name of the uniform jacket worn by Hussars.

Dolmen (Celtic *daul*, table; *maen*, stone), a modern archaeological term applied to the megalithic framework of prehistoric sepulchral structures, which were formerly called cromlechs. On the Continent of Europe the term is used to describe the whole structure with the cairn or covering mound. There are numerous Ds. in France, the Grotte aux Fées at Metzray, near Tours, and La Pierre Turquoise in Seine-et-Oise being very fine specimens. In England the word is usually applied

W. F. Mansell

DOLMEN DE MANÉ KERIONEC, BRITTANY

only to the stone props with accompanying stone roofs, such as Kils Coity House, near Aylesford in Kent. There are over 700 Ds. in Ireland. See Borlase's *Dolmens of Ireland*, 1897.

Dolmetsch, Arnold (1858-1940), Fr. expert on old musical instruments and their music; born at Le Mans. Studied violin under Vieuxtemps in Brussels and at the Royal College of Music, London. Then became a teacher at Dulwich College. Collected and repaired old instruments and learned to play them. At Chickering factory, Boston, U.S.A., 1902-09, and later had a dept. in Gaveau factory, Paris, 1911-14, where he made clavichords and harpsichords; returned to London, 1914, and equipped a workshop at Haslemere, Surrey, where he arranged periodical festivals of old music. He made and revived the playing of most instruments of the fifteenth to the eighteenth centuries. Supporting these activities was a 'Dolmetsch Foundation' instituted on the suggestion of the poet-laureate, Bridges. Awarded a Civil List pension in 1937. Pub.: *Select English Songs and Dialogues of Sixteenth and Seventeenth Centuries*, 1912; *The Interpretation of the Music of the Seventeenth and Eighteenth Centuries*, 1915.

Dolo, tn. in the prov. of Venice, from which it is 12 m. distant, in Italy. Pop. 8700.

Dolomieu, Déodat Guy Sylvain-Tancrède Gratre de (1750-1801), a famous Fr. geologist and mineralogist of Dolomieu,

Isère, France. Early a member of the Order of Malta, he killed a knight of his gallej in a duel (1768), but the death-sentence was revoked by the grand master, and nine months' imprisonment substituted. D. soon left the army to study science, visiting Etna, Vesuvius, the Apennines, Lipari Is. and Calabria. In 1783 he pub. *Voyage aux îles de Lipari*; in 1784, studies on earthquakes; and in 1785 appeared memoirs on basalt, the mineral 'dolomite' (named after him, 1791). He became prof. of geology at the School of Mines, 1796, and Daubenton's successor at the Natural History Museum, 1800. In 1798 on the scientific staff which accompanied Bonaparte's expedition to Egypt. Returning for his health, 1799, he was imprisoned at Taranto, and only released after the battle of Marengo, 1801. Other works are: *Mémoires sur les îles Ponces*... (1788), *Dernier voyage dans les Alpes* (1802), *Philosophie Minéralogique*, (1802, partly written in prison).

Dolomite, common mineral crystallising in rhombohedra and consisting of carbonates of calcium and magnesium. It has a hardness of 3½ to 4, and a specific gravity of 2·8, and is therefore harder and heavier than calcite. The crystals are usually white in colour, and have curved faces, some varieties being almost spherical. The term D. is also applied to rocks containing that mineral. Such rocks are common to every geological formation both in the Old World and in the New. They seldom contain fossils and are often found in the neighbourhood of rock salt and gypsum. Many of the D. rocks of Britain are esteemed as building stone. The Houses of Parliament were built with D. from Bosover, in Derbyshire; other localities are Nottinghamshire (Mansfield stone) and Durham. Ds. are common in the Alps and a district in the S. Tyrolean Alps, much favoured by tourists, is known by that name.

Dolomites, The, mountainous dist. in the S. Tyrolean Alps. It is chiefly composed of magnesian limestone, where the peaks rise in most fantastic forms and shapes, and are streaked by veins of wonderful vivid colourings. The D. region lies between the Brenner railway from Franzensgaste to Trent, and the road over the Monte Croce Pass from Innichen in the Drave Valley by way of the Sexten valley, and the Piave valley to Belluno and Feltre. The highest peak is the Marmolata, 10,972 ft., but other much more typical peaks are the Sorapiss, the Cimon della Pala, the Langkogel, the Pelmo, Drei Zinnen, and Rosengarten.

Dolon-Nor, or **Lama-Miao**, tn. of Jehol, Manchuria. It is situated 165 m. N. of Peiping, and is noted for the manuf. of brass and iron idols, vases, bells, etc. It is a centre of trade for E. Mongolia. There are numerous ruins and Buddhist temples in the neighbourhood. Pop. 30,000.

Dolores, tn. of Buenos Aires in the Argentine Republic. It is 127 m. from the city of Buenos Aires by rail. Pop. 14,600. (2) A tn. in Uruguay, S. America. Pop. 8000.

Dolphin, popular name given to many

cetaceans, but applied particularly to members of the genus *Delphinus*, which belongs to the family Delphinidae. There are four known species of these mammals, all of which have a long and distinct beak, numerous teeth—forty to sixty in number—and sickle-shaped fins; in length they are not usually more than 10 ft.; in habit they are gregarious, and the diet consists chiefly of herrings. *D. delphis*, the common D., is found in the Mediterranean and N. Atlantic; *D. tursio* is sometimes found off Brit. coasts. Other members of the same family, but of different genera, are called Ds., and two well-known species are *Sotalis sinensis*, the Chinese white D., and *Graminus griscus*, Risso's D. In ancient times the D. was sacred to Apollo, and has since been used as a symbol. The fishes known as Ds. are members of the family Coryphenidae (see CORYPHENEA).

Dolphin, The, see DELPHINUS.

Dom, 14,912 ft., the highest mt. entirely in Swiss ter. It rises between the valleys of Saas and Zermatt. First ascent by the Rev. J. L. Davies in 1858.

Domagk, Gerhard, Ger. chemist, b. 1895 at Lagow, Brandenburg, attached to the Bayer Company at Elberfeld. Discoverer of Prontosil, and other new drugs of medical value. His results are due to an extension of the method developed by Ehrlich (q.v.), but he tried the effects of a series of dyes on bacteria in the body, irrespective of their effects on bacteria outside the body. He pub. the discovery of Prontosil in 1935—a wonderfully effective remedy against streptococcal infections, such as puerperal fever and gonorrhoea. Awarded Nobel prize for medicine in 1939.

Domat, or **Daumat**, Jean (1625-96), Fr. jurist, was the author of *Lois civiles dans leur ordre naturel* (1639), and *Le droit publique* (1697). This work, which earned for D. a pension of £2000 from Louis XIV., is still regarded as a valuable and authoritative treatise on the science of law, all law being considered a development from principles of ethics. When Pascal died D. took care of his private manuscripts.

Domazlice, or **Taus**, manuf. tn. of Bohemia, Czechoslovakia. Pop. 7700.

Dombasle, small tn. of France, in the dept. of Meurthe-et-Moselle, situated about 10 m. S.E. of Nancy. It has the most important works in France for the manuf. of soda and its chemical products. Pop. 8000.

Dombes, name of a former dist. of France, which now forms a part of the dept. of Ain. Numerous small lakes are found, which rest on a substratum of clay that was artificially made in the ninth and tenth centuries. Owing to the unhealthiness of the district, two-thirds of the marshes have been reclaimed.

Dombrowski, Jan Henryk (1755-1818), Polish general, b. at Pierszowice in the prov. of Cracow, from 1792 to 1794 took part in the Polish campaigns against Russia and Prussia, gaining distinction during the siege of Warsaw under Kosciuszko. In the 18. campaign he was conspicuous for his bravery at the Trebbia (1799). With the div. of Foles he had

organised for Napoleon in 1806, he commanded in the Polish campaign of 1809, and during the fatal march on Moscow in 1812 was wounded whilst crossing the Beresina. For his reorganisation of the Polish forces he was appointed cavalry-general in the new kingdom of Poland (1815).

Dome (It. *duomo*), applied since the Renaissance strictly to the outer part of a circular or polygonal roof (of which the 'cupola' is the inner part), rising above the rest of the building. It was known to the Assyrians and Persians, and used to a certain extent among some Gk. tribes. It formed a very favourite feature of Renaissance church architecture. Each vertical section forms a semicircular or pointed arch. The Romans really developed the D.

Correggio and Parmigiano, later joining him at Rome. Cardinal Agucchi was his first patron, and employed him in his palace. D. helped Annibale Carracci at the Farnese, and painted 'The Death of Adonis' from his own designs. He painted frescoes for Cardinals Borghese, Farnese, and Aldobrandini. He should be judged chiefly by his frescoes, and is undoubtedly one of the finest of all It. painters. Some of the best are the series at the Basilican Abbey of Grottaferrata. His famous oil painting, 'The Last Communion of St. Jerome,' was judged by Poussin next best in Rome to Raphael's 'The Transfiguration.' In 1617 he returned to Bologna disgusted by the jealousy of rivals, but was in Rome again in

AN EXCERPT FROM THE DOMESDAY BOOK

as an architectural ornament, though it is often spoken of as a product of the East, owing to its frequent use in mosques. In Italy 'dome' often had the wider meaning of cathedral or chief church (*domus*, or house of God). Cf. Ger. *dom* or *domkirche*, cathedral. Ds. are much used in the Mohammedan architecture of Turkey and India, notable examples being Santa Sofia, Constantinople (A.D. 538), supported on four arches by means of 'pendentives'; Taj Mahal, Agra. The most noted in modern Rome are the Pantheon (probably of Trajan's time, A.D. 98-117); St. Peter's (139 ft in diameter, 330 ft. high). St. Mark's, Venice, has five Ds. The Invalides and Panthéon of Paris are famous, also the Capitol at Washington, America. In London St. Paul's Cathedral (the dome of which has a diameter of 112 ft.), and the Albert Hall are the best examples. The Rotunda of the Musta Church, in Malta, which has a diameter of 118 ft., is the largest D. in the British Empire.

Dome of the Rock, see OMAR, MOSQUE OF.

Domenichino, **Domenico Zampieri** (1581-1641), It. painter of the Bolognese school, pupil of Calvert and the Carracci. A friend of Albani, he visited with him Parma, Modena, and Reggio, to study

1621. In 1630 he went to Naples to decorate the Capella del Tesoro. His fame roused much envy among the estab. painters there, and it was suspected that he was poisoned. Among his works are: 'The Flagellation of St. Andrew' (1608), frescoes of the lives of St. Nilus and St. Bartholomew (1609-10), frescoes of St. Cecilia (S. Luigi de' Francesi, Rome), 'The Four Evangelists' (S. Andrea della Valle), 'Diana and her Nymphs', 'The Sybil of Cumæ' (Borghese Palace), 'The Repose of Venus', 'Diana and Actæon' (Pitti, Florence), 'The Angel and Tobias', 'St. George and the Dragon' (landscapes, National Gallery, London), 'Moses and the Burning Bush', 'Combat of Hercules and Achelous', 'The triumph of Love' (Louvre), 'St. John in a Vision', 'Time Trampling on Youth'. His portrait of Cardinal Colonna was highly praised. See C. P. Landon, *Vie et Œuvres des Peintres les plus Célèbres*, 1803-24; and life by L. Serra, 1921.

Domesday Book, or **Doomsday Book**, a valuation survey of England made by William the Conqueror. The survey was begun in 1085 and completed in 1087. The book records the owners of the land, the nature of its cultivation, the number of its inhabs., and their respective classes—freemen, villeins, and serfs. The com-

pillan of the book was a marvellous enterprise, admirably planned and of inestimable value both in times of peace and of war. It made possible taxation on a sound basis, besides being a census roll and a record of estate valuations. To the historian the book is priceless. The survey was called the D. B. because in the eyes of the people it was like the great reckoning of doomsday. The original MS. in two vols. is preserved in the Public Record Office, London. See H. Ellis, *A General Introduction to the Domesday Book*, 1833; J. H. Round, *Domesday Studies*, 1888; F. W. Maitland, *Domesday Book and Beyond*, 1897, 1907.

Domestication of Animals, process by which man has changed certain species of animals to suit his own needs. This change can only be rendered effective if carried on for successive generations, as the term domestication implies permanent changes in certain characteristics, and also in the structure in many cases, these changes being brought about by alteration of their environment and a system of breeding. This includes also the protection and provision of food for some animals and the special control exercised over them which prevents their leading an absolutely wild life. It is necessary in the case of the animals that they should be able and willing to adapt themselves to this control, and that they should be fertile though under control or living under different conditions. The process by which domestication is produced consists principally in selecting certain species which possess the most desirable qualities and in causing them to breed only with other desirable species, at the same time, in all probability, altering their food and surroundings. This leads to changes in their outward form, in some cases not very noticeable, in others very marked, as the difference in feathers, hair, colouring, and, deeper-seated still, those of structure. Among domestic animals there may be mentioned a number of birds, as fowls, ducks, geese, and many others. Dogs, cats, and several other mammals are also domesticated. Certain kinds of insects and fishes, too, have certainly been altered by man, if they cannot lay claim to the title of domesticated animals. See C. Darwin, *The Variation of Animals and Plants under Domestication*, 1868; and N. S. Shaler, *Domesticated Animals, their Relation to Man and his Advancement in Civilisation*, 1896.

Domestic Economy (from Gk. *oikonomia*, management, which is made up of *oikos*, house, and *nomos*, to manage) is the only expression in which the original sense of house management survives. To-day it is used both of the thrifty control of the home from a financial point of view and more generally of the science which teaches household duties and control. This science has, in recent years, assumed a prominent place in the education schemes of girls' schools and, in some univs., for women students. D. E. treats of the study of food values and preparation of food, nutrition and physiology, personal hygiene, ventilation, sanitation,

laundering, needlework, home nursing, and the management of household expenditure and income. Degree and diploma courses are taken at London, Bristol, Reading, and Sheffield univs. Other D. E. institutions are the National Training Colleges of Domestic Subjects, Buckingham Palace Road, London; and similar centres in Aberdeen, Bath, Belfast, Bristol, Cardiff, Edinburgh, Glasgow, Gloucester, Leeds, Leicester, Manchester, and Newcastle-on-Tyne. See also HOUSECRAFT AND HOUSEWIFERY.

Domestic Servants are those employed to perform the so-called menial work of a household. The majority of them are women, though page boys, footmen, and butlers, etc., are indispensable in all large estates. A mistress may dismiss a maid at once for dishonesty, immorality, hopeless incapacity, or flagrant disobedience, and is not obliged to give a character if she judges the maid unworthy of one. Servants are usually paid by the quarter or the month, a month's notice being required on either side for the termination of a contract. They are entitled to a month's wages if summarily dismissed. D. S. are included in the Employers' Liability Act, and under the National Insurance (Industrial Injuries) Act, 1946 (replacing the Workmen's Compensation Act, 1925) (see WORKMEN'S COMPENSATION) can claim compensation for injuries arising during their employment, provided that gross negligence or other wilful misconduct on their part has not caused the injury. If the servant loses his life, his dependants are entitled to a sum equal to three years' earnings or £200, whichever sum is larger, but not exceeding in any case £300; if he leaves no dependants, a sum not exceeding £15 must be allowed by the employer for medical and funeral expenses. If the servant is totally or partially disabled, his master must pay him a sum not exceeding 30s. a week till death or recovery. Dismissal without just cause shown entitles the servant to normal and also to board wages until the expiration of the half year. All D. S. must insure against sickness under the National Insurance Acts, the conditions being the same for them as for other workers. Statistics show a decrease in the number of D. S. proportionate to the population. The census returns of 1921 showed that 371,682 men-servants were employed throughout Great Britain in that year, and 1,844,574 women, giving a total of 2,216,256. In the financial year 1936-37, the number of licences taken out for male servants was only 173,822. There are no up-to-date statistics of female D. S. but the total to-day is far below the total for 1921. A gov. scheme introduced by the Labour gov. in 1947, as the National Institute of Houseworkers, had for its primary object the raising of the prestige of domestic work by giving it the status of a skilled craft, and consequently attracting more workers. It estab. a diploma for skilled domestic workers, who qualify at the end of a six months' training course and to other domestic workers able to satisfy an examining board. The Institute cannot enforce standards of

conditions and wages, but prescribes rates of wages and conditions to which employers of holders of diplomas are expected to conform. 'Resident workers' of the Institute have a working week of 48 hours and 'non-resident workers' one of 44 hours, spend over a seven-day week. Employees are entitled to one full day and one half day off each week but there may be mutual agreement for three half days instead. Workers have a fortnight's holiday with pay each year for the first five years after obtaining the diploma and of three weeks a year afterwards.

Domett, Sir William (1754-1823), Eng. admiral, b. in Devonshire. He was present in the light off Ushant (1778), in the *Chesapeake* under Arbuthnot (1781), and in the battle of the Saints (1782). In Howe's battle (1794) he commanded the flagship *Royal George*, and in 1795 he was present in the action off L'Orient. Four years later he fought in Basque road, and at Copenhagen he served as flag-captain under Sir Hyde Parker (1801).

Domfront, tn. in the dept. of Orne, France. It owes its origin to a hermit Saint Front, of the sixth century. It is perched on a hill and has kept fourteen towers and the high wall which enclosed it in the eleventh century, the dungeon of its castle, old granito houses, and a beautiful church. It suffered much from war and was besieged in 1574. Pop. 3800.

Domicile, according to Rom. law, the place 'where a person has his family abode and chief business premises, whence he does not depart unless business affairs compel him, and on leaving which he considers himself a sojourner, and on returning to which he considers himself at home' (Cod. 10, lit. 40, 1, etc.). The D. of the parents is the D. of the child, and the latter changes with the D. of the parent during the child's minority. An illegitimate child takes the D. of the mother. Should the father die during the minority of a child, the child's D. is the last D. of the father. A woman when she marries takes the D. of her husband. A new D. is acquired by residence and intention of adoption. When a man has two or more places of residence, his D. is that residence which he selects as his home and which is the centre of his affairs. D. is therefore of three types: (1) D. of origin, depending on the D. of the parents at the time of birth; (2) D. of choice, which is voluntarily acquired by a party; (3) D. by law, e.g. the D. which a wife acquires by marriage. See *LEX LOCI*.

Dominance, in biology connotes the fact that when an offspring receives the genes of two contrasting characters from its parents, in many cases one of those characters, the dominant, will develop to the exclusion of the other, instead of combining with it. The repressed character—the recessive—may, however, reappear in the next generation, thus, a hybrid between pure-bred horned and hornless cattle produces offspring which are all hornless; but if these were mated some horned animals might be found among their descendants. See *HEREDITY*.

Dominio, St. (Dominic de Guzman) (1170-1221), was b. at Caleruega, a small tn. in the diocese of Osma in Old Castile, Spain. As a young priest he resigned a canonry to take up missionary work among the Albigenses in the S. of France. In 1215 he founded his order of mendicant friars, adding to the Rule of St. Augustine his own constitutions. Pope Honorius III. recognised and sanctified the order in 1216. The régime of the order was most severe, enjoining silence, poverty, and fasting. The friars were called Dominicans from their founder; Preaching Friars from their zeal in persuasion; Black Friars from the colour of their dress; and in France, Jacobins, from their original headquarters in the Rue St. Jacques at Paris. For women desirous of following the same Rule the 'Second Order' was formed; and a confraternity of men and women in the world but governing their lives by the same principles was called the 'Third Order.' The order numbered some famous divines, e.g. Thomas Aquinas. The Dominican Order have always upheld Aquinas's theological system (Thomism), and on some matters have taken part in acrimonious disputes with theologians of other schools, notably the Jesuits. The Order furnished examining judges and often the presidents of the Span., Rom., and Portuguese Inquisitions. St. Dominic was canonised by Pope Gregory IX. in 1235. See A. Jessopp, *The Coming of the Friars*, 1889; and J. Herkless, *Francis and Dominic*, 1901.

Dominica, largest of the Windward Is., Brit. W. Indies, is 29 m. long and 15 m. broad, area 305 sq. m., of volcanic formation and very mountainous, with a healthy climate and a rainfall of 80 in. in parts and over 250 in. in others. Sugar has ceased to be an article of export, and the main industry is the cultivation of limes and the manu. of their products. There are about 100 pure Caribs still living on the Is. D. owes its name to the fact that it was discovered by Columbus on a Sunday (Span. *Domingo*), Nov. 3, 1493. The Is. was included in a grant by Charles I. to the earl of Carlisle, but as all attempts to subdue the aboriginal Caribs failed, it was agreed in 1748 by the treaty of Aix-la-Chapelle that D. and other W. Indian Is. should be neutral and the Caribs left in possession. But the Fr. ignored this arrangement and estab. plantations in the Is. after which England captured it in 1759 and by the peace of Paris, 1763, it was assigned to England. In 1778 the Fr. under the Marquis de Bouillé invaded it and marched into Roseau; but though many Brit. W. Indian Is. fell into Fr. hands at this time Rodney, at the B. of Saints saved the situation, and D., with various other Is., was restored to England by the Treaty of Versailles, 1763. The Fr. republican, Victor Hugues, however, invaded D. with a force from Guadeloupe in 1795 but was repelled. Then later, in 1805, Gen. La Grange captured Roseau once more but was unable to reduce the colony and after extorting a payment of £12,000 from the people and vainly calling on the Eng. governor to surrender,

sailed to Guadeloupe. The Eng. governor, Gen. Prevost, was duly rewarded by the Dominican House of Assembly for his gallantry and on his return to England was created a baronet. Until 1940 D. was a part of the Leeward Is. group but in that year became a separate colony under the governor of the Windward Is. A legislative council was created in 1898 when the assembly was abrogated and Crown Colony gov. estab. but in 1925 the elective principle was reintroduced. Pop. 42,000. Roscau (9800) is the cap.

Dominical Letters, the letter used to denote the Sundays throughout one year. The seven letters, A B C D E F G, are used in succession to denote the first seven days of the year, from Jan. 1 to 7, and then in rotation the next seven days, and so on. Thus, if Jan. 3 be a Sunday, it is evident that the D. L. for the year is C, as the number of letters and of the days of the week is the same. Leap year has two D. L., one for the days preceding Feb. 29 and the other for the rest of the year. The intercalary day is marked by the same letter as the day preceding it, thus effecting the change on the following Sunday. D. L. displaced the nundinal letters in the Rom. calendar: rules and tables for finding them are given in prayer books.

Dominican Order, see under DOMINIC, ST.

Dominican Republic, also known as **Santo Domingo**, W. Indian republic, formerly the Sp. portion of the Is. of Santo Domingo or Hispaniola. It occupies the E. or larger part of the Is. of which Haiti is the W. part. Its area is 19,332 sq. m., with over 1000 m. of coast-line, and the pop. 2,120,000. There are 18 provs., and the chief tns. are Ciudad Trujillo (formerly Santo Domingo, pop. 139,000); Santiago de los Caballeros (59,600); San Pedro de Macoris (23,700); San Francisco de Macoris (17,200); and Puerto Plata (16,500). The chief crops are sugar and cocoa; coffee and tobacco are also grown in good quantities; and, among other products, are mahogany and other furniture, hardwoods, cotton, lignum vitae, honey, logwood, turtle shell, etc. In 1916 imports were valued at 27,880,000 gold pesos and exports at 64,792,000. The gold peso equals the U.S. dollar. There are 168 m. of publicly-owned railways. There is cable communication with N. and S. America, New York, Porto Rico, and Cuba. The republic is governed under a constitution proclaimed on Jan. 10, 1947. Congress is composed of a Senate of 19 members (one from each prov. and the dist. of Santo Domingo) chosen by direct popular vote and a chamber of forty-five deputies, both houses being chosen for five years. The judicial power is vested in the Supreme Court, courts of appeal, courts of first instance, communal courts, and other tribunals set up by special laws such as the land courts. The state religion is Rom. Catholicism, and other forms of religion are tolerated. The Dominican army consists of 12,000 officers and men; there is an air corps, and a small navy. S. D. is the oldest settlement of European origin in the New

World, having been founded by Bartolomeo Colombo (or Columbus) in 1496, when it was named Hispaniola. After its discovery it was occupied by numbers of Spaniards with imported African slaves and the local tribes were quickly exterminated. An independent republic was proclaimed in 1821, when the Spaniards evacuated the Is. The present republic seceded from Haiti (q.v.) in 1844, and became the independent Dominican Republic in that year. In 1916 American military forces landed in S. D. and a military gov. was proclaimed. Between 1922 and 1924 a provisional Dominican gov. was in office, but a duly elected constitutional gov. replaced it in July 1924, with authority in all matters except customs and foreign debt redemption, which latter were administered by an Amer. official. In 1941 a law was passed for the creation of the Reserve Bank, which, starting with branches purchased from the National City Bank of New York, opened for business on Oct. 27, 1947. In 1947 a new Central Bank was inaugurated, with total assets (Dec. 31, 1947) of 13,625,000 pesos. See O. Schonrich, *Santo Domingo: The Country with a Future*, New York, 1919; S. Welles, *Naboth's Vineyard*, 1928.

Dominions Office, Brit. gov. dept. dealing with the United Kingdom gov. relations with the self-governing Dominions including S. Rhodesia. Up to 1925 its work had been done by the Colonial Office, but in that year a separate Secretary of State was appointed with a separate (but more or less interchangeable) staff. The D. O. dealt also with the High Commission, etc., of the Bechuanaland Protectorate, Basutoland, and Swaziland. In July 1947 the title of the D. O. was changed to Commonwealth Relations Office.

Dominion Status, the political status of any co-equal member of the Brit. Commonwealth of Nations—which latter term has now become the official substitute for the older 'British Empire,' a term which in the view of many savours too much of the old-time Imperialism. The self-governing dominions are Canada, Australia, New Zealand, S. Africa, India, Pakistan and Ceylon. Newfoundland (q.v.) was formerly a dominion but after having had its D. S. suspended for some years for economic reasons, it finally elected to become a prov. of Canada and so became in March, 1949. S. Rhodesia enjoys a large measure of autonomy but should be classified as a self-governing colony. All the seven great Dominions enjoy complete autonomy and may even, and do, appoint their own diplomatic representatives in foreign caps. or in each other's caps. They are, in fact, bound together with the 'mother country'—an expression of no more than historical import by nothing more than their common allegiance to the Crown. Their gradual approach towards independence was recognised in the Balfourian formula adopted in the Inter-Imperial Relations Report of the Imperial Conference of 1926, which Report states that equality of status is the principle governing inter-imperial relations or affairs as between

the U.K. gov. and the gov. of the various Dominions, which are here described as 'autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any respect of their domestic or external affairs, though united by a common allegiance to the Crown and freely associated as members of the Brit. Commonwealth of Nations'. This loosely worded formula, found its sequel in the Statute of Westminster of 1931, the purpose of which was to give extra-territorial operation to the legislation of the various Dominion Parliaments and to remove the last vestiges of the governor's veto as enshrined in the classic Colonial Laws' Validity Act of 1865—the governor—or governor-general as he is called in the case of a Dominion—having now become merely the King's representative and in no sense the agent of the United Kingdom gov. The common allegiance to the Crown is exemplified in the appointment of the governor-general—the choice of whom is the function of the premier of the Dominion concerned—the right of appeal to the Judicial Committee of the Privy Council and the status of all subjects of the Dominions as Brit. subjects. Eire (Ireland) has by Act of the Dail abolished the right of appeal to the Judicial Committee in the case of its own citizens and has eliminated the Crown from the internal part of its Constitution. See also BRITISH EMPIRE OR BRITISH COMMONWEALTH OF NATIONS.

Dominis de, Marcus Antonius (1566–1624), It. theologian and natural philosopher, b. at Arba in Dalmatia. During his novitiate in the Jesuit order, he taught rhetoric, mathematics, and physics. It was during this period that he wrote his *De Radiis Visus et Lucis in Virtus Perspectivae et Iride*. He became bishop of Segni and afterwards of Spalato, but being implicated in the disputes between Rome and Venice, having quarrelled with the pope and exhibited, moreover, certain Protestant leanings, he was obliged to resign his see. He was subsequently received in 1616 by James I. of England. As dean of Windsor he wrote *De Republica Ecclesiastica*. He afterwards expressed a desire to return to the Catholic Church, but some letters he possessed belied his conversion, and he was imprisoned under the Inquisition at St. Angelo, where he died in a few months. His chief merit rests on his discoveries with regard to the refraction of light in the rainbow.

Dominium, term in Rom. law which has been adopted into most European codes. It signifies complete and lawful right to and in an object, being distinct from the usufruct which is merely the right arising from actual possession.

Domino, originally the hood or cape with which officiating priests protected themselves in cold weather. In Venice and other parts of Italy the D. was worn at masquerades and fancy-dress balls by people not otherwise dressed in character. It was a wide-sleeved enveloping cloak with a half-mask. The word D. is popularly used as synonym for mask.

Dominoes (probably so called from the resemblance of the black backs of the pieces to the mask known as the domino), a game, partly of chance, partly of skill, played by any number of players, from two upwards. Twenty-eight oblong pieces of ivory, bone, or wood, white on the face, are required. The white face is divided into two parts by a line, and, except in the case of the double-blank, there are dots on one side or both sides of this line from the number of which the piece takes its name. Thus there is the double-six, with six dots on either side, the six-five, the six-four, etc.; the double-five, five-four, etc., ending with six-blank, five-blank, etc. Sometimes sets are also used ranging up to double-nine and double-twelve. The *block* and *draw* games are played as follows: The pieces, called also cards, are shuffled on the table face downwards, and each player draws the number of cards required, usually seven. The remainder of the pieces form the *stock*. The leader then plays, or, technically speaking, *poses* a D., generally the highest he has; the second player must then pose one from his own set so that one of its numbers shall be the same as one of those on the D. first posed. Thus, if double-six were first posed, he can follow with any D. which has six on one side. By some rules, however, if a player pose a double he may play a second card if possible. If a player cannot match he 'passes,' and the first player (supposing the number be two) plays again. If the 'draw' game is being played, however, a player who cannot match may draw on the stock until he gets a card that does match, provided always that two cards be left in the stock. If a player play out all his pieces he cries 'Domino' and wins the hand, scoring a number of points equivalent to the number of *pips* on his opponent's remaining cards. If neither can play any further, each counts the number of pips on his remaining D., and each then scores the number of his opponent's pips. Fresh hands are then dealt until one player reaches 100. Double cards are laid cross-wise (*à cheval*). This is the commonest system of playing D. in England, but the *matador* is the commoner form on the Continent and is perhaps the more scientific. The object here is not to match the end number, but to make that number up to seven. The game probably came from the E.

Domitian (Domitianus), Titus Flavius, (A.D. 51–97) b. at Rome, the youngest son of the Rom. Emperor Vespasian, succeeded his brother Titus as emperor in the year A.D. 81. Though Tacitus (*Hist.* iv. 51, 68) alludes to the immoral practices of his youth, he commenced his reign with an earnest attempt to stem the tide of immorality at Rome. He reorganised the gov. of the provs. and erected some fine buildings at Rome. During his reign the conquest of Britain was effected by Agricola. The vices that disgraced his youth, however, grew malignant towards the end of his reign. He exiled Epictetus and other philosophers from Rome. In A.D. 93 a persecution of the Christians and

Jews took place with cruel massacres. A conspiracy was formed against the emperor in A.D. 96, and he was put to death by his officers in his own chamber, with the connivance of his wife, Domitia.

Domitius Ulpianus, see **ULPIAN**.

Domodossola, tn. in Italy in the prov. of, and 55 m. N.W. of the tn. of Novara. It is 25 m. S.E. of the head of the Simplon Pass. Pop. 6400.

Domremy-la-Pucelle, vil. of France, in the dept. of Vosges. It is situated on the l. b. of the Meuse, about 7½ m. N. of Neufchâteau, and 30 m. S.W. of Nancy. It is historically interesting as being the birthplace of Joan of Arc (La Pucelle d'Orléans), 1412. The house in which she lived is preserved, and over the door are the arms of France, together with the following inscription: 'Vive Labeur; vive le roi Louys.' Opposite the house is an immense bust of the heroine, and there are sev. monuments erected to her memory. Pop. 300.

Don, (1) called by the ancients the Tanais, a river, of S. Russia, rises in Lake Ivanski in Tula, and flows in a S.S.E. direction through Ryazan, Tambov, Voronezh, and the ter. of the Don Cossacks (q.v.), but repelled by the mts. Situated to the W. of the Volga, it turns at Kalatch in a S.W. direction and enters the Sea of Azov. The projected Don-Volga Canal will give the whole of the Caucasus access to the Black Sea, the Caspian, and, by way of the Volga, to a large part of the lands of European Russia. The riv. is 1156 m. long and is navigable up to Zadonsk. In spring the riv. overflows its banks and covers the adjoining ter., with unhealthy swamps. The fisheries on the river are extremely valuable. The Don regions, including the Donetz Basin or Donbas, were the scene of protracted and desperate battles in 1941-43 between Soviet and Ger. forces, in which Rostov-on-Don and Kharkov on a trib. of the Don, changed hands sev. times. For full details see **EASTERN FRONT** or **RUSSO-GERMAN CAMPAIGNS** IN SECOND WORLD WAR. (2) Riv. of N.E. Scotland, rising in the Lodder Hills and flowing E. to the N. Sea near Aberdeen, 83 m. long. (3) Riv. of N.E. England rising in the Pennines and flowing through Sheffield to join the R. Ouse at Goole, 70 m. long.

Dona Francisca, or **Joinville**, tn. of the prov. of Santa Catharina, S. Brazil. It is to the W. of the town of São Francisco, and about 80 m. N. of Florianopolis. Pop. 25,000.

Donaghadee, tn. of N. Ireland, in co. Down, situated on the Irish Channel, near Belfast Lough. It is the nearest port to Britain. The harbour is small, and accommodation scanty, but a shipping trade in dairy produce and cattle is carried on. Pop. 5000.

Donaghmore, name of numerous places in Ireland, situated in cos. Cork, Down, Kildare, Kilkenny, Leix, Limerick, Meath, Tyrone, Wicklow.

Donash ben Labrath, Jewish poet and grammarian of the tenth century, b. at Bagdad. Not only was he one of the first to treat grammar scientifically, but he

also wrote the earliest known specimen of metre in the Jewish language, his verse being an imitation of the Arabic.

Donatello, or **Donato de Nicolo di Betto Bardi** (c. 1386-1466), famous It. sculptor, b. at Florence. His father a wool merchant, came to Rome at the age of seventeen with his friend Brunelleschi, where the two youths, besides carrying on the trade of goldsmith, devoted themselves to the study of architecture. After some

DONATELLO: ST. JOHN THE BAPTIST

years, both men returned to Florence rich in ideas and inspiration. D. is celebrated for his marble and bronze statues, which are beautifully executed, and which reveal the nobility and force of those works of antiquity which formed his constant study and delight. He combines the good points of the Renaissance together with his own original way of treating his subject. The Renaissance betokened the revival of the Classic as opposed to the Gothic in the hist. of architecture, and Brunelleschi, D.'s lifelong friend, was the inaugurator of this new movement. D.'s patron was Cosimo de' Medici, who well rewarded him for his industry. The sculptor was correspondingly generous towards his friends. His prin. works are the marble statues of St. Peter and St. Mark in the church of San Michele at Florence; a bronze statue of David J. Florence, another bronze figure of the equestrian Gattamelata in a public place at Padua. Othersculptural works are the statues on Giotto's belfry, decorative

work on the pulpit of San Lorenzo, and figures in the baptistery at Florence. See Lord Crawford and Balcarros, *Donatello*, 1903, 1911; M. Crutwell, *Donatello*, 1911.

Donati, Giovanni Battista (1826-73), It. astronomer, b. at Pisa. From 1854-64 he discovered six comets, the finest which appeared in 1858, bearing his name. By subjecting the light of a comet to the spectrum analysis, he was able to describe its gaseous composition.

Donatio Mortis Causa, gift made in prospect of death. This practice is derived from Rom. law, and is thus defined in the *Institutes* (ii. tit. 7): 'A gift made under an apprehension of death, as when a thing is given on condition that, if the donor die, the donee shall have it, but that it shall be returned if the donor shall survive the danger he apprehends or repents of his donation or if the donee die before the donor.' Actual transfer is necessary, but where the nature of the goods makes this impossible the transfer of a symbol of ownership (e.g. a key) is permitted.

Donatists, powerful sect which arose in the Christian Church in N. Africa at the commencement of the fourth century. There had long been two parties in Carthage: a moderate party, headed, until his death in 311, by the bishop Mensurius; and a strong fanatical party, headed by Lucilla, a wealthy widow. This latter party carried on in a more developed form the African tradition of severity towards *traditores*. In 311 Mensurius died, and, in order to be beforehand with the rigorists, the moderate party hastily elected Cæcilian as bishop, without awaiting the arrival of the Numidian bishops, and secured his consecration by Felix, bishop of Aptunga. Secundus, bishop of Tigisis, treated this act as illegal, and convened a synod of seventy bishops at Carthage, which excommunicated Cæcilian. The lector Marjorinus was elected in his stead, and on the death of Marjorinus in 315, Donatus the Great, from whom the sect is named, took his place. Both parties had, before this time, appealed to the Emperor Constantine, and his decisions had been in favour of orthodoxy. General synods at Arles (314) and Milan (316) also pronounced against the D., but the schism spread, and there were soon rival bishops throughout N. Africa. The D. excommunicated the rest of the Church, baptising again all Catholics who seceded to them. The orthodox reaction against this practice gave rise to the theory of a sacramental character imparted in baptism, confirmation and order. Finding them proof against persuasion, Constantine ignored them, but they were subjected to severe persecution under Constantians. In 411, a great disputation, attended by 286 Catholic and 279 D. bishops, was held at Carthage, and decision again given for the orthodox. The members of the sect were subject to cruel persecutions in which they gloried; and in the seventh century the sect was annihilated by the Saracens. See D.

Voelter, *Ursprung des Donatismus*, 1883; P. Monceaux, *Histoire littéraire de l'Afrique chrétienne* (vols. iv., vi), 1913, 1923.

Donative, see ADVOWSON.

Donato d'Agnolo, see BRAMANTE, LAZZARI.

Donatus, Ælius, Rom. grammarian who lived in the middle of the fourth century A.D. He wrote a grammar and a commentary on Virgil and Terence. St. Jerome studied grammar under him. The commentary on Virgil ascribed to him is now supposed to be spurious.

Donaueschingen, tn. of Baden, Germany, with brewerles and a silk industry. The tn. was largely rebuilt in 1908 after a serious fire. Pop. 6600.

Donauwörth, tn. and riv. port of Germany, in the prov. of Schwaben, Bavaria. It is situated on the l. b. of the Danube, at its junction with the Wörnitz, 25 m. N.N.W. of Augsburg. At one time it was a free imperial city, and it contains sev. old buildings of interest, including a Benedictine abbey. It was stormed by Gustavus Adolphus and taken by King Ferdinand during the Thirty Years' War. Marshal Soult was victorious over the Austrians at D. in 1805. Flax and hemp, hops and fruit are cultivated. The tn. is noted for manufs. of heavy iron goods, machinery, etc., and some trade carried on by the Danube. Pop. 4700.

Donawitz, tn. of Austria, in the prov. of Styria, situated 2 m. N. of Leoben. Iron foundries, and brown-coal workings. Pop. 18,000.

Don Benito, tn. of Spain in the prov. of Badajoz, 57 m. N.E. by E. of the city of that name, and 25 m. N.E. of Merida. There are manufs. of hats and oil presses. A trade is carried on in corn, fruit, and wine. Pop. 20,700.

Don Carlos, see CARLOS.

Doncaster, co. bor. of Yorkshire, England, on the r. b. of the Don, 35 m. S.W. of York and 156 m. from London. It is on the Great North Road and is served by the old L.N.E.R. of the British Railways. Apart from its importance as a centre for the richest coal-fields in the co. and its manuf. of the L.N.E.R. locomotives and rolling stock, D. has varied industries, including confectionery, artificial silk, cinema furniture, agric. machinery, wallpaper, electrical equipment, and brass, fencing, and rope works. The Mansion House near Priory Place, the first stone of which was laid in 1744, contains one of the finest banqueting halls in the country and its municipal treasures include a map dating from 1683. Other noteworthy buildings are the guildhall, now used solely for police headquarters and courts; the central library in St. George's Gate; the museum and art gallery overlooking the Beechfield Gardens; the technical college for which large extensions are projected; and the corn exchange opened in 1873, adjoining which is the mrkt. hall and covered mrkt.—among the best of their kind in the co. The corporation owns all these buildings, as well as the public utilities, the airport and the racecourse. It also owns six public parks and pleasure

grounds: these include the Hexthorpe Flatts (28 ac.) containing the well-known beauty spot 'the Dell'; Elmfield Park opened in 1923; and Sandall Park, a new park in rural surroundings. To the N. of French Gate is the parish church of St. George. The old building was destroyed in 1853, and the present medieval-looking building, with elaborately pinnacled and battlemented tower, was designed by Sir Gilbert Scott. The Romans had a military station here named *Danum* and in Domesday Book the place name occurs many times as 'Donecaestre.' In 1194 Richard I. gave the tn. its first known charter, and it was a charter of Edward IV., dated Oct. 30, 1467, which authorised the election of a mayor. From such street nomenclature as French Gate, Baxter Gate, St. Sepulchre Gate, etc., it might be inferred that in feudal times, D. was fortified but, according to Leland, it was never a walled town, the word 'gate' in this context meaning simply 'street.' Such names as Priory Place and Greyfriars Road indicate the former presence of religious orders. In the mid-seventeenth century John Evelyn described D. as 'a large, fair town, famous for great wax lights and good stockings'. For its loyalty in the Civil war Charles II. granted the tn. the privilege of being a free borough of itself. The traditions of the tn. when it was chiefly interested in agric. are kept alive in Robert Southey's memoirs of Dr. Daniel Dove. For generations D. retained the character given it by Southey but with the advent of the railway the character of the tn. was completely changed and works for the manuf. of brass, wire, wagons, and woollens opened in due course, while the development of the S. Yorkshire coalfield soon led to further great changes. In 1926 D. was constituted a co. bor. and granted arms which incorporate a Saxon crown indicative of the fact that D. (part of which pertained to the soke of Hexthorpe) belonged to Earl Tostig. Pop. 72,000.

Don Cossacks, Province of the, former prov. of S. Russia lying between Rs. Don and Donetz, and now included in the Rostov and Stalingrad Regions. The country consists mainly of steppes, without trees or shrubs, but rich in pasturage. The chief tns. are Old Cherkask, New Cherkask, and Pordjansk. See *Cossacks* and *Don*.

Donegal, (1) co. of Ireland in the prov. of Ulster, but belonging to S. Ireland or Eire, is bounded by the Atlantic Ocean and the cos. of Londonderry, Tyrone, Fermanagh, and Leitrim. The coast-line is very irregular, being broken by Lough Swilly, Sheep Haven, Boyleagh Bay, Gweebarra Bay, and Donegal Bay. The coast is fringed by many is., of which the chief are Inishnah, Tory Is., and Aran Is. The surface of the country is mountainous. These mts. include eight summits of which Mt. Errigal (2466 ft.) is the highest. Adjoining Malin Beg Head in the W. of Donegal Bay there is a sea cliff 1964 ft. in height. The chief rvs. are the Foyle, the Finn, the Swilly, the Erne, the Gweebarra, the Uweedore and the Owenoe.

The co. also possesses many lakes, of which the prin. are Loughs Derg, Deele, Gartan, Eask, and Glen. The climate of D. is inclement. Rude winds prevail, rendering great tracts of the county barren. The mould in some regions consists of light clay, suitable for crops of potatoes, oats, and barley. Agric. implements are for the most part primitive. The breeding of cattle and sheep is the most profitable occupation of the inhabs. but the fisheries of the coast support most. The country women occupy their time with the embroidery of linen, lace, and muslin. Linen and tweed (Donegal tweed) are also manf. in the county. Of the historical remains the most interesting is the Grianan of Ailbeach, the palace of the kings of N. Ireland from most auct. times. There are also interesting relics of St. Columba and the famous Purgatory of St. Patrick situated on an is. in Lough Derg. The co. tn. is Lifford. Area 1,193,581 ac. Pop. 136,136. (2) mrkt. tn. in the co. of D. at the head of Donegal Bay. It has remains of a castle and a monastery. Pop. 1100.

Donelson Fort, camp at Dover, Tennessee, U.S.A. It was built in the time of the Civil war by the Confederates for the purpose of guarding the Lower Cumberland R., and it consisted of two lines of entrenchments on the land side, and water batteries. It was taken by the Federals in 1862, the prisoners numbering nearly 15,000, which was considerably over two-thirds of the original army.

Doneraile, small tn. of Eire (Ireland) in Cork co., situated on the Awbeg, about 5 m. N.E. by N. of Mallow. Pop. 800.

Donetz, or **Donbas**, name of a great coal dist. of Russia, which forms part of the region of Dniepropetrovsk, Ukraine S.S.R. It extends over much of the Donetz plateau, which is one of the highest portions of the Russian interior. The actual coal-field of the Donbas has an area of about 16,000 sq. m., and produces excellent anthracite and steam coal; iron is also extensively mined. Geologically, the coals are not found until the close of the Lower Carboniferous period. The R. Donetz ('Little Don'), which gives its name to the above dist., is a riv. of S. Russia which flows generally S. for 280 m., receiving on the right the Oudai. It then turns to the W. at Oskal, forms the boundary of the Donetz plateau, and finally flows into the Don, after a course of 680 m. During high water the riv. affords access to the Kharkov Region. The iron and steel industries of the Donbas, estab. relatively late in Russian hist. with aid of foreign capital, and employing coke in place of charcoal for smelting, achieves a higher standard of technique than that in the Urals. The area of the Donbas coal measures, from which about 60 per cent. of Russian coal is produced (67,000,000 tons in 1937), is exceeded only by that of the Kuznetsk coalfield. The Donbas coal seams are thinner than those of Kuznetsk but the Donbas is in a more fortunate position for industrial development. It is, for example, in the centre of a densely populated area, and connects

by the best railway network in Russia, with other large centres of population such as Moscow and Leningrad. The Donbas includes the tns. of Kirovgrad, Stalino, Voroshilovsk, Voroshilovgrad, Artemovsk, and Slavyansk. The Gers. captured the Donetz basin in 1911 but by Feb. 1943 the Gers. were driven out of most of the basin. again. On March 15, however, the Gers., by retaking Kharkov, subsequently regained most of the D. basin, but again evacuated it in Sept.-Oct. See further under EASTERN FRONT, or RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR.

Dongen, tn. and com. of the Netherlands, situated in the prov. of N. Brabant. Pop. 7200.

Don Giovanni, see DON JUAN.

Dongnai, see DON-NAI.

Dongola, prov. of the Anglo-Egyptian Sudan, stretching between lat. 70° 50' and 19° 10' N. It consists of a long, narrow plain, situated in the valley of the Nile, and includes both banks of the riv., while to the E. lies the Nubian desert, and to the W. is the Libyan desert. From 1820 to the Mahdi insurrection of '85 it was Egyptian. Gen. Kitchener took it in 1896. Merowé the cap. of the prov. (pop. 15,000) is situated on the l. b. of the Nile. New Dongola (pop. 16,000) is the chief centre of trade; also a military depot. Old D., a decayed tn., is 75 m. S.S.E. of New D. The Nubian race are the prin. inhabs. of the prov.

Doni, Antonio Francesco (1513-74). It. priest, b. at Florence. In Venice he settled down as a printer and writer, publishing many original works, distinguished rather by their curious conceits and eccentric style than for real worth. *La Morale Filosofica*, and the *Marmi*, both pub. in 1552, are his best known works. In the former, for which he was largely indebted to Firenzuola, he makes his moral teaching palatable by sugaring it with allegories, legends, and fables, whilst in the latter he freely reviles the vices, and especially the superstitions, of the age.

Dönitz, Karl (b. 1892). Ger. admiral, b. in Mecklenburg of a family of ship-owners. At first he served in the cruiser *Breslau*, but transferred to the submarine branch of the service and served for the greater part of the 1914-18 war in U-boats. Took part in many attacks on allied convoys in the Mediterranean until he was captured in 1918 and interned in England. Feigning insanity, he was among the first of the Ger. prisoners to be repatriated after the Armistice. After the outbreak of war in 1939 Hitler chose him to be head of the U-boat service. He had a fanatical faith in the power of the U-boat to gain victory for Germany by destroying the sea-power of the Allies, and his successes in the early months seemed to confirm his optimism. He developed the 'pack' system of attack. But in 1943 the tables were turned and the allies got the upper hand. D. attained the rank of admiral in 1942 and that of grand admiral in 1943, in which year he succeeded Raeder as commander-in-chief of the Ger. navy. On the Ger.

surrender he put himself forward as the successor to Hitler, with the style of Führer. But he was arrested and held for ultimate trial as a war criminal. At the Nuremberg trial he was sentenced to a term of imprisonment for waging aggressive war within the meaning of the word as defined by the charter constituting the court.

Donizetti, Gaetano (1797-1848). It. musical composer, studied music in his native place, Bergamo, and later at Bologna. There is no truth in the story sometimes heard that he was of Scottish descent (Scholes). D. for some time until 1822 served in the army. The opera which made his name was *Anne Bolena*, produced in 1830 at Milan. His *Elixir of Love* (1832) abounds in clear pure sentiment and radiant joy. Altogether he composed sixty-two operas. His *Lucia di Lammermoor*, produced at Naples in 1835, was his greatest success and gained him a professorship of counterpoint in that city. His closing years were saddened by signs of lunacy brought on, it is said, by intemperance. Considering that his rivals were Rossini and Bellini, D.'s contemporary popularity is a remarkable tribute to his talents. *La Fille du Régiment* (1840) is his most popular work, but the finest probably is *La Favorita*, produced, curiously enough, in the same year. In the 'marriage contract' and 'tomb' scenes of *Lucia* and in *Favorita* and *Linda* (1842) he proves himself as gifted a master of melody as Bellini, and a more dramatic master of the concerted number. His melodies demanded capable singers in a period when opera was essentially an exhibition of vocal tone and technique. His last opera, *Catarino Carnaro*, was produced in 1844. D. combined the gift of writing pleasant melodies and composition, peculiarly suited to the voice, with extreme facility, vigour, and some sense of humour, as shown in *Don Pasquale* (1843). He proves his grasp of the orchestra, both in dramatic and comic vein, in the later operas and the overtures to *Favorita*, *Linda*, and *Pasquale*, that to *Favorita* being especially fine, and showing unexpected mastery of form. He became paralysed in 1845. See A. Cametta, *Donizetti*, 1907.

Donjon, see DUNGEON.

Don Juan (It. Don Giovanni), famous figure in legend, whose prototype is found in the Span. play (pub. in 1630), entitled *El Burlador de Sevilla y convidado*, and attributed to Tirso de Molina. Like the Faust of northern legend, D. J. sacrifices everything to self-gratification, but with this fundamental difference that, whereas for Faust self-gratification means intellectual supremacy, for D. J. it is the consummation of all, even the lowest, sensual pleasures. The following is a bare outline of the story, though different versions are found in all European countries, and even so far afield as Iceland. D. J., of the noble family Tenorio, is an abandoned profligate who lived in the days of Peter the Cruel at Seville. When Ulloa thwarts D. J. in his machinations to seduce his daughter, he is promptly

stabbed by the dissolute lover. An arrant disbeliever, D. J. mockingly challenges a stone image of his victim to a banquet in his tomb. The outraged Ullua accepts and thereupon carries his murderer off to the very hell at which he has so exultingly scoffed. This quaint story has been immortalised by Mozart's magnificent music to Da Ponte's libretto. Hence came the inspiration for Mérimée's novel *Les Ames du purgatoire*, Dumas' *Don Juan de Marana*, and Balzac's *Élixir d'une longue vie*. Henry Purcell, however, who used Shadwell's obscene play, *The Libertine* (1676), was the first to write a musical setting whilst Gluck's ballet music is still played. Goldoni, Molière, Espronceda, Flaubert, Landau, and Heyse have all coloured the legend according to their own fancy, but of all later writers Zorrilla, whose *Don Juan Tenorio* has come to be regarded as a national work, may justly claim the distinction of having cast the story into its most popular form. D. J. is introduced into Bernard Shaw's play *Man and Superman*. See O. Rank, *Don Juan*, 1924; L. di Bradi, *Don Juan, la légende et l'histoire*, 1930.

Don-nai, Donai or Dongnai, riv. of Lower Fm. Cochín-China, rising at an altitude of 5000 ft. It receives the Saigon and others, and after a course of 250 m. enters the China Sea in the N. E. of the Mekong delt, which communicates with the riv. by sev. channels.

Donnay, Maurice Charles (1859-1945), Fr. playwright and author, b. at Paris. Among his plays are: *Amants* (1895), *Douloureuse* (1897), *L'Affranchie* (1898), *Le Retour de Jérusalem* (a satire on Max Nordau, 1903), *La Patronne* (1908), *Ménage de Molière* (1912), *Les Éclaircissements* (1913), *La Chasse à l'Homme* (1920), *Le Roi Candale* (1920), *Un Homme léger* (1925), *La Reprise* (1925), *L'Ascension de Virginie* (1929). Of his non-dramatic works *Alfred de Musset* appeared in 1914.

Donne, John (1573-1631), Eng. poet, son of Rom. Catholic parents, connected through his mother's family with Sir Thomas More and with John Heywood, the dramatist. He is quaintly enough the hero of a truly romantic love-story. This is strange because the very glow of his spiritual life, combined with his melancholy and fantastic humours, would seem to leave small room for romance. Both at Oxford and Cambridge he proved an excellent scholar, but his religion, Rom. Catholicism, forbade his taking the oath necessary for a degree. His life-long intimacy with Sir Henry Wotton dates from his Oxford days. At seventeen he began to study law at Lincoln's Inn, and it was at this time that he became a Protestant, finding himself after careful scrutiny more in sympathy with the Anglican than the Rom. standpoint. After a year spent in Italy and Spain, he became Lord Ellesmere's secretary, fell in love with his patron's niece, whom he secretly married, and thus lost his position. D. was imprisoned by his father-in-law, but finally won back his freedom and his wife after a protracted lawsuit which ran away with

nearly the whole of his property. Whilst with Sir Robert Drury in Paris, he saw the phantom of his beloved wife carrying a dead infant in her arms; twelve days later he heard that his wife had at that very time been delivered of a still-born child. With the accession of King James his fortune changed. In 1610, desirous of a place at Court, he made a bid for royal patronage with *Pseudomartyr* (a contribution to the disputes about the Oath of Supremacy and Allegiance), and in 1611-1613 with *Ignatius his Conclave* (an attack on the Jesuits), an *Elegy on Prince Henry* and *Epithalamium* for the marriage of the Princess Elizabeth. So delighted was the king with D.'s polemic against Catholicism (*Pseudo Martyr*, 1610), that he insisted on the author taking holy orders and appointed him his chaplain-in-ordinary. Other honours followed, and at his death, which was hastened by consumption, he was vicar of St. Dunstan's and dean of St. Paul's. The famous angler, Sir Izaak Walton, has left a delightful life of the pious D. In the pulpit he was, according to his biographer, 'always preaching to himself like an angel from a cloud, but in none.' As a poet, Saintsbury justly praises 'the magical illumination of obscure and shadowy thoughts with the lightning of fancy,' whilst Dryden's verdict that he was 'the greatest wit though not the best poet of our nation' is not amiss. But it would be difficult to find a better appreciation than that contained in Ben Jonson's prophetic remarks, that he was 'the first poet in the world in some things,' but that he would perish 'for not being understood,' but there has been a decided revival of interest in D.'s poetry in recent years. The very faintness of his fancy and wealth of erotic fervour are obscured from the ordinary gaze by a host of fantastical conceits, of 'guips and cranks' expressive of far-fetched, if ingenious, imaginings and of wanton deformities, both of wit and metre. To restore poetry to its high seriousness became the chief object of the early seventeenth century literature and this problem produced, among others, the writers whom Johnson and Pope styled 'Metaphysical.' D. and John Cleveland were the chief 'metaphysical' poets, both trying to ennoble poetry by applying it to the phenomena of science and making their muse the handmaid of natural philosophy. D. followed 'nature' as faithfully as Dryden or Wordsworth but 'nature' as conceived by a mystical scientist. D. is the lover and sensualist, but he reviews his love in philosophical terms, or explores it with the images conceived in his scientific and theological reading. 'He can perceive beauty, but at the very moment of that perception, he sees the corpse, the cerement cloths, the skeleton. He knows passion but he can mock at the physical body through which passion is transmitted . . . This frankness in passion, this despair of making a unity out of the broken images of life, have brought him close to some contemporary poets' (B. Ifor Evans) and partly explain the revival of interest in his works. The standard ed. of Donne's poems is that of

H. J. C. Grierson (1912, 1929); and some of his prose works appear in *The Complete Poetry and Selected Prose* ed. by J. Hayward (1929, 1930). Bibliography by G. Keynes (1914, 1932). See lives by Izaak Walton, 1658; H. I. A. Fausset (editor of *Poems in Everyman's Library*), 1924; also Sir E. Gosse, *Life and Letters of John Donne*, 1899; Mary P. Ramsay, *Les Doctrines médiévales chez Donne*, 1917, 1924; Mrs. E. M. Simpson, *A study of the Prose Works of John Donne*, 1924; G. Williamson, *The Donne Tradition*, 1930; C. M. Coffin, *John Donne and the New Philosophy*, 1937.

Donnybrook, old vil. of Ireland, in Dublin co. It now forms a western suburb of the city of Dublin. It is historically interesting. King John estab. yearly fairs, which were held towards the end of Aug. These became notorious for the riotous disorder practised, and were eventually discontinued in 1855.

Donoghue, Stephen (1885-1945), Eng. jockey, born at Warrington, Lancashire. Rode Derby winner in 1915, 1917, 1921, 1922, 1923, and 1925. He retired from racing in 1937 and took up training. Wrote a novel: *The Luck of the Gentle Grafter* (1926), and an autobiography, *Just my Story* (1923).

Donora, tn. of Westmoreland co., Pennsylvania, U.S.A., with manufs. of steel, nails, chemicals, etc. Pop. 13,100.

Donovan, Edward (1768-1837), Eng. natural historian and botanist, was a fellow of the Linnean Society. The results of his considerable labours were pub. in his *Natural History of British Insects*, 1792-1813, and his natural hist. of Brit. birds, 1799-1819; Brit. fishes, 1802-8; and Brit. shells, 1800-4, etc.

Don Quixote, see under CERVANTES.

Donzy, tn. in the dept. of Nièvre, France, 26 m. N. of Nevers. Cardinal Mazarin founded factories here in 1659, and there are Rom. ruins. Pop. 2200.

Doo, George Thomas (1800-86), Eng. line engraver who had the misfortune to live in a time when his art was no longer appreciated. He tried portrait painting in oils, but art-lovers will remember him rather as a fine engraver, remarkable for his faithfulness to the original, his free animated style, and his sensitive lines. His plates of 'Italian Pilgrims,' after Eastlake, are admirable; but his best are those after Correggio's 'Ecce Homo,' and Raphael's 'Infant Christ bearing the Cross.'

Doolittle, Hilda, (b. 1886), Amer. poetess, associated with Ezra Pound and Richard Aldington (her husband) in founding the Imagist school of poets.

Doom, or **Doum**, popular name of *Hyphene thebaica*, a palm-tree of Upper Egypt, clumps of which occur near Thebes. The fruit is about the size of an orange, reddish in colour, and has a spongy, tasteless, but nutritious rind.

Doomsday Book, see DOMESDAY BOOK.

Doon, lock and riv. of Scotland, in the co. of Ayrshire. The lock is 3 m. S. of Dalmellington; it is 6 m. long and one mile wide, being nearly 700 ft. above the level of the sea. There are several small

is., and it is enclosed by mts. The R. Doon flows through the lock, emptying itself into the firth of Clyde, 3 m. from Ayr. Trout and char abound in both lock and river. The poet Burns immortalised the R. Doon.

Doones, The, were a tribe who lived in Exmoor, Devonshire, England. Very probably these people were descendants of the anct. savage Britons. Their chief home was at Ilagworthy, and they lived by plunder. In R. D. Blackmore's book, *Lorna Doone*, pub. in 1869, the tribe figures largely. They were so dreaded that they were practically rooted out in the seventeenth century by the people of Devon.

Door, in architecture, the filling, usually solid, of a doorway, so constructed that it may easily be opened or shut. The D. and doorway have always been regarded as one of the features of a building upon which architectural ornament should be lavished, and they have generally been made of an imposing nature. In the Egyptian and Assyrian systems the doorway was made of great size and was flanked with colossal statues. In the Gk. and Rom. temples size was also aimed

PERPENDICULAR DOORWAY
Magdalen College, Oxford

at, but when, as in the case of Gk. architecture, the flat lintel was used, it was impossible to span a very large space. The introduction of the arch opened the way to many improvements, and doorways were now generally spanned by this method. All the later architectural systems derived from the Rom. inherited this tradition. In Romanesque architecture the arch is semicircular, ornamented with heavy engravings, the arched head being frequently filled in with a flat stone, so as to make the D. opening rectangular. Among the Gothic styles, it is in France especially that the doorway receives magnificent treatment. The triple portal of Rheims Cathedral is perhaps the most

superb of all. The Ds. themselves are usually constructed of timber adorned with ironwork, though metal was occasionally used.

Doorn, tn. of the prov. of Utrecht, Netherlands, where the ex-emperor of Germany, William II., resided from 1920 to 1941.

Doornijk, see **TOURNAI**.

Dopes, for fuels, see under **MOTOR CARS** and **MOTOR CYCLES**.

Doppler, Christian Johann (1803-1853), celebrated Austrian scientist, b. at Salzburg, chiefly remembered for 'Doppler's principle' (1842). This states (a) that the pitch of a sound is changed if the object emitting it is moving relatively to the observer, and (b) that the light emitted by a moving star is changed in colour as perceived by a relatively stationary observer. Doppler's principle has proved of great value in physics and astronomy.

Dorado, 'the sword-fish,' a S. constellation, discovered by Bayer in 1603, situated in the S. hemisphere between Pictor and Hydrus, and cut nearly in half by a line joining α Argus and ϵ Eridani. Alpha Doradus is a white star of 3.5 magnitude, with a peculiar spectrum. The S. pole of the ecliptic lies near ϵ Doradus, a star of the fifth magnitude.

Dorcas, John (1807-78), miscellaneous writer of Irish parentage, became at an early age a man of letters. In 1869 he was editor of the *Athenæum*, and, later, of *Notes and Queries*. Wrote a number of works dealing with the lighter phases of manners, antiquities, and social hist., often bearing punning titles, e.g. *Table Traits with Something on Them* (1854), and *Knights and their Days* (1856). He also wrote *Lives of the Queens of England of the House of Hanover* (1855) and *The History of Court Fools* (1858), and ed. Horace Walpole's *Journal of the Reign of King George the Third* (1859). His books contain much curious and out-of-the-way information.

Dorat, Claude Joseph (1731-80), Fr. author and poet. He left the career of advocate to devote himself to literature, imitated Voltaire, and contributed largely to *L'Almanach des muses*. He wrote comedies, fables, madrigals, romances, and dramas, but had no very real talent, being merely a 'boudoir poet' of considerable popularity in his own time. Among his plays are: *Zulica*, (1760) and *Adelaide de Hongrie*. His *Réponse d'Abelard à Heloise* gained immediate popularity. Among his poems may be mentioned: *Sélim et Sélima*, *Le Mots de mai*, *Les Tourterelles*.

Dor-beetle, or *Geotrupes stercorarius*, species of Scarabæide frequently found in England, where it is sometimes called the buzzard clock. It is a dung-beetle, not quite an inch in length, and in colour it is a metallic black. In summer evenings it flies about at dusk with a curious droning sound.

Dorcas Society, name given to working parties of ladies, where they make garments for charity. The name is derived from Dorcas (mentioned in the Acts), who made coats for the widows.

Dorchester: (1) Parl. and municipal bor., cap of Dorsetshire, England, situated 140 m. S.W. of London. The tn. is very picturesquely situated. The boulevards, built on the site of the Rom. wall, surround about three-fourths of the tn. and make a delightful promenade. The tn. was an important military station of the Roms. and was called Durnovaria or Durium; Maiden Castle, a Rom. camp, is situated to the S. of the tn. The Rom. amphitheatre at Maumbury is the best preserved Rom. structure in the kingdom. Since 1868 D. returns one member to parliament (previous to 1868, two). There is a Grammar School founded in 1569, but now rebuilt, an almshouse built in 1616, and a museum with the forepaddle of a Pliosaurus, 7 ft. long. Thomas Hardy, the poet and novelist, was born 3 m. from Dorchester at Upper Bockhampton, and he designed the house at Max Gate, Fordington, in which he resided, looking down upon the roofs of Dorchester. Max Gate took its name from an old turnpike gate. Pop. 10,000. (2) A parl. and vil. of Oxfordshire, England, 9 m. E. by S. of Oxford. In A.D. 631 St. Birinus, the apostle of the W. Saxons, here baptised Cynegils, king of the W. Saxons, to whom King Oswald of Northumbria was godfather. Birinus founded a bishopric at D. which lasted for 450 years, until Remigius (1067-1092) transferred it to Lincoln. The Abbey Church is a very remarkable building with many interesting tombs. There is a missionary college for twenty-six students, a Rom. camp, and an anct. Brit. earthwork. Many Rom. coins have been found. Pop. 770. (3) Dist. of Boston, U.S.A., containing two of the oldest houses in New England and a burying ground dated 1631. It was founded by 140 colonists from Dorsetshire, England, encouraged thereto by Rev. John White, of Trinity par., Dorchester. See W. D. Orcutt, *Good Old Dorchester*.

Dordogne, (1) dept. in S. France, comprising almost wholly the basin of the R. D., formed from the anct. provs. of Périgord and part of Limousin and Angoumois. The surface of the dept. is hilly and well wooded, and the valleys are remarkably beautiful and prolific. Vineyards abound on the gentle slopes of the hills, where the vines are trained on the branches of the elm and walnut trees. Chestnut trees are abundant; the yield of chestnuts is immense and contributes largely to the food-supply of the inhabs. of the country, and provides food for hogs. Wheat, peas, beans, and maize are also grown. The choice truffes of Périgord are a product of the soil. Iron, coal, and manganese mines are worked, and there are many important foundries. In July 1940 a new series of grottoes with magnificent prehistoric wall-paintings of animals was discovered at Lascaux near Montignac sur Vézère, in the D., in an area very rich in prehistoric remains. The find was made not far from the Les Eyzies, the centre from which are usually visited the prehistoric sites of Cro-Magnon and Le Moustier, both of which

have become scientific names for palaeolithic types of man. These newly-discovered paintings would seem second only to those of Altamira, in Spain. Evidently they were paintings from what must have been, some twenty or thirty thousand years ago, one of the great centres of religion and magic of Aurignacian man untrod by any human foot for a period five times as long as the whole of recorded hist. In the cave were found the painter's lamp of hollowed stone and the pestle and mortar in which he crushed his three colours, ochre, red peroxide of iron and black manganese. There were some 600 different pictures of animals—wild cattle, wild horses and deer. A certain number of objects, possibly hunting devices, are also shown in the pictures. Périgieux is the cap. of the dept. which has 4 arrons: Périgueux, Bergerac, Nontron, and Sarlat. The area is 3561 sq. m., and the pop. 387,600. (2) Riv. of France, which rises in the Puy de Sanoy, Puy de Dôme, and flows through Souillac, Bergerac, Castillon, Libourne and Cubzac to join the Garonne at Ambès, a distance of 306 m. See A. H. Brodrick, *The Caves of Lascaux*, 1948.

Dordrecht (popularly called **Dort**), seaport on the Merwede, 12½ m. by rail S.E. of Rotterdam, in the prov. of S. Holland. Intersected by a number of canals which greatly facilitate communications, it is engaged in many industries, such as ship-building and engineering, and also manufs. But Rotterdam has diverted a great part of the traffic which made it the richest and most important trading town of Holland and a member of the Hansatic League. It still retains many quaint thoroughfares and gabled houses. The original residence of the counts of Holland, it witnessed in 1572 the declaration of independence of the United Provs., and in 1618-19 the famous synod which anathematised Arminius' heresies. Pop. 54,000.

Doré, Louis Auguste Gustave (1832-83), Fr. painter and illustrator, b. at Strasburg, drew first for the *Journal Pour Rire*, 1848, and later for the *Journal Pour Tous*. His drawings show genius for grotesque and humorous illustration as also fertility of invention and preference for the fantastic. He illustrated an ed. of the Bible, and among other works were Balzac's *Ces Cent Contes Drôlatiques* (1837); trans. into Eng. as *Droll Stories collected from the Abbays of Touraine* (illustrated with 425 engravings by D., 1874); Dante's *Divina Commedia* (1863-66); Milton's *Paradise Lost*, 1866; Tennyson's *Idylls* (1867-68); La Fontaine's *Fables* (1867); and Rabelais' *Gargantua and Pantagruel*. As a sculptor he is remembered for his statue of Dumas, in Paris, whilst he was ambitious for fame as an historical and religious painter. In the Luxembourg hangs his 'Tobit and the Angel', whilst the Doré Gallery in London was long decorated with his huge canvases depicting 'Christ leaving the Prætorium', 1887-72, etc. See B. Roosevelt, *Life and Reminiscences of Gustave Doré*, 1885; and life by M. Rose (ed. J. Laver), 1945.

Dorema, genus of Umbelliferae, *D. ammoniacum* is found in dry plains and gravelly soil, exposed to the burning sun in Persia; it yields the gum ammoniacum used in medicine.

Dore Monts, volcanic mt. group of France, belonging to the Auvergne system, and situated in the dept. of Puy-de-Dôme. The chief heights of all are in this group, and include the Puy-de-Sancy, which has an elevation of over 6000 ft.

Doria, Andrea (1468-1560), Genoese nobleman, b. at Onigila, who, like his ancestors, entered on a military career. First served under various It. princes on different expeditions; he next entered the service of the Fr. king Charles I., and eventually became high admiral of the Levant. Later on, resigned his command of the fleet, as he feared for the safety of Genoa, which was threatened by the Fr. In 1528 D. expelled the Fr. from the garrison of Genoa, and refusing a sovereignty, ruled the city on republican lines. He was very active in his attacks against sea pirates, and was styled 'father and liberator of his country'.

Dorians, are, like the Ionians and the Æolians, one of the chief peoples in historic Greece. In Hellenic times the whole of the Peloponnese, except Elis and Achæa, Doris in N. Greece, together with Megara and Ægina, the is. of Crete, Rhodes, Chidus, Melos, Thera, etc., and the S. shores of Sicily, colonised from Corinth, etc., were inhabited by D. Legend says that Dorus, son of Hellen, the founder of the race, settled in Doris before 1100 B.C. Archaeologists conclude that about 1100 B.C. rude D. invaders overthrew the Achæan civilisation described in Homer, which in its turn had supplanted the Mycæan. Compared with Ionians, the D. were harder, rougher, simpler, more conservative, and aristocratic—a truth to be appreciated alike in their stern and majestic architecture, their archaic unhallowed dialect (retained in the choruses of Attic drama), and the customs and constitution, for instance, of Sparta, where the Helots were jealously kept in their servile condition, and where the rigid martial discipline of Lycurgus prevailed.

Doric Dialect, The, was spoken in Hellenic times in every region where Dorians (q.v.) settled. The broad features which distinguish it from Ionic are -μεν for -μεν in first person plural; -αι and -αν for η; -α for ἄρ, and -αω, -αω, and -ω as ending for the first person of the future. The Dorians invariably claimed a greater antiquity for their dialect than Ionic, a fact which probably accounts for the archaic Doric, which appears as an anachronism in Attic drama. Pindar wrote in Doric.

Doric Order, earliest and most characteristic type of Gk. architecture, of which the Parthenon at Athens is a fine example. The Doric column is a massive fluted pillar imposing in its severity and absence of adornment; base and mouldings are absent from the foot of the column; the capital is plain and corn-

posed of merely an echinus, abacus, and triglyphed frieze.

Dorigny, Sir Nicholas (1657-1746), Fr. engraver. From 1711 to 1719 he worked for Queen Anne at Hampton Court, engraving the cartoons of Raphael. Heaviness of outline, hard contrasts, and excess of vigour mar most of his reproductions of It. paintings, but his 'Transfiguration' after Raphael is good.

Dorion, Sir Antoine Aimé (1816-91), Canadian statesman. He became leader of the Liberal party, and was the first to enunciate clearly the principle of federation as applicable to his country. As minister of justice in the Mackenzie gov. he passed the Electoral Law (1874), and the Controverted Elections Act. In 1874 he was appointed justice of the prov. of Ontario.

Doris, or Archidoris, important genus of nudibranchiate molluscs, is typical of the family Dorididae. The species are usually a white, brown, or yellow colour, whence they are called sea-lemons, but they often take to themselves the colour of their surroundings. *D. pilosa* and *D. tuberculata* are well-known members of the genus.

Doris, in anct. geog., mountainous dist. of Central Greece. It was surrounded by Phocis, Locris, Ætolia, and Malis, and it contained the sources of the Cephissus. The Dorians named this ter. as their home. It is now included in the gov. of Phocis.

Dorking, mkt. tn. in Surrey, England, 6 m. W. of Eigate and 29 m. S.W. of London. It is picturesquely situated on the N. Downs and within a small radius are some of the most beautiful spots of Surrey. The tn. is famous for its poultry. D. fowls are noted for their fine eggs and fine quality of flesh. Pop. 10,100.

Dormer, or Dormer Window, of which the Hôtel de Ville in Rouen furnishes a splendid illustration, is a little window set in a projection built out from a sloping roof. After 1350 dormers appear in Gothic domestic architecture.

Dormitory (Lat. *dormitorium*, a sleeping place) was the name given to the sleeping quarters of monks. In most monasteries the Ds. were on the ground floor, giving easy communications with the Church, though sometimes they formed the upper story of the cloisters. Sometimes they were long halls, but more often a series of cells or cubicles. To-day the name is applied to large bedrooms in schools, etc.

Dormont, residential borough of Pittsburgh, Pennsylvania, U.S.A. Pop. 12,900.

Dormouse, name given to members of the rodent family Gliridae, consists of small, arboreal animals living in the Old World. The eyes and ears are large, the tail is long and hairy, and the intestine has no cæcum. The animals are squirrel-like in habit and diet, but they are nocturnal. *Muscardinus axellanus*, the common D., is found all over Europe, and is remarkable for its winter sleep, the period of time during which it hibernates being about six months. *Myoxus glis*, the fat or squirrel D., is an allied European species.

Dornbirn, tn. of Austria, in the prov. of Vorarlberg. It is situated on the R. b. of the Dornberger Ach, near the Lake of Constance. It is an important centre of industry, and the most densely populated tn. in Vorarlberg. There are iron-works, cotton factories, dye-works, etc. Pop. 14,000.

Dornburg, tn. of Thuringia in Germany. It is situated on the l. b. of the Saale, 14 m. E. of Weimar. It possesses three castles. The Altes Schloss was frequently used as a residence by the Emperors Otto I. and III. The Neues Schloss was built in the It. style of architecture, in 1748. Goethe visited here as a guest. The third castle is a modern palace. Pop. 1000.

Dornoch, par., royal, and police burgh, seaport, and cap. of the co. of Sutherlandshire, Scotland. The tn. is situated on the N. of Dornoch Firth, 14 m. E. of Bonar Bridge, and 8 m. S.E. by S. of Mound Station. In pre-Reformation times it was the see of a bishop, and Gilbert de Moravia, who died in 1245, and was the last on the calendar of Scottish saints, built a cathedral, which was restored in 1837 by the second duke of Sutherland. The last execution for witchcraft in N. Britain took place here in 1722. Skibo Castle, about 4 m. from D., belongs now to Mrs. Andrew Carnegie. The golf links in the vicinity of D. are very fine. Pop. of par., 2500; tn. 720.

Dorohol, or Dorogol, tn. of Rumania. There is considerable trade in dairy and farm produce, also timber. A noted ann. fair is held in June. Pop. 16,000.

Doronicum, or Leopard's Bane, genus of bright orange composite plants found in Europe.

Dorpat, see TARTU-DORPAT.

D'Orsay, Alfred Guillaume Gabriel, Count (1801-52), the second son of Gen. Count D'O., served in the Fr. army until 1822, when, after a tour of the continent with the earl and countess of Blessington, he came to England. Though married to a daughter of Lord Blessington by his first wife, D'O. was on very intimate terms with Lady Blessington, and was always to be found at Grosvenor House. Exceptionally handsome, the most admired man of the day, he was a leader of the dandies, though he never had the sway of Beau Brummell. During his twenty years' residence in this country he executed a series of admirable drawings of his most noted contemporaries. Bankrupt in 1849; went to Paris, where he died three years later. Having some pretensions to art as a painter and sculptor, he was appointed Director of Fine Arts in Paris by Louis Napoleon after the coup d'état, but he did not live to fill the position. There is a biography of D'O. by W. Teignmouth Shore.

Dorset, Charles Sackville, Earl of Middlesex, sixth Earl of Dorset (1638-1706), son of Richard Sackville, fifth earl, and grandson of the first earl of Middlesex. In Charles II.'s first parliament he was M.P. for E. Grinstead, and in 1685 joined an expedition against the Dutch. The early part of his career, however, was spent in pleasure and dissipation. He

had no prominent place at court during the reign of James II., but was reinstated on the accession of William III. The only work by which he is remembered is his poem, *To All You Ladies now on Land*.

Dorset, Thomas Sackville, first Earl of (1536-1608), b. at Buckhurst. He collaborated with Thomas Norton in the writing of the first tragedy in blank verse, *Gorboduc*, founded on the Senecan model, and noteworthy on account of its purity of style. About the year 1567 Sackville was created Lord Buckhurst and shortly after that entered the diplomatic service in France. He was made a K.G. in 1598, and ten years later was appointed Lord High Treasurer, which office he held till his death. He also wrote the *Induction to the Mirror for Magistrates* (1563).

Dorsetshire, maritime co. on the S.W. of England, between Devonshire and Hampshire, the cap. being Dorchester. Open downs, affording excellent sheep pasturage, are the salient features of its undulating surface. To the E. the beautiful coastline is broken by Poole Harbour, to the S. of which lies the peninsula known as the Isle of Purbeck. Chesil Bank, which ends in Portland Bill, is a remarkable stretch of shingle connecting the Isle of Portland with the mainland at Portland Roads, where a harbour of refuge has been constructed with the help of huge breakwaters. The prin. streams are the Stour, flowing S.E. into Hants, and the Frome and Piddle, which enter Poole Harbour. Agriculture is the chief industry, the country being noted for its excellent dairy produce, whilst the industry second in importance is quarrying. The white freestones of Portland are well-known to builders, and the coarse marbles and white pipeclay of Purbeck are also in great demand. Gillingham and Sherborne in the N. are on the former Southern main railway line, branch lines serving Dorchester (12,000), Swanage, Weymouth (24,570), and Portland (4400), etc. Bridport, Lyme Regis, Swanage, Weymouth, and Poole (78,000) are the chief seaports. The fine ruins of Corfe Castle and Wimborne Minster, Milton Abbey and the abbey church of Sherborne, possess considerable antiquarian interest, and remains of immense reptiles have been unearthed at Lyme Regis. The total acreage of the co. is 622,800; pop. 282,700. See A. de Selincourt, *Dorset*, 1947.

Dorsetshire Regiment, The, formerly the 39th and 54th Foot. The 39th was raised in 1702, and after service in Europe went to India in 1754, being the first King's Regiment to serve in that country, a fact which is still commemorated in its motto 'Primus in India.' The 54th was raised in 1755. Towards the end of the eighteenth century William Cobbett was regimental sergeant-major of the 54th. The Dorsetshire Regiment has a long roll of battle honours, and its battalions served on many fronts during the First World War. The 2nd Battalion was with General Townshend at Kut-el-Amara, and was taken prisoner at the capitulation; another 2nd Battalion was raised

to take its place. In the Second World War the D. R. fought in N.W. Europe, taking part in the Battle of Normandy and the advance to the Rhine. Other units were part of the British forces in Burma.

Dorsten, tn. of Westphalia, Germany, situated on the Lippe, 35 m. S.W. of Münster. Pop. 9000.

Dorstfeld, small tn., Westphalia, Germany. It is situated 2 m. N.W. of Dortmund, and there are collieries in the vicinity. Pop. 4500.

Dori, see DORDRECHT.

Dortmund, before the Second World War, was the most important tn. in Westphalia, Germany, with 542,000 inhabs., being the centre of a great mining dist., with numerous foundries. There are extensive beds of iron ore. It was a free, fortified Hanseatic tn., but later the site of the walls was occupied by promenades. Its monumental buildings included the thirteenth-century Reinoldi kirche, the Marien kirche of the twelfth and the Propstel kirche of 1331-1354. Its municipal museum contained prehistoric Rom. and Westphalian collections. D. was frequently the target of Allied air attack in the Second World War: notably on May 23, 1913. Before that time, a pall of smoke from factories and haze covered the city for nine days out of ten. After the raid D. was absolutely clear of industrial smoke. The catastrophe of D. was greater even than that of Essen. In March 1913, more than 5000 tons of bombs were dropped on the tn. in one of the biggest, if not the biggest, daylight air attack of the war. This attack was carried out by 1000 aircraft of the R.A.F., the majority being Halifaxes and Lancasters, the rest being escorting Mustangs and Spitfires. Previously to this raid, there was a daylight attack on Nov. 29, 1941, but on a small scale, and a night attack on Feb. 20, 1945, when it was estimated that nearly half the tn.'s total acreage suffered damage or destruction.

Dortmund-Weser-Ems Canal, a canal of Germany which unites the Westphalian coalfield via Münster to the seaports of the North Sea. Between 1892 and 1899 the R. Ems was canalised for 43 m., and this was the nucleus of the present canal, which is 169 m. long; 108 m. of which were excavated. The canal has a width of 98½ ft. at the surface, 59 ft. at the bottom, and a depth of 8 ft. 2 in. The cost was about 3½ million pounds. The R.A.F. frequently damaged the canal in the Second World War. They drained it for the second time on Nov. 4, 1944, by breaching the embankment and they repeated this on Nov. 21. Again on Jan. 1, 1945, Lancasters once again breached the repaired canal, and, ever vigilant, attacked yet again on March 3. After that the Allies controlled the canal sending an airborne force across on April 1 for Osnabrück.

Dory, or *John Dory*, the *Zeus faber*, a species of *Zeldæ* allied to the halibut and other flat-fishes. It is a marine fish found in temperate seas of the Old World, and is valued highly as a food. The body is

laterally compressed and about 1½ ft. in length, and the general appearance is very unprepossessing. During the breeding season it utters curious sonorous noises. J. D. is probably from the Fr. *jaune dorée* (yellow gilded), a reference to the metallic lustre of the fish.

JOHN DORY

Dórah (Arabic, treading), a religious ceremony performed by the dervishes of the Sa'di order in Cairo. The chief, or sheikh, of the order rode on horseback, allowing his horse to tread upon the bodies of the dervishes who were lying down, and who were said to be unhurt by the hoofs of the animal. The ceremony was abolished in 1884.

Dos Hermanas, tn. of Andalusia, Spain. Manuf. olive oil and textiles. Pop. 10,000.

Dospad Dagb, see RHODOPE MOUNTAINS.

Dossi, Dosso and Battista, brothers, and painters of the It. school. Battista D. (d. c. 1548), who worked with his brother, was the landscape painter, while Giovanni di Nicolo di Lutero (c. 1479-1542) (as his real name was) painted the figures. Both these brothers seem to have been pupils of Lorenzo Costa, and they also spent some time in Venice together and probably also in Rome. These painters, whose work is notable for its beautiful colouring and originality, are mentioned by Ariosto in his *Orlando Furioso*. Many of their paintings are in the gallery at Ferrara and in the palace there, as they were employed by the duke. Among their works are: 'St. John at Patmos,' 'Alice,' and 'The Hours of the Day,' the latter in the Ferrara Palace.

Doss-megen-ora Mountains, the highest points in the Boro-khoro Mts. of the Tian Shan group of Central Asia. They rise to a height of 20,000 ft.

Dost Mohammed (c. 1798-1863), the brother of the vizier of Mahmud Shah. For a time he had complete power in Kabul, but was eventually compelled by the Brit. to surrender. See AFGHANISTAN.

Dostoevsky, Fedor Mikhailovich (1822-81), one of the giants of Russian literature

and one of the greatest novelists of all time, b. Nov. 11, at Moscow, son of a military surgeon. He had a troubled childhood, due to epilepsy, of which he was a sufferer all his life, and which had much to do with the mysticism, mingled with religious ecstasy and humanitarian pity and pardon for the lowly and the outcast, which was to mark his great works. He went to the St. Petersburg engineering school and made good progress, but had already shown that his love for writing was greater than his desire to be an army officer. In 1846 his first work *Poor Folk*, appeared, and gave him considerable celebrity in his own country. In 1849 he was arrested for alleged association with a revolutionary band. He was sentenced to death, and endured a horrible moment expecting to be shot, but he was reprieved and sent to Siberia, where he spent four years of misery. His confinement among criminals and political outcasts was to furnish him with boundless material for his later works. After serving a certain time in the army, he wrote *Memoirs of a House of the Dead* (1861-62) which was drawn from his own life. In a momentary period of comparative affluence he spent some time travelling in Europe, but was incurably Slav and gladly returned to his own country. Turgenev was the brightest star in the Russian galaxy then, and also had a great reputation abroad. Dostoevsky never forgave him for being too Europeanised. In 1866 he wrote one of his greatest works, *Crime and Punishment*, filled with the peculiar Russian pity for the outcast, even the murderer. All the rest of his life he struggled with his epileptic ailment and with spells of grinding poverty. Like Balzac, he sat at his writing-table penning immortal novels in the endeavour to keep the wolf from the door. At one time he wrote that he had a notion to hang himself. He could neither pay his debts, he said, nor travel. Gradually, however, he retrieved his fortunes by hard work, and made a marked success with his novels. He died on Jan. 28, and was given a public funeral. Some of his other notable novels are *The Idiot* (1868), *The Possessed* (1871), and *The Brothers Karamazov* (1879-80) his last major work. Dostoevsky understood Russia and the Russians as few writers of his country have done. Nietzsche, not given to praise, said he was the only man who had taught him something of psychology. He was less touched by European influences than any other great Russian writer, and appreciation of him has not only increased abroad, but has largely influenced all the writing of his country since his death. Despite their enormous length, his major novels have been translated into all modern languages and have had a considerable influence on European fiction. In the Second World War the Gers. looted and destroyed D.'s house during their occupation of Staraya Russa. See monographs by J. Middleton Murry, 1916, 1923; J. Lavrin, 1920; A. Glde, 1925, 1949; A. J. Meier-Graefe, 1928; E. H. Carr, 1931; A. Yarmolinsky, 1934;

S. S. Smith, 1935; H. Troyat, *Firebrand*, 1947; S. Mackiewicz, *Dostojewsky*, 1918.

Dot, in music, is a mark which is placed after a note and increases its duration by one half. When the D. is placed over the note it indicates a short staccato tone.

Dothan, city of Henry co., Alabama, U.S.A., about 120 m. S.E. of Montgomery. It has iron-works and cotton mills and many diverse manufs. Pop. 17,100.

Dotterel, or *Eudromia morinellus*, a limicoline bird of the plover family, or Charadriidae. Its home is N. Europe and Asia, but in Britain, e.g. in the Lake District and the Scottish mts., it is approaching extinction owing to the custom of

DOTTEREL

shooting the birds during the breeding season to ensure the delicacy of their flesh. The general colour is ashy-brown, with white and black markings, and the three eggs which are laid in hollows of the ground, are pale green with brown marks.

Dou, Dow, or Douw, Gerrit or Gerard (1613-75), Dutch genre painter, b. at Leyden, at an early age became a pupil of Rembrandt, from whom he acquired the art of beautiful colouring. He soon, however, gave up portrait painting and devoted his time to scenes of everyday life. His pictures reveal his close study of nature and are remarkable for their delicacy and finish. They number in all about two hundred, 'The Woman with the Dropsy,' in the Louvre, being his masterpiece. Other well-known ones are 'The Poulterer's Shop,' portrait of himself and 'The Evening School.'

Douai, tn. and arron. in the dept. of Nord, France, 15 m. E.N.E. of Arras, on the Scarpe and the Canal de la Sensée. The tn. of D. is industrial with ironworks, and refineries, breweries and trading in coal and corn. It possesses old houses, a belfry of the fourteenth to fifteenth centuries, the remains of an abbey, now the courts of justice, a museum and libraries. The Academy was transferred to Lille in 1880. In the fourteenth to fifteenth centuries D. was famous for its tapestries. The Douai Bible, the authorised Eng. version for Catholics, was issued here. The school was moved to England in 1903. Pop. (tn.) 37,200; (arron.) 197,000. D.

was occupied by the Allies on Sept. 1, 1944.

Douarnenez, fishing tn. of W. France, in the dept. of Finistère, and the arron. of Quimper. The sardine and mackerel fisheries are important. Other industries are boat-building, net- and rope-making. Pop. 20,500.

Douaumont, Fr. vil. in the dept. of Meuse and the name of the first of the outlying permanent forts of Verdun. It was attacked by the Gers. in the First World War on Feb. 25, 1916, the Brandenburger troops losing a great number of men. This supreme assault, witnessed by the Kaiser from a distant hill, captured the fort on that day, the fort itself being then in ruins; but the D. hill, nearly 400 metres high, was still held. Gen. Pétain arrived at the fall and reorganised the demoralised defence. For many days a great battle raged round the ruins of the fort and the vil. of D., and by March 1 the Ger. defence of the position had given way before the Fr. counter-attack. Large reinforcements reached the Fr., and the vital defences of Verdun remained intact (see VERDUN). Later in March and in April ruined D. changed hands several times, the Ger. Crown Prince striving to capture Pepper Ridge in order to turn the D. position, but the repulse by the Fr. at that hill finally determined the failure of the Ger. blow at Verdun. In Oct. of the same year (ten. Nivelle) recovered both Fort D. and Vaux village in a furious attack on the E. bank of the Meuse.

Double-Base, or **Base** (music), see under VIOLIN.

Double Bassoon, see under BASSOON.

Double Entry, see under BOOK-KEEPING.

Double-Flowers are a product of cultivation, in which the stamens and pistil have been replaced by petals, and the plant is therefore incapable of producing seed. No plant in the wild state is found double, but the cultivated form which is most popular is often the double one, e.g. rose.

Double Refraction, name applied by physicists to the splitting up of a ray of light incident on a crystal of calcite into two refracted rays. The phenomenon was first described by Erasmus Bartholinus in 1669, who was led to its discovery by observing that when objects were viewed through certain transparent crystals of Iceland spar two images of each object were seen. If a pencil mark is made on a sheet of white paper and a crystal of calcite is placed upon it, two images of the pencil mark are seen. On rotating the crystal, one image remains stationary while the other revolves in a circle about it. The stationary image is called the ordinary image, while the moving image, which is always displaced in the direction of the shorter axis of the rhombic face of the crystal, is called the extraordinary image. When a beam of light falls obliquely on a crystal of calcite the two rays into which it divides are called the ordinary ray and the extraordinary ray. The ordinary ray obeys the laws of refraction in the usual way, but the extraordinary ray departs from

the plane of incidence, and the ratio of the angles of incidence and refraction which it makes with the face of the crystal is not constant. The two refracted rays are found to be polarised in perpendicular planes.

Double Vision, see *under* **EYE**.

Doublings, term used in heraldry, and is applied to the linings of state robes, or mantles, or to mantlings.

Doubling the Cube, problem which originated in early Gk. times, and was one of the three great problems studied by the early mathematicians. Hippocrates, Archytas, and others solved the problem, though its solution could not be obtained by simple geometry, but necessitated a more advanced knowledge. There are various traditions as to how the question arose, one of them being an attempt of the Delians to double a cubical altar, so that it is sometimes known as the Delian problem.

Doublon (Sp. *doblon*, double), gold piece, once coined in Spain and Sp. America, worth two pistoles. Up to 1848 its value was £3 4s. 8d., but the 'Doblon de Isabel,' which entered the currency in that year, was worth £1 0s. 8d. only.

Doubs, an E. frontier dept. of France, once part of the duchy of Burgundy and later of *Franchie Comté*, served by the Paris-Lyons and the Dôle-Switzerland railways. Bounded on the N. by Belfort and Haute Saône, on the E. and S.E. by Switzerland, and on the S.W. and W. by Switzerland, it falls naturally into three zones. The plain region between the Ognon (on the W.) and the R. Doubs is the most fertile, producing wheat, oats, and other cereals, besides vegetables, hemp, fruits, and vines in abundance. The second region, mostly given to pasturage and forests, covers the central dists., whilst the third is very mountainous, being crossed by four parallel chains of the Jura in the direction N.E. to S.W. Mont d'Or (4800 ft.) in the eastern-most ridge is the highest peak. The chief exports are watches (manufactured at Besançon, the cap., and Morteau), hardware (at Hérimoncourt and Valentigney), iron (from foundries at Audincourt), livestock, vegetables, and wine. Building-stone and rock salt are the only noteworthy minerals. Besançon, Pontarlier, and Montbéliard are the 3 arrons. Pop. 298,200, the area being 2052 sq. m.

Douce, Francis (1757-1834), Eng. antiquary, published his curious *Illustrations of Shakespeare* in 1807, and his *Dance of Death* in 1833. A contributor to the *Archæologia* and *Gentleman's Magazine*, he bequeathed at his death a valuable collection of books, illuminated manuscripts, coins, etc., to the Bodleian Library.

Doughty, Charles Montagu (1843-1926), Eng. traveller and author, son of a clergyman, b. at Therberton Hall, Suffolk. Educated for the navy, and, later, at King's College, London, and at Cambridge Univ. He travelled widely in three continents, Europe, Africa, and Asia. His most memorable journey, begun in 1876, was through parts of Arabia unexplored by Europeans up to that time. Author

of *Travels in Arabia Deserta* (1888) and much poetry of an austere vein, the best known work being *The Dawn in Britain* (1906). Other vols. of poetry were *The Cliffs* (a play in verso, 1909) and *The Clouds* (a poetic drama, 1912). See D. G. Hogarth, *The Life of Charles M. Doughty*, 1928; B. Fairley, *Charles M. Doughty: A Critical Study*, 1927.

Douglas (1) cap. of the Isle of Man, and a popular seaside resort, situated 80 m. N.W. of Liverpool and 62 m. W.N.W. of Fleetwood, with both of which it is in regular steamer communication. D. has grown up round a splendid bay in the E. of the island, at the confluence of the Awin-Dhov and Awin-Glass. A fine esplanade encircles the bay from Derby Castle on the N. to Douglas Head on the S., N. of which lies the harbour, the first in the world to be equipped with radar to aid navigation. D. is served by steamers crossing in the season to Barrow, Dublin, Belfast, and Glasgow; by trams, and by the Isle of Man railway, connecting it with Peel, Castletown, and Port Erin. It has public buildings (including the House of Keys), a free library and a great number of attractions for its visitors, who exceed half a million from Easter to Oct. Pop. 19,300. (2) Vil. of Lanarkshire, Scotland, and, formerly, a place of some importance. It has a ruined castle (Scott's *Castle Dangerous*). Pop. 1500.

Douglas, city of Arizona, U.S.A. with copper and lead smelters. Pop. 8600.

Douglas (Gaelic, *dubh glas*, black water), the name of a Scottish family. **William of Douglas** is the first one of this family of whom anything definite is known, and of him there are records between the years 1175 and 1213. He was succeeded by his son, *Sir Archibald*, who died about the middle of the thirteenth century. *Sir William of Douglas* (d. 1298) ('le Hardi') was the grandson of the former. He rose against Edward I. in 1297, for which he was imprisoned and died in the Tower the following year. *Sir James of Douglas* (1286-1330), known as the 'Good' Sir James, was his son, and bore the title lord of Douglas. During the life of Robert Bruce, D. was his firm supporter, sharing the command at Bannockburn, and being successful in many border raids, till his name the 'Black D.' roused terror among the people. After many deeds of daring, he set out in 1330, according to Bruce's request, to carry the heart of the latter to Palestine, and was killed on the way. *William D.*, his son, died at the battle of Halidon Hill, and *William D.*, first earl (1327-84), became owner of the estates through his uncle Hugh, and was made earl of Douglas about 1358, and became earl of Mar by his marriage. His son, *James, Earl of Douglas and Mar* (d. 1388), succeeded him, and fell at the battle of Otterburn. As there was no direct heir to the estates, *Archibald D.* (c. 1328-c. 1400), a natural son of Good Sir James, became the third earl. He in his turn was succeeded by his son *Archibald* (c. 1369-1424), who was made a prisoner at the battle of Homildon Hill and at Shrewsbury. He afterwards became duke

of Touraine, and was killed at the battle of Verneuil. His successor was his son *Archibald*, fifth earl (c. 1391-1439). *William*, his son and heir, was murdered with his brother in Edinburgh Castle, 1440, by order of Sir William Crichton. The estates then passed to *James D.*, their great-uncle, known as the 'Gross.' His son *William*, eighth earl (c. 1425-52), was murdered by James II. in Stirling Castle, and *James* (1426-88), his brother, became the ninth earl. He proceeded at once to war with James on account of the murder of his brother, but had to surrender. His brothers identified themselves with his cause, but were defeated by the earl of Angus, another branch of the D. family who were coming into prominence. The lands of the D. branch were given over to the fourth earl of Angus, known as the 'Red D.' *Archibald*, fifth earl of Angus (c. 1449-1514), called 'Bell-the-Cat,' was succeeded by *Archibald* (c. 1489-1557), his grandson, who married Margaret, sister of Henry VIII., king of England, and their daughter Margaret was the mother of Lord Darnley, father of James VI. This earl of Angus was for a time extremely powerful in Scotland, but was eventually compelled by James V. to relinquish that power. His successors were *David*, seventh earl, and *Archibald*, eighth earl, the estates then passing to another branch, *William D. of Glenberrie*, ninth earl. In 1633 his grandson *William* (1589-1660), the eleventh earl, was made marquis of Douglas, and his son became the third duke of Hamilton by his marriage. *James D.*, second marquis (c. 1646-1700), and grandson of the first marquis, was succeeded by his son *Archibald* (1694-1761), first duke of Douglas, but as he had no heirs the title died with him. About the year 1760 one of the twin sons of Lady Jane D., sister of the duke, became the heir to the estates in spite of his right having formerly been disputed, and in 1790 became baron D. of Douglas, being raised to the peerage. He was succeeded in turn by his three sons, and when the fourth baron D. died, the earls of Home became the next heirs. The dukes of Hamilton, Buccleuch, and Queensberry, as well as the earls of Morton, Home, and Wemyss, are members of this family. See D. Hume of Godscroft, *The History of the House of Douglas and Angus*, 1644; Sir W. Fraser, *The Douglas Book*, 1885; and H. Maxwell, *History of the House of Douglas*, 1902.

Douglas, Lord Alfred Bruce (1870-1945), Eng. poet, third son of eighth marquess of Queensberry. Educated at Winchester and Magdalen College, Oxford. In London he became known as the close friend of Oscar Wilde and a member of his circle. In his *Without Apology* (1938) and his *Oscar Wilde: A Summing Up* (1940), he returned, with candour and generosity, to the subject of his former friend as if unable to rid himself of the obsession of the past. But when that is forgotten, it is probable that some of his literary work will be remembered with the best that has been written by his contemporaries. His serious verse is seen at its best in his

sonnets and he also wrote some of the best nonsense verse in the Eng. language—*Tales with a Twist* and *The Placid Pug* are typical of this verse. In his *Belgian Hare* he showed that a gaiety less satirical than good-hearted was also within his powers. His first book of poetry was *The City of the Soul*, pub. in 1899. Twenty-five years later came his *In Excelesis* (1924), written in prison as was its counterpart Oscar Wilde's *De Profundis*. This work seems to shew that great poetry was within his powers but that he did not use them; yet he left more than mere *elegantia* and he was at his best, perhaps, within the rigid limits that he could set to the strictest of forms—the Petrarchan sonnet. See W. Freeman, *Lord Alfred Douglas*, 1948.

Douglas, Sir Andrew Snape (1761-97), Brit. naval officer. In 1781 he commanded the *Chatham* and captured over fifty Fr. vessels. He was appointed flag-captain of Lord Howe's flag-ship the *Queen Charlotte*, and was dangerously wounded on the 'glorious first of June,' 1794. He recovered sufficiently to take part in the victory off L'Orient in the following year, but died two years later.

Douglas, Sir Charles (d. 1789), Brit. rear-admiral. Made commander in 1759, he was sent out to defend Quebec in 1776, and was present at the battle of Ushant in 1778.

Douglas, David (1798-1831), Scottish traveller and botanist, was born at Scone, Perthshire. He was originally a gardener, but in 1823 went to the U.S.A. on a commission for the Royal Horticultural Society, and on his second journey to America about two years later he made several discoveries of plants, among them the tree named after him as *D. Fir* (q.v.).

Douglas, Gavin or Gawin (c. 1474-1522), Scottish poet and bishop, was a son of Archibald 'Bell the Cat,' fifth earl of Angus. Educated at St. Andrews for the priesthood, he became provost of St. Giles, Edinburgh, in 1501, and finally bishop of Dunkeld in 1516. But as he had disobeyed the statute which forbade any one accepting preferment through the pope's bull, he underwent a term of imprisonment before taking up office. Although his nephew married the widowed queen of James IV., D. failed to rise so high in the church as he had hoped. When the regent Albany was trying to negotiate for the queen a divorce from Angus, D. made futile efforts to interest Henry VIII. in his kinsman's favour. D. wrote two allegorical poems, *The Palace of Honour*, and *King Hart*, both of which illustrate the writer's indebtedness to Chaucer, but his chief literary work was his trans. of the *Æneid* (pub. after his death, 1553), the first version of a Lat. classic pub. in Britain. See J. Small, *The Poetical Works of Gavin Douglas, Bishop of Dunkeld, and Life*, 1874; P. Lange, *Chaucers Einfluss auf die Originaldichtungen des Schotten Gavin Douglas*, 1882; L. M. Watt, *Douglas's Æneid*, 1920.

Douglas, George (Scottish writer), see BROWN, GEORGE DOUGLAS.

Douglas, John Sholto, see QUEENSBERRY, MARQUESS OF.

Douglas, Stephen Arnold (1813-61), one of the greatest Amer. statesmen and orators of his time, born Brandon, Vermont, April 23. Son of a doctor, he studied law and settled in the state of Illinois, and soon became a leader in the Democratic party. In 1836 he entered the state legislature; in 1840 he became its secretary, and in 1843 he was elected Congressman. Four years later he was elected to the U.S. Senate, and remained there until his death. He was the hero of the slave-holding states in the political struggles prior to the Amer. Civil war. Stood for the Presidency when Lincoln was elected. Was a leader in the W. states. In the Senate, however, Douglas superbly defended Lincoln's inaugural address and went to the White House and pledged Lincoln his support. In the last great speech of his life, which he made at Columbus, Ohio, on his way to Washington, he declared that the union must be preserved at all costs. The N. now closed ranks to fight the S. Douglas died in Chicago, June 3.

Douglas, Thomas, see SELKIRK, EARL OF.

Douglas, Sir William Fettes (1822-91), Scottish painter, b. in Edinburgh. From 1877-82 he was curator of the National Gallery of Scotland, and in 1882 he became president of the Royal Scottish Academy. His pictures are characterised by their perfection of detail and colouring, among his best being: 'The Alchemist,' 'The Rosicrucians,' and 'A Fishing Village.'

Douglas Fir (*Pseudotsuga Douglasii* or *taxifolia*), tall ever-green tree resembling the pine, native to W. North America. It attains a height of 250 ft. The timber is strong and quick growing. It is exported in considerable quantities, being known in Britain as Oregon Pine or Brit. Columbian Pine.

Douglass, Frederick (1817-95), Amer. journalist and orator. He was b. at Tuckahoe in Maryland, and was at first brought up as a slave, for his father, who was a white man, had married a negro slave. In 1838 he managed to free himself by escaping from a shipyard in Baltimore, and he then assumed the name of D. instead of Bailey, his original one. After living at New York and then New Bedford, he was appointed a lecturer by the Anti-Slavery Society on account of his eloquence. He pub. *Frederick Douglass's Paper* on the abolition of slavery, and in addition he filled some important offices, among them marshal for the dist. of Columbia and minister to Haiti.

Douglass, Sir James Nicholas (1826-98), Brit. engineer, b. in London. After being apprenticed and holding one or two posts as an engineer, he became in 1862 chief engineer to Trinity House, his chief work being the designing of the new Eddystone Lighthouse of 1878.

Doukhobors, see DUKHOBORS.

Douala, see DUALA.

Doullens, Fr. tn. in the dept. of Somme. It stands on the Authie to the N. of Amiens, and has a fine sixteenth century church. Pop. 5700.

Doulton, Sir Henry (1820-97), Eng. pottery manuf., b. in London. He was at first employed under his father, and afterwards opened at Lambeth the pottery works bearing his name, which are the largest in the world. He is noted especially for reviving art in connection with the design and manuf. of pottery.

Doom, see DOOM.

Doumer, Paul (1857-1932), Fr. statesman, and colonial governor-general, b. at Aurillac. Unsuccessful at the presidential elections of 1906, he was elected president in 1931. He was one of the makers of the Fr. colonial empire. Arriving in Indo-China in 1897 as governor-general, it was he who finally gave the colony a definite administrative structure, really united the colony and set its people on the path of progress. He was in power there for five years and he owed his success to direct action and carefully planned centralisation. 'To govern everywhere and administer nowhere is the task of the Governor-General' was his dictum. Thus he voluntarily renounced his administrative functions and successfully demanded that a Resident be named for the Protectorate. He revitalised the Imperial Council of Indo-China, with Fr. administrators and presidents of chambers of commerce as representative members, and the Resident as the effective chairman of the native King's Council. Assassinated in France by a Russian named Gorgoulou in 1932.

Doumergue, Emile (1844-1937), Fr. theologian, b. at Nîmes. Studied theology in Geneva, Montauban, and in Germany. Then made a special study of Calvinism and pub. a series of vols. on Calvin, among which are *L'Art et le sentiment dans l'œuvre de Calvin*; *La Pieté réformée d'après Calvin*; *Calvin le fondateur des libertés modernes*.

Doumergue, Gaston (1863-1937), Fr. statesman, and president of the Fr. Republic 1924 to 1931; b. at Algues-Vives, and son of a farmer. Educated at the lycée, Nîmes. Practised as barrister and became magistrate first in Cochinchina, and then in Algiers. Deputy for Gard, 1893, secretary of the chamber of deputies, 1895-96; colonial minister, 1902, 1905; vice-president of the chamber, 1905-06; minister of commerce, industry, and labour, 1906-08; of education, 1908-1910; and Premier in 1913. On the outbreak of war, he was colonial minister in Viviani's Cabinet. He had the distinction of being the first Protestant President of the Republic (1924-31). Prime Minister, 1934. (See illustration, p. 744.)

Doune, Scottish vil. situated in the co. of Perthshire, on the Teith. It lies to the N.W. of Stirling and contains the well-preserved ruins of its castle, built in medieval times. The old bridge was erected by the tailor of Princess Margaret of England, afterwards queen of James IV. Pop. 820.

Dour, com. of Belgium in the prov. of Hainaut, 10 m. S.W. of Mons. There are coal-mines in the vicinity. Pop. 11,600.

Doura, ruined tn. on the banks of the Euphrates, founded 300 B.C., but

abandoned after the destruction of Palmyra in A.D. 273. The Brit. troops discovered here in 1920 paintings of the second and third centuries, and excavations were made by the Fr. Académie des Inscriptions, which revealed the plan of the fortress, the streets, the temple of the Palmyrian gods, frescoes, sculptures, and inscriptions.

Topical Press

GASTON DOUMERGUE

Doura, or **Durra**, flour from a kind of millet seed yielded by different varieties of *Andropogon sorghum*, which is a coarse kind of grass much cultivated in Asia, Africa, and S. Europe. Indian durra makes inferior bread, but is used as a substitute for rice. The leaves and stalks of this variety before the plant flowers are poisonous to cattle. The name durra is often wrongly used to represent the genus *Sorghum*, but, correctly speaking, it applies only to the flour.

Douro (anc. **Durius**), third largest riv. of the Iberian Peninsula (about 185 m. long), draining an area of some 37,500 sq. m. Rising in the Pico de Urbiön (7389 ft.), S. of the Sierra de la Denianda, the D. crosses the Castilian plateau in a W. direction, then from 3 m. E. of Parafella to Barca d'Alva runs S.W., being for 65 m. the boundary between Spain and Portugal, and finally reaches the Atlantic at São João da Foz, 3 m. below Oporto, having traversed Portugal with a W. course. The tributaries on the right bank are the Pisuerga, Valderaduey, and Esla (in Spain), and the Sabor, Túa, and Tamega (in Portugal), and from the left the Span. Adaja, Tormen Yeltes, and the Portuguese Agueda, Cóa, and Paiva. A sand-bar at the mouth, rapids and swift inundations render the lower courses useless for navigation. Toro and Zamora are on its r. b.

Douroucouli, popular name for S.

Amer. monkeys of the genus *Nyctipithecus* in the family Cebidae. The incisors in the lower jaw project forwards, and the eyes of the monkeys are large, both of which features give them a lemurine appearance. They are unlike many of their allies in having the long tail non-prehensile.

Douw, Gerard, see **DOU**.

Dove, riv. of England, rising in Axe Edge, Derbyshire, 4 m. from Buxton. It forms the S.W. border of that co. and is noted for its beauty. Trout abound in its waters, and for this reason it was well known to Izaak Walton. The riv. flows into the Trent near Burton.

Dove. In very early times the D. was used in pictures to represent the Holy Ghost, and is often seen in pictures which deal with the various periods of Christ's life, especially in those of the Annunciation and His baptism. It was used also as the form of the pyx, and was sometimes placed on fonts. When represented with three pairs of wings it typified the church.

Dove, see **PIGEON**.

Dovedale, picturesque dell on the borders of Staffordshire and Derbyshire, England, extending from Thorpe Cloud to Dove Holes. The scenery is a charming combination of wood, rocks, and water.

Dover, chief of the five Cinque Ports, bor. markt. tn., and holiday resort in the co. of Kent, England. It is situated in a breach between high chalk cliffs on the N.W. side of D. Strait. It is 21 m. distant from Cap Gris Nez on the opposite side of the Eng. Channel, and lies 66 m. to the E.S.E. of London. The dominant feature of the tn. is its castle, with an altitude of 375 ft. above sea-level, which includes in its grounds a Rom. lighthouse, the anc. cruciform church of St. Mary-in-Castro, a massive Norman keep now used as a bomb magazine, and barracks for 200 men. The prospect from the keep includes, on a clear day, the Fr. coast from Boulogne to Gravelines, and the cliffs from Folkestone to Ramsgate, together with the many elaborate fortifications which honeycomb the D. cliffs on either side. D. College has been built round the fine remains of the twelfth century St. Martin's priory. The Admiralty Pier (begun in 1847) and the Prince of Wales Pier (begun in 1893), the former of which has an overhead railway, enclose many acres of sheltered waters. In 1896 the construction of an artificial naval harbour, with an area of 610 ac., was commenced, and also that of three great enclosing breakwaters of concrete, the combined length of which are over 1½ m. There are two docks, the Granville and the Wellington, the latter of which was widened for large Channel steamers in 1888. D. has shipbuilding, rope- and sail-making industries, besides her fisheries and traffic in dairy produce with France. The D. routes to the Continent via Calais, Boulogne, and Ostend are popular. The steamer crossing to Calais takes little over one hr. There is a pilot station with seventy-five pilots and a life-boat station. The boundaries were extended in 1921. During the Second World War, D. was one of Great Britain's 'front-line' tns.,

being repeatedly shelled from the coast of France by the Gers. In addition to considerable aerial bombardment. The bor. council, having been granted authority to acquire 26 ac. of 'blitzed' sea front by compulsory purchase, propose to build blocks of eight storied flats and hotels to replace the derelict boarding-houses. Pop. 41,000.

Dover : (1) The oldest (1623) city in the Stafford co. of New Hampshire, U.S.A., on the Cochecho Riv., 68 m. N. by E. of Boston. It has cotton and woollen mills, besides print works. The Univ. of New Hampshire is at Durham 5 m. S.W. Pop. 14,900. (2) The cap. of Delaware, U.S.A., and co. tn. of Kent co. on Jones' Creek and the Philadelphia, Baltimore, and Washington railway, 48 m. S. of Wilmington. Besides being the centre of a fruit district, D. has factories for canning fruit, etc. Pop. 4800. (3) A tn. of Morris co. New Jersey, U.S.A., with iron mines and varied manufs. Pop. 10,400. (4) A city of Tuscarawas co., Ohio, with iron ore and coal and manufs. Pop. 9600.

Dover Patrol. On the outbreak of the First World War the D. P. formed part of the E. Coast Naval Command, under the command of Admiral Ballard. Its duties were to prevent Ger. ships forcing their way into the Eng. Channel, and to inspect neutrals for contraband (*q.v.*). Soon after the War commenced it was made a separate command under Admiral Hood (*q.v.*), (who was subsequently killed at the Battle of Jutland). Later on, 'drifters', i.e., vessels equipped with drift nets in order to catch submarines, and trawlers to sweep for mines were added to the Patrol. Eventually it consisted of twenty-four distinct classes of fighting vessels. Admiral Bacon was in command from 1915 to 1917, being succeeded by Adm. Evans (later Lord Mountevans) of Antarctic fame. The work of the D. P. was very varied. Besides safeguarding the transport of troops to France, the D. P. was engaged offensively against the Gers. on the Belgian coast, and against their bases at Zeebrugge and Ostend; and in all, twenty-eight bombardments were carried out. Mines and mine net barrages were laid along the Belgian coast, a procedure which stopped enemy mine-laying in the Channel. Over five million troops were transported to France without a single casualty. The record of the D. P. is told by Adm. Sir R. Bacon in his *The Dover Patrol, 1915-1917*.

Dover, Strait of (anc. *Frelum Gallium*, Fr. *Pas de Calais*, narrow channel separating France and England, and joining the Eng. Channel with the North Sea. It is about 22 m. in length, and at its narrowest part, from Dover Pier to Calais, its breadth does not exceed 21 m. It extends from Dungeness and Cap Gris Nez in a N.E. direction to S. Foreland and Calais. The greatest depth is not quite 180 ft. The geological formation of the channel bed points to the fact that at one time England joined the continent. The tides of the N. Sea and the Eng. Channel meet in the Strait.

Dovercourt, holiday resort of Essex, England, situated at the mouth of the Stour estuary, S. of Harwich. There are two lighthouses guarding the entrance into Harwich Harbour and also marking the position of a sandbank. Good bathing is to be obtained at D. Pop. 8000.

Dovey (or *Dyff*), a river of N. Wales, rising in Merionethshire and emptying in to Cardigan Bay at Aberdovey. Length, 30 m.

Dovrejsfeld, forms part of the mountainous tableland of Norway, being marked off by the valleys of the Sundal, Laagen, and Rauma, and by the fjords off Nordmøre. Precipitous, irregular spurs, attaining an elevation of 6000 ft., shut in the Rauma valley (well known to tourists as the Ramsdal), but Snehætton, a magnificent snow field, is the highest peak (7615 ft.).

Dove, Ring, see CUSHAT.

Dow, Lorenzo (1777-1834), Amer. Methodist preacher, b. at Coventry, Connecticut. Was sent as a missionary to the Catholics in Ireland, and both in England and America attracted great audiences: helped to found the Primitive Methodist Society in England. He was a strenuous opponent of the Rom. Catholics.

Dowager (O.F. *douage*, dower), meant originally a widow with a dower. First used in England of Catherine of Aragon, widow of Prince Arthur, it is now applied to all widows of high rank to distinguish them from their sons' wives.

Dowaziac, city and summer resort of Cass co., S.W. Michigan. Manufs. furnaces. Pop. 5000.

Dowden, Edward (1813-1913), Irish critic and literary historian, native of Cork, where he began his education, afterwards proceeding to Trinity College, Dublin. He held first the post of professor of oratory at that univ., and afterwards that of professor of literature. He was a great authority on Shakespeare and an able critic, his chief works being *The Life of Percy Bysshe Shelley* (1886), *New Studies in Literature* (1895), *The French Revolution and English Literature* (lectures, 1897), *Puritan and Anglican: Studies in Literature, 1800*; *Robert Browning* (1904), *Essays, Modern and Elizabethan* (1910). He also ed. or wrote introductions to the following: *Shakespeare's Scenes and Characters* (1876), *The Sonnets of Shakespeare* (1881), *The International Shakespeare* (1884), *Romeo and Juliet* (The Arden Shakespeare, 1899), *See Lily E. Marshall, The Letters and Poems of Edward Dowden, 1914*.

Dowie, John Alexander (1847-1907), b. in Edinburgh, was for a time a student at Edinburgh Univ. He afterwards went to S. Australia, where his parents were living, as the minister of a Congregational church. Later on he claimed the power of being able to heal people by means of prayer, and organised the 'Christian Catholic Church in Zion', he himself being the overseer, and at the beginning of 1900 he settled with his followers on the shores of Lake Michigan in Zion City. In 1903 and 1904 he visited England, where he did not meet with much encouragement, and

in 1906 his prestige over his followers was lost after the revolt of Zion City. D. was popularly known by the title of 'Doctor,' and he himself claimed to be Elijah.

Dowlais, industrial community of Wales, in the co. of Glamorgan adjoining Merthyr-Tydfil, of which it is a suburb. The Dowlais Iron and Steel Works employ about 20,000 workers.

Downland, John (1563-1626), Eng. lutenist, b. probably in London. According to Fuller's *Worthies* he was a native of Westminster. The greatest lutenist of his age, he held the position of court lutenist to Christian IV. of Denmark at a salary of 500 dalers per annum, a sum equalling the salaries of the high officers of state. According to Henry Peacham (*Minerva Britannia*, 1612), D. was neglected in England, Peacham comparing him to a 'nightingale sitting on a briar in the depth of winter.' D. was recognised in his own country only in his old age when he was appointed one of the King's (Charles I.) Musicians for the Lutes. His songs with lute accompaniment are the most accomplished of their kind and are said to have been pub. in all the chief European capitals. His *First Booke of Songs or Ayres of Foure Parties with Tableture for the Lute* was pub. in 1597. Its success was immediate and four more eds. were called for between 1600 and 1613. It was represented in score by the Musical Antiquarian Society in 1844 and all four books with three songs in 'The Musical Banquet' have been pub. in the *English School of Lutenist Song-writers* (ed. E. H. Fellowes). As a performer on the lute D. had no rival in Europe and his skill is celebrated in a sonnet by Richard Barnfield. His son Robert (1586-1641) succeeded him in his English royal office.

Dowlas, coarse kind of unbleached linen. Exceedingly strong; it was used by workmen for their aprons and sometimes for their shirts. It is not used so much, however, in the present day.

Dowlatabad, see DAULATABAD.

Down, maritime co. with a coastline of 67 m., in N. Ireland, having an area of 609,057 ac. Belfast Lough, Dundrum and Carlingford Bays are spacious inlets along the indented shores, but the largest is Strangford Lough, whose waters are studded with 260 islets. Slieve Donard reaches the highest altitude (2796 ft.) in the Mourne Mts. to the S. The Bann, the Lagan, and the Annacloy are the chief rivers, whilst the Newry Canal along the W. gives increased facilities for communication. Oats, potatoes, wheat, turnips, and flax are widely cultivated, whilst pigs and cattle are reared. Linen, hosiery, woollens, leather, cattle, butter, and corn are the prin. exports. The co. tn. is Downpatrick. Round towers, stone cairns, raths and abbeys are among the antiquities of interest. Two members represent Down in the Imperial House of Commons. Pop. 310,600.

Downham Market, mrkt. tn. and urban dist. of England, in the co. of Norfolk. It is situated on the Ouse, 11 m. S.W. of King's Lynn and has a large flour mill, malt houses and a brewery. Pop. 3400.

Downing College, Cambridge, founded in the year 1800 by money which had been left in 1717 by Sir George Downing for that purpose, and its charter was sealed in the same year, making it part of the Univ. of Cambridge. The college must consist of a master, two professors (one of laws of England, and one of medicine), and a certain number of fellows and scholars. There are scholarships which may be competed for by those who are not members of the univ. Some of these are foundation scholarships, and others are minor ones of less value, and those obtaining them may afterwards compete for foundation ones.

Downing, Sir George (c. 1623-1684), Eng. soldier and politician, son of Emmanuel D., of the Inner Temple and later of Massachusetts. Educated partly in England and partly at Harvard College. Went to England about 1645, and became a scout-master-general in Cromwell's Scottish Army, and a teller of the Exchequer. Was deputed by Cromwell, after the war, to make a settlement with Scotland. Represented Edinburgh in Parliament, and later England at The Hague, being one of the foremost advisers on foreign policy during the Protectorate, under both Oliver and Richard Cromwell, his greatest mission of that time being to try to bring about a union of all the European Protestant Powers. Always a zealot for the old Constitution, he was active, on the accession of Charles II., in endeavouring to arrest the regicides who had sought refuge on the Continent. He received large grants from the king for his services, but though an able man, he was crafty, avaricious, and treacherous. He is often mentioned in Pepys' Diary.

Downing Street, street of Westminster, London, leading into Whitehall. Its name is derived from Sir George Downing, a celebrated politician, who lived in the reign of Charles II., and was Secretary to the Treasury in 1667. The Foreign Office and also the Colonial Office (shortly to move to more commodious premises) are here, as well as the official residences of the Prime Minister and the chancellor of the exchequer; numbers 10 and 11 respectively. See E. Jameson, *Ten Downing Street: The Romance of a House*, 1945.

Downpatrick, cap. of co. Down, N. Ireland, 28 m. S.S.E. of Belfast (by the Belfast and County Down railway), is a tn. of extreme antiquity, situated close to the S.W. fringe of Strangford Lough. Though St. Patrick founded the see in 440, the present cathedral (Protestant) is not older than 1790. Ships of 100 tons come up as far as Quoile quay, about a mile from the tn. The dun or rath of Keltar, extending over an area of 10 ac., is one of the best in Ireland. Its race meetings attract visitors, and Rom. Catholics seek its holy wells. Brewing, tanning, soap and linen making are the chief industries; cattle, pigs, corn, and potatoes the chief exports. Pop. 3200.

Downs, North and South, two ranges of rounded chalk hills, situated in the S. and S.E. of England, the enclosed valley being called the Weald. They have their be-

ginning in Hampshire, by Salisbury Plain. The N. D. lie in Surrey and Kent, ending in the S. Foreland. The highest points reach over 800 ft. above sea-level. The S. D. cross Sussex, and terminate in Beachy Head. The highest points reach 800 ft. above sea-level. The sheep reared on the Downs are celebrated.

Downs, The, safe place of anchorage for ships, 8 m. long by 6 m. broad, between the Goodwin Sands and the Kentish Coast. The scene of sev. sea-battles between the Brit. and Dutch.

Downton, par., formerly a mkt. tn., of England in the co. of Wiltshire, situated on the Avon, 6 m. S.W. of Salisbury. D. is of ant. origin, having been important in A.-S. times. The 'Moot' and earthworks of that period still remain. Cerdic, the Saxon, gained a victory here in 519. It sent two members to Parliament until 1832. Pop. 1300.

Dowsing, see under DIVINING ROD.

Doxology (Gk. *doxologia*, praise-giving), an ascription of praise to God. The name is given to the short ascriptions given at the end of some of the N. T. epistles, and occurring sometimes in the middle of an argument (e.g. the ends of Rom. and 2 Pet., and in Rom. ii. 36). The title is, however, more particularly applied to (1) the ascription, 'Glory be to the Father and to the Son, etc.', repeated in the Anglican and Rom. churches, principally at the end of psalms and canticles. This is known as the Lesser D.; (2) the Trisagion or Tersanctus taken from Isaiah vi. 3; (3) the concluding part of the Lord's Prayer, 'For Thine is the Kingdom, etc.'; (4) the Greater D., known also as the *Gloria in Excelsis*, which occurs in the first part of the Rom. Mass and the end of the Eng. Communion Rite.

Doyle, Sir Arthur Conan (1859-1930), Eng. author, eldest son of Charles D. the artist; also nephew of Richard D. of *Punch*, and the grandson of the famous John D. ('H. B.'). He studied medicine, and took his degree at Edinburgh; afterwards practising at Southsea, until his success as a writer induced him to devote himself entirely to letters. During the S. African War, however, he went out as senior physician of the Langman Field Hospital. His first book, *A Study in Scarlet*, in which 'Sherlock Holmes' made his first appearance, was pub. in 1887. He pub. many stories of different kinds: historical novels such as *The White Company* (1891), *The Exploits of Brigadier Gerard* (1896), *Uncle Bernac* (1897), and the excellent picture of the Georgian rakehell set, *Rodney Stone* (1896). But fame came to him through the creation of 'Sherlock Holmes,' the wonderful inductive detective, whose adventures thrilled the entire world, which followed his adventures with breathless interest. Undoubtedly suggested by the 'Dupin' of Edgar Allan Poe, Holmes was a mere caricature of that excellent conception: he captivated, not by real astuteness, but by mannerisms and by a portrait that was an afterthought of the illustrator—whether suggested by D. or not; and it is more than suspected that his creator

held him in derision. D. wrote also for the stage; and his dramatic version of a story of his own, *A Story of Waterloo*, gave Sir Henry Irving one of his most popular successes. The latter part of D.'s career was largely expended on psychio research; and, after some books on the S. African and First World War, came *The Wanderings of a Spiritualist* (1921), and *The History of Spiritualism* (1926). The hero he found it so difficult to kill made his last appearance in *The Case Book of Sherlock Holmes* (1927). Sir Arthur was finally successful in his long effort to obtain the release of the unjustly condemned Oscar Slater. See J. Lamond, *Arthur Conan Doyle; a Memoir*, 1931; V. Starrett, *The Private Life of Sherlock Holmes*, 1934; J. D. Carr, *The Life of Sir Arthur Conan Doyle*, 1949.

Doyle, Richard (1824-83), caricaturist, was the second son of John D., also famous as a caricaturist. At the age of fifteen he pub. *The Eglinton Tournament*, or, *The Days of Chivalry Revived*. In 1843, when *Punch* was two years old, he became a regular contributor, and much of his best work appeared in it, notably 'Manners and Customs of ye Englyshe,' until in 1850 he retired, owing to the paper's attacks on papal aggression. He illustrated many books, among others Thackeray's *Rebecca and Rowena* and *The Newcomes*, Locker's *London Lyrics* and the *Bon Gaultier Ballads*. As an artist he was at his best in fantastic designs, for his fancy was unbounded, and in dainty elf-like designs such as those, by him, which still decorate the cover of *Punch*.

D'Oyly Carte, Richard (1844-1901) was for some time a concert and lecture agent, but at the age of thirty-one he became a theatrical manager, and it was in that capacity he became known to the world. In March 1875 he produced at the Royalty Theatre, London, *Trial by Jury*, the first of the series of comic operas written by Sir W. S. Gilbert and composed by Sir Arthur Sullivan. At the Opera Comique he brought out *The Sorcerer* and *H.M.S. Pinafore*, and followed these with *The Pirates of Penzance* and *Patience*. All these were successful, and the three men made, it is said, £60,000 a year. D. invested his share of the profits in the erection of the Savoy Theatre, where he put on the other Gilbert and Sullivan plays, nearly all of which had a long run. D. in 1891, opened the building now known as the Palace Theatre as the English Opera House, but here he met with his first and only check. The venture was a failure, and the building was disposed of to a syndicate for music-hall purposes.

Dracæna, genus of Liliacæ, comprehends forty species found in warm parts of the Old World. It was estab. by Linnaeus and named from one of the species yielding the resinous exudation known as dragon's blood. *D. terminalis* is regarded as a symbol of truth and of peace in the E. Archipelago; sugar and an intoxicating drink are obtained from the roots in the is. of the Pacific. *D. draco*, the dragon-tree, which yields the red

gum-resin, had a celebrated representative in Teneriffe. This tree, which was blown down in 1868, was 45 ft. in diameter, 70 ft. in height, and was supposed to be about 6000 years old.

Drachenburg, or **Drachenfels**, peak in the Rhineland, Germany, belonging to the Siebengebirge range. It is situated on the r. b. of the Rhine, 10 m. S.E. of Bonn, and close to Königswinter. Rising to a height of 1055 ft., it is noted as being the steepest, although not the highest mt. of the whole group. The Drachenhöhle, or the dragon's cave, is in the slopes, around which is woven the story of the dragon that was slain by Siegfried. The peak is ascended by a road and a rack and pinion mt. railway. A castle, ruined since the Thirty Years War, stands on the summit.

Drachenstein Mountains, chain of mts. in the S.W. of Cape Prov., S. Africa. They extend N. and S. to a distance of 25 m. eastward of Cape Town.

Drachm, or **Dram**, see **under WEIGHTS AND MEASURES**.

Drachma was, in anct. Greece, a silver coin, equal in value to one-hundredth part of a mina and a six-hundredth part of a talent. Until Solon's day a D. was worth a little over a shilling, but the Attic D. was equivalent to about 9½d. in Eng. currency. The obol was equal to one-sixth of a D. In Athens the principal coin in use was the tetradrachmon, worth four drachmæ, having the head of Pallas engraved on one side, and the owl on the other. As a weight measure, 100 drachmæ were again equal to 1 mina (almost a lb.). The Gk. D. in modern currency, is worth about 8½d. It is divided into 100 lepta.

Drac, Canal du, see **GAP CANAL**.

Dracina, **Dracolin**, see **DRAGON'S BLOOD**.

Draco (seventh century B.C.). Athenian statesman and lawgiver. He was the first codifier of the laws of Athens. Before his time the laws were unwritten and were administered by the Eupatridæ. Tradition has always connected his name with a severity which has become proverbial in the word 'draconian.' Demades, the orator, declared that D.'s laws were 'written in blood,' for nearly every law-breaker suffered the penalty of death. It is now generally agreed by scholars that the constitution assigned by Aristotle (*Athen. Polit.*) is not authentic. See also **ATHENS** and **GREEK—History**.

Draco, (lizard), see **FLYING DRAGON**.

Draco ('the dragon'), constellation in the northern hemisphere. A star in Draconis was used by Bradley in his discovery of the aberration of light. It is situated almost in the solstitial colure, and so the minor axis of the lesser aberrational ellipse lies in the meridian at its transit.

Draco, (Greece), see **PIRÆUS**.

Dracunculium, see **DRAGON**.

Dracut, tn. of Middlesex co., Massachusetts, U.S.A. Pop. 7300.

Dra-el-Mizan, tn. of Algeria in the arron. of Tizi-Ouzon, with marble quarries and cork manufs. Pop. 6740.

Draft, order written by the drawer to authorise the payment of a sum of money by some other person acting as an agent.

These Ds. are used in commerce between firms and in municipal affairs by corporations.

Dragomans (Fr. *dragoman*, It. *dragomanno*, Arabic *layuman*), the men in the E. who act as interpreters. They act as guides, and in addition to that they make all the arrangements for their travellers, some of them being employed at the ambassadors' courts.

Dragon (Gk. *δράκων*, the seeing one, from *δρακωμαι*, to see; Lat. *draco*, Fr. *dragon*), in the mythology of almost all nations, is typical of the power of evil which has to be overcome, hence the great work of the heroes of the nations was to kill the D. The conception of its shape seems to have varied slightly, but in its essential principles it was snake-like, probably having wings and being able to breathe out fire from its mouth. With this idea of the snake's representing the power of evil is connected that of the N.T., in which the serpent is typical of sin, as the D. held a similar place in the sacred writings of the Heb. In the Gk. mythology, the hydra, or monster with nine heads, was slain by Hercules, while others among the heroes also slew Ds. In the same way the heroes of the stories of northern mythology made their great feat the slaying of the D., among them being the god Thor, Siegfried, whose story is related in the *Nibelungenlied*, and Beowulf, the hero of the poem of that name. This idea is found in later Gk. Romances and in the medieval stories of King Arthur and Tristan. In the Gk. mythology the D. is represented with eyes ever on the watch, a symbol of the evil that waylays men to kill, as in guarding the 'Apples of the Hesperides' and the 'Golden Fleece', because these are prizes that fall only to those who are as vigilant towards him as he is to them. It is consecrated to Minerva to signify that true wisdom, as sensible as the ever-vigilant D., never sleeps.

Dragon, popular name of several species of lizards, and is particularly applied to members of the Amer. genus *Dracena* and the Malayan *Draco*, see **FLYING LIZARD**.

Dragon, in botany, is the name applied to plants in the araceous genus *Dracunculium*. The stem is usually mottled, and the flowers have a gaping mouth. Green Dragon is a herb found in S. America. The corn contains a sap used locally in medicine. The term 'dragon plants' is applied to the two species of *Dracunculus* which flourish round the Mediterranean. The name of dragon-wort is given to two distinct herbs, *Arenisia dracunculius*, a species of Compositæ, and *Polygonum bistorta*, a species of Polygonacæ. The plant known as the dragon-tree is *Dracena draco*, a liliaceous tree from which exudes the resin called dragon's blood. Dragon-Root occurs in hot countries and is believed to be fertilised by snails; the tuber is used in medicine. Dragon's Head, or *Dracocephalum*, a genus of the Labiæ which receives its name from the appearance of the corolla.

Dragonet, or *Callionymus*, a genus of small fishes living in the sea, the males

have the fin-rays produced into filaments. *C. draco* is known as the skulpin.

Dragon-fly, name of a number of insects now considered to belong to the order Odonata, though some writers still call the family Libellulidæ. They are sometimes called 'devil's darning needles' and 'horse-stingers,' but are at the same time harmless except to the insects which form their food; horses and ponies, however, view them with some misgiving and will move out of their path of flight. They are characterised by a very freely moving head; large compound eyes, made up of thousands of facets; an overhanging upper lip enabling them to catch their prey; small antennæ; two pairs of wings equal in size, the main nervures having a longitudinal direction crossed by a number of

W. J. Lucas, *British Dragon-flies, Odonata*, 1900.

Dragon Mountains, see **DRAKENBERG**.

Dragonnades, see **CAMISARDS**.

Dragon's Blood, a name applied in ancient pharmacology to the resin derived from a number of plants, chief of which are the *Calamus draco*, and *E. Indian palm*, *Dracæna draco* of the Canary Is., and the *Croton draco* of Mexico.

Dragon's Mouth and Snapdragon, popular names for flowers of the genus *Antirrhinum*, and order Scrophulariaceæ. The corolla is personate, and when pinched between the fingers the mouth opens and then closes with a snap.

Dragon (Fr. *dragon*), originally applied to a cavalry soldier, trained to fight on foot. He received his name from his weapon, a 'dragon' or short musket, so called from the dragon's head worked on the muzzle, which was first carried by the horsemen of Marshal Brissac in 1600. Accustomed to fight with the infantry, they were organised into companies, their officers bearing infantry titles. Ds. were naturally at a disadvantage, as regards armament and horsemanship, compared with the *bona fide* cavalry regiments. Since the campaigns of Frederick the Great, the term D. has been used of medium cavalry. In police and in all kinds of guerilla warfare, Ds. have been employed, because they combine efficiency with economy. When Louis XIV. proceeded against the Protestants, he was said to 'dragoon' or 'dragoonade' them. The Scots Greys (established in 1683) is the oldest D. regiment in the British army. See also **ROYAL DRAGOONS**; **SCOTS GREYS**; **GUARDS**; **DRAGOON**.

Draguignan, tn. of France, cap. of dept. of Var., 50 m. N.E. of Toulon. Pop. 11,800 (arron.), 112,500.

Drain (Sewers), see **SEWAGE**.

Draining, Drainage, process of rendering a mass of substance free from moisture. Drainage is often associated with the carrying away of sewage matter in artificial channels (see **SEWAGE**), and with reclaiming land by enclosing it with dykes and carrying off the water by special channels. In the practice of agriculture, however, the term is most often used to designate the removal of excess of water, which would otherwise become stagnant, from a clayey soil. Such D. was practised by the Romans, who kept their lands dry by open trenches or drains in which a porous channel was maintained by a layer of stones or twigs. The use of covered drains was revived in England by Joseph Elkington about 1763, who showed that land could be freed from stagnant water by tapping the obstructing clay by deep drains in suitable directions. In 1823, James Smith of Deanston introduced the parallel system which is the basis of all methods now in use. When the slope of the field, or of any section of it, is determined, and a suitable outlet for the water obtained, a main receiving drain is constructed along the lowest part of the ground, and a series of parallel drains made so as to fall towards the main drain. Smith suggested that each trench should

DRAGON-FLY

nervules; an elongated abdomen and slender legs. The flight is very fast and powerful, and on migration the D. can fly hundreds of m. In the early stages of their life they live close to the water—the eggs being deposited in or near the water, and there is no stage of quiescence between the larva and the nymph. During the larva stage, the mask, a modification of the lip, enables them to obtain their prey. The number of species is about 2000, distributed over the globe, but principally in tropical regions, however, being natives of Britain. It is a curious fact that none of the varieties has been given a popular name, as is the case with butterflies and moths. They are exceedingly voracious and very active, some species having a brilliant and beautiful colouring. Included in the number of 43 species in Britain are 16 damselflies, differing little in appearance from Ds. Their nymphs, however, breathe through the back while those of Ds. breathe through their tails. The damselfly, too, is not so strong as the D. and is content to fly around the home water. See W. F. Kirby, *A Synonymic Catalogue of Neuroptera Odonata*, 1890;

be 30 in. deep; at the present day they are usually cut to a depth of 3 to 4 ft., the width at the bottom being just sufficient to receive the line of porous cylinders which carry off the water. Formerly these were connected by collars, but if well laid there is no necessity for that method of joining. The distances between the parallel drains may be from 10 to 40 ft., according to the extent to which water is imprisoned.

The effect of D. land is greatly to increase its agric. value. In a marshy soil, aquatic plants and mosses thrive and prevent the proper development of grass or corn. The temp. tends to be low from the constant evaporation, and crops are, therefore, liable to fail in bad seasons. Tillage is difficult on account of the toughness of the soil. The excess of moisture prevents the passage of air through the soil, thus starving the roots. Sheep and cattle are much more liable to disease. When the land is drained these disadvantages disappear. By this means many districts in the low-lying parts of the E. of England have been converted into good arable and pasture land. The Land Drainage Act, 1930, was passed to promote schemes of land drainage, through the formation of catchment authorities under the Act. See R. W. Walker, *Principles of Underdrainage*, 1929; B. W. Adkin, *Land Drainage in Britain*, 1933; H. H. Nicholson, *The Principles of Field Drainage*, 1942.

Drake, see DUCK.

Drake, Sir Francis (c. 1545-96), navigator. One of the most popular figures in England's naval annals, and his praises have been sung from his own day until ours. There is much uncertainty on both the date of his birth and even on his parentage. Local tradition has it that he was born at Crowndale, near Tavistock, in a cottage the appearance of which is preserved in Lewis's *Scenery of the Tamar and Tavy* (1823). In Stow's *Annals* it is implied that he was born in 1545, but the statements on two authentic portraits suggest that the true date was some years earlier. It appears that his father's name was Robert, probably third son of the last John Drake of Otterton, and that his mother was Agnes Kelloway. His father seems to have been in a humble way of life, though, according to a note added to the grant of arms in 1581, D. had the right to bear the arms of his name and family. Certainly D.'s uncle, John D. of Exmouth, was an energetic and successful merchant who had estab. his rights to an estate in Ash and raised his family to opulence and influence—in which good fortune, however, Robert, his brother, had but little share. There is evidence that Robert D. was in some way connected with or dependent upon the rising house of Russell, whose heir, the earl of Bedford became godfather to Francis. All we know of John D.'s life is what may be read in his grandson, Sir Francis D.'s preface to *Drake Revived*, pub. in 1626. The story of D. becoming the favourite page of King Philip of Spain at the Eng. Court, is apocryphal and similarly, there is no

evidence that he was ever employed in a post of trust in the W. Indies. But there is no reason to doubt Camden's statement that in his youth D. was apprenticed to the sea. In 1565 he sailed with Capt. John Lovell to the Sp. Main, and his capacity for handling a vessel became so well known that two years later he was selected to command the *Judith* in that ill-fated expedition of Sir John Hawkins, which was defeated with great loss off San Juan de Luna. Between 1570 and 1573 he made three voyages to the W. Indies, during which he sacked Portobello and Vera Cruz, and accumulated a considerable fortune. It was in 1577 that he set

SIR FRANCIS DRAKE

out for the R. *Plato* on a buccaneering expedition, and he made his way through the straits of Magellan, sailed through the Indian Archipelago, rounded the Cape of Good Hope, and returned to England, having thus completed the circumnavigation of the globe, the first Englishman to have done so. To his vessel, the *Golden Hinde*, came Queen Elizabeth on April 4, 1581, and there knighted the intrepid sailor. Four years later he was given the command of a fleet, and committed many assaults on the Sp. fleet and the Sp. coast towns. He was urgent in his advice that every effort should be made to destroy the Sp. fleet in its own waters, but other counsels prevailed with the gov. So it came about that in 1588 the Sp. Armada sailed for England, and D., having the chance of his life, seized it, and defeated the Armada off Gravelines, pursuing it and destroying several vessels, as the fleet sailed northwards up the coast to Scotland. Still vigorous, D. now carried the war again into the enemy's country, and laid waste many towns, and destroyed many ships and vast stores, thus putting an end for many years to come to any fears of a further armada being sent. In 1594 he was sent with a fleet to the W. Indies, and it was whilst on this expedition that he died at Portobello. He was buried at sea, the proper cemetery for a brave and brilliant seaman. The reputation of D. has suffered some vicissitudes. He has been called a common

pirate; he was acclaimed as a great Christian hero by the pugnacious Protestants of the Victorian age. Kingsley's robust sentimentality and Froude's special pleading may have had the combined effect of turning people against the sea-adventurers of the Elizabethan age. It might seem that, when we forget the Tractarian Movement, which was, in some sort, the inspiration of Kingsley's and Froude's portraits, we shall see D., not as a Christian hero, but as the greatest sailor of his time, as the man who wrested the mastery of the sea from the Spaniards and the Portuguese, and as the initiator of the traditional Eng. naval strategy—that of seeking out the enemy in his own waters and fighting him there. See lives by Sir J. Barrow, 1843; A. Brereton, 1917; E. F. Benson, 1927; and A. E. W. Mason, 1941; also J. A. Williamson, *The Age of Drake*, 1938.

Drake, Nathan (1766–1836), Eng. essayist and doctor, b. at York. His best-known book is *Shakespeare and His Times* (1817).

Drakenberg Mountains, or **Dragon Mountains**, chain of mts., situated in S.E. Africa and lying parallel to the coast, between Cape Prov. and the Vaal R. The seaward slopes are steep and precipitous, while landwards the slopes are more gradual and form part of the tableland. That portion of the chain, between Natal and Basutoland, contains the highest points, Champagne Castle, Mont-aux-Sources, and Giant's Castle, each being considerably over 10,000 ft. in altitude, and all within 60 m. of each other. The prin. heights along the Transvaal, Natal, and Orange Free State frontiers are Malani, Inkwelo, Tintwa Majuba, and Drakenberg. The s. part of the chain forms the watershed between the rivs. flowing w. to the Atlantic and those flowing E. and S. to the Indian Ocean. The Orange R. and the Tugela rise in Mont-aux-Sources. Van Reinen's Pass and Laing's Nek are the chief passes crossing the range.

Dram, see **WEIGHTS AND MEASURES**.

Drama, tn. of E. Macedonia, Greece, celebrated for its tobacco. It has an active trade and fertile surroundings. The tn. was settled after the First World War by many refugees from Asia Minor, thereby providing labour for a large increase in tobacco culture. Here was the first Christian community on European soil. Pop. 31,600.

Drama (from the Gk. *δρᾶμα*, to do), a form of literary art for the direct representation of human actions and characters through individual impersonation, before an audience. In literary hist. the D. is classified as a branch of poetry, though many plays have been written in prose. Both the epic, or narrative, and the lyric, expressing individual emotion, are applied in D., where the facts of a story are developed in interchange of speech and action. This latter distinguishes the D. from simple dialogue; the illusion of reality is rendered plausible by the scene-painter and the stage-manager; altogether they express objectively every emotion by

word, gesture, or play of feature. The div. of a play in acts and scenes originates in the subject-matter of the D. itself, the invention of the drop-curtain and scene-shifting has created mechanical accessories. All these divs. mark the different stages of the development of the plot, show the complications leading to the climax, and finally solve the problem by the 'catastrophe'. The famous doctrine of the 'unities' is hardly more than a formulation of the inevitable stage-restrictions. Their origin may be traced to Aristotle's remarks on tragedy, but as conventions of the theatre they were definitely accepted by the classical Fr. dramatists, foremost among them being Racine and Corneille. The 'dramatic unities' are three: of place, of time, and of action. Place precludes any extensive change of scene; time is limited to the space of one day for the development of events; action requires that all the events shall converge on a simple plot. Shakespeare, Lessing, and the Fr. romanticists recognise as fundamental only the last of the three. Upon the Greek stage, the model for the classicists, there was no curtain and very little possibility for change of scene, consequently, unity of place was practically inevitable. Unity of time was necessary from the habitual presence of the chorus on the stage. Unity of action is simply an application of the principle on which is based every work of art. Sometimes a secondary plot is created by the author for the display of subsidiary characters of the play, mostly for the purpose of enhancing, by contrast, the effectiveness of the main action. The classic departments of the D. are tragedy and comedy; tragedy has a sad ending, comedy ends happily. But there are other differences. Tragedy deals seriously with serious themes, with the sufferings of humanity, and with fatality. Comedy exploits the follies and absurdities of the ridiculous and the base. Tragedy entertains through the excitement to pity and sympathy, comedy through the excitement to mirth. Satirical purposes may dictate the choice of the object of ridicule. Under-plots in tragedy introduce a comic element as a counterpoise to tragic emotions and heighten the impressiveness of the latter (see the grave-digging scene in *Hamlet*). Modern plays, however, contain much more diversity of plots than the ancient, and many of them are neither tragedy nor comedy, neither fish nor flesh. Of the different kinds of D., the so-called historical or romantic are sufficiently defined by their names; *melodrama*, of It. origin is a broadly treated mixture of tragedy and comedy, appealing to the lesser critical emotions; the Fr. *drame*, described variously as *tragédie bourgeoise*, or *comédie larmoyante*, represents life with little limitation as to form. Comedy has developed in not a few varieties, from the 'comedy of manners' of the eighteenth century to farce, burlesque, and vaudeville. Pantomime and ballet are ancient offshoots of the regular D., perhaps parts of its origin. Mimicry is fundamental to the acted D.,

an inevitable part of human nature, and doubtless common to all people. The dramatic dialogue of the Book of Job and the dramatic lyrics in the Canticles may be the primitive form of dramatic tendency, but the regular dramatic history begins in Greece.

Greek drama, both tragedy and comedy, was the consequence of the worship of Dionysus or Bacchus. At the Dionysian festivals in Attica, the followers of the wine-god were impersonated by choruses of men half-clad in goat-skins, whence probably derives the word tragedy (*τραγῳδία* = lit. goat-song), singing dithyrambic songs in honour of the god as they danced about the altar; thus, about 600 B.C. the Corinthian poet, Arion, led a cyclic chorus of fifty. Half a century later appeared Thespis of Attica, whose innovation was the introduction of an actor to fill the intervals of singing with stories, mimicry, and short dialogues with the leader of the chorus. Soon after the more serious performances were limited to the sadder parts of Dionysus' story and of other mythological tales. Pisistratus estab. at Athens the *Lenæa* festival, in which, as somewhat later, at the *Great Dionysia*, prize dramatic contests were included, and the development of tragedy was continued by Chærilus, Phrynicus, and other playwrights. The fifth century B.C. produced the greatest tragic writers of the Athenian stage: Æschylus, who enlarged the dramatic possibilities by making the number of actors two; Sophocles added a third. The original chorus of fifty was divided into four of twelve each (increased to fifteen by Sophocles), and plays were presented in groups of four called tetralogies, in one of which in each tetralogy the original satyric form was maintained. The other three, called trilogy, formed a consecutive series upon a single legend. A tragedy generally was made up of a series of episodes, separated by lyrics sung by the chorus, introduced by the prologue and terminated by the exode. The actors were trained by the author, and to 'teach' a D. was equivalent to producing it. The expenses of the production were borne by a chosen citizen, called the *choregus*, who thus participated in the contest. The Athenian tragedy was a sort of serious religious function. Aristotle in his *Poetics* defines its motive as 'to purify the passions of fear and pity through the exalted exercise of them.' Characterisations of the 'great tragic trio' of Athens have been innumerable from the times of Aristophanes. With Æschylus, the idea of *Nemesis* (divine vengeance) is an overwhelming mystery; with Sophocles it is a part of the moral law of life; with Euripides it becomes a source of human sadness. Under this trinity, tragedy in Attica became the means of expressing the deepest religious thoughts: their successors, Ion, Aæchæus, Agathon, and others, are insignificant, as none of their works have come down to us. Later, most of the lyrical element was lost through the dropping of the chorus from being an Athenian institu-

tion, tragedy spread to other Gk. tns., and its special relation to the worship of Dionysus disappeared. However, the earlier works were continually reproduced; we find them performed under the Ptolemies at Alexandria. Gk. comedy developed parallel with tragedy; it originated with the crude songs of the more rustic Dionysian festivals, which led naturally to a dramatic composition of a gay character. It is said to have been introduced into Attica early in the sixth century B.C. by Susarion, the Megarian but before it was encouraged at Athens it developed elsewhere, particularly among the Dorians in Sicily, where flourished Epicharmus of Kos (born c. 540 B.C.) and Sophron, the inventor of mimes, who wrote in Doric prose, dispensing with both chorus and plot. Athenian comedy is commonly divided in three periods of Old, Middle and New Comedy. Aristophanes was the great master of the first; Cratinus, Crates, and Eupolis were his contemporaries. It was constructed on similar lines to tragedy, but with a chorus of twenty-four and an additional element, the *parabasis*, in which the audience was directly addressed; it dealt frankly in personalities, was largely political and did not hesitate to caricature the leading men of the day. At the period of middle comedy the freedom of speech was somewhat limited, and the butt of the comedian's ridicule were the follies and foibles of whole classes rather than those of individuals. The chorus was dropped. The new comedy, at the beginning of the third century B.C., had brought the aforementioned tendency to a full development. Political questions were neglected, and writers like Menander and Philemon devoted themselves to the exhibition of ridiculous complications of the social life of a decadent society. Some of the types then created, the glib old man, the dissipated son, the impudent servant, serve still in our days. This latest Gk. comedy is chiefly known to us through the adaptations of the Rom. comedians Plautus and Terence.

Roman drama—The Romans, who had but few dramatic gifts, naturally preferred comedy to tragedy. Comic elements are to be found in the *saturnæ* of the early Lat. tns. It is generally assumed that the Romans borrowed their first idea of a play during a period of national dependency (364 B.C., Livy vii. 2) from the Etruscans, from whom came their word *histrio*, an actor. The rude farces known as *fabulæ Atellanæ* were effusions of sportive humour, and came from the Oscans. Mimes they took from Magna Græcia; and their literary D. was practically an imitation of the Gk. The D. was one of the earliest branches of literature cultivated by the Romans. Both comedies and tragedies were written by Livius Andronicus, Nævius, and Ennius; tragedies by Pacuvius and Attius, none of which have come down to us. Nævius is celebrated for having got into trouble by ridiculing prominent people in imitation of the old comedy of Athens. What is left to us of Rom. comedy belongs to the works of Plautus and Terence, of the class called

palliate; closely adhering to the Gk. models, as distinct from the so-called *togata*, which had Rom. subjects. *Plautus*, once a poor labourer, has a degree of rough vigour and broad jocularly, while *Terence*, a Carthaginian slave, is more refined and delicate in his wit and characterisation. The works of both are based on *Menander* and *Philemon*, but one change of form is to be particularly noted; the prologue ceased to be the first act of the play, and became what it has since remained, a detached explanation. Tragedy, more as literature than for stage production, was cultivated by writers of the Augustan age and later. Of all these attempts naught remains except the rhetorical *De*s. attributed to *Seneca*, though certainly not all to this philosopher. One of them, *Octavia*, is of the class called *proetacta*, treating historical Rom. subjects; the remainder are all from Gk. mythology. With the decadence of the Rom. empire, all 'legitimate' *D.* declined, and the stage was held by dancers and pantomimes, some of whom became great popular favourites. *Cicero* testifies to the excellence of *Roscus*, the most celebrated of Rom. actors.

Indian drama was long said to have been derived from the Gks., but is now generally thought to be of independent origin. Like the Gk., it arose from religious ceremonies, along with the dances and songs of popular festivals. However, the Hindu *D.* is not tragic, and makes far more of romantic love than does that of the Gks. *Kalidasa*, the greatest literary genius of India, commonly assigned to the first century B.C., is by recent criticism placed several centuries later. The best period of Sanskrit *D.* was from about the fourth to the ninth century A.D. A peculiar feature of Indian plays is the use of different dialects for different characters. Gods, heroes, and men of high standing speak Sanskrit; women and men of low position speak Prakrit in various forms. The best known Sanskrit play is *Kalidasa's Sakuntala*, a heroic love *D.* of poetical beauty. Another five-act play of *Kalidasa's* is *Micramoreasi* (The Hero and the Nymph). Among other Hindu dramatists deserve to be mentioned *Bhavabhuti*, a Brahman of S. India in the eighth century; two of his three plays concern the adventures of Rama, the hero of the epic of *Ramayana*, on which several of the later Indian *De*s. are founded. Other noted plays are: *Mricchakatika* (the Toy Cart), a *D.* of social life, in ten acts, credited to King Sudraka of the sixth century; and *Ratnavali* (the Pearl Necklace), a romantic play, supposed to have been written by King Sriharsha, of the seventh century. The Moslem invasion killed the *D.* in India, and, though Sanskrit plays have been written in modern times, they are rarely acted.

Chinese drama.—Of all the other Oriental races, the only one which has a sort of dramatic literature is the Chinese, and their *D.*, in spite of the antiquity of the other Chinese literature, is comparatively modern. There are reasons for attributing its origin to the Tartars,

though it has commonly been considered an evolution from the native songs and dances. In the eighth century A.D. a sort of academy of music, known as the 'Pear Garden,' was founded by an emperor of the T'ang dynasty. *D.* proper did not develop till about the thirteenth century; the most famous of Chinese plays is called *Pi Pa Chi* (Story of the Guitar) of a somewhat later period. There are many printed collections of plays, but they differ materially from their acted versions. The avowed aims of the Chinese *D.* are of the most elevated, the glorification of all the virtues. Generally the plays are rather arid and conventional; as acted, they include much interpolated matter, which may account for the low esteem in which actors are held. Chinese plays are broadly classified, not as tragedies or comedies, but as 'civil' or 'military.' The latter include combats and all sorts of violent deeds. The former are quieter and deal with the more ordinary aspects of social life, with a tendency to the comic. There is little attempt at realism or stage setting. Women's parts are taken by men. Whole series of plays are commonly performed without intermission, which has led to statements as to the extraordinary length of Chinese plays. The nearest approximation in Chinese *D.* to the conception of tragedy is the universally popular play, *The Orphan of the Chao Family*, by Chi Chan-Hsiang.

Japanese drama.—The origins of Jap. *D.* were both social and religious. First written references to Jap. *D.* occur in the *Ko-ji-ki*, a Record of Ancient Matters, A.D. 712, where an account of *Kagura*, God-Music, is given. *Kagura* may have been originally music and dance either between, or in the presence of, gods. It is still played before *Shinto* shrines, and chants, rhythmic accompaniments to the movements of labour, such as the song for driving in stones, seem to have been incorporated into the *Kagura*. Field dances, *Tamae*, and field music, *Dengaku*, are of anc. origin; while other dramatic forms of social origin are *Sabara*, songs probably sung when the people were about to carry tribute to their rulers, and *Azuma mae*, songs of the E. provs. The *Matsuri* (processions of cars) are still popular in Japan.

Dengaku included six forms of *D.*—*Shiba* (lawn), *Dai* (great), *Sho* (small), *Maiko* (dancing girls), *Maru* (village) and *Kachi* (walking, probably on horseback)—and, with other dance *D.* such as *Ennen*, became formalised with the growth of Buddhism and developed into the *Noh* plays ('*noh*' meaning accomplishment), which are extremely conventionalised. *Noh* of *Sarugaku* (monkey-music) was originally comic, but lost its comic nature under the influence of the priests. In *Noh* there are two or more actors, the play is in verse and is chanted, the players are often masked and all movement is formalised. By the end of the fifteenth century four types of *Noh* plays were in existence—*Shinto noh*, which deals with mythological subjects; *Shugen noh*, commemorating customs; *Furei* and *Serei noh*, in which ghosts and spirits

occur, and *Genzai mono noh* dealing with things of life to illustrate a moral truth. As the literary preservation of *Noh* plays was under the care of Buddhist priests all comic element in them disappeared. The comic plays were extempore, and became incorporated in *Kyogen*. *Kyogen* means easy speech, and is realistic, non-literary social comedy. It is in prose, and is performed as interludes in the long programmes of *Noh* plays.

Medieval drama.—During the Middle Ages the church, practical as ever, undertook to replace the pagan shows by a Christianised equivalent, which seems to have arisen naturally out of the responsive chants and narrations of biblical events with which the congregations were both instructed and entertained. Later these entertainments took the form of regular liturgical D., which developed into the *miracle-plays, mysteries, and passion-plays*, which at Oberammergau and elsewhere have come down to our own days. With a similar purpose arose also the *moralities*, which mostly were performed by wandering churchmen. Out of these beginnings, varied occasionally by secular tendencies, modern D. may be said to have developed till the Renaissance came with a new impulse.

Italian drama.—In Italy, where the revival of the classical D. was earliest, the religious D. came to a full development before it was superseded by the modern dramatic form. The *Rappresentazione Sacra*, mostly in connection with the festivities in honour of Saint John the Baptist, were responsible for two works of great merit, *Abramo e Isacco* (1449) by Feo Belcarì, and *San Giovanni e San Paulo* by Lorenzo de' Medici. At the beginning of the sixteenth century Plautine comedy was revived in the writings of Cardinal Bibbiena, Ariosto, and Machiavelli, and some erratic attempts, like that of Poliziano, but the modern It. D. was born when Aristino produced a rather dull and conventional tragedy in blank verse, *Sofonisba*. Torquato Tasso's *Amita* (1573) set the fashion of pastoral plays. At the end of the same century Giambattista della Porta wrote his familiar and sometimes farcical comedies of a pleasant originality. The romantic D., originated in Spain, found favour in Italy, and the reaction against the domination of the classic school became effective. Borghini, Michelangelo Buonarroti (a nephew of the great artist), with his comedies *Fancia* (1612) and *Piera* (1618), and others, supported the movement. At the same period Rinuccini and his followers, by uniting music to the romantic D., created what was called the *melodrama*. Consequently tragedy and comedy were rapidly superseded by the *musica opera*, which, a century later, was brought to a literary level by Zeno, and perfected to the utmost by Metastasio, who with his *Didone Abbandonata* (first produced in Rome 1723) completely fascinated the It. public. His long series of works culminated in the triumph of his *Attilio Regolo* (1750). Maffei produced his

Merope (1713) with the definite purpose of restoring classic tragedy. But Fr. dramatic art soon began to influence the It. stage, especially through the efforts of the actor-playwright Riccoboni. The eighteenth century produced Italy's three greatest dramatists: Carlo Goldoni, Carlo Gozzi, and Vittorio Alfieri. Goldoni (1707-93), left his native Venice in 1761 for Paris; he is called the 'Italian Molière,' and may be called the master of It. regular literary comedy. Gozzi (1720-1806) his rival, wrote dramas based on fairy tales; both transformed the popular *Commedia dell' arte* (Comedy of Masks) into a literary shape which for some time enjoyed immense success. Alfieri (1749-1803) was of quite another metal. He was bold and passionate, a follower of the classic school and observer of the unities, and helped to revive the national spirit by such tragedies as *Filippo II.*, *Saul*, and *La Congiura de' Fieschi*. His successors, Monti, Nicolini, Manzoni, Silvio Pellico, and Cossa relaxed their adherence to classic forms. In the nineteenth century Italy was influenced by Shakespearean methods, in consequence of which her dramatists affected to give prominence to the historical D. Some exceptionally good works were successfully performed by the great It. actors, Modena, Salvini, Rossi, and Madame Ristori. In recent years the poet Gabriele d'Annunzio gained some reputation as a playwright, principally by such of his works as he wrote specially for the great actress, Eleonora Duse. Luigi Pirandello (1867-1936) was one of the greatest twentieth-century dramatists. His drama is metaphysical, and is influenced by the theory of relativity. There is nothing absolute about his plays and the characters in them are always concerned with their real, though hidden, personalities. Although the problems of his plays may be considered as abstractions, the characters are so possessed with these abstractions that the problems become human, and the characters lose nothing of their reality. The language of the plays is exact and unembellished, and his whole dramatic treatment is objective, but his dramas hold the spectator throughout, and possess something of the quality of poetry. *Six Characters in Search of an Author* (1921) and *Henry IV* (1922) are two of his best plays, most of which have been translated into Eng. and many other languages. See also *COMMEDIA DELL' ARTE*. Giuseppe Giacosa (1847-1906) and Roberto Bracco (1862-1943) showed in their work much of the influence of Ibsen.

Spanish drama.—Spain may well be considered as the bp. of the romantic D. Santillana, Lope de Rueda, called the patriarch of the Sp. stage, and Naharro were the beginners; Cervantes (1547-1616), Lope de Vega (1582-1635) and Calderon de la Barca (1600-81) became the perfectioners, the masters of Sp. dramatic literature. It is not generally known that Cervantes, of Don Quixote fame, is also the author of *La Numancia*, a serious tragedy of literary worth and dignity. Of his lesser contemporaries

Cueva, Virtues, and Argensula may be mentioned. Lope de Vega, the most prolific of dramatists of all times and nations, set all literary laws at defiance. He wrote with the most prodigious facility and with dramatic vigour. The number of his plays is said to exceed 1800, and won immense popularity, to which he often sacrificed some of his better qualities. Contemporaries of him were Juan Ruiz de Alarcón (c. 1580-1639), and Tirso de Molina (1571-1648) (Fray Gabriel Téllez), in whose *Burlador de Sevilla, ó el convidado di pietra*, was first introduced the figure of Don Juan. Calderon was greater than Lope de Vega. He was the greatest of Sp. dramatists and one of the great dramatists of the world. He is lyrical and animated by the highest sentiments. His ideals were devotion to the king, to the church, and to personal 'honour.' Some of his best works are the religious plays called *autos sacramentales*, in which the mystery of the Eucharist was dramatically set forth. With his death in 1681 the brilliant period of the Sp. theatre was practically closed. His contemporary, Moreto, wrote numerous fine comedies, mostly of the 'cloak and sword' sort, for which the Sp. stage is proverbial. José Echegaray y Eizaguirre (1832-1916) wrote more than thirty plays, many of which have as their theme a conflict between two forces. His best play is *El Gran Galeoto* (1881). He attempted to deviate in his plays from the so-called 'punto de honor,' on which Sp. drama had centred hitherto. In 1904 Echegaray divided the Nobel Prize for literature with Frédéric Mistral, but the younger Sp. dramatists, the 'generation of '98,' revolted against the past theatre of Spain and expressed their grievances in a manifesto against Echegaray. Benito Pérez-Galdós (q.v.) (1843-1920), a contemporary of Echegaray, was exempt from the criticism of the 'generation of '98.' His plays usually express some attitude of revolt, and are written regardless of stage technique, but the characterisation is good. One of the most famous of the 'generation of '98' is Jacinto Bonavente (b. 1866), whose work is prolific and varied. His plays form the link between the old and new D. of Spain and contain the varied thought of all the most important European dramatists of the nineteenth century. Among twentieth-century dramatists Gregorio Martínez Sierra (b. 1881) and the brothers Serafín (1871-1938), and Joaquín Álvarez Quintero (1873-1914) are outstanding.

French Drama.—France, accepting the 'unities' as the first essentials in the D., revived the classical D., which appeals to the logical temper of the national genius. In the *mystères, moralités, soties, farces*, romantic or anti-classic tendencies were manifest, but no great advance in proper dramatic achievement was made. The first regular five-act tragedy was written by Jodelle for the court of Henri II. He wrote some more plays, not without merit, but nothing remarkable was done till Pierre Corneille appeared under Louis XIII., when the star of Richelieu was shining brightly. He had to humour the

Court by humouring the Academy, and to please the Academy he had to observe the rules of Aristotle. He had already produced several plays of classical elegance and dignity, when, attracted by its romantic tendencies, he wrote his masterpiece, *The Cid*. All Paris rang with the praises of this work, but the Academy held aloof. Corneille had to return to the classical limitations, and was rewarded with a seat in the Academy. It was more than came to his contemporary, the great Molière, who insisted on remaining an actor, a resolve which the dignified academicians could by no means tolerate. Molière's name is doubtless in all the essentials of pure comedy the foremost name in the history of the stage. Like Shakespeare he borrowed much from the *Ita.*, the Spaniards, and the *Lats.*, but he made his theatre truly Fr. in wit, expression, and characterisation. By the union of Molière's company with that of the actors of the Hotel de Bourgogne, Louis XIV. estab. in 1680 Comédie-Française, (q.v.) an institution which is at the heart of the Fr. theatre, and is the most famous national theatre in the world. Racine was the great tragedian of the times of Louis XIV. He was not tempted, like Corneille, to overstep the academic proprieties. He was perhaps the most tender and the most elegant of Fr. writers, and it may be truly said that his *Athalie*, his masterpiece, has never been surpassed in noble elegance and severe grandeur. The brilliant and erratic Voltaire astonished Europe with the audacity and power of his romantic tragedies. Could he have been able to temper the intolerant iconoclasm of his fight against superstition he would have ranked as a dramatist with Corneille and Racine. In the nineteenth century, the D. of France was much more prolific than that of any other nation. Alfred de Vigny, Scribe, and Legouvé, Alexander Dumas pere and Victor Hugo, the leaders of the 'romantic movement,' Alfred de Musset, Emile Augier, Dumas fils, Octave Feuillet, Victorien Sardou, Edmond Rostand (the reviver of poetical plays), Jean Richepin, François Coppée all produced meritorious dramatic works. Writers who composed their plays on the 'marital triangle,' giving great attention to construction, are P. Hervieu (q.v.) (1857-1915), praised for his literary style, Maurice Donnay (1860-1945), and Henry Bataille (1872-1922). Other twentieth-century dramatists who specialise in sex drama, often with applied psychology, are Henryavedan (1859-1940), Jules Lemaitre (1853-1914), and Georges de Porto-Riche (1849-1930), while the plays of Alfred Capus (q.v.) (1858-1922) are sceptical in the extreme. Henry Bernstein (q.v.) (b. 1876) is a popular dramatist whose plays are almost melodrama. Eugène Brieux (q.v.) (1858-1932), with other of his contemporaries, François de Curel (1854-1928) and Henri Becque (1857-99), had his plays first produced at the Théâtre Libre, which was founded by Antoine in 1890. Brieux is known in Europe for the controversial subjects of his plays, but his dramatic ability is great and

his language is incisive. Sacha Guitry (b. 1885) is another twentieth-century dramatist, but his fame is more in connection with his acting and elocution. Since the First World War Fr. D. has developed European importance in the works of H. K. Lenormand, Jean-Jacques Bernard, Jean Sarment, Jules Romains, Paul Géraudy, Paul Claudel, Jean Giraudoux, Jean Cocteau and Jean Paul Sartre, and exportism has taken the place of tradition.

German, Austrian, and Czechoslovak drama.—Ger. drama dates practically from Lessing, Goethe and Schiller. Its origin is similar to that of all cultured nations, and up to the middle of the eighteenth century the Ger. stage was little more than a feeble reflex of Fr. influence. Lessing, both by his works and critiques, was the reformer, not to say the inaugurator, of Ger. dramatic art. His tragic plays, *Miss Sarah Sampson* (1755) and *Emilia Galotti* (1772), and his comedy *Minna von Barnhelm* (1763), opened a new era for the Ger. D., while in his *Hamburgische Dramaturgie* (1767–1769) he attacked Fr. classicism and praised Shakespeare. Goethe, one of the world's greatest geniuses, does not rank high as a dramatist. His *Faust* (1759) is doubtless one of the greatest modern compositions; but his chief purpose is self-cultivation, and in the prologue, his last and most famous production, he explains why, although writing in dramatic form, he cannot accommodate himself to the exigencies of a popular theatre. Schiller is the dramatic poet proper of Germany. Goethe's genius was fuller and more complete, but Schiller compensated by the intensity of his powers. Of his contemporaries there deserve to be remembered Heinrich von Kleist, Körner, Effland (actor, manager and author), of his successors Grillparzer, Grabbe, Otto Ludwig, Hebbel, Halm, Mosenthal, Gottschall, Auzengruber. Gerhart Hauptmann (1862–1913) is an important dramatist of the late nineteenth century. His plays are naturalistic and poetic and, with those of Sudermann, were performed by the Free Stage Society, founded in Berlin in 1889. Sudermann's greatest play is *Magda*. A contemporary of his, Frank Wedekind (1864–1918), wrote plays which refuse to be classified. *The Awakening of Spring* is one of his best known plays: his dialogue is brilliant and his influence on post-war dramatists great. If Wedekind may be called a writer of expressionistic drama, three important twentieth-century dramatists may be classed with him, Georg Kaiser, (1878–1945), Ernst Toller (1893–1939), and Fritz von Unruh (b. 1885). Max Reinhardt (1873–1943) is important in the hist. of the theatre, and his designs for productions are world famous. Arthur Schnitzler (1872–1931) is an important Austrian dramatist, his best play being *The Green Cockatoo*: Hugo von Hofmannsthal (1874–1929) is a tragic poet of profound influence; and Max Mell (b. 1882) dealing in drama of the homeland. Czechoslovakia has two expressionistic dramatists, Karel Capek (1890–1939) and his

brother Josef, whose best-known play is *R.U.R.*

Dutch and Scandinavian drama.—The Dutch D. is hardly more than an imitation of Fr. romantic plays. Nothing remarkable has been produced in Holland save for the work of Hermann Heijermans (1861–1924) and Jan Fabricius (b. 1871); or in Flemish Belgium. Fr. Belgium is the motherland of the poet Maurice Maeterlinck (b. 1862), whose plays are of a rather extreme type of some of the features of the symbolist movement. The Scandinavian countries have in recent times developed a D. of importance. The Norwegians, Bjørnsterne Bjørnson (1832–1910), and, first and foremost, Henrik Ibsen (1828–1906), have become very distinctive figures in the D. of psychological and social problems. Ibsen's influence on European drama is immeasurable. *Peer Gynt* (1868), *The Pillars of Society* (1877), *A Doll's House* (1879), *The Wild Duck* (1884), and *Hedda Gabler* (1890) are some of his best-known plays. Contemporaries and followers of him are Gunnar Heiberg, Veltio Visle, Gabriel Finne, Anders Sullöf, and Knut Hamsun. Johan August Strindberg, the Swede (1844–1912), a powerful but somewhat discursive dramatist, is an antidote to Ibsen's feminism. In Denmark, Adam Gottlob Oehlenschläger (1779–1850) is known for his dramas of the national tradition of the nordic hero-world. A wide influence in drama and literature also belonged to Georg Brandes (1842–1927) both dramatist and critic. Notable early twentieth-century Dan. dramatists are Johannes Anker-Larsen, Valdemar Rørdam, Otto Benson, Fru Emma Dnd, Gustav Bismann, Sven Lange, Gustav Wied, Hans Wiens-Jønsen, and Hjalmar Bergström.

Russian Drama is of very recent development. It is said that in earlier days Russian religious plays were performed. The first Russian theatre was estab. in 1756 in St. Petersburg, and its manager, Sumarokoff, and Kinaznin, and other forgotten authors, wrote plays for it in the Fr. style. Catharine II. herself elaborated satirical comedies, and at her time Ozlerov (1769–1816) was a writer of tragedies of repute. In the nineteenth century we have Griboedov (1795–1829) the author of *Goree Nama* (The Misfortune of being too clever); Nicolai Gogol (1809–1852), whose comedy *Revisor* (The Inspector) has become known all over the world; Alexander Pushkin (1799–1837), whose *Boris Godunov* shows Shakespearean influence; Alexander Ostrovsky (1824–86), whose plays are realistic and deal with the emotions of the people; Alexis Tolstoy (1817–75) whose dramas are founded on stories of the Russian Kings; and Count Leo Tolstoy (q.v.), whose plays follow no traditions, but contain great character studies. Early twentieth-century dramatists are Maxim Gorky (q.v.), whose greatest play is *The Lowest Depths*, and Leonid Andreyev (q.v.), whose plays are written in excellent prose. Both these authors belong to the period of the first Revolution. Anton

Checkhov (*q.v.*), one of the greatest twentieth-century dramatists, wrote plays for the Moscow Art Theatre, which theatre did not produce a specifically Soviet play until 1926. These plays are naturalistic artistically, needing simple yet sensitive acting. A later twentieth-century writer is Evreinov, much of whose work is based on his own theory of 'monodrama.' Since the Revolution, 1917, a new theatre has been built up in Soviet Russia, which has reflected the various phases of the republic. Lack of money made simplification of production necessary, and out of this grew geometrical construction in scenery. The main energies of the theatre in Soviet Russia have been devoted to organization and proselytising, and to preserving and developing the best in the Czarist regime. All the theatres are, of course, State-owned, being run by a dept. of the commissariat of education and in recent years they have sprung up all over the Union tapping an immense and hitherto uncultured audience. Each autonomous Republic and each racial minority has its specific theatre and, besides this expansion of the professional theatre, the amateur theatre is also an active and state-aided force. In the provinces there are Little Theatres and Strolling Players. Other theatres are the experimental state theatres and state circus, Jewish theatres, and the Moscow Art Studios. The theatre in Moscow to-day falls broadly in two parts: there is the section represented by the Moscow Art Theatre, the Maly Theatre, and the Kamerny Theatre, which has successfully merged the old traditions with the new. The other section is led by men like Meierhold, the firebrand of the Soviet Theatre, and Nikolai Okhlopkov, of the Realistic Theatre. Meierhold works on an elaborate theory of biomechanics; his actors, in fact, use stylised movements and steps and ladders; Okhlopkov has abolished the div. between the auditorium and the stage, becoming more Elizabethan than the Elizabethans. See André Van Gysegom, *Theatre in Soviet Russia*, 1943.

English drama, as in other countries, had its origin in the religious plays, written and performed by churchmen, who understood how to spice their miracle plays and mysteries with grotesque amusement, and it was not until the middle of the sixteenth century, as elsewhere, under the influence of the Renaissance, that the Eng. D. freed itself from these anct. fetters. The earliest known Eng. comedy is (1531 or thereabouts) *Ralph Roister Doister*, by Nicholas Udall, a learned master of Eton. A few years later Sackville and Norton produced their dull tragedy in blank verse, *Gorboduc*, or *Ferrex et Porrex*. Thereafter dramatic production was rapid, but mostly worthless; authors were Bishop Still, Kyd, Lodge, Lyly, Peele, Green, and Nash. The first dramatist of real merit was Christopher Marlowe (*q.v.*), the great predecessor of Shakespeare, whose best tragedies are *Doctor Faustus* (1604) and *Edward II.* (1594). But the great

luminary of Eng. D.—it may well be said of all the world's D.—is Shakespeare (*q.v.*). Among dramatists, the worthiest of his contemporaries are Ben Jonson, and Beaumont and Fletcher. Jonson wrote comedies and tragedies, stood more under the influence of the classics, but withal became famous with his light and graceful masques, which were the court's favourite entertainment. Beaumont and Fletcher worked in collaboration, and stand next to Shakespeare in romantic D. Dekker, Massinger, Ford, Webster, Chapman, and Shirley were authors of older Eng. dramas, when this kind of literature was abruptly and sharply terminated by the Puritan Revolution. With the Restoration, Fr. influence became apparent. *Display* mastered the play, and lavish staging over-ranked the value of the work. Leo and the unfortunate Otway wrote tragedies. Shadwell and the licentious Wycherley produced comedies; Vanbrugh, Congreve, and Farquhar brilliantly depicted society under a veil of immorality and indecency even more marked than that of some of Shakespeare's immediate predecessors. Then came Gay, Mrs. Centlivre, and the actor-playwright Colley Cibber, who was not lacking in dramatic spirit and invention. Famous, in another way, became Addison's tragedy *Cato* (1713), a solemn literary work, written in blank verse. Lillo, Moore, Garrick the actor, Goldsmith, the Colmans, and Cumberland nearly all wrote in prose. They produced agreeable comedies; but, except Goldsmith's *She Stoops to Conquer* (1773), hardly any of their works had a lasting success. Sheridan, who gave the impulse to what the Fr. call 'Comédie de Salon,' and whose *School for Scandal* (1777) is perhaps among its best Eng. examples, has long acquired a lasting place in the list of the Eng. D. Sheridan's immediate successors, Holcroft, 'Monk' Lewis, Maturin, Mrs. Inchbald, and others are insignificant. Later Joanna Baillie, Coleridge, Byron, Shelley, and Henry Taylor wrote fine book-dramas little suited for theatrical production. Then came in more recent times the dramatic poetry of Tennyson, Browning, and Swinburne. Plays of scenic power were written by Sheridan Knowles and Bulwer-Lytton, and during the Victorian era many mediocreities flooded the Eng. stage with their wares. A sort of speciality was created by W. S. Gilbert in 'the libretti' he wrote for Arthur Sullivan's operas. Late nineteenth-century dramatists were H. A. Jones (1851–1929), Sir Arthur Wing Pinero (1855–1934), and Oscar Wilde (1854–1900), who wrote comedies of wit. Bernard Shaw (b. 1856), with his plays that followed his dramatic criticism, brought new life to the Eng. theatre. His plays are controversial and witty, and have received world-wide recognition. *Arms and the Man*, one of his earliest plays, was produced by the Independent Theatre that was founded by Gresham in 1891. Other twentieth-century dramatists are John Galsworthy (1867–1933), whose plays are statements of social problems; Sir James Barrie (1860–1937), who

introduces an element of phantasy, the Poet Laureate, John Masefield (b. 1875), Somerset Maugham (b. 1874), Frederick Lonsdale (b. 1881), Clemence Dane, and Harley Granville Barker (1877-1946), whose most important work is in stage production, and James Bridle (b. 1888). Repertory theatres that have been formed in the provs. have produced such dramatists as Stanley Houghton (1881-1913), Allan Monkhouse (1858-1936), while verse drama has been written by Stephen Phillips (1867-1915), Thomas Hardy (1840-1928), Robert Bridges (1844-1930), Laurence Binyon (1869-1943), Laurence Housman (b. 1863), and Gordon Bottomley (b. 1874). Of the few important post-war Eng. dramatists Noel Coward (b. 1899), who writes satirical social comedies; T. S. Eliot notable for his striking renewal of poetic dramas; and J. B. Priestley (b. 1894), the novelist, whose later plays have portrayed the ordinary mortal involved with matters of time, the supernatural and the next world.

In 1899 the Irish Literary Theatre was estab. by Edward Martyn, George Moore, and W. B. Yeats, later to be joined by Lady Gregory and 'A. E.' (i.e. George William Russell, 1867-1935). In 1904 this theatre became the Irish National Theatre, when it was financed by Miss Horniman as the Abbey Theatre. W. C. Fay (1872-1947), an actor who was also a founder of the modern Irish dramatic movement, was one of the creators of the style of acting which made that theatre famous. Two types of plays have been produced—literary plays and folk plays. Irish dramatists who have written for this theatre are J. M. Synge, the greatest (1871-1909), W. B. Yeats (1865-1939), Lady Gregory (1859-1932), Sean O'Casey, and Lennox Robinson (b. 1886). Other Irish dramatists are Lord Dunsany (b. 1878), and St. John Ervine (b. 1883).

American drama is a recent development. Up to about thirty-five years ago Fr. and Eng. influence prevailed. With the advent of such popular melodrama as the *Old Homestead* of Denman Thompson, and such essentially indigenous farces of low life as those semi-improvised works of Harrigan and Hart, native originality first began to reveal itself. Probably James A. Herne, actor and stage manager, gave the greatest impetus to Amer. D. with his realistic play of New England rural life, *Shore Acres* (1892), and his late pieces *Griffith Davenport* (1898) and *Sag Harbour* (1900). In their directness, sincere representation of human nature and absence of all psychological finesses, lay their popularity—a popularity echoed by the modern *Mrs Wiggs of the Cabbage Patch*. Perhaps the most successful of modern Amer. dramatists was Clyde Fitch, whose social Ds. put him in the very front rank. Other successful Amer. Ds. are *The Easiest Way* (1909) by Eugene Walter; *The Great Divide* (1907) by William Vaughan Moody; *Jeanne*

d'Arc (1906), a poetical play by Percy MacKaye, and *Salvation Nell*, a striking slum theme by Edward Sheldon. The plays of these authors and also of Augustus Thomas, whose dialogue is excellent, Charles Rann Kennedy, and J. M. Paterson, are serious in intent and are written on European models, but perhaps it is not so much from these plays as from those aiming at a box-office success that a truly Amer. D. will develop. Plays of this latter type, such as those by George Ade and George Cohan, depend for their success on being up to date with current Amer. opinion. America's greatest dramatist, however, whose work is most alive with new possibilities, is Eugene O'Neill (b. 1888), a realist writer who also uses expressionist technique, as in *The Hairy Ape*. Another expressionist playwright is Elmer Rice (b. 1892), although in his best play, *Street Scene*, he abandons expressionism. Amer. D. to-day is becoming ever more important, for though the so-called 'new drama' came much later to America than to the Old World, the Amer. theatre has, for various reasons, flourished remarkably, and imported plays are but little regarded. Eugene O'Neill leads, enjoying, as he did, an international fame, but, inside America, Sidney Howard, Maxwell Anderson, S. N. Behrman and Clifford Odets enjoy some vogue for their abandonment of mere didacticism in favour of the dramatic quality of classical English D.
